aws ec2 get-verified-access-group-policy \
    --verified-access-group-id vagr-0dbe967baf14b7235
```

Output:

```
{
    "PolicyEnabled": true,
    "PolicyDocument": "permit(principal,action,resource)\nwhen
 {\n    context.identity.groups.contains(\"finance\") &&\n
 context.identity.email_verified == true\n};"
}
```

For more information, see Verified Access groups in the *AWS Verified Access User Guide*.

- For API details, see GetVerifiedAccessGroupPolicy in *AWS CLI Command Reference*.

`get-vpn-connection-device-sample-configuration`

The following code example shows how to use `get-vpn-connection-device-sample-configuration`.

AWS CLI

To download a sample configuration file

The following `get-vpn-connection-device-sample-configuration` example downloads the specified sample configuration file. To list the gateway devices with a sample configuration file, call the `get-vpn-connection-device-types` command.

```
aws ec2 get-vpn-connection-device-sample-configuration \
    --vpn-connection-id vpn-123456789abc01234 \
    --vpn-connection-device-type-id 5fb390ba
```

Output:

```
{
    "VpnConnectionDeviceSampleConfiguration": "contents-of-the-sample-configuration-
file"
}
```

For more information, see Download the configuration file in the *AWS Site-to-Site VPN User Guide*.

- For API details, see GetVpnConnectionDeviceSampleConfiguration in *AWS CLI Command Reference*.

`get-vpn-connection-device-types`

The following code example shows how to use `get-vpn-connection-device-types`.

AWS CLI

To list gateway devices with a sample configuration file

The following `get-vpn-connection-device-types` example lists the gateway devices from Palo Alto Networks that have sample configuration files.

```
aws ec2 get-vpn-connection-device-types \
    --query "VpnConnectionDeviceTypes[?Vendor=='Palo Alto Networks']"
```

Output:

```
[
    {
        "VpnConnectionDeviceTypeId": "754a6372",
        "Vendor": "Palo Alto Networks",
        "Platform": "PA Series",
        "Software": "PANOS 4.1.2+"
    },
    {
        "VpnConnectionDeviceTypeId": "9612cbed",
        "Vendor": "Palo Alto Networks",
        "Platform": "PA Series",
        "Software": "PANOS 4.1.2+ (GUI)"
    },
    {
        "VpnConnectionDeviceTypeId": "5fb390ba",
        "Vendor": "Palo Alto Networks",
        "Platform": "PA Series",
        "Software": "PANOS 7.0+"
    }
]
```

For more information, see Download the configuration file in the *AWS Site-to-Site VPN user Guide*.

- For API details, see GetVpnConnectionDeviceTypes in *AWS CLI Command Reference*.

`import-client-vpn-client-certificate-revocation-list`

The following code example shows how to use `import-client-vpn-client-certificate-revocation-list`.

AWS CLI

To import a client certificate revocation list

The following `import-client-vpn-client-certificate-revocation-list` example imports a client certificate revocation list to the Client VPN endpoint by specifying the location of the file on the local computer.

```
aws ec2 import-client-vpn-client-certificate-revocation-list \
    --certificate-revocation-list file:///path/to/crl.pem \
    --client-vpn-endpoint-id cvpn-endpoint-123456789012abcde
```

Contents of `crl.pem`:

```
-----BEGIN X509 CRL-----
MIIBpzCBkAIBATANBgkqhkiG9w0BAQsFADAUMRIwEAYDVQQDDAlFWEFNUExFQ0EX
EXAMPLECRLDATAEXAMPLECRLDATAEXAMPLECRLDATAEXAMPLECRLDATAEXAMPLE=
-----END X509 CRL-----
```

Output:

```
{
    "Return": true
}
```

For more information, see Client Certificate Revocation Lists in the *AWS Client VPN Administrator Guide*.

- For API details, see ImportClientVpnClientCertificateRevocationList in *AWS CLI Command Reference*.

`import-image`

The following code example shows how to use `import-image`.

AWS CLI

To import a VM image file as an AMI

The following `import-image` example imports the specified OVA.

```
aws ec2 import-image \
    --disk-containers Format=ova,UserBucket="{S3Bucket=my-import-bucket,S3Key=vms/
my-server-vm.ova}"
```

Output:

```
{
    "ImportTaskId": "import-ami-1234567890abcdef0",
    "Progress": "2",
    "SnapshotDetails": [
        {
            "DiskImageSize": 0.0,
            "Format": "ova",
            "UserBucket": {
                "S3Bucket": "my-import-bucket",
                "S3Key": "vms/my-server-vm.ova"
            }
        }
    ],
    "Status": "active",
    "StatusMessage": "pending"
}
```

For more information, see Import a VM to Amazon EC2 as an image using VM Import/Export in the *VM Import/Export User Guide*.

- For API details, see ImportImage in *AWS CLI Command Reference*.

`import-key-pair`

The following code example shows how to use `import-key-pair`.

AWS CLI

To import a public key

The following `import-key-pair` example imports a public key. First, generate a key pair with the tool of your choice. For example, use the following `ssh-keygen` command.

```
ssh-keygen -t rsa -C "my-key" -f ~/.ssh/my-key
```

The `ssh-keygen` command displays output similar to the following:

```
Generating public/private rsa key pair.
Enter passphrase (empty for no passphrase):
Enter same passphrase again:
Your identification has been saved in /home/ec2-user/.ssh/my-key.
Your public key has been saved in /home/ec2-user/.ssh/my-key.pub.
...
```

The following command imports the specified public key.

```
aws ec2 import-key-pair \
    --key-name "my-key" \
    --public-key-material fileb://~/.ssh/my-key.pub
```

Output:

```
{
    "KeyName": "my-key",
    "KeyFingerprint": "1f:51:ae:28:bf:89:e9:d8:1f:25:5d:37:2d:7d:b8:ca"
}
```

For more information, see Create a key pair for your Amazon EC2 instance in the *Amazon EC2 User Guide*.

- For API details, see ImportKeyPair in *AWS CLI Command Reference*.

`import-snapshot`

The following code example shows how to use `import-snapshot`.

AWS CLI

To import a snapshot

The following `import-snapshot` example imports the specified disk as a snapshot.

```
aws ec2 import-snapshot \
    --description "My server VMDK" \
    --disk-container Format=VMDK,UserBucket={'S3Bucket=my-import-bucket,S3Key=vms/
my-server-vm.vmdk'}
```

Output:

```
{
    "Description": "My server VMDK",
    "ImportTaskId": "import-snap-1234567890abcdef0",
    "SnapshotTaskDetail": {
        "Description": "My server VMDK",
        "DiskImageSize": 0.0,
        "Format": "VMDK",
        "Progress": "3",
        "Status": "active",
        "StatusMessage": "pending",
        "UserBucket": {
            "S3Bucket": "my-import-bucket",
            "S3Key": "vms/my-server-vm.vmdk"
        }
    }
}
```

For more information, see Import a disk as an EBS snapshot using VM Import/Export in the *VM Import/Export User Guide*.

- For API details, see ImportSnapshot in *AWS CLI Command Reference*.

`list-images-in-recycle-bin`

The following code example shows how to use `list-images-in-recycle-bin`.

AWS CLI

To list the images in the Recycle Bin

The following `list-images-in-recycle-bin` example lists all of the images that are currently retained in the Recycle Bin.

```
aws ec2 list-images-in-recycle-bin
```

Output:

```
{
    "Images": [
        {
            "RecycleBinEnterTime": "2022-03-14T15:35:08.000Z",
            "Description": "Monthly AMI One",
            "RecycleBinExitTime": "2022-03-15T15:35:08.000Z",
            "Name": "AMI_01",
            "ImageId": "ami-0111222333444abcd"
        }
    ]
}
```

For more information, see Recover deleted AMIs from the Recycle Bin in the *Amazon EBS User Guide*.

- For API details, see ListImagesInRecycleBin in *AWS CLI Command Reference*.

`list-snapshots-in-recycle-bin`

The following code example shows how to use `list-snapshots-in-recycle-bin`.

AWS CLI

To view snapshots in the Recycle Bin

The following `list-snapshots-in-recycle-bin` example lists information about snapshots in the Recycle Bin, including the snapshot ID, a description of the snapshot, The ID of the volume from which the snapshot was created, the date and time when the snapshot was deleted and it entered the Recycle Bin, and the date and time when the retention period expires.

```
aws ec2 list-snapshots-in-recycle-bin \
    --snapshot-ids snap-01234567890abcdef
```

Output:

```
{
    "Snapshots": [
        {
            "Description": "Monthly data backup snapshot",
```

```
            "RecycleBinEnterTime": "2022-12-01T13:00:00.000Z",
            "RecycleBinExitTime": "2022-12-15T13:00:00.000Z",
            "VolumeId": "vol-abcdef09876543210",
            "SnapshotId": "snap-01234567890abcdef"
        }
    ]
}
```

For more information about Recycle Bin, see Recover deleted snapshots from the Recycle Bin in the *Amazon EBS User Guide*.

- For API details, see ListSnapshotsInRecycleBin in *AWS CLI Command Reference*.

`lock-snapshot`

The following code example shows how to use `lock-snapshot`.

AWS CLI

Example 1: To lock a snapshot in governance mode

The following `lock-snapshot` example locks the specified snapshot in governance mode.

```
aws ec2 lock-snapshot \
    --snapshot-id snap-0b5e733b4a8df6e0d \
    --lock-mode governance \
    --lock-duration 365
```

Output:

```
{
    "SnapshotId": "snap-0b5e733b4a8df6e0d",
    "LockState": "governance",
    "LockDuration": 365,
    "LockCreatedOn": "2024-05-05T00:56:06.208000+00:00",
    "LockExpiresOn": "2025-05-05T00:56:06.208000+00:00",
    "LockDurationStartTime": "2024-05-05T00:56:06.208000+00:00"
}
```

For more information, see Snapshot lock in the *Amazon EBS User Guide*.

Example 2: To lock a snapshot in compliance mode

The following `lock-snapshot` example lock the specified snapshot in compliance mode.

```
aws ec2 lock-snapshot \
    --snapshot-id snap-0163a8524c5b9901f \
    --lock-mode compliance \
    --cool-off-period 24 \
    --lock-duration 365
```

Output:

```
{
    "SnapshotId": "snap-0b5e733b4a8df6e0d",
    "LockState": "compliance-cooloff",
    "LockDuration": 365,
    "CoolOffPeriod": 24,
    "CoolOffPeriodExpiresOn": "2024-05-06T01:02:20.527000+00:00",
    "LockCreatedOn": "2024-05-05T01:02:20.527000+00:00",
    "LockExpiresOn": "2025-05-05T01:02:20.527000+00:00",
    "LockDurationStartTime": "2024-05-05T01:02:20.527000+00:00"
}
```

For more information, see Snapshot lock in the *Amazon EBS User Guide*.

- For API details, see LockSnapshot in *AWS CLI Command Reference*.

`modify-address-attribute`

The following code example shows how to use `modify-address-attribute`.

AWS CLI

To modify the domain name attribute associated with an elastic IP address

The following `modify-address-attribute` examples modify the domain name attribute of an elastic IP address.

Linux command.

```
aws ec2 modify-address-attribute \
    --allocation-id eipalloc-abcdef01234567890 \
    --domain-name example.com
```

Windows command.

```
aws ec2 modify-address-attribute ^
    --allocation-id eipalloc-abcdef01234567890 ^
    --domain-name example.com
```

Output:

```
{
    "Address": {
        "PublicIp": "192.0.2.0",
        "AllocationId": "eipalloc-abcdef01234567890",
        "PtrRecord": "example.net.",
        "PtrRecordUpdate": {
            "Value": "example.com.",
            "Status": "PENDING"
        }
    }
}
```

To monitor the pending change and to view the modified attributes of an elastic IP address, see describe-addresses-attribute in the *AWS CLI Command Reference*.

For more information, see Create a reverse DNS record for email on Amazon EC2 in the *Amazon EC2 User Guide*.

- For API details, see ModifyAddressAttribute in *AWS CLI Command Reference*.

`modify-availability-zone-group`

The following code example shows how to use `modify-availability-zone-group`.

AWS CLI

To enable a zone group

The following `modify-availability-zone-group` example enables the specified zone group.

```
aws ec2 modify-availability-zone-group \
    --group-name us-west-2-lax-1 \
    --opt-in-status opted-in
```

Output:

```
{
    "Return": true
}
```

For more information, see Regions and Zones in the *Amazon EC2 User Guide*.

- For API details, see ModifyAvailabilityZoneGroup in *AWS CLI Command Reference*.

`modify-capacity-reservation-fleet`

The following code example shows how to use `modify-capacity-reservation-fleet`.

AWS CLI

Example 1: To modify the total target capacity of a Capacity Reservation Fleet

The following `modify-capacity-reservation-fleet` example modifies the total target capacity of the specified Capacity Reservation Fleet. When you modify the total target capacity of a Capacity Reservation Fleet, the Fleet automatically creates new Capacity Reservations, or modifies or cancels existing Capacity Reservations in the Fleet to meet the new total target capacity. You can't attempt additional modifications to a Fleet while it is in the `modifying` state.

```
aws ec2 modify-capacity-reservation-fleet \
    --capacity-reservation-fleet-id crf-01234567890abcedf \
    --total-target-capacity 160
```

Output:

```
{
    "Return": true
}
```

Example 2: To modify the end date of a Capacity Reservation Fleet

The following `modify-capacity-reservation-fleet` example modifies the end date of the specified Capacity Reservation Fleet. When you modify the end date for the Fleet, the end dates for all of the individual Capacity Reservations are updated accordingly. You can't attempt additional modifications to a Fleet while it is in the `modifying` state.

```
aws ec2 modify-capacity-reservation-fleet \
    --capacity-reservation-fleet-id crf-01234567890abcedf \
    --end-date 2022-07-04T23:59:59.000Z
```

Output:

```
{
    "Return": true
}
```

For more information about Capacity Reservation Fleets, see Capacity Reservation Fleets in the *Amazon EC2 User Guide*.

- For API details, see ModifyCapacityReservationFleet in *AWS CLI Command Reference*.

`modify-capacity-reservation`

The following code example shows how to use `modify-capacity-reservation`.

AWS CLI

Example 1: To change the number of instances reserved by an existing capacity reservation

The following `modify-capacity-reservation` example changes the number of instances for which the capacity reservation reserves capacity.

```
aws ec2 modify-capacity-reservation \
    --capacity-reservation-id cr-1234abcd56EXAMPLE \
    --instance-count 5
```

Output:

```
{
    "Return": true
}
```

For more information, see Modify a Capacity Reservation in the *Amazon EC2 User Guide*.

Example 2: To change the end date and time for an existing capacity reservation

The following `modify-capacity-reservation` example modifies an existing capacity reservation to end at the specified date and time.

```
aws ec2 modify-capacity-reservation \
    --capacity-reservation-id cr-1234abcd56EXAMPLE \
    --end-date-type limited \
    --end-date 2019-08-31T23:59:59Z
```

Output:

```
{
    "Return": true
}
```

For more information, see Modify a Capacity Reservation in the *Amazon EC2 User Guide*.

- For API details, see ModifyCapacityReservation in *AWS CLI Command Reference*.

`modify-client-vpn-endpoint`

The following code example shows how to use `modify-client-vpn-endpoint`.

AWS CLI

To modify a Client VPN endpoint

The following `modify-client-vpn-endpoint` example enables client connection logging for the specified Client VPN endpoint.

```
aws ec2 modify-client-vpn-endpoint \
    --client-vpn-endpoint-id cvpn-endpoint-123456789012abcde \
    --connection-log-options Enabled=true,CloudwatchLogGroup=ClientVPNLogs
```

Output:

```
{
    "Return": true
}
```

For more information, see Client VPN Endpoints in the *AWS Client VPN Administrator Guide*.

- For API details, see ModifyClientVpnEndpoint in *AWS CLI Command Reference*.

`modify-default-credit-specification`

The following code example shows how to use `modify-default-credit-specification`.

AWS CLI

To modify the default credit option

The following `modify-default-credit-specification` example modifies the default credit option for T2 instances.

```
aws ec2 modify-default-credit-specification \
    --instance-family t2 \
    --cpu-credits unlimited
```

Output:

```
{
    "InstanceFamilyCreditSpecification": {
        "InstanceFamily": "t2",
        "CpuCredits": "unlimited"
    }
}
```

For more information, see Configure burstable performance instances in the *Amazon EC2 User Guide*.

- For API details, see ModifyDefaultCreditSpecification in *AWS CLI Command Reference*.

`modify-ebs-default-kms-key-id`

The following code example shows how to use `modify-ebs-default-kms-key-id`.

AWS CLI

To set your default CMK for EBS encryption

The following `modify-ebs-default-kms-key-id` example sets the specified CMK as the default CMK for EBS encryption for your AWS account in the current Region.

```
aws ec2 modify-ebs-default-kms-key-id \
```

```
    --kms-key-id alias/my-cmk
```

Output:

```
{
    "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111"
}
```

For more information, see Enable Amazon EBS encryption by default in the *Amazon EBS User Guide*.

- For API details, see ModifyEbsDefaultKmsKeyId in *AWS CLI Command Reference*.

`modify-fleet`

The following code example shows how to use `modify-fleet`.

AWS CLI

To scale an EC2 Fleet

The following `modify-fleet` example modifies the target capacity of the specified EC2 Fleet. If the specified value is greater than the current capacity, the EC2 Fleet launches additional instances. If the specified value is less than the current capacity, the EC2 Fleet cancels any open requests and if the termination policy is `terminate`, the EC2 fleet terminates any instances that exceed the new target capacity.

```
aws ec2 modify-fleet \
    --fleet-id fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \
    --target-capacity-specification TotalTargetCapacity=5
```

Output:

```
{
    "Return": true
}
```

For more information, see Manage an EC2 Fleet in the *Amazon EC2 User Guide*.

- For API details, see ModifyFleet in *AWS CLI Command Reference*.

`modify-fpga-image-attribute`

The following code example shows how to use `modify-fpga-image-attribute`.

AWS CLI

To modify the attributes of an Amazon FPGA image

The following `modify-fpga-image-attribute` example adds load permissions for account ID 123456789012 for the specified AFI.

```
aws ec2 modify-fpga-image-attribute \
    --attribute loadPermission \
    --fpga-image-id afi-0d123e123bfc85abc \
    --load-permission Add=[{UserId=123456789012}]
```

Output:

```
{
    "FpgaImageAttribute": {
        "FpgaImageId": "afi-0d123e123bfc85abc",
        "LoadPermissions": [
            {
                "UserId": "123456789012"
            }
        ]
    }
}
```

For more information, see Specifications for Amazon EC2 accelerated computing instances in the *Amazon EC2 Instance Types Guide*.

- For API details, see ModifyFpgaImageAttribute in *AWS CLI Command Reference*.

`modify-hosts`

The following code example shows how to use `modify-hosts`.

AWS CLI

Example 1: To enable auto-placement for a Dedicated Host

The following `modify-hosts` example enables auto-placement for a Dedicated Host so that it accepts any untargeted instance launches that match its instance type configuration.

```
aws ec2 modify-hosts \
    --host-ids h-06c2f189b4EXAMPLE \
    --auto-placement on
```

Output:

```
{
    "Successful": [
        "h-06c2f189b4EXAMPLE"
    ],
    "Unsuccessful": []
}
```

For more information, see Modify the auto-placement setting for a Dedicated Host in the *Amazon EC2 User Guide*.

Example 2: To enable host recovery for a Dedicated Host

The following `modify-hosts` example enables host recovery for the specified Dedicated Host.

```
aws ec2 modify-hosts \
    --host-ids h-06c2f189b4EXAMPLE \
    --host-recovery on
```

Output:

```
{
    "Successful": [
        "h-06c2f189b4EXAMPLE"
    ],
    "Unsuccessful": []
}
```

For more information, see Modify the auto-placement setting for a Dedicated Host in the *Amazon EC2 User Guide*.

- For API details, see ModifyHosts in *AWS CLI Command Reference*.

`modify-id-format`

The following code example shows how to use `modify-id-format`.

AWS CLI

Example 1: To enable the longer ID format for a resource

The following `modify-id-format` example enables the longer ID format for the `instance` resource type.

```
aws ec2 modify-id-format \
    --resource instance \
    --use-long-ids
```

This command produces no output.

For more information, see Manage your Amazon EC2 resources in the *Amazon EC2 User Guide*.

Example 2: To disable the longer ID format for a resource

The following `modify-id-format` example disables the longer ID format for the `instance` resource type.

```
aws ec2 modify-id-format \
    --resource instance \
    --no-use-long-ids
```

This command produces no output.

The following `modify-id-format` example enables the longer ID format for all supported resource types that are within their opt-in period.

```
aws ec2 modify-id-format \
    --resource all-current \
    --use-long-ids
```

This command produces no output.

For more information, see Manage your Amazon EC2 resources in the *Amazon EC2 User Guide*.

- For API details, see ModifyIdFormat in *AWS CLI Command Reference*.

`modify-identity-id-format`

The following code example shows how to use `modify-identity-id-format`.

AWS CLI

Example 1: To enable an IAM role to use longer IDs for a resource

The following `modify-identity-id-format` example enables the IAM role `EC2Role` in your AWS account to use long ID format for the `instance` resource type.

```
aws ec2 modify-identity-id-format \
    --principal-arn arn:aws:iam::123456789012:role/EC2Role \
    --resource instance \
    --use-long-ids
```

This command produces no output.

For more information, see Manage your Amazon EC2 resources in the *Amazon EC2 User Guide*.

Example 2: To enable an IAM user to use longer IDs for a resource

The following `modify-identity-id-format` example enables the IAM user `AdminUser` in your AWS account to use the longer ID format for the `volume` resource type.

```
aws ec2 modify-identity-id-format \
    --principal-arn arn:aws:iam::123456789012:user/AdminUser \
    --resource volume \
    --use-long-ids
```

This command produces no output.

The following `modify-identity-id-format` example enables the IAM user `AdminUser` in your AWS account to use the longer ID format for all supported resource types that are within their opt-in period.

```
aws ec2 modify-identity-id-format \
    --principal-arn arn:aws:iam::123456789012:user/AdminUser \
    --resource all-current \
```

```
    --use-long-ids
```

This command produces no output.

For more information, see Manage your Amazon EC2 resources in the *Amazon EC2 User Guide*.

- For API details, see ModifyIdentityIdFormat in *AWS CLI Command Reference*.

`modify-image-attribute`

The following code example shows how to use `modify-image-attribute`.

AWS CLI

Example 1: To make an AMI public

The following `modify-image-attribute` example makes the specified AMI public.

```
aws ec2 modify-image-attribute \
    --image-id ami-5731123e \
    --launch-permission "Add=[{Group=all}]"
```

This command produces no output.

For more information, see Make your AMI publicly available for use in Amazon EC2 in the *Amazon EC2 User Guide*.

Example 2: To make an AMI private

The following `modify-image-attribute` example makes the specified AMI private.

```
aws ec2 modify-image-attribute \
    --image-id ami-5731123e \
    --launch-permission "Remove=[{Group=all}]"
```

This command produces no output.

For more information, see Make your AMI publicly available for use in Amazon EC2 in the *Amazon EC2 User Guide*.

Example 3: To grant launch permission to an AWS account

The following `modify-image-attribute` example grants launch permissions to the specified AWS account.

```
aws ec2 modify-image-attribute \
    --image-id ami-5731123e \
    --launch-permission "Add=[{UserId=123456789012}]"
```

This command produces no output.

For more information, see Share an AMI with specific AWS accounts in the *Amazon EC2 User Guide*.

Example 4: To remove launch permission from an AWS account

The following `modify-image-attribute` example removes launch permissions from the specified AWS account.

```
aws ec2 modify-image-attribute \
    --image-id ami-5731123e \
    --launch-permission "Remove=[{UserId=123456789012}]"
```

This command produces no output.

For more information, see Share an AMI with specific AWS accounts in the *Amazon EC2 User Guide*.

- For API details, see ModifyImageAttribute in *AWS CLI Command Reference*.

`modify-instance-attribute`

The following code example shows how to use `modify-instance-attribute`.

AWS CLI

Example 1: To modify the instance type

The following `modify-instance-attribute` example modifies the instance type of the specified instance. The instance must be in the `stopped` state.

```
aws ec2 modify-instance-attribute \
    --instance-id i-1234567890abcdef0 \
    --instance-type "{\"Value\": \"m1.small\"}"
```

This command produces no output.

Example 2: To enable enhanced networking on an instance

The following `modify-instance-attribute` example enables enhanced networking for the specified instance. The instance must be in the `stopped` state.

```
aws ec2 modify-instance-attribute \
    --instance-id i-1234567890abcdef0 \
    --sriov-net-support simple
```

This command produces no output.

Example 3: To modify the sourceDestCheck attribute

The following `modify-instance-attribute` example sets the `sourceDestCheck` attribute of the specified instance to `true`. The instance must be in a VPC.

```
aws ec2 modify-instance-attribute \
    --instance-id i-1234567890abcdef0 \
    --source-dest-check "{\"Value\": true}"
```

This command produces no output.

Example 4: To modify the deleteOnTermination attribute of the root volume

The following `modify-instance-attribute` example sets the `deleteOnTermination` attribute for the root volume of the specified Amazon EBS-backed instance to `false`. By default, this attribute is `true` for the root volume.

```
aws ec2 modify-instance-attribute \
    --instance-id i-1234567890abcdef0 \
    --block-device-mappings "[{\"DeviceName\": \"/dev/sda1\",\"Ebs\":
{\"DeleteOnTermination\":false}}]"
```

This command produces no output.

Example 5: To modify the user data attached to an instance

The following `modify-instance-attribute` example adds the contents of the file `UserData.txt` as the UserData for the specified instance.

Contents of `UserData.txt`:

```
#!/bin/bash
yum update -y
service httpd start
chkconfig httpd on
```

The contents of the file must be base64 encoded. The first command converts the text file to base64 and saves it as a new file.

Linux/macOS version of the command:

```
base64 UserData.txt > UserData.base64.txt
```

Windows version of the command:

```
certutil -encode UserData.txt tmp.b64 && findstr /v /c:- tmp.b64 >
 UserData.base64.txt
```

The `certutil` command displays output similar to the following:

```
Input Length = 67
Output Length = 152
CertUtil: -encode command completed successfully.
```

Contents of `UserData.base64.txt`:

```
IyEvYmluL2Jhc2gKeXVtIHVwZGF0ZSAteQpzZXJ2aWNlIGh0dHBkIHN0YXJ0CmNoa2NvbmZpZyBodHRwZCBvbgo=
```

Now you can reference that file in the following CLI command.

```
aws ec2 modify-instance-attribute \
    --instance-id=i-09b5a14dbca622e76 \
    --attribute userData \
    --value file://UserData.base64.txt
```

This command produces no output.

For more information, see User Data and the AWS CLI in the *EC2 User Guide*.

- For API details, see ModifyInstanceAttribute in *AWS CLI Command Reference*.

`modify-instance-capacity-reservation-attributes`

The following code example shows how to use `modify-instance-capacity-reservation-attributes`.

AWS CLI

Example 1: To modify an instance's capacity reservation targeting settings

The following `modify-instance-capacity-reservation-attributes` example modifies a stopped instance to target a specific capacity reservation.

```
aws ec2 modify-instance-capacity-reservation-attributes \
    --instance-id i-EXAMPLE8765abcd4e \
    --capacity-reservation-specification
 'CapacityReservationTarget={CapacityReservationId= cr-1234abcd56EXAMPLE }'
```

Output:

```
{
    "Return": true
}
```

For more information, see Modify the Capacity Reservation settings of your instance in the *Amazon EC2 User Guide*.

Example 2: To modify an instance's capacity reservation targeting settings

The following `modify-instance-capacity-reservation-attributes` example modifies a stopped instance that targets the specified capacity reservation to launch in any capacity reservation that has matching attributes (instance type, platform, Availability Zone) and that has open instance matching criteria.

```
aws ec2 modify-instance-capacity-reservation-attributes \
    --instance-id i-EXAMPLE8765abcd4e \
    --capacity-reservation-specification 'CapacityReservationPreference=open'
```

Output:

```
{
    "Return": true
}
```

For more information, see Modify the Capacity Reservation settings of your instance in the *Amazon EC2 User Guide*.

- For API details, see ModifyInstanceCapacityReservationAttributes in *AWS CLI Command Reference*.

`modify-instance-credit-specification`

The following code example shows how to use `modify-instance-credit-specification`.

AWS CLI

To modify the credit option for CPU usage of an instance

The following `modify-instance-credit-specification` example modifies the credit option for CPU usage of the specified instance in the specified region to "unlimited". Valid credit options are "standard" and "unlimited".

```
aws ec2 modify-instance-credit-specification \
    --instance-credit-
specifications "InstanceId=i-1234567890abcdef0,CpuCredits=unlimited"
```

Output:

```
{
    "SuccessfulInstanceCreditSpecifications": [
        {
            "InstanceId": "i-1234567890abcdef0"
        }
    ],
    "UnsuccessfulInstanceCreditSpecifications": []
}
```

For more information, see Configure burstable performance instances in the *Amazon EC2 User Guide*.

- For API details, see ModifyInstanceCreditSpecification in *AWS CLI Command Reference*.

`modify-instance-event-start-time`

The following code example shows how to use `modify-instance-event-start-time`.

AWS CLI

To modify the event start time for an instance

The following `modify-instance-event-start-time` example modifies the event start time for the specified instance. Specify the event ID by using the `--instance-event-id` parameter. Specify the new date and time by using the `--not-before` parameter.

```
aws ec2 modify-instance-event-start-time \
    --instance-id i-1234567890abcdef0 \
    --instance-event-id instance-event-0abcdef1234567890 \
    --not-before 2019-03-25T10:00:00.000
```

Output:

```
{
    "Event": {
        "InstanceEventId": "instance-event-0abcdef1234567890",
        "Code": "system-reboot",
        "Description": "scheduled reboot",
        "NotAfter": "2019-03-25T12:00:00.000Z",
        "NotBefore": "2019-03-25T10:00:00.000Z",
        "NotBeforeDeadline": "2019-04-22T21:00:00.000Z"
    }
}
```

For more information, see Reschedule a scheduled event for an EC2 instance in the *Amazon EC2 User Guide*.

- For API details, see ModifyInstanceEventStartTime in *AWS CLI Command Reference*.

`modify-instance-event-window`

The following code example shows how to use `modify-instance-event-window`.

AWS CLI

Example 1: To modify the time range of an event window

The following `modify-instance-event-window` example modifies the time range of an event window. Specify the `time-range` parameter to modify the time range. You can't also specify the `cron-expression` parameter.

```
aws ec2 modify-instance-event-window \
    --instance-event-window-id iew-0abcdef1234567890 \
    --time-ranges StartWeekDay=monday,StartHour=2,EndWeekDay=wednesday,EndHour=8
```

Output:

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "TimeRanges": [
            {
                "StartWeekDay": "monday",
                "StartHour": 2,
                "EndWeekDay": "wednesday",
                "EndHour": 8
            }
        ],
        "Name": "myEventWindowName",
        "AssociationTarget": {
            "InstanceIds": [
                "i-0abcdef1234567890",
                "i-0be35f9acb8ba01f0"
            ],
            "Tags": [],
            "DedicatedHostIds": []
        },
        "State": "creating",
        "Tags": [
            {
                "Key": "K1",
                "Value": "V1"
            }
        ]
    }
}
```

For more information about event window constraints, see Create custom event windows for scheduled events that affect your Amazon EC2 instances in the *Amazon EC2 User Guide*.

Example 2: To modify a set of time ranges for an event window

The following `modify-instance-event-window` example modifies the time range of an event window. Specify the `time-range` parameter to modify the time range. You can't also specify the `cron-expression` parameter.

```
aws ec2 modify-instance-event-window \
    --instance-event-window-id iew-0abcdef1234567890 \
    --time-ranges '[{"StartWeekDay": "monday", "StartHour": 2, "EndWeekDay":
 "wednesday", "EndHour": 8},
        {"StartWeekDay": "thursday", "StartHour": 2, "EndWeekDay": "friday",
 "EndHour": 8}]'
```

Output:

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "TimeRanges": [
            {
                "StartWeekDay": "monday",
                "StartHour": 2,
                "EndWeekDay": "wednesday",
                "EndHour": 8
            },
            {
                "StartWeekDay": "thursday",
                "StartHour": 2,
                "EndWeekDay": "friday",
                "EndHour": 8
            }
        ],
        "Name": "myEventWindowName",
        "AssociationTarget": {
            "InstanceIds": [
                "i-0abcdef1234567890",
                "i-0be35f9acb8ba01f0"
            ],
            "Tags": [],
            "DedicatedHostIds": []
        },
        "State": "creating",
        "Tags": [
```

```
            {
                "Key": "K1",
                "Value": "V1"
            }
        ]
    }
}
```

For more information about event window constraints, see Create custom event windows for scheduled events that affect your Amazon EC2 instances in the *Amazon EC2 User Guide*.

Example 3: To modify the cron expression of an event window

The following `modify-instance-event-window` example modifies the cron expression of an event window. Specify the `cron-expression` parameter to modify the cron expression. You can't also specify the `time-range` parameter.

```
aws ec2 modify-instance-event-window \
    --instance-event-window-id iew-0abcdef1234567890 \
    --cron-expression "* 21-23 * * 2,3"
```

Output:

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [
                "i-0abcdef1234567890",
                "i-0be35f9acb8ba01f0"
            ],
            "Tags": [],
            "DedicatedHostIds": []
        },
        "State": "creating",
        "Tags": [
            {
                "Key": "K1",
                "Value": "V1"
            }
```

```
        ]
    }
}
```

For more information about event window constraints, see Create custom event windows for scheduled events that affect your Amazon EC2 instances in the *Amazon EC2 User Guide*.

- For API details, see ModifyInstanceEventWindow in *AWS CLI Command Reference*.

`modify-instance-maintenance-options`

The following code example shows how to use `modify-instance-maintenance-options`.

AWS CLI

Example 1: To disable the recovery behavior of an instance

The following `modify-instance-maintenance-options` example disables simplified automatic recovery for a running or stopped instance.

```
aws ec2 modify-instance-maintenance-options \
    --instance-id i-0abcdef1234567890 \
    --auto-recovery disabled
```

Output:

```
{
    "InstanceId": "i-0abcdef1234567890",
    "AutoRecovery": "disabled"
}
```

For more information, see Configure simplified automatic recovery in the *Amazon EC2 User Guide*.

Example 2: To set the recovery behavior of an instance to default

The following `modify-instance-maintenance-options` example sets the automatic recovery behavior to default which enables simplified automatic recovery for supported instance types.

```
aws ec2 modify-instance-maintenance-options \
    --instance-id i-0abcdef1234567890 \
```

```
    --auto-recovery default
```

Output:

```
{
    "InstanceId": "i-0abcdef1234567890",
    "AutoRecovery": "default"
}
```

For more information, see Configure simplified automatic recovery in the *Amazon EC2 User Guide*.

- For API details, see ModifyInstanceMaintenanceOptions in *AWS CLI Command Reference*.

`modify-instance-metadata-options`

The following code example shows how to use `modify-instance-metadata-options`.

AWS CLI

Example 1: To enable IMDSv2

The following `modify-instance-metadata-options` example configures the use of IMDSv2 on the specified instance.

```
aws ec2 modify-instance-metadata-options \
    --instance-id i-1234567898abcdef0 \
    --http-tokens required \
    --http-endpoint enabled
```

Output:

```
{
    "InstanceId": "i-1234567898abcdef0",
    "InstanceMetadataOptions": {
        "State": "pending",
        "HttpTokens": "required",
        "HttpPutResponseHopLimit": 1,
        "HttpEndpoint": "enabled"
    }
}
```

For more information, see Instance metadata in the *Amazon EC2 User Guide*.

Example 2: To disable instance metadata

The following `modify-instance-metadata-options` example disables the use of all versions of instance metadata on the specified instance.

```
aws ec2 modify-instance-metadata-options \
    --instance-id i-1234567898abcdef0 \
    --http-endpoint disabled
```

Output:

```
{
    "InstanceId": "i-1234567898abcdef0",
    "InstanceMetadataOptions": {
        "State": "pending",
        "HttpTokens": "required",
        "HttpPutResponseHopLimit": 1,
        "HttpEndpoint": "disabled"
    }
}
```

For more information, see Instance metadata in the *Amazon EC2 User Guide*.

Example 3: To enable instance metadata IPv6 endpoint for your instance

The following `modify-instance-metadata-options` example turns on the IPv6 endpoint for the instance metadata service. By default, the IPv6 endpoint is disabled. This is true even if you have launched an instance into an IPv6-only subnet. The IPv6 endpoint for IMDS is only accessible on instances built on the Nitro System.

```
aws ec2 modify-instance-metadata-options \
    --instance-id i-1234567898abcdef0 \
    --http-protocol-ipv6 enabled \
    --http-endpoint enabled
```

Output:

```
{
    "InstanceId": "i-1234567898abcdef0",
    "InstanceMetadataOptions": {
```

```
        "State": "pending",
        "HttpTokens": "required",
        "HttpPutResponseHopLimit": 1,
        "HttpEndpoint": "enabled",
        "HttpProtocolIpv6": "enabled"
    }
}
```

For more information, see Instance metadata in the *Amazon EC2 User Guide*.

- For API details, see ModifyInstanceMetadataOptions in *AWS CLI Command Reference*.

`modify-instance-placement`

The following code example shows how to use `modify-instance-placement`.

AWS CLI

Example 1: To remove an instance's affinity with a Dedicated Host

The following `modify-instance-placement` example removes an instance's affinity with a Dedicated Host and enables it to launch on any available Dedicated Host in your account that supports its instance type.

```
aws ec2 modify-instance-placement \
    --instance-id i-0e6ddf6187EXAMPLE \
    --affinity default
```

Output:

```
{
    "Return": true
}
```

Example 2: To establish affinity between an instance and the specified Dedicated Host

The following `modify-instance-placement` example establishes a launch relationship between an instance and a Dedicated Host. The instance is only able to run on the specified Dedicated Host.

```
aws ec2 modify-instance-placement \
    --instance-id i-0e6ddf6187EXAMPLE \
```

```
    --affinity host \
    --host-id i-0e6ddf6187EXAMPLE
```

Output:

```
{
    "Return": true
}
```

Example 3: To move an instance to a placement group

The following `modify-instance-placement` example moves an instance to a placement group by stopping the instance, modifying the instance placement, and then restarting the instance.

Stop the instance.

```
aws ec2 stop-instances \
    --instance-ids i-1234567890abcdef0
```

Modify the placement.

```
aws ec2 modify-instance-placement \
    --instance-id i-1234567890abcdef0 \
    --group-name MySpreadGroup
```

Output:

```
{
    "Return": true
}
```

Restart the instance.

```
aws ec2 start-instances \
    --instance-ids i-1234567890abcdef0
```

Example 4: To remove an instance from a placement group

The following `modify-instance-placement` example removes an instance from a placement group by stopping the instance, modifying the instance placement, and then restarting the

instance. The following example specifies an empty string ("") for the placement group name to indicate that the instance is not to be located in a placement group.

Stop the instance.

```
aws ec2 stop-instances \
    --instance-ids i-1234567890abcdef0
```

Modify the placement (Windows Command Prompt).

```
aws ec2 modify-instance-placement \
    --instance-id i-1234567890abcdef0 \
    --group-name ""
```

Modify the placement (Windows PowerShell, Linux, and macOS).

```
aws ec2 modify-instance-placement `
    --instance-id i-1234567890abcdef0 `
    --group-name ''
```

Output:

```
{
    "Return": true
}
```

Restart the instance.

```
aws ec2 start-instances \
    --instance-ids i-1234567890abcdef0
```

For more information, see Modify Dedicated Host tenancy and affinity in the *Amazon EC2 User Guide*.

- For API details, see ModifyInstancePlacement in *AWS CLI Command Reference*.

`modify-ipam-pool-allocation`

The following code example shows how to use `modify-ipam-pool-allocation`.

AWS CLI

To modify an IPAM pool allocation

The following `modify-ipam-pool-allocation` example modifies the description of an IPAM pool allocation.

For Linux, use the following command.

```
aws ec2 modify-ipam-pool-allocation \
    --ipam-pool-allocation-id ipam-pool-alloc-018ecc28043b54ba38e2cd99943cebfbd \
    --description "Engineering team  us-west-2 allocation"
```

For Windows, use the following command.

```
aws ec2 modify-ipam-pool-allocation ^
    --ipam-pool-allocation-id ipam-pool-alloc-018ecc28043b54ba38e2cd99943cebfbd ^
    --description "Engineering team  us-west-2 allocation"
```

Output:

```
{
    "IpamPoolAllocation": {
        "Cidr": "10.0.0.0/24",
        "IpamPoolAllocationId": "ipam-pool-alloc-018ecc28043b54ba38e2cd99943cebfbd",
        "Description": "Engineering team  us-west-2 allocation",
        "ResourceType": "custom",
        "ResourceOwner": "123456789012"
    }
}
```

For more information, see Modify an IPAM pool allocation in the *Amazon VPC IPAM User Guide*.

- For API details, see ModifyIpamPoolAllocation in *AWS CLI Command Reference*.

`modify-ipam-pool`

The following code example shows how to use `modify-ipam-pool`.

AWS CLI

To modify an IPAM pool

The following `modify-ipam-pool` example modifies an IPAM pool.

For Linux, use the following command.

```
aws ec2 modify-ipam-pool \
    --ipam-pool-id ipam-pool-0533048da7d823723 \
    --add-allocation-resource-tags "Key=Owner,Value=Build Team" \
    --clear-allocation-default-netmask-length \
    --allocation-min-netmask-length 14
```

For Windows, use the following command.

```
aws ec2 modify-ipam-pool ^
    --ipam-pool-id ipam-pool-0533048da7d823723 ^
    --add-allocation-resource-tags "Key=Owner,Value=Build Team" ^
    --clear-allocation-default-netmask-length ^
    --allocation-min-netmask-length 14
```

Output:

```
{
    "IpamPool": {
        "OwnerId": "123456789012",
        "IpamPoolId": "ipam-pool-0533048da7d823723",
        "IpamPoolArn": "arn:aws:ec2::123456789012:ipam-pool/ipam-
pool-0533048da7d823723",
        "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-
scope-02fc38cd4c48e7d38",
        "IpamScopeType": "private",
        "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
        "IpamRegion": "us-west-2",
        "Locale": "None",
        "PoolDepth": 1,
        "State": "modify-complete",
        "AutoImport": true,
        "AddressFamily": "ipv4",
        "AllocationMinNetmaskLength": 14,
        "AllocationMaxNetmaskLength": 26,
        "AllocationResourceTags": [
            {
                "Key": "Environment",
                "Value": "Preprod"
            },
```

```
            {
                "Key": "Owner",
                "Value": "Build Team"
            }
        ]
    }
}
```

For more information, see Edit a pool in the *Amazon VPC IPAM User Guide*.

- For API details, see ModifyIpamPool in *AWS CLI Command Reference*.

`modify-ipam-resource-cidr`

The following code example shows how to use `modify-ipam-resource-cidr`.

AWS CLI

To modify the CIDR allocated to a resource

The following `modify-ipam-resource-cidr` example modifies a resource CIDR.

For Linux, use the following command.

```
aws ec2 modify-ipam-resource-cidr \
    --current-ipam-scope-id ipam-scope-02fc38cd4c48e7d38 \
    --destination-ipam-scope-id ipam-scope-0da34c61fd189a141 \
    --resource-id vpc-010e1791024eb0af9 \
    --resource-cidr 10.0.1.0/24 \
    --resource-region us-west-2 \
    --monitored
```

For Windows, use the following command.

```
aws ec2 modify-ipam-resource-cidr ^
    --current-ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^
    --destination-ipam-scope-id ipam-scope-0da34c61fd189a141 ^
    --resource-id vpc-010e1791024eb0af9 ^
    --resource-cidr 10.0.1.0/24 ^
    --resource-region us-west-2 ^
    --monitored
```

Output:

```
{
    "IpamResourceCidr": {
        "IpamId": "ipam-08440e7a3acde3908",
        "IpamScopeId": "ipam-scope-0da34c61fd189a141",
        "IpamPoolId": "ipam-pool-0533048da7d823723",
        "ResourceRegion": "us-west-2",
        "ResourceOwnerId": "123456789012",
        "ResourceId": "vpc-010e1791024eb0af9",
        "ResourceCidr": "10.0.1.0/24",
        "ResourceType": "vpc",
        "ResourceTags": [
            {
                "Key": "Environment",
                "Value": "Preprod"
            },
            {
                "Key": "Owner",
                "Value": "Build Team"
            }
        ],
        "IpUsage": 0.0,
        "ComplianceStatus": "noncompliant",
        "ManagementState": "managed",
        "OverlapStatus": "overlapping",
        "VpcId": "vpc-010e1791024eb0af9"
    }
}
```

For more information on moving resources, see Move resource CIDRs between scopes in the *Amazon VPC IPAM User Guide*.

For more information on changing monitoring states, see Change the monitoring state of resource CIDRs in the *Amazon VPC IPAM User Guide*.

- For API details, see ModifyIpamResourceCidr in *AWS CLI Command Reference*.

`modify-ipam-resource-discovery`

The following code example shows how to use `modify-ipam-resource-discovery`.

AWS CLI

To modify the operating regions of a resource discovery

The following `modify-ipam-resource-discovery` example modifies the operating regions of a non-default resource discovery in your AWS account. In this example, you're an IPAM delegated admin.

To complete this request:

You cannot modify a default resource discovery and you must be the owner of the resource discovery.You need the resource discovery ID, which you can get with [describe-ipam-resource-discoveries].

The command adds the `us-west-1` operating Region and removes the `us-east-2` operating Region.

```
aws ec2 modify-ipam-resource-discovery \
    --ipam-resource-discovery-id ipam-res-disco-0f4ef577a9f37a162 \
    --add-operating-regions RegionName='us-west-1' \
    --remove-operating-regions RegionName='us-east-2'
```

Output:

```
{
    "IpamResourceDiscovery": {
        "OwnerId": "123456789012",
        "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",
        "IpamResourceDiscoveryArn": "arn:aws:ec2::123456789012:ipam-resource-
discovery/ipam-res-disco-0365d2977fc1672fe",
        "IpamResourceDiscoveryRegion": "us-east-1",
        "Description": "Example",
        "OperatingRegions": [
            {
                "RegionName": "us-east-1"
            },
            {
                "RegionName": "us-west-1"
            }
        ],
        "IsDefault": false,
        "State": "modify-in-progress"
    }
}
```

For more information, see [Work with resource discoveries] in the *Amazon VPC IPAM User Guide*.

- For API details, see ModifyIpamResourceDiscovery in *AWS CLI Command Reference*.

`modify-ipam-scope`

The following code example shows how to use `modify-ipam-scope`.

AWS CLI

To modify the description of a scope

The following `modify-ipam-scope` example updates the description of an IPAM scope. In this scenario, you're an IPAM delegated admin.

To complete this request, you'll need the scope ID, which you can get with describe-ipam-scopes.

```
aws ec2 modify-ipam-scope \
    --ipam-scope-id ipam-scope-0d3539a30b57dcdd1 \
    --description example
```

Output:

```
{
    "IpamScope": {
        "OwnerId": "123456789012",
        "IpamScopeId": "ipam-scope-0d3539a30b57dcdd1",
        "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-
scope-0d3539a30b57dcdd1",
        "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-005f921c17ebd5107",
        "IpamRegion": "us-west-2",
        "IpamScopeType": "public",
        "IsDefault": true,
        "Description": "example",
        "PoolCount": 1,
        "State": "modify-in-progress"
    }
}
```

For more information about scopes, see How IPAM works in the *Amazon VPC IPAM User Guide*.

- For API details, see ModifyIpamScope in *AWS CLI Command Reference*.

modify-ipam

The following code example shows how to use `modify-ipam`.

AWS CLI

To modify an IPAM

The following `modify-ipam` example modifies an IPAM by adding an Operating Region.

For Linux, use the following command.

```
aws ec2 modify-ipam \
    --ipam-id ipam-08440e7a3acde3908 \
    --add-operating-regions RegionName=us-west-2
```

For Windows, use the following command.

```
aws ec2 modify-ipam ^
    --ipam-id ipam-08440e7a3acde3908 ^
    --add-operating-regions RegionName=us-west-2
```

Output:

```
{
    "Ipam": {
        "OwnerId": "123456789012",
        "IpamId": "ipam-08440e7a3acde3908",
        "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
        "IpamRegion": "us-east-1",
        "PublicDefaultScopeId": "ipam-scope-0b9eed026396dbc16",
        "PrivateDefaultScopeId": "ipam-scope-02fc38cd4c48e7d38",
        "ScopeCount": 3,
        "OperatingRegions": [
            {
                "RegionName": "us-east-1"
            },
            {
                "RegionName": "us-east-2"
            },
            {
                "RegionName": "us-west-1"
            },
```

```
            {
                "RegionName": "us-west-2"
            }
        ],
        "State": "modify-in-progress"
    }
}
```

For more information, see Modify IPAM operating Regions in the *Amazon VPC IPAM User Guide*.

- For API details, see ModifyIpam in *AWS CLI Command Reference*.

`modify-launch-template`

The following code example shows how to use `modify-launch-template`.

AWS CLI

To change the default launch template version

The following `modify-launch-template` example specifies version 2 of the specified launch template as the default version.

```
aws ec2 modify-launch-template \
    --launch-template-id lt-0abcd2907511931ef \
    --default-version 2
```

Output:

```
{
    "LaunchTemplate": {
        "LatestVersionNumber": 2,
        "LaunchTemplateId": "lt-0abcd2907511931ef",
        "LaunchTemplateName": "WebServers",
        "DefaultVersionNumber": 2,
        "CreatedBy": "arn:aws:iam::123456789012:root",
        "CreateTime": "2017-12-01T13:35:46.000Z"
    }
}
```

For more information, see Modify a launch template (manage launch template versions) in the *Amazon EC2 User Guide*.

- For API details, see ModifyLaunchTemplate in *AWS CLI Command Reference*.

`modify-managed-prefix-list`

The following code example shows how to use `modify-managed-prefix-list`.

AWS CLI

To modify a prefix list

The following `modify-managed-prefix-list` example adds an entry to the specified prefix list.

```
aws ec2 modify-managed-prefix-list \
    --prefix-list-id pl-0123456abcabcabc1 \
    --add-entries Cidr=10.1.0.0/16,Description=vpc-c \
    --current-version 1
```

Output:

```
{
    "PrefixList": {
        "PrefixListId": "pl-0123456abcabcabc1",
        "AddressFamily": "IPv4",
        "State": "modify-in-progress",
        "PrefixListArn": "arn:aws:ec2:us-west-2:123456789012:prefix-list/
pl-0123456abcabcabc1",
        "PrefixListName": "vpc-cidrs",
        "MaxEntries": 10,
        "Version": 1,
        "OwnerId": "123456789012"
    }
}
```

For more information, see Managed prefix lists in the *Amazon VPC User Guide*.

- For API details, see ModifyManagedPrefixList in *AWS CLI Command Reference*.

`modify-network-interface-attribute`

The following code example shows how to use `modify-network-interface-attribute`.

AWS CLI

Example 1: To modify the attachment attribute of a network interface

The following `modify-network-interface-attribute` example modifies the `attachment` attribute of the specified network interface.

```
aws ec2 modify-network-interface-attribute \
    --network-interface-id eni-686ea200 \
    --attachment AttachmentId=eni-attach-43348162,DeleteOnTermination=false
```

This command produces no output.

Example 2: To modify the description attribute of a network interface

The following `modify-network-interface-attribute` example modifies the `description` attribute of the specified network interface.

```
aws ec2 modify-network-interface-attribute \
    --network-interface-id eni-686ea200 \
    --description "My description"
```

This command produces no output.

Example 3: To modify the groupSet attribute of a network interface

The following `modify-network-interface-attribute` example modifies the `groupSet` attribute of the specified network interface.

```
aws ec2 modify-network-interface-attribute \
    --network-interface-id eni-686ea200 \
    --groups sg-903004f8 sg-1a2b3c4d
```

This command produces no output.

Example 4: To modify the sourceDestCheck attribute of a network interface

The following `modify-network-interface-attribute` example modifies the `sourceDestCheck` attribute of the specified network interface.

```
aws ec2 modify-network-interface-attribute \
```

```
    --network-interface-id eni-686ea200 \
    --no-source-dest-check
```

This command produces no output.

For more information, see Modify network interface attributes in the *Amazon EC2 User Guide*.

- For API details, see ModifyNetworkInterfaceAttribute in *AWS CLI Command Reference*.

`modify-private-dns-name-options`

The following code example shows how to use `modify-private-dns-name-options`.

AWS CLI

To modify the options for instance hostnames

The following `modify-private-dns-name-options` example disables the option to respond to DNS queries for instance hostnames with DNS A records.

```
aws ec2 modify-private-dns-name-options \
    --instance-id i-1234567890abcdef0 \
    --no-enable-resource-name-dns-a-record
```

Output:

```
{
    "Return": true
}
```

For more information, see Amazon EC2 instance hostname types in the *Amazon EC2 User Guide*.

- For API details, see ModifyPrivateDnsNameOptions in *AWS CLI Command Reference*.

`modify-reserved-instances`

The following code example shows how to use `modify-reserved-instances`.

AWS CLI

Example 1: To modify Reserved Instances

The following `modify-reserved-instances` example moves a Reserved Instance to another Availability Zone in the same region.

```
aws ec2 modify-reserved-instances \
    --reserved-instances-ids a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --target-configurations AvailabilityZone=us-west-2c,Platform=EC2-
Classic,InstanceCount=10
```

Output:

```
{
    "ReservedInstancesModificationId": "rimod-d3ed4335-b1d3-4de6-ab31-0f13aaf46687"
}
```

For more information, see Modify Reserved Instances in the *Amazon EC2 User Guide*.

Example 2: To modify the network platform of Reserved Instances

The following `modify-reserved-instances` example converts EC2-Classic Reserved Instances to EC2-VPC.

```
aws ec2 modify-reserved-instances \
    --reserved-instances-ids a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
    --target-configurations AvailabilityZone=us-west-2c,Platform=EC2-
VPC,InstanceCount=5
```

Output:

```
{
    "ReservedInstancesModificationId": "rimod-82fa9020-668f-4fb6-945d-61537009d291"
}
```

For more information, see Modify Reserved Instances in the *Amazon EC2 User Guide*.

Example 3: To modify the instance size of Reserved Instances

The following `modify-reserved-instances` example modifies a Reserved Instance that has 10 m1.small Linux/UNIX instances in us-west-2c so that 8 m1.small instances become 2 m1.large instances, and the remaining 2 m1.small become 1 m1.medium instance in the same Availability Zone.

```
aws ec2 modify-reserved-instances \
    --reserved-instances-ids a1b2c3d4-5678-90ab-cdef-EXAMPLE33333 \
    --target-configurations AvailabilityZone=us-west-2c,Platform=EC2-
Classic,InstanceCount=2,InstanceType=m1.large AvailabilityZone=us-
west-2c,Platform=EC2-Classic,InstanceCount=1,InstanceType=m1.medium
```

Output:

```
{
    "ReservedInstancesModificationId": "rimod-acc5f240-080d-4717-b3e3-1c6b11fa00b6"
}
```

For more information, see Modify Reserved Instances in the *Amazon EC2 User Guide*.

- For API details, see ModifyReservedInstances in *AWS CLI Command Reference*.

`modify-security-group-rules`

The following code example shows how to use `modify-security-group-rules`.

AWS CLI

To modify a security group rules to update the rule description, the IP protocol, and the CidrIpv4 address range

The following `modify-security-group-rules` example updates the description, the IP protocol, and the IPV4 CIDR range of a specified security group rule. Use the `security-group-rules` parameter to enter the updates for the specified security group rules. `-1` specifies all protocols.

```
aws ec2 modify-security-group-rules \
    --group-id sg-1234567890abcdef0 \
    --security-group-rules SecurityGroupRuleId=sgr-
abcdef01234567890,SecurityGroupRule='{Description=test,IpProtocol=-1,CidrIpv4=0.0.0.0/0}'
```

Output:

```
{
    "Return": true
}
```

For more information about security group rules, see Security group rules in the *Amazon EC2 User Guide*.

- For API details, see ModifySecurityGroupRules in *AWS CLI Command Reference*.

`modify-snapshot-attribute`

The following code example shows how to use `modify-snapshot-attribute`.

AWS CLI

Example 1: To modify a snapshot attribute

The following `modify-snapshot-attribute` example updates the `createVolumePermission` attribute for the specified snapshot, removing volume permissions for the specified user.

```
aws ec2 modify-snapshot-attribute \
    --snapshot-id snap-1234567890abcdef0 \
    --attribute createVolumePermission \
    --operation-type remove \
    --user-ids 123456789012
```

This command produces no output.

For more information, see Share an Amazon EBS snapshot with other AWS accounts in the *Amazon EBS User Guide*.

Example 2: To make a snapshot public

The following `modify-snapshot-attribute` example makes the specified snapshot public.

```
aws ec2 modify-snapshot-attribute \
    --snapshot-id snap-1234567890abcdef0 \
    --attribute createVolumePermission \
    --operation-type add \
    --group-names all
```

This command produces no output.

For more information, see Share an Amazon EBS snapshot with other AWS accounts in the *Amazon EBS User Guide*.

- For API details, see ModifySnapshotAttribute in *AWS CLI Command Reference*.

`modify-snapshot-tier`

The following code example shows how to use `modify-snapshot-tier`.

AWS CLI

To archive a snapshot

The following `modify-snapshot-tier` example archives the specified snapshot. The `TieringStartTime` response parameter indicates the date and time at which the archive process was started, in UTC time format (YYYY-MM-DDTHH:MM:SSZ).

```
aws ec2 modify-snapshot-tier \
    --snapshot-id snap-01234567890abcedf \
    --storage-tier archive
```

Output:

```
{
    "SnapshotId": "snap-01234567890abcedf",
    "TieringStartTime": "2021-09-15T16:44:37.574Z"
}
```

For more information about snapshot archiving, see Archive Amazon EBS snapshots in the *Amazon EBS User Guide*.

- For API details, see ModifySnapshotTier in *AWS CLI Command Reference*.

`modify-spot-fleet-request`

The following code example shows how to use `modify-spot-fleet-request`.

AWS CLI

To modify a Spot fleet request

The following `modify-spot-fleet-request` example updates the target capacity of the specified Spot fleet request.

```
aws ec2 modify-spot-fleet-request \
    --target-capacity 20 \
    --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

Output:

```
{
    "Return": true
}
```

The following `modify-spot-fleet-request` example decreases the target capacity of the specified Spot fleet request without terminating any Spot Instances as a result.

```
aws ec2 modify-spot-fleet-request \
    --target-capacity 10 \
    --excess-capacity-termination-policy NoTermination \
    --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

Output:

```
{
    "Return": true
}
```

For more information, see Modify a Spot Fleet request in the *Amazon EC2 User Guide*.

- For API details, see ModifySpotFleetRequest in *AWS CLI Command Reference*.

`modify-subnet-attribute`

The following code example shows how to use `modify-subnet-attribute`.

AWS CLI

Example 1: To change a subnet's public IPv4 addressing behavior

The following `modify-subnet-attribute` example modifies subnet-1a2b3c4d to specify that all instances launched into this subnet are assigned a public IPv4 address.

```
aws ec2 modify-subnet-attribute \
```

```
    --subnet-id subnet-1a2b3c4d \
    --map-public-ip-on-launch
```

This command produces no output.

For more information, see Modify the IP addressing attributes of your subnet in the *Amazon VPC User Guide*.

Example 2: To change a subnet's IPv6 addressing behavior

The following `modify-subnet-attribute` example modifies subnet-1a2b3c4d to specify that all instances launched into this subnet are assigned an IPv6 address from the range of the subnet.

```
aws ec2 modify-subnet-attribute \
    --subnet-id subnet-1a2b3c4d \
    --assign-ipv6-address-on-creation
```

This command produces no output.

For more information, see IP addressing for your VPCs and subnets in the *Amazon VPC User Guide*.

- For API details, see ModifySubnetAttribute in *AWS CLI Command Reference*.

`modify-traffic-mirror-filter-network-services`

The following code example shows how to use `modify-traffic-mirror-filter-network-services`.

AWS CLI

To add network services to a Traffic Mirror filter

The following `modify-traffic-mirror-filter-network-services` example adds the Amazon DNS network services to the specified filter.

```
aws ec2 modify-traffic-mirror-filter-network-services \
    --traffic-mirror-filter-id tmf-04812ff784EXAMPLE \
    --add-network-services amazon-dns
```

Output:

```
{
    "TrafficMirrorFilter": {
        "Tags": [
            {
                "Key": "Name",
                "Value": "Production"
            }
        ],
        "EgressFilterRules": [],
        "NetworkServices": [
            "amazon-dns"
        ],
        "TrafficMirrorFilterId": "tmf-04812ff784EXAMPLE",
        "IngressFilterRules": [
            {
                "SourceCidrBlock": "0.0.0.0/0",
                "RuleNumber": 1,
                "DestinationCidrBlock": "0.0.0.0/0",
                "Description": "TCP Rule",
                "Protocol": 6,
                "TrafficDirection": "ingress",
                "TrafficMirrorFilterId": "tmf-04812ff784EXAMPLE",
                "RuleAction": "accept",
                "TrafficMirrorFilterRuleId": "tmf-04812ff784EXAMPLE"
            }
        ]
    }
}
```

For more information, see Create, modify, or delete a traffic mirror filter in the *AWS Traffic Mirroring Guide*.

- For API details, see ModifyTrafficMirrorFilterNetworkServices in *AWS CLI Command Reference*.

`modify-traffic-mirror-filter-rule`

The following code example shows how to use `modify-traffic-mirror-filter-rule`.

AWS CLI

To modify a traffic mirror filter rule

The following `modify-traffic-mirror-filter-rule` example modifies the description of the specified traffic mirror filter rule.

```
aws ec2 modify-traffic-mirror-filter-rule \
    --traffic-mirror-filter-rule-id tmfr-0ca76e0e08EXAMPLE \
    --description "TCP Rule"
```

Output:

```
{
    "TrafficMirrorFilterRule": {
        "TrafficMirrorFilterRuleId": "tmfr-0ca76e0e08EXAMPLE",
        "TrafficMirrorFilterId": "tmf-0293f26e86EXAMPLE",
        "TrafficDirection": "ingress",
        "RuleNumber": 100,
        "RuleAction": "accept",
        "Protocol": 6,
        "DestinationCidrBlock": "10.0.0.0/24",
        "SourceCidrBlock": "10.0.0.0/24",
        "Description": "TCP Rule"
    }
}
```

For more information, see Create, modify, or delete a traffic mirror filter in the *AWS Traffic Mirroring Guide*.

- For API details, see ModifyTrafficMirrorFilterRule in *AWS CLI Command Reference*.

`modify-traffic-mirror-session`

The following code example shows how to use `modify-traffic-mirror-session`.

AWS CLI

To modify a traffic mirror session

The following `modify-traffic-mirror-session` example changes the traffic mirror session description and the number of packets to mirror.

```
aws ec2 modify-traffic-mirror-session \
    --description "Change packet length" \
```

```
    --traffic-mirror-session-id tms-08a33b1214EXAMPLE \
    --remove-fields "packet-length"
```

Output:

```
{
    "TrafficMirrorSession": {
        "TrafficMirrorSessionId": "tms-08a33b1214EXAMPLE",
        "TrafficMirrorTargetId": "tmt-07f75d8feeEXAMPLE",
        "TrafficMirrorFilterId": "tmf-04812ff784EXAMPLE",
        "NetworkInterfaceId": "eni-070203f901EXAMPLE",
        "OwnerId": "123456789012",
        "SessionNumber": 1,
        "VirtualNetworkId": 7159709,
        "Description": "Change packet length",
        "Tags": []
    }
}
```

For more information, see Create, modify, or delete a traffic mirror session in the *Traffic Mirroring Guide*.

- For API details, see ModifyTrafficMirrorSession in *AWS CLI Command Reference*.

`modify-transit-gateway-prefix-list-reference`

The following code example shows how to use `modify-transit-gateway-prefix-list-reference`.

AWS CLI

To modify a reference to a prefix list

The following `modify-transit-gateway-prefix-list-reference` example modifies the prefix list reference in the specified route table by changing the attachment to which traffic is routed.

```
aws ec2 modify-transit-gateway-prefix-list-reference \
    --transit-gateway-route-table-id tgw-rtb-0123456789abcd123 \
    --prefix-list-id pl-11111122222222333 \
    --transit-gateway-attachment-id tgw-attach-aabbccddaabbccaab
```

Output:

```
{
    "TransitGatewayPrefixListReference": {
        "TransitGatewayRouteTableId": "tgw-rtb-0123456789abcd123",
        "PrefixListId": "pl-11111122222222333",
        "PrefixListOwnerId": "123456789012",
        "State": "modifying",
        "Blackhole": false,
        "TransitGatewayAttachment": {
            "TransitGatewayAttachmentId": "tgw-attach-aabbccddaabbccaab",
            "ResourceType": "vpc",
            "ResourceId": "vpc-112233445aabbccdd"
        }
    }
}
```

For more information, see Prefix list references in the *Transit Gateways Guide*.

- For API details, see ModifyTransitGatewayPrefixListReference in *AWS CLI Command Reference*.

`modify-transit-gateway-vpc-attachment`

The following code example shows how to use `modify-transit-gateway-vpc-attachment`.

AWS CLI

To modify a transit gateway VPC attachment

The following `modify-transit-gateway-vpc-attachment` example adds a subnet to the specified transit gateway VPC attachment.

```
aws ec2 modify-transit-gateway-vpc-attachment \
    --transit-gateway-attachment-id tgw-attach-09fbd47ddfEXAMPLE \
    --add-subnet-ids subnet-0e51f45802EXAMPLE
```

Output:

```
{
    "TransitGatewayVpcAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-09fbd47ddfEXAMPLE",
        "TransitGatewayId": "tgw-0560315ccfEXAMPLE",
```

```
        "VpcId": "vpc-5eccc927",
        "VpcOwnerId": "123456789012",
        "State": "modifying",
        "SubnetIds": [
            "subnet-0e51f45802EXAMPLE",
            "subnet-1EXAMPLE"
        ],
        "CreationTime": "2019-08-08T16:47:38.000Z",
        "Options": {
            "DnsSupport": "enable",
            "Ipv6Support": "disable"
        }
    }
}
```

For more information, see Transit gateway attachments to a VPC in the *Transit Gateways Guide*.

- For API details, see ModifyTransitGatewayVpcAttachment in *AWS CLI Command Reference*.

`modify-transit-gateway`

The following code example shows how to use `modify-transit-gateway`.

AWS CLI

To modify a transit gateway

The following `modify-transit-gateway` example modifies the specified transit gateway by enabling ECMP support for VPN attachments.

```
aws ec2 modify-transit-gateway \
    --transit-gateway-id tgw-1111112222aaaaaaa \
    --options VpnEcmpSupport=enable
```

Output:

```
{
    "TransitGateway": {
        "TransitGatewayId": "tgw-1111112222aaaaaaa",
        "TransitGatewayArn": "64512",
        "State": "modifying",
        "OwnerId": "123456789012",
        "CreationTime": "2020-04-30T08:41:37.000Z",
```

```
        "Options": {
            "AmazonSideAsn": 64512,
            "AutoAcceptSharedAttachments": "disable",
            "DefaultRouteTableAssociation": "enable",
            "AssociationDefaultRouteTableId": "tgw-rtb-0123456789abcd123",
            "DefaultRouteTablePropagation": "enable",
            "PropagationDefaultRouteTableId": "tgw-rtb-0123456789abcd123",
            "VpnEcmpSupport": "enable",
            "DnsSupport": "enable"
        }
    }
}
```

For more information, see Transit gateways in the *Transit Gateways Guide*.

- For API details, see ModifyTransitGateway in *AWS CLI Command Reference*.

`modify-verified-access-endpoint-policy`

The following code example shows how to use `modify-verified-access-endpoint-policy`.

AWS CLI

To configure the Verified Access policy for an endpoint

The following `modify-verified-access-endpoint-policy` example adds the specified Verified Access policy to the specified Verified Access endpoint.

```
aws ec2 modify-verified-access-endpoint-policy \
    --verified-access-endpoint-id vae-066fac616d4d546f2 \
    --policy-enabled \
    --policy-document file://policy.txt
```

Contents of `policy.txt`:

```
permit(principal,action,resource)
when {
    context.identity.groups.contains("finance") &&
    context.identity.email.verified == true
};
```

Output:

```
{
    "PolicyEnabled": true,
    "PolicyDocument": "permit(principal,action,resource)\nwhen
 {\n    context.identity.groups.contains(\"finance\") &&\n
 context.identity.email_verified == true\n};"
}
```

For more information, see Verified Access policies in the *AWS Verified Access User Guide*.

- For API details, see ModifyVerifiedAccessEndpointPolicy in *AWS CLI Command Reference*.

`modify-verified-access-endpoint`

The following code example shows how to use `modify-verified-access-endpoint`.

AWS CLI

To modify the configuration of a Verified Access endpoint

The following `modify-verified-access-endpoint` example adds the specified description to the specified Verified Access endpoint.

```
aws ec2 modify-verified-access-endpoint \
    --verified-access-endpoint-id vae-066fac616d4d546f2 \
    --description 'Testing Verified Access'
```

Output:

```
{
    "VerifiedAccessEndpoint": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
        "VerifiedAccessEndpointId": "vae-066fac616d4d546f2",
        "ApplicationDomain": "example.com",
        "EndpointType": "network-interface",
        "AttachmentType": "vpc",
        "DomainCertificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "EndpointDomain": "my-ava-
app.edge-00c3372d53b1540bb.vai-0ce000c0b7643abea.prod.verified-access.us-
west-2.amazonaws.com",
```

```
        "SecurityGroupIds": [
            "sg-004915970c4c8f13a"
        ],
        "NetworkInterfaceOptions": {
            "NetworkInterfaceId": "eni-0aec70418c8d87a0f",
            "Protocol": "https",
            "Port": 443
        },
        "Status": {
            "Code": "updating"
        },
        "Description": "Testing Verified Access",
        "CreationTime": "2023-08-25T20:54:43",
        "LastUpdatedTime": "2023-08-25T22:46:32"
    }
}
```

For more information, see Verified Access endpoints in the *AWS Verified Access User Guide*.

- For API details, see ModifyVerifiedAccessEndpoint in *AWS CLI Command Reference*.

`modify-verified-access-group-policy`

The following code example shows how to use `modify-verified-access-group-policy`.

AWS CLI

To configure a Verified Access policy for a group

The following `modify-verified-access-group-policy` example adds the specified Verified Access policy to the specified Verified Access group.

```
aws ec2 modify-verified-access-group-policy \
    --verified-access-group-id vagr-0dbe967baf14b7235 \
    --policy-enabled \
    --policy-document file://policy.txt
```

Contents of `policy.txt`:

```
permit(principal,action,resource)
when {
    context.identity.groups.contains("finance") &&
```

```
    context.identity.email.verified == true
};
```

Output:

```
{
    "PolicyEnabled": true,
    "PolicyDocument": "permit(principal,action,resource)\nwhen
 {\n    context.identity.groups.contains(\"finance\") &&\n
 context.identity.email_verified == true\n};"
}
```

For more information, see Verified Access groups in the *AWS Verified Access User Guide*.

- For API details, see ModifyVerifiedAccessGroupPolicy in *AWS CLI Command Reference*.

`modify-verified-access-group`

The following code example shows how to use `modify-verified-access-group`.

AWS CLI

To modify the configuration of a Verified Access group

The following `modify-verified-access-group` example adds the specified description to the specified Verified Access group.

```
aws ec2 modify-verified-access-group \
    --verified-access-group-id vagr-0dbe967baf14b7235 \
    --description "Testing Verified Access"
```

Output:

```
{
    "VerifiedAccessGroup": {
        "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "Description": "Testing Verified Access",
        "Owner": "123456789012",
        "VerifiedAccessGroupArn": "arn:aws:ec2:us-west-2:123456789012:verified-
access-group/vagr-0dbe967baf14b7235",
```

```
        "CreationTime": "2023-08-25T19:55:19",
        "LastUpdatedTime": "2023-08-25T22:17:25"
    }
}
```

For more information, see Verified Access groups in the *AWS Verified Access User Guide*.

- For API details, see ModifyVerifiedAccessGroup in *AWS CLI Command Reference*.

`modify-verified-access-instance-logging-configuration`

The following code example shows how to use `modify-verified-access-instance-logging-configuration`.

AWS CLI

To enable logging for a Verified Access instance

The following `modify-verified-access-instance-logging-configuration` example enables access logging for the specified Verified Access instance. The logs will be delivered to the specified CloudWatch Logs log group.

```
aws ec2 modify-verified-access-instance-logging-configuration \
    --verified-access-instance-id vai-0ce000c0b7643abea \
    --access-logs CloudWatchLogs={Enabled=true,LogGroup=my-log-group}
```

Output:

```
{
    "LoggingConfiguration": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "AccessLogs": {
            "S3": {
                "Enabled": false
            },
            "CloudWatchLogs": {
                "Enabled": true,
                "DeliveryStatus": {
                    "Code": "success"
                },
                "LogGroup": "my-log-group"
            },
```

```
            "KinesisDataFirehose": {
                "Enabled": false
            },
            "LogVersion": "ocsf-1.0.0-rc.2",
            "IncludeTrustContext": false
        }
    }
}
```

For more information, see Verified Access logs in the *AWS Verified Access User Guide*.

- For API details, see ModifyVerifiedAccessInstanceLoggingConfiguration in *AWS CLI Command Reference*.

`modify-verified-access-instance`

The following code example shows how to use `modify-verified-access-instance`.

AWS CLI

To modify the configuration of a Verified Access instance

The following `modify-verified-access-instance` example adds the specified description to the specified Verified Access instance.

```
aws ec2 modify-verified-access-instance \
    --verified-access-instance-id vai-0ce000c0b7643abea \
    --description "Testing Verified Access"
```

Output:

```
{
    "VerifiedAccessInstance": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "Description": "Testing Verified Access",
        "VerifiedAccessTrustProviders": [
            {
                "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
                "TrustProviderType": "user",
                "UserTrustProviderType": "iam-identity-center"
            }
        ],
```

```
        "CreationTime": "2023-08-25T18:27:56",
        "LastUpdatedTime": "2023-08-25T22:41:04"
    }
}
```

For more information, see Verified Access instances in the *AWS Verified Access User Guide*.

- For API details, see ModifyVerifiedAccessInstance in *AWS CLI Command Reference*.

`modify-verified-access-trust-provider`

The following code example shows how to use `modify-verified-access-trust-provider`.

AWS CLI

To modify the configuration of a Verified Access trust provider

The following `modify-verified-access-trust-provider` example adds the specified description to the specified Verified Access trust provider.

```
aws ec2 modify-verified-access-trust-provider \
    --verified-access-trust-provider-id vatp-0bb32de759a3e19e7 \
    --description "Testing Verified Access"
```

Output:

```
{
    "VerifiedAccessTrustProvider": {
        "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
        "Description": "Testing Verified Access",
        "TrustProviderType": "user",
        "UserTrustProviderType": "iam-identity-center",
        "PolicyReferenceName": "idc",
        "CreationTime": "2023-08-25T19:00:38",
        "LastUpdatedTime": "2023-08-25T19:18:21"
    }
}
```

For more information, see Trust providers for Verified Access in the *AWS Verified Access User Guide*.

- For API details, see ModifyVerifiedAccessTrustProvider in *AWS CLI Command Reference*.

`modify-volume-attribute`

The following code example shows how to use `modify-volume-attribute`.

AWS CLI

To modify a volume attribute

The following `modify-volume-attribute` example sets the `autoEnableIo` attribute of the volume with the ID `vol-1234567890abcdef0` to `true`.

```
aws ec2 modify-volume-attribute \
    --volume-id vol-1234567890abcdef0 \
    --auto-enable-io
```

This command produces no output.

For more information, see Amazon EBS volume status checks in the *Amazon EBS User Guide*.

- For API details, see ModifyVolumeAttribute in *AWS CLI Command Reference*.

`modify-volume`

The following code example shows how to use `modify-volume`.

AWS CLI

Example 1: To modify a volume by changing its size

The following `modify-volume` example changes the size of the specified volume to 150GB.

```
aws ec2 modify-volume \
    --size 150 \
    --volume-id vol-1234567890abcdef0
```

Output:

```
{
    "VolumeModification": {
        "TargetSize": 150,
        "TargetVolumeType": "io1",
        "ModificationState": "modifying",
        "VolumeId": " vol-1234567890abcdef0",
```

```
        "TargetIops": 100,
        "StartTime": "2019-05-17T11:27:19.000Z",
        "Progress": 0,
        "OriginalVolumeType": "io1",
        "OriginalIops": 100,
        "OriginalSize": 100
    }
}
```

For more information, see Request Amazon EBS volume modifications in the *Amazon EBS User Guide*.

Example 2: To modify a volume by changing its type, size, and IOPS value

The following `modify-volume` example changes the volume type to Provisioned IOPS SSD, sets the target IOPS rate to 10000, and sets the volume size to 350GB.

```
aws ec2 modify-volume \
    --volume-type io1 \
    --iops 10000 \
    --size 350 \
    --volume-id vol-1234567890abcdef0
```

Output:

```
{
    "VolumeModification": {
        "TargetSize": 350,
        "TargetVolumeType": "io1",
        "ModificationState": "modifying",
        "VolumeId": "vol-0721c1a9d08c93bf6",
        "TargetIops": 10000,
        "StartTime": "2019-05-17T11:38:57.000Z",
        "Progress": 0,
        "OriginalVolumeType": "gp2",
        "OriginalIops": 150,
        "OriginalSize": 50
    }
}
```

For more information, see Request Amazon EBS volume modifications in the *Amazon EBS User Guide*.

- For API details, see ModifyVolume in *AWS CLI Command Reference*.

`modify-vpc-attribute`

The following code example shows how to use `modify-vpc-attribute`.

AWS CLI

Example 1: To modify the enableDnsSupport attribute

The following `modify-vpc-attribute` example modifies the `enableDnsSupport` attribute. This attribute indicates whether DNS resolution is enabled for the VPC. If this attribute is `true`, the Amazon DNS server resolves DNS hostnames for your instances to their corresponding IP addresses; otherwise, it does not.

```
aws ec2 modify-vpc-attribute \
    --vpc-id vpc-a01106c2 \
    --enable-dns-support "{\"Value\":false}"
```

This command produces no output.

For more information, see View and update DNS attributes for your VPC in the *Amazon VPC User Guide*.

Example 2: To modify the enableDnsHostnames attribute

The following `modify-vpc-attribute` example modifies the `enableDnsHostnames` attribute. This attribute indicates whether instances launched in the VPC get DNS hostnames. If this attribute is `true`, instances in the VPC get DNS hostnames; otherwise, they do not.

```
aws ec2 modify-vpc-attribute \
    --vpc-id vpc-a01106c2 \
    --enable-dns-hostnames "{\"Value\":false}"
```

This command produces no output.

For more information, see View and update DNS attributes for your VPC in the *Amazon VPC User Guide*.

- For API details, see ModifyVpcAttribute in *AWS CLI Command Reference*.

`modify-vpc-endpoint-connection-notification`

The following code example shows how to use `modify-vpc-endpoint-connection-notification`.

AWS CLI

To modify an endpoint connection notification

The following `modify-vpc-endpoint-connection-notification` example changes the SNS topic for the specified endpoint connection notification.

```
aws ec2 modify-vpc-endpoint-connection-notification \
    --connection-notification-id vpce-nfn-008776de7e03f5abc \
    --connection-events Accept Reject \
    --connection-notification-arn arn:aws:sns:us-west-2:123456789012:mytopic
```

Output:

```
{
    "ReturnValue": true
}
```

For more information, see Receive alerts for endpoint service events in the *AWS PrivateLink User Guide*.

- For API details, see ModifyVpcEndpointConnectionNotification in *AWS CLI Command Reference*.

`modify-vpc-endpoint-service-configuration`

The following code example shows how to use `modify-vpc-endpoint-service-configuration`.

AWS CLI

To modify an endpoint service configuration

The following `modify-vpc-endpoint-service-configuration` example changes the acceptance requirement for the specified endpoint service.

```
aws ec2 modify-vpc-endpoint-service-configuration \
    --service-id vpce-svc-09222513e6e77dc86 \
    --no-acceptance-required
```

Output:

```
{
    "Return": true
}
```

For more information, see Configure an endpoint service in the *AWS PrivateLink User Guide*.

- For API details, see ModifyVpcEndpointServiceConfiguration in *AWS CLI Command Reference*.

`modify-vpc-endpoint-service-payer-responsibility`

The following code example shows how to use `modify-vpc-endpoint-service-payer-responsibility`.

AWS CLI

To modify the payer responsibility

The following `modify-vpc-endpoint-service-payer-responsibility` example modifies the payer responsibility of the specified endpoint service.

```
aws ec2 modify-vpc-endpoint-service-payer-responsibility \
    --service-id vpce-svc-071afff70666e61e0 \
    --payer-responsibility ServiceOwner
```

This command produces no output.

For more information, see Configure an endpoint service in the *AWS PrivateLink User Guide*.

- For API details, see ModifyVpcEndpointServicePayerResponsibility in *AWS CLI Command Reference*.

`modify-vpc-endpoint-service-permissions`

The following code example shows how to use `modify-vpc-endpoint-service-permissions`.

AWS CLI

To modify endpoint service permissions

The following `modify-vpc-endpoint-service-permissions` example adds permission for an AWS account to connect to the specified endpoint service.

```
aws ec2 modify-vpc-endpoint-service-permissions \
    --service-id vpce-svc-03d5ebb7d9579a2b3 \
    --add-allowed-principals '["arn:aws:iam::123456789012:root"]'
```

Output:

```
{
    "ReturnValue": true
}
```

The following `modify-vpc-endpoint-service-permissions` example adds permission for a specific IAM user (`admin`) to connect to the specified endpoint service.

```
aws ec2 modify-vpc-endpoint-service-permissions \
    --service-id vpce-svc-03d5ebb7d9579a2b3 \
    --add-allowed-principals '["arn:aws:iam::123456789012:user/admin"]'
```

For more information, see Configure an endpoint service in the *AWS PrivateLink User Guide*.

- For API details, see ModifyVpcEndpointServicePermissions in *AWS CLI Command Reference*.

`modify-vpc-endpoint`

The following code example shows how to use `modify-vpc-endpoint`.

AWS CLI

Example 1: To modify a gateway endpoint

The following `modify-vpc-endpoint` example modifies gateway endpoint `vpce-1a2b3c4d` by associating route table `rtb-aaa222bb` with the endpoint, and resetting the policy document.

```
aws ec2 modify-vpc-endpoint \
```

```
    --vpc-endpoint-id vpce-1a2b3c4d \
    --add-route-table-ids rtb-aaa222bb \
    --reset-policy
```

Output:

```
{
    "Return": true
}
```

For more information, see Gateway endpoints in the *AWS PrivateLink User Guide*.

Example 2: To modify an interface endpoint

The following `modify-vpc-endpoint` example modifies interface endpoint `vpce-0fe5b17a0707d6fa5` by adding subnet `subnet-d6fcaa8d` to the endpoint.

```
aws ec2 modify-vpc-endpoint \
    --vpc-endpoint-id vpce-0fe5b17a0707d6fa5 \
    --add-subnet-ids subnet-d6fcaa8d
```

Output:

```
{
    "Return": true
}
```

For more information, see Access an AWS service using an interface VPC endpoint in the *AWS PrivateLink User Guide*.

- For API details, see ModifyVpcEndpoint in *AWS CLI Command Reference*.

`modify-vpc-peering-connection-options`

The following code example shows how to use `modify-vpc-peering-connection-options`.

AWS CLI

Example 1: To enable communication over a VPC peering connection from your local ClassicLink connection

The following `modify-vpc-peering-connection-options` example modifies the VPC peering connection options for peering connection `pcx-aaaabbbb` to enable a local ClassicLink connection to communicate with the peer VPC. In this example, the owner of the requester VPC modifies the options.

```
aws ec2 modify-vpc-peering-connection-options \
    --vpc-peering-connection-id pcx-aaaabbbb \
    --requester-peering-connection-
options AllowEgressFromLocalClassicLinkToRemoteVpc=true
```

Output:

```
{
    "RequesterPeeringConnectionOptions": {
        "AllowEgressFromLocalClassicLinkToRemoteVpc": true
    }
}
```

Example 2: To enable communication over a VPC peering connection from your local VPC to a remote ClassicLink connection

The following `modify-vpc-peering-connection-options` example modifies the VPC peering connection options for `pcx-aaaabbbb` to enable the local VPC to communicate with the ClassicLink connection in the peer VPC. In this example, the owner of the accepter VPC modifies the options.

```
aws ec2 modify-vpc-peering-connection-options \
    --vpc-peering-connection-id pcx-aaaabbbb \
    --accepter-peering-connection-
options AllowEgressFromLocalVpcToRemoteClassicLink=true
```

Output:

```
{
    "AccepterPeeringConnectionOptions": {
        "AllowEgressFromLocalVpcToRemoteClassicLink": true
    }
}
```

Example 3: To enable DNS resolution support for the VPC peering connection

The following `modify-vpc-peering-connection-options` example modifies the VPC peering connection options for `pcx-aaaabbbb` to enable the local VPC to resolve public DNS hostnames to private IP addresses when queried from instances in the peer VPC. In this example, the owner of the requester VPC modifies the options.

```
aws ec2 modify-vpc-peering-connection-options \
    --vpc-peering-connection-id pcx-aaaabbbb \
    --requester-peering-connection-options AllowDnsResolutionFromRemoteVpc=true
```

Output:

```
{
    "RequesterPeeringConnectionOptions": {
        "AllowDnsResolutionFromRemoteVpc": true
    }
}
```

For more information, see Enable DNS resolution for a VPC peering connection in the *Amazon VPC Peering Guide*.

- For API details, see ModifyVpcPeeringConnectionOptions in *AWS CLI Command Reference*.

`modify-vpc-tenancy`

The following code example shows how to use `modify-vpc-tenancy`.

AWS CLI

To modify the tenancy of a VPC

The following `modify-vpc-tenancy` example modifies the tenancy of VPC `vpc-1a2b3c4d` to `default`.

```
aws ec2 modify-vpc-tenancy \
    --vpc-id vpc-1a2b3c4d \
    --instance-tenancy default
```

Output:

```
{
```

```
    "ReturnValue": true
}
```

For more information, see Change the instance tenancy of a VPC in the *Amazon EC2 User Guide*.

- For API details, see ModifyVpcTenancy in *AWS CLI Command Reference*.

`modify-vpn-connection-options`

The following code example shows how to use `modify-vpn-connection-options`.

AWS CLI

To modify your VPN connection options

The following `modify-vpn-connection-options` example modifies the local IPv4 CIDR on the customer gateway side of the specified VPN connection.

```
aws ec2 modify-vpn-connection-options \
    --vpn-connection-id vpn-1122334455aabbccd \
    --local-ipv4-network-cidr 10.0.0.0/16
```

Output:

```
{
    "VpnConnection": {
        "CustomerGatewayConfiguration": "...configuration information...",
        "CustomerGatewayId": "cgw-01234567abcde1234",
        "Category": "VPN",
        "State": "modifying",
        "Type": "ipsec.1",
        "VpnConnectionId": "vpn-1122334455aabbccd",
        "TransitGatewayId": "tgw-00112233445566aab",
        "Options": {
            "EnableAcceleration": false,
            "StaticRoutesOnly": true,
            "LocalIpv4NetworkCidr": "10.0.0.0/16",
            "RemoteIpv4NetworkCidr": "0.0.0.0/0",
            "TunnelInsideIpVersion": "ipv4"
        },
        "Routes": [],
        "Tags": [
```

```
            {
                "Key": "Name",
                "Value": "CanadaVPN"
            }
        ],
        "VgwTelemetry": [
            {
                "AcceptedRouteCount": 0,
                "LastStatusChange": "2020-07-29T10:35:11.000Z",
                "OutsideIpAddress": "203.0.113.3",
                "Status": "DOWN",
                "StatusMessage": ""
            },
            {
                "AcceptedRouteCount": 0,
                "LastStatusChange": "2020-09-02T09:09:33.000Z",
                "OutsideIpAddress": "203.0.113.5",
                "Status": "UP",
                "StatusMessage": ""
            }
        ]
    }
}
```

For more information, see Modifying Site-to-Site VPN connection options in the *AWS Site-to-Site VPN User Guide*.

- For API details, see ModifyVpnConnectionOptions in *AWS CLI Command Reference*.

`modify-vpn-connection`

The following code example shows how to use `modify-vpn-connection`.

AWS CLI

To modify a VPN connection

The following `modify-vpn-connection` example changes the target gateway for VPN connection `vpn-12345678901234567` to virtual private gateway `vgw-11223344556677889`.

```
aws ec2 modify-vpn-connection \
    --vpn-connection-id vpn-12345678901234567 \
```

```
    --vpn-gateway-id vgw-11223344556677889
```

Output:

```
{
    "VpnConnection": {
        "CustomerGatewayConfiguration": "...configuration information...",
        "CustomerGatewayId": "cgw-aabbccddee1122334",
        "Category": "VPN",
        "State": "modifying",
        "Type": "ipsec.1",
        "VpnConnectionId": "vpn-12345678901234567",
        "VpnGatewayId": "vgw-11223344556677889",
        "Options": {
            "StaticRoutesOnly": false
        },
        "VgwTelemetry": [
            {
                "AcceptedRouteCount": 0,
                "LastStatusChange": "2019-07-17T07:34:00.000Z",
                "OutsideIpAddress": "18.210.3.222",
                "Status": "DOWN",
                "StatusMessage": "IPSEC IS DOWN"
            },
            {
                "AcceptedRouteCount": 0,
                "LastStatusChange": "2019-07-20T21:20:16.000Z",
                "OutsideIpAddress": "34.193.129.33",
                "Status": "DOWN",
                "StatusMessage": "IPSEC IS DOWN"
            }
        ]
    }
}
```

For more information, see Modify the target gateway of an AWS Site-to-Site VPN connection in the *AWS Site-to-Site VPN User Guide*.

- For API details, see ModifyVpnConnection in *AWS CLI Command Reference*.

`modify-vpn-tunnel-certificate`

The following code example shows how to use `modify-vpn-tunnel-certificate`.

AWS CLI

To rotate a VPN tunnel certificate

The following `modify-vpn-tunnel-certificate` example rotates the certificate for the specified tunnel for a VPN connection.

```
aws ec2 modify-vpn-tunnel-certificate \
    --vpn-tunnel-outside-ip-address 203.0.113.17 \
    --vpn-connection-id vpn-12345678901234567
```

Output:

```
{
    "VpnConnection": {
        "CustomerGatewayConfiguration": "...configuration information...",
        "CustomerGatewayId": "cgw-aabbccddee1122334",
        "Category": "VPN",
        "State": "modifying",
        "Type": "ipsec.1",
        "VpnConnectionId": "vpn-12345678901234567",
        "VpnGatewayId": "vgw-11223344556677889",
        "Options": {
            "StaticRoutesOnly": false
        },
        "VgwTelemetry": [
            {
                "AcceptedRouteCount": 0,
                "LastStatusChange": "2019-09-11T17:27:14.000Z",
                "OutsideIpAddress": "203.0.113.17",
                "Status": "DOWN",
                "StatusMessage": "IPSEC IS DOWN",
                "CertificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/
c544d8ce-20b8-4fff-98b0-example"
            },
            {
                "AcceptedRouteCount": 0,
                "LastStatusChange": "2019-09-11T17:26:47.000Z",
                "OutsideIpAddress": "203.0.114.18",
                "Status": "DOWN",
                "StatusMessage": "IPSEC IS DOWN",
                "CertificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/5ab64566-761b-4ad3-b259-example"
```

```
            }
        ]
    }
}
```

For more information, see AWS Site-to-Site VPN tunnel authentication options in the *AWS Site-to-Site VPN User Guide*.

- For API details, see ModifyVpnTunnelCertificate in *AWS CLI Command Reference*.

`modify-vpn-tunnel-options`

The following code example shows how to use `modify-vpn-tunnel-options`.

AWS CLI

To modify the tunnel options for a VPN connection

The following `modify-vpn-tunnel-options` example updates the Diffie-Hellman groups that are permitted for the specified tunnel and VPN connection.

```
aws ec2 modify-vpn-tunnel-options \
    --vpn-connection-id vpn-12345678901234567 \
    --vpn-tunnel-outside-ip-address 203.0.113.17 \
    --tunnel-options Phase1DHGroupNumbers=[{Value=14},{Value=15},{Value=16},
{Value=17},{Value=18}],Phase2DHGroupNumbers=[{Value=14},{Value=15},{Value=16},
{Value=17},{Value=18}]
```

Output:

```
{
    "VpnConnection": {
        "CustomerGatewayConfiguration": "...configuration information...",
        "CustomerGatewayId": "cgw-aabbccddee1122334",
        "Category": "VPN",
        "State": "available",
        "Type": "ipsec.1",
        "VpnConnectionId": "vpn-12345678901234567",
        "VpnGatewayId": "vgw-11223344556677889",
        "Options": {
            "StaticRoutesOnly": false,
            "TunnelOptions": [
                {
```

```
                    "OutsideIpAddress": "203.0.113.17",
                    "Phase1DHGroupNumbers": [
                        {
                            "Value": 14
                        },
                        {
                            "Value": 15
                        },
                        {
                            "Value": 16
                        },
                        {
                            "Value": 17
                        },
                        {
                            "Value": 18
                        }
                    ],
                    "Phase2DHGroupNumbers": [
                        {
                            "Value": 14
                        },
                        {
                            "Value": 15
                        },
                        {
                            "Value": 16
                        },
                        {
                            "Value": 17
                        },
                        {
                            "Value": 18
                        }
                    ]
                },
                {
                    "OutsideIpAddress": "203.0.114.19"
                }
            ]
        },
        "VgwTelemetry": [
            {
                "AcceptedRouteCount": 0,
```

```
                "LastStatusChange": "2019-09-10T21:56:54.000Z",
                "OutsideIpAddress": "203.0.113.17",
                "Status": "DOWN",
                "StatusMessage": "IPSEC IS DOWN"
            },
            {
                "AcceptedRouteCount": 0,
                "LastStatusChange": "2019-09-10T21:56:43.000Z",
                "OutsideIpAddress": "203.0.114.19",
                "Status": "DOWN",
                "StatusMessage": "IPSEC IS DOWN"
            }
        ]
    }
}
```

For more information, see Modify AWS Site-to-Site VPN tunnel options in the *AWS Site-to-Site VPN User Guide*.

- For API details, see ModifyVpnTunnelOptions in *AWS CLI Command Reference*.

`monitor-instances`

The following code example shows how to use `monitor-instances`.

AWS CLI

To enable detailed monitoring for an instance

The following `monitor-instances` example enables detailed monitoring for the specified instance.

```
aws ec2 monitor-instances \
    --instance-ids i-1234567890abcdef0
```

Output:

```
{
    "InstanceMonitorings": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "Monitoring": {
```

```
                "State": "pending"
            }
        }
    ]
}
```

For more information, see Manage detailed monitoring for your EC2 instances in the *Amazon EC2 User Guide*.

- For API details, see MonitorInstances in *AWS CLI Command Reference*.

`move-address-to-vpc`

The following code example shows how to use `move-address-to-vpc`.

AWS CLI

To move an address to EC2-VPC

The following `move-address-to-vpc` example moves Elastic IP address 54.123.4.56 to the EC2-VPC platform.

```
aws ec2 move-address-to-vpc \
    --public-ip 54.123.4.56
```

Output:

```
{
    "Status": "MoveInProgress"
}
```

For more information, see Elastic IP addresses in the *Amazon EC2 User Guide*.

- For API details, see MoveAddressToVpc in *AWS CLI Command Reference*.

`move-byoip-cidr-to-ipam`

The following code example shows how to use `move-byoip-cidr-to-ipam`.

AWS CLI

To transfer a BYOIP CIDR to IPAM

The following `move-byoip-cidr-to-ipam` example transfers a BYOIP CIDR to IPAM.

For Linux, use the following command.

```
aws ec2 move-byoip-cidr-to-ipam \
    --ipam-pool-id ipam-pool-0a03d430ca3f5c035 \
    --ipam-pool-owner 123456789012 \
    --cidr 130.137.249.0/24
```

For Windows, use the following command.

```
aws ec2 move-byoip-cidr-to-ipam ^
    --ipam-pool-id ipam-pool-0a03d430ca3f5c035 ^
    --ipam-pool-owner 123456789012 ^
    --cidr 130.137.249.0/24
```

Output:

```
{
    "ByoipCidr": {
        "Cidr": "130.137.249.0/24",
        "State": "pending-transfer"
    }
}
```

For more information, see Tutorial: Transfer an existing BYOIP IPv4 CIDR to IPAM in the *Amazon VPC IPAM User Guide*.

- For API details, see MoveByoipCidrToIpam in *AWS CLI Command Reference*.

`provision-byoip-cidr`

The following code example shows how to use `provision-byoip-cidr`.

AWS CLI

To provision an address range

The following `provision-byoip-cidr` example provisions a public IP address range for use with AWS.

```
aws ec2 provision-byoip-cidr \
```

```
    --cidr 203.0.113.25/24 \
    --cidr-authorization-context Message="$text_message",Signature="$signed_message"
```

Output:

```
{
    "ByoipCidr": {
        "Cidr": "203.0.113.25/24",
        "State": "pending-provision"
    }
}
```

For more information about creating the messages strings for the authorization context, see Bring Your Own IP Addresses in the *Amazon EC2 User Guide*.

- For API details, see ProvisionByoipCidr in *AWS CLI Command Reference*.

`provision-ipam-pool-cidr`

The following code example shows how to use `provision-ipam-pool-cidr`.

AWS CLI

To provision a CIDR to an IPAM pool

The following `provision-ipam-pool-cidr` example provisions a CIDR to an IPAM pool.

For Linux, use the following command.

```
aws ec2 provision-ipam-pool-cidr \
    --ipam-pool-id ipam-pool-0533048da7d823723 \
    --cidr 10.0.0.0/24
```

For Windows, use the following command.

```
aws ec2 provision-ipam-pool-cidr ^
    --ipam-pool-id ipam-pool-0533048da7d823723 ^
    --cidr 10.0.0.0/24
```

Output:

```
{
```

```
    "IpamPoolCidr": {
        "Cidr": "10.0.0.0/24",
        "State": "pending-provision"
    }
}
```

For more information, see Provision CIDRs to a pool in the *Amazon VPC IPAM User Guide*.

- For API details, see ProvisionIpamPoolCidr in *AWS CLI Command Reference*.

`purchase-host-reservation`

The following code example shows how to use `purchase-host-reservation`.

AWS CLI

To purchase a Dedicated Host Reservation

The following `purchase-host-reservation` example purchases the specified Dedicated Host Reservation offering for the specified Dedicated Host in your account.

```
aws ec2 purchase-host-reservation \
    --offering-id hro-03f707bf363b6b324 \
    --host-id-set h-013abcd2a00cbd123
```

Output:

```
{
    "TotalHourlyPrice": "1.499",
    "Purchase": [
        {
            "HourlyPrice": "1.499",
            "InstanceFamily": "m4",
            "PaymentOption": "NoUpfront",
            "HostIdSet": [
                "h-013abcd2a00cbd123"
            ],
            "HostReservationId": "hr-0d418a3a4ffc669ae",
            "UpfrontPrice": "0.000",
            "Duration": 31536000
        }
    ],
    "TotalUpfrontPrice": "0.000"
```

```
}
```

For more information, see Amazon EC2 Dedicated Host pricing and billing in the *Amazon EC2 User Guide*.

- For API details, see PurchaseHostReservation in *AWS CLI Command Reference*.

`purchase-reserved-instances-offering`

The following code example shows how to use `purchase-reserved-instances-offering`.

AWS CLI

To purchase a Reserved Instance offering

The following `purchase-reserved-instances-offering` example purchases a Reserved Instances offering, specifying an offering ID and instance count.

```
aws ec2 purchase-reserved-instances-offering \
    --reserved-instances-offering-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --instance-count 3
```

Output:

```
{
    "ReservedInstancesId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Buy Reserved Instances for Amazon EC2 in the *Amazon EC2 User Guide*.

- For API details, see PurchaseReservedInstancesOffering in *AWS CLI Command Reference*.

`purchase-scheduled-instances`

The following code example shows how to use `purchase-scheduled-instances`.

AWS CLI

To purchase a Scheduled Instance

The following `purchase-scheduled-instances` example purchases a Scheduled Instance.

```
aws ec2 purchase-scheduled-instances \
    --purchase-requests file://purchase-request.json
```

Contents of `purchase-request.json`:

```
[
    {
        "PurchaseToken": "eyJ2IjoiMSIsInMiOjEsImMiOi...",
        "InstanceCount": 1
    }
]
```

Output:

```
{
    "ScheduledInstanceSet": [
        {
            "AvailabilityZone": "us-west-2b",
            "ScheduledInstanceId": "sci-1234-1234-1234-1234-123456789012",
            "HourlyPrice": "0.095",
            "CreateDate": "2016-01-25T21:43:38.612Z",
            "Recurrence": {
                "OccurrenceDaySet": [
                    1
                ],
                "Interval": 1,
                "Frequency": "Weekly",
                "OccurrenceRelativeToEnd": false,
                "OccurrenceUnit": ""
            },
            "Platform": "Linux/UNIX",
            "TermEndDate": "2017-01-31T09:00:00Z",
            "InstanceCount": 1,
            "SlotDurationInHours": 32,
            "TermStartDate": "2016-01-31T09:00:00Z",
            "NetworkPlatform": "EC2-VPC",
            "TotalScheduledInstanceHours": 1696,
            "NextSlotStartTime": "2016-01-31T09:00:00Z",
            "InstanceType": "c4.large"
        }
    ]
}
```

For more information, see Amazon EC2 billing and purchasing options in the *Amazon EC2 User Guide*.

- For API details, see PurchaseScheduledInstances in *AWS CLI Command Reference*.

`reboot-instances`

The following code example shows how to use `reboot-instances`.

AWS CLI

To reboot an Amazon EC2 instance

The following `reboot-instances` example reboots the specified instance.

```
aws ec2 reboot-instances \
    --instance-ids i-1234567890abcdef5
```

This command produces no output.

For more information, see Reboot your Amazon EC2 instance in the *Amazon EC2 User Guide*.

- For API details, see RebootInstances in *AWS CLI Command Reference*.

`register-image`

The following code example shows how to use `register-image`.

AWS CLI

Example 1: To register an AMI using a manifest file

The following `register-image` example registers an AMI using the specified manifest file in Amazon S3.

```
aws ec2 register-image \
    --name my-image \
    --image-location amzn-s3-demo-bucket/myimage/image.manifest.xml
```

Output:

```
{
    "ImageId": "ami-1234567890EXAMPLE"
```

```
}
```

For more information, see Amazon Machine Images (AMI) in the *Amazon EC2 User Guide*.

Example 2: To register an AMI using a snapshot of a root device

The following `register-image` example registers an AMI using the specified snapshot of an EBS root volume as device `/dev/xvda`. The block device mapping also includes an empty 100 GiB EBS volume as device `/dev/xvdf`.

```
aws ec2 register-image \
    --name my-image \
    --root-device-name /dev/xvda \
    --block-device-mappings DeviceName=/dev/
xvda,Ebs={SnapshotId=snap-0db2cf683925d191f} DeviceName=/dev/
xvdf,Ebs={VolumeSize=100}
```

Output:

```
{
    "ImageId": "ami-1a2b3c4d5eEXAMPLE"
}
```

For more information, see Amazon Machine Images (AMI) in the *Amazon EC2 User Guide*.

- For API details, see RegisterImage in *AWS CLI Command Reference*.

`register-instance-event-notification-attributes`

The following code example shows how to use `register-instance-event-notification-attributes`.

AWS CLI

Example 1: To include all tags in event notifications

The following `register-instance-event-notification-attributes` example includes all tags in event notifications.

```
aws ec2 register-instance-event-notification-attributes \
    --instance-tag-attribute IncludeAllTagsOfInstance=true
```

Output:

```
{
    "InstanceTagAttribute": {
        "InstanceTagKeys": [],
        "IncludeAllTagsOfInstance": true
    }
}
```

For more information, see Scheduled events for your instances in the *Amazon EC2 User Guide*.

Example 2: To include specific tags in event notifications

The following `register-instance-event-notification-attributes` example includes the specified tags in event notifications. You cannot specify tags if `IncludeAllTagsOfInstance` is `true`.

```
aws ec2 register-instance-event-notification-attributes \
    --instance-tag-attribute InstanceTagKeys="tag-key1","tag-key2"
```

Output:

```
{
    "InstanceTagAttribute": {
        "InstanceTagKeys": [
            "tag-key1",
            "tag-key2"
        ],
        "IncludeAllTagsOfInstance": false
    }
}
```

For more information, see Scheduled events for your instances in the *Amazon EC2 User Guide*.

- For API details, see RegisterInstanceEventNotificationAttributes in *AWS CLI Command Reference*.

`register-transit-gateway-multicast-group-members`

The following code example shows how to use `register-transit-gateway-multicast-group-members`.

AWS CLI

To view the information about the transit gateway multicast domain associations

The following `register-transit-gateway-multicast-group-members` example returns the associations for the specified multicast domain.

```
aws ec2 register-transit-gateway-multicast-group-members \
    --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
    --group-ip-address 224.0.1.0 \
    --network-interface-ids eni-0e246d32695012e81
```

Output:

```
{
    "RegisteredMulticastGroupMembers": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
        "RegisteredNetworkInterfaceIds": [
            "eni-0e246d32695012e81"
        ],
        "GroupIpAddress": "224.0.1.0"
    }
}
```

For more information, see Multicast domains in the *Transit Gateways User Guide*.

- For API details, see RegisterTransitGatewayMulticastGroupMembers in *AWS CLI Command Reference*.

`register-transit-gateway-multicast-group-sources`

The following code example shows how to use `register-transit-gateway-multicast-group-sources`.

AWS CLI

To register a source with a transit gateway multicast group.

The following `register-transit-gateway-multicast-group-sources` example registers the specified network interface group source with a multicast group.

```
aws ec2 register-transit-gateway-multicast-group-sources \
```

```
    --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
    --group-ip-address 224.0.1.0 \
    --network-interface-ids eni-07f290fc3c090cbae
```

Output:

```
{
    "RegisteredMulticastGroupSources": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
        "RegisteredNetworkInterfaceIds": [
            "eni-07f290fc3c090cbae"
        ],
        "GroupIpAddress": "224.0.1.0"
    }
}
```

For more information, see Multicast domains in the *Transit Gateways Guide*.

- For API details, see RegisterTransitGatewayMulticastGroupSources in *AWS CLI Command Reference*.

`reject-transit-gateway-peering-attachment`

The following code example shows how to use `reject-transit-gateway-peering-attachment`.

AWS CLI

To reject a transit gateway peering attachment

The following `reject-transit-gateway-peering-attachment` example rejects the specified transit gateway peering attachment request. The `--region` parameter specifies the Region that the accepter transit gateway is located in.

```
aws ec2 reject-transit-gateway-peering-attachment \
    --transit-gateway-attachment-id tgw-attach-4455667788aabbccd \
    --region us-east-2
```

Output:

```
{
```

```
    "TransitGatewayPeeringAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbccd",
        "RequesterTgwInfo": {
            "TransitGatewayId": "tgw-123abc05e04123abc",
            "OwnerId": "123456789012",
            "Region": "us-west-2"
        },
        "AccepterTgwInfo": {
            "TransitGatewayId": "tgw-11223344aabbcc112",
            "OwnerId": "123456789012",
            "Region": "us-east-2"
        },
        "State": "rejecting",
        "CreationTime": "2019-12-09T11:50:31.000Z"
    }
}
```

For more information, see Transit Gateway Peering Attachments in the *Transit Gateways Guide*.

- For API details, see RejectTransitGatewayPeeringAttachment in *AWS CLI Command Reference*.

`reject-transit-gateway-vpc-attachment`

The following code example shows how to use `reject-transit-gateway-vpc-attachment`.

AWS CLI

To reject a transit gateway VPC attachment

The following `reject-transit-gateway-vpc-attachment` example rejects the specified transit gateway VPC attachment.

```
aws ec2 reject-transit-gateway-vpc-attachment \
    --transit-gateway-attachment-id tgw-attach-0a34fe6b4fEXAMPLE
```

Output:

```
{
    "TransitGatewayVpcAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
        "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
        "VpcId": "vpc-07e8ffd50fEXAMPLE",
```

```
        "VpcOwnerId": "123456789012",
        "State": "pending",
        "SubnetIds": [
            "subnet-0752213d59EXAMPLE"
        ],
        "CreationTime": "2019-07-10T17:33:46.000Z",
        "Options": {
            "DnsSupport": "enable",
            "Ipv6Support": "disable"
        }
    }
}
```

For more information, see Transit gateway attachments to a VPC in the *Transit Gateways Guide*.

- For API details, see RejectTransitGatewayVpcAttachment in *AWS CLI Command Reference*.

`reject-vpc-endpoint-connections`

The following code example shows how to use `reject-vpc-endpoint-connections`.

AWS CLI

To reject an interface endpoint connection request

The following `reject-vpc-endpoint-connections` example rejects the specified endpoint connection request for the specified endpoint service.

```
aws ec2 reject-vpc-endpoint-connections \
    --service-id vpce-svc-03d5ebb7d9579a2b3 \
    --vpc-endpoint-ids vpce-0c1308d7312217abc
```

Output:

```
{
    "Unsuccessful": []
}
```

For more information, see Configure an endpoint service in the *AWS PrivateLink User Guide*.

- For API details, see RejectVpcEndpointConnections in *AWS CLI Command Reference*.

`reject-vpc-peering-connection`

The following code example shows how to use `reject-vpc-peering-connection`.

AWS CLI

To reject a VPC peering connection

The following `reject-vpc-peering-connection` example rejects the specified VPC peering connection request.

```
aws ec2 reject-vpc-peering-connection \
    --vpc-peering-connection-id pcx-1a2b3c4d
```

Output:

```
{
    "Return": true
}
```

For more information, see Accept or reject a VPC peering connection in the *Amazon VPC Peering Guide*.

- For API details, see RejectVpcPeeringConnection in *AWS CLI Command Reference*.

`release-address`

The following code example shows how to use `release-address`.

AWS CLI

Example 1: To release an Elastic IP address for EC2-Classic

The following `release-address` example releases an Elastic IP address for use with instances in EC2-Classic.

```
aws ec2 release-address \
    --public-ip 198.51.100.0
```

This command produces no output.

For more information, see Release an Elastic IP address in the *Amazon EC2 User Guide*.

Example 2: To release an Elastic IP address for EC2-VPC

The following `release-address` example releases an Elastic IP address for use with instances in a VPC.

```
aws ec2 release-address \
    --allocation-id eipalloc-64d5890a
```

This command produces no output.

For more information, see Release an Elastic IP address in the *Amazon EC2 User Guide*.

- For API details, see ReleaseAddress in *AWS CLI Command Reference*.

`release-hosts`

The following code example shows how to use `release-hosts`.

AWS CLI

To release a Dedicated host from your account

The following `release-hosts` example releases a Dedicated host from your account. Instances that are on the host must be stopped or terminated before the host can be released.

```
aws ec2 release-hosts \
    --host-ids=h-0029d6e3cacf1b3da
```

Output:

```
{
    "Successful":  [
        "h-0029d6e3cacf1b3da"
    ],
    "Unsuccessful": []
}
```

For more information, see Release an Amazon EC2 Dedicated Host in the *Amazon EC2 User Guide*.

- For API details, see ReleaseHosts in *AWS CLI Command Reference*.

`release-ipam-pool-allocation`

The following code example shows how to use `release-ipam-pool-allocation`.

AWS CLI

To release an IPAM pool allocation

The following `release-ipam-pool-allocation` example releases an IPAM pool allocation. In this example, you're an IPAM delegated admin who tried to delete an IPAM pool but received an error that you cannot delete the pool while the pool has allocations. You are using this command to release a pool allocation.

Note the following:

You can only use this command for custom allocations. To remove an allocation for a resource without deleting the resource, set its monitored state to false using modify-ipam-resource-cidr.To complete this request, you'll need the IPAM pool ID, which you can get with describe-ipam-pools. You'll also need the allocation ID, which you can get with get-ipam-pool-allocations.If you do not want to remove allocations one by one, you can use the `--cascade option` when you delete an IPAM pool to automatically release any allocations in the pool before deleting it.There are a number of prerequisites before running this command. For more information, see Release an allocation in the *Amazon VPC IPAM User Guide*.The `--region` in which you run this command must be the locale of the IPAM pool where the allocation is.

To release the allocation, run the following command.

```
aws ec2 release-ipam-pool-allocation \
    --ipam-pool-id ipam-pool-07bdd12d7c94e4693 \
    --cidr 10.0.0.0/23 \
    --ipam-pool-allocation-id ipam-pool-alloc-0e66a1f730da54791b99465b79e7d1e89 \
    --region us-west-2
```

Output:

```
{
    "Success": true
}
```

Once you release an allocation, you may want to run delete-ipam-pool.

- For API details, see ReleaseIpamPoolAllocation in *AWS CLI Command Reference*.

`replace-iam-instance-profile-association`

The following code example shows how to use `replace-iam-instance-profile-association`.

AWS CLI

To replace an IAM instance profile for an instance

The following `replace-iam-instance-profile-association` example replaces the IAM instance profile represented by the association `iip-assoc-060bae234aac2e7fa` with the IAM instance profile named `AdminRole`.

```
aws ec2 replace-iam-instance-profile-association \
    --iam-instance-profile Name=AdminRole \
    --association-id iip-assoc-060bae234aac2e7fa
```

Output:

```
{
    "IamInstanceProfileAssociation": {
        "InstanceId": "i-087711ddaf98f9489",
        "State": "associating",
        "AssociationId": "iip-assoc-0b215292fab192820",
        "IamInstanceProfile": {
            "Id": "AIPAJLNLDX3AMYZNWYYAY",
            "Arn": "arn:aws:iam::123456789012:instance-profile/AdminRole"
        }
    }
}
```

For more information, see IAM roles for Amazon EC2 in the *Amazon EC2 User Guide*.

- For API details, see ReplaceIamInstanceProfileAssociation in *AWS CLI Command Reference*.

`replace-network-acl-association`

The following code example shows how to use `replace-network-acl-association`.

AWS CLI

To replace the network ACL associated with a subnet

The following `replace-network-acl-association` example associates the specified network ACL with the subnet for the specified network ACL association.

```
aws ec2 replace-network-acl-association \
    --association-id aclassoc-e5b95c8c \
    --network-acl-id acl-5fb85d36
```

Output:

```
{
    "NewAssociationId": "aclassoc-3999875b"
}
```

For more information, see Control subnet traffic with network access control lists in the *Amazon VPC User Guide*.

- For API details, see ReplaceNetworkAclAssociation in *AWS CLI Command Reference*.

`replace-network-acl-entry`

The following code example shows how to use `replace-network-acl-entry`.

AWS CLI

To replace a network ACL entry

The following `replace-network-acl-entry` example replaces an entry for the specified network ACL. The new rule 100 allows ingress traffic from 203.0.113.12/24 on UDP port 53 (DNS) into any associated subnet.

```
aws ec2 replace-network-acl-entry \
    --network-acl-id acl-5fb85d36 \
    --ingress \
    --rule-number 100 \
    --protocol udp \
    --port-range From=53,To=53 \
    --cidr-block 203.0.113.12/24 \
    --rule-action allow
```

This command produces no output.

For more information, see Network ACL rules in the *Amazon VPC User Guide*.

- For API details, see ReplaceNetworkAclEntry in *AWS CLI Command Reference*.

`replace-route-table-association`

The following code example shows how to use `replace-route-table-association`.

AWS CLI

To replace the route table associated with a subnet

The following `replace-route-table-association` example associates the specified route table with the subnet for the specified route table association.

```
aws ec2 replace-route-table-association \
    --association-id rtbassoc-781d0d1a \
    --route-table-id rtb-22574640
```

Output:

```
{
    "NewAssociationId": "rtbassoc-3a1f0f58"
}
```

For more information, see Manage subnet route tables in the *Amazon VPC User Guide*.

- For API details, see ReplaceRouteTableAssociation in *AWS CLI Command Reference*.

`replace-route`

The following code example shows how to use `replace-route`.

AWS CLI

To replace a route

The following `replace-route` example replaces the specified route in the specified route table. The new route matches the specified CIDR and sends the traffic to the specified virtual private gateway.

```
aws ec2 replace-route \
    --route-table-id rtb-22574640 \
    --destination-cidr-block 10.0.0.0/16 \
    --gateway-id vgw-9a4cacf3
```

This command produces no output.

For more information, see Manage subnet route tables in the *Amazon VPC User Guide*.

- For API details, see ReplaceRoute in *AWS CLI Command Reference*.

`replace-transit-gateway-route`

The following code example shows how to use `replace-transit-gateway-route`.

AWS CLI

To replace the specified route in the specified transit gateway route table

The following `replace-transit-gateway-route` example replaces the route in the specified transit gateway route table.

```
aws ec2 replace-transit-gateway-route \
    --destination-cidr-block 10.0.2.0/24 \
    --transit-gateway-attachment-id tgw-attach-09b52ccdb5EXAMPLE \
    --transit-gateway-route-table-id tgw-rtb-0a823edbdeEXAMPLE
```

Output:

```
{
    "Route": {
        "DestinationCidrBlock": "10.0.2.0/24",
        "TransitGatewayAttachments": [
            {
                "ResourceId": "vpc-4EXAMPLE",
                "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
                "ResourceType": "vpc"
            }
        ],
        "Type": "static",
        "State": "active"
```

```
    }
}
```

For more information, see Transit gateway route tables in the *Transit Gateways Guide*.

- For API details, see ReplaceTransitGatewayRoute in *AWS CLI Command Reference*.

`report-instance-status`

The following code example shows how to use `report-instance-status`.

AWS CLI

To report status feedback for an instance

The following `report-instance-status` example reports status feedback for the specified instance.

```
aws ec2 report-instance-status \
    --instances i-1234567890abcdef0 \
    --status impaired \
    --reason-codes unresponsive
```

This command produces no output.

For more information, see Status checks for Amazon EC2 instances in the *Amazon EC2 User Guide*.

- For API details, see ReportInstanceStatus in *AWS CLI Command Reference*.

`request-spot-fleet`

The following code example shows how to use `request-spot-fleet`.

AWS CLI

Example 1: To request a Spot fleet in the subnet with the lowest price

The following `request-spot-fleet` example creates a Spot fleet request with two launch specifications that differ only by subnet. The Spot fleet launches the instances in the specified subnet with the lowest price. If the instances are launched in a default VPC, they receive a

public IP address by default. If the instances are launched in a nondefault VPC, they do not receive a public IP address by default.

Note that you can't specify different subnets from the same Availability Zone in a Spot fleet request.

```
aws ec2 request-spot-fleet \
    --spot-fleet-request-config file://config.json
```

Contents of `config.json`:

```
{
    "SpotPrice": "0.04",
    "TargetCapacity": 2,
    "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "KeyName": "my-key-pair",
            "SecurityGroups": [
                {
                    "GroupId": "sg-1a2b3c4d"
                }
            ],
            "InstanceType": "m3.medium",
            "SubnetId": "subnet-1a2b3c4d, subnet-3c4d5e6f",
            "IamInstanceProfile": {
                "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
            }
        }
    ]
}
```

Output:

```
{
    "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE"
}
```

For more information, see Create a Spot Fleet in the *Amazon EC2 User Guide*.

Example 2: To request a Spot fleet in the Availability Zone with the lowest price

The following `request-spot-fleet` example creates a Spot fleet request with two launch specifications that differ only by Availability Zone. The Spot fleet launches the instances in the specified Availability Zone with the lowest price. If your account supports EC2-VPC only, Amazon EC2 launches the Spot instances in the default subnet of the Availability Zone. If your account supports EC2-Classic, Amazon EC2 launches the instances in EC2-Classic in the Availability Zone.

```
aws ec2 request-spot-fleet \
    --spot-fleet-request-config file://config.json
```

Contents of `config.json`:

```
{
    "SpotPrice": "0.04",
    "TargetCapacity": 2,
    "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "KeyName": "my-key-pair",
            "SecurityGroups": [
                {
                    "GroupId": "sg-1a2b3c4d"
                }
            ],
            "InstanceType": "m3.medium",
            "Placement": {
                "AvailabilityZone": "us-west-2a, us-west-2b"
            },
            "IamInstanceProfile": {
                "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
            }
        }
    ]
}
```

Output:

```
{
    "SpotFleetRequestId": "sfr-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Create a Spot Fleet in the *Amazon EC2 User Guide*.

Example 3: To launch Spot instances in a subnet and assign them public IP addresses

The following `request-spot-fleet` example assigns public addresses to instances launched in a nondefault VPC. Note that when you specify a network interface, you must include the subnet ID and security group ID using the network interface.

```
aws ec2 request-spot-fleet \
    --spot-fleet-request-config file://config.json
```

Contents of `config.json`:

```
{
    "SpotPrice": "0.04",
    "TargetCapacity": 2,
    "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "KeyName": "my-key-pair",
            "InstanceType": "m3.medium",
            "NetworkInterfaces": [
                {
                    "DeviceIndex": 0,
                    "SubnetId": "subnet-1a2b3c4d",
                    "Groups": [
                        "sg-1a2b3c4d"
                    ],
                    "AssociatePublicIpAddress": true
                }
            ],
            "IamInstanceProfile": {
                "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
            }
        }
    ]
}
```

Output:

```
{
```

```
    "SpotFleetRequestId": "sfr-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
}
```

For more information, see Create a Spot Fleet in the *Amazon EC2 User Guide*.

Example 4: To request a Spot fleet using the diversified allocation strategy

The following `request-spot-fleet` example creates a Spot fleet request that launches 30 instances using the diversified allocation strategy. The launch specifications differ by instance type. The Spot fleet distributes the instances across the launch specifications such that there are 10 instances of each type.

```
aws ec2 request-spot-fleet \
    --spot-fleet-request-config file://config.json
```

Contents of `config.json`:

```
{
    "SpotPrice": "0.70",
    "TargetCapacity": 30,
    "AllocationStrategy": "diversified",
    "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "c4.2xlarge",
            "SubnetId": "subnet-1a2b3c4d"
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "m3.2xlarge",
            "SubnetId": "subnet-1a2b3c4d"
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "r3.2xlarge",
            "SubnetId": "subnet-1a2b3c4d"
        }
    ]
}
```

Output:

```
{
    "SpotFleetRequestId": "sfr-a1b2c3d4-5678-90ab-cdef-EXAMPLE44444"
}
```

For more information, see Create a Spot Fleet in the *Amazon EC2 User Guide*.

- For API details, see RequestSpotFleet in *AWS CLI Command Reference*.

`request-spot-instances`

The following code example shows how to use `request-spot-instances`.

AWS CLI

To request Spot Instances

The following `request-spot-instances` example creates a one-time Spot Instance request for five instances in the specified Availability Zone. If your account supports EC2-VPC only, Amazon EC2 launches the instances in the default subnet of the specified Availability Zone. If your account supports EC2-Classic, Amazon EC2 launches the instances in EC2-Classic in the specified Availability Zone.

```
aws ec2 request-spot-instances \
    --spot-price "0.03" \
    --instance-count 5 \
    --type "one-time" \
    --launch-specification file://specification.json
```

Contents of `specification.json`:

```
{
    "ImageId": "ami-1a2b3c4d",
    "KeyName": "my-key-pair",
    "SecurityGroupIds": [
        "sg-1a2b3c4d"
    ],
    "InstanceType": "m3.medium",
    "Placement": {
        "AvailabilityZone": "us-west-2a"
    },
    "IamInstanceProfile": {
        "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
```

```
    }
}
```

Output:

```
{
    "SpotInstanceRequests": [
        {
            "Status": {
                "UpdateTime": "2014-03-25T20:54:21.000Z",
                "Code": "pending-evaluation",
                "Message": "Your Spot request has been submitted for review, and is
 pending evaluation."
            },
            "ProductDescription": "Linux/UNIX",
            "SpotInstanceRequestId": "sir-df6f405d",
            "State": "open",
            "LaunchSpecification": {
                "Placement": {
                    "AvailabilityZone": "us-west-2a"
                },
                "ImageId": "ami-1a2b3c4d",
                "KeyName": "my-key-pair",
                "SecurityGroups": [
                    {
                        "GroupName": "my-security-group",
                        "GroupId": "sg-1a2b3c4d"
                    }
                ],
                "Monitoring": {
                    "Enabled": false
                },
                "IamInstanceProfile": {
                    "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
                },
                "InstanceType": "m3.medium"
            },
            "Type": "one-time",
            "CreateTime": "2014-03-25T20:54:20.000Z",
            "SpotPrice": "0.050000"
        }
    ]
}
```

For more information, see Create a Spot Instance request in the *Amazon EC2 User Guide*.

The following `request-spot-instances` example creates a one-time Spot Instance request for five instances in the specified subnet. Amazon EC2 launches the instances in the specified subnet. If the VPC is a nondefault VPC, the instances do not receive a public IP address by default.

```
aws ec2 request-spot-instances \
    --spot-price "0.050" \
    --instance-count 5 \
    --type "one-time" \
    --launch-specification file://specification.json
```

Contents of `specification.json`:

```
{
    "ImageId": "ami-1a2b3c4d",
    "SecurityGroupIds": [
        "sg-1a2b3c4d"
    ],
    "InstanceType": "m3.medium",
    "SubnetId": "subnet-1a2b3c4d",
    "IamInstanceProfile": {
        "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
    }
}
```

Output:

```
{
    "SpotInstanceRequests": [
        {
            "Status": {
                "UpdateTime": "2014-03-25T22:21:58.000Z",
                "Code": "pending-evaluation",
                "Message": "Your Spot request has been submitted for review, and is
 pending evaluation."
            },
            "ProductDescription": "Linux/UNIX",
            "SpotInstanceRequestId": "sir-df6f405d",
            "State": "open",
            "LaunchSpecification": {
```

```
                "Placement": {
                    "AvailabilityZone": "us-west-2a"
                },
                "ImageId": "ami-1a2b3c4d",
                "SecurityGroups": [
                    {
                        "GroupName": "my-security-group",
                        "GroupId": "sg-1a2b3c4d"
                    }
                ],
                "SubnetId": "subnet-1a2b3c4d",
                "Monitoring": {
                    "Enabled": false
                },
                "IamInstanceProfile": {
                    "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
                },
                "InstanceType": "m3.medium"
            },
            "Type": "one-time",
            "CreateTime": "2014-03-25T22:21:58.000Z",
            "SpotPrice": "0.050000"
        }
    ]
}
```

For more information, see Create a Spot Instance request in the *Amazon EC2 User Guide*.

The following `request-spot-instances` example assigns a public IP address to the Spot Instances that you launch in a nondefault VPC. Note that when you specify a network interface, you must include the subnet ID and security group ID using the network interface.

```
aws ec2 request-spot-instances \
    --spot-price "0.050" \
    --instance-count 1 \
    --type "one-time" \
    --launch-specification file://specification.json
```

Contents of `specification.json`:

```
{
    "ImageId": "ami-1a2b3c4d",
    "KeyName": "my-key-pair",
```

```
    "InstanceType": "m3.medium",
    "NetworkInterfaces": [
        {
            "DeviceIndex": 0,
            "SubnetId": "subnet-1a2b3c4d",
            "Groups": [
                "sg-1a2b3c4d"
            ],
            "AssociatePublicIpAddress": true
        }
    ],
    "IamInstanceProfile": {
        "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
    }
}
```

For more information, see Create a Spot Instance request in the *Amazon EC2 User Guide*.

- For API details, see RequestSpotInstances in *AWS CLI Command Reference*.

`reset-address-attribute`

The following code example shows how to use `reset-address-attribute`.

AWS CLI

To reset the domain name attribute associated with an elastic IP address

The following `reset-address-attribute` examples reset the domain name attribute of an elastic IP address.

For Linux, use the following command.

```
aws ec2 reset-address-attribute \
    --allocation-id eipalloc-abcdef01234567890 \
    --attribute domain-name
```

For Windows, use the following command.

```
aws ec2 reset-address-attribute ^
    --allocation-id eipalloc-abcdef01234567890 ^
    --attribute domain-name
```

Output:

```
{
    "Address": {
        "PublicIp": "192.0.2.0",
        "AllocationId": "eipalloc-abcdef01234567890",
        "PtrRecord": "example.com.",
        "PtrRecordUpdate": {
            "Value": "example.net.",
            "Status": "PENDING"
        }
    }
}
```

To monitor the pending change, see describe-addresses-attribute in the *AWS CLI Command Reference*.

For more information, see Create a reverse DNS record for email on Amazon EC2 in the *Amazon EC2 User Guide*.

- For API details, see ResetAddressAttribute in *AWS CLI Command Reference*.

`reset-ebs-default-kms-key-id`

The following code example shows how to use `reset-ebs-default-kms-key-id`.

AWS CLI

To reset your default CMK for EBS encryption

The following `reset-ebs-default-kms-key-id` example resets the default CMK for EBS encryption for your AWS account in the current Region.

```
aws ec2 reset-ebs-default-kms-key-id
```

Output:

```
{
    "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111"
}
```

For more information, see Enable Amazon EBS encryption by default in the *Amazon EBS User Guide*.

- For API details, see ResetEbsDefaultKmsKeyId in *AWS CLI Command Reference*.

`reset-fpga-image-attribute`

The following code example shows how to use `reset-fpga-image-attribute`.

AWS CLI

To reset the attributes of an Amazon FPGA image

The following `reset-fpga-image-attribute` example resets the load permissions for the specified AFI.

```
aws ec2 reset-fpga-image-attribute \
    --fpga-image-id afi-0d123e123bfc85abc \
    --attribute loadPermission
```

Output:

```
{
    "Return": true
}
```

For more information, see Specifications for Amazon EC2 accelerated computing instances in the *Amazon EC2 Instance Types Guide*.

- For API details, see ResetFpgaImageAttribute in *AWS CLI Command Reference*.

`reset-image-attribute`

The following code example shows how to use `reset-image-attribute`.

AWS CLI

To reset the launchPermission attribute

The following `reset-image-attribute` example resets the `launchPermission` attribute for the specified AMI to its default value. By default, AMIs are private.

```
aws ec2 reset-image-attribute \
    --image-id ami-5731123e \
    --attribute launchPermission
```

This command produces no output.

For more information, see Share an AMI with specific AWS accounts in the *Amazon EC2 User Guide*.

- For API details, see ResetImageAttribute in *AWS CLI Command Reference*.

`reset-instance-attribute`

The following code example shows how to use `reset-instance-attribute`.

AWS CLI

Example 1: To reset the sourceDestCheck attribute

The following `reset-instance-attribute` example resets the `sourceDestCheck` attribute of the specified instance. The instance must be in a VPC.

```
aws ec2 reset-instance-attribute \
    --instance-id i-1234567890abcdef0 \
    --attribute sourceDestCheck
```

This command produces no output.

For more information, see NAT instances in the *Amazon VPC User Guide*.

Example 2: To reset the kernel attribute

The following `reset-instance-attribute` example resets the `kernel` attribute of the specified instance. The instance must be in the `stopped` state.

```
aws ec2 reset-instance-attribute \
    --instance-id i-1234567890abcdef0 \
    --attribute kernel
```

This command produces no output.

For more information, see User provided kernels in the *Amazon Linux 2 User Guide*.

Example 3: To reset the ramdisk attribute

The following `reset-instance-attribute` example resets the `ramdisk` attribute of the specified instance. The instance must be in the `stopped` state.

```
aws ec2 reset-instance-attribute \
    --instance-id i-1234567890abcdef0 \
    --attribute ramdisk
```

This command produces no output.

For more information, see User provided kernels in the *Amazon Linux 2 User Guide*.

- For API details, see ResetInstanceAttribute in *AWS CLI Command Reference*.

`reset-network-interface-attribute`

The following code example shows how to use `reset-network-interface-attribute`.

AWS CLI

To reset a network interface attribute

The following `reset-network-interface-attribute` example resets the value of the source/destination checking attribute to `true`.

```
aws ec2 reset-network-interface-attribute \
    --network-interface-id eni-686ea200 \
    --source-dest-check sourceDestCheck
```

This command produces no output.

For more information, see Modify network interface attributes in the *Amazon EC2 User Guide*.

- For API details, see ResetNetworkInterfaceAttribute in *AWS CLI Command Reference*.

`reset-snapshot-attribute`

The following code example shows how to use `reset-snapshot-attribute`.

AWS CLI

To reset a snapshot attribute

The following `reset-snapshot-attribute` example resets the create volume permissions for snapshot `snap-1234567890abcdef0`.

```
aws ec2 reset-snapshot-attribute \
    --snapshot-id snap-1234567890abcdef0 \
    --attribute createVolumePermission
```

This command produces no output.

For more information, see Share an Amazon EBS snapshot with other AWS accounts in the *Amazon EBS User Guide*.

- For API details, see ResetSnapshotAttribute in *AWS CLI Command Reference*.

`restore-address-to-classic`

The following code example shows how to use `restore-address-to-classic`.

AWS CLI

To restore an address to EC2-Classic

The following `restore-address-to-classic` example restores Elastic IP address 198.51.100.0 to the EC2-Classic platform.

```
aws ec2 restore-address-to-classic \
    --public-ip 198.51.100.0
```

Output:

```
{
    "Status": "MoveInProgress",
    "PublicIp": "198.51.100.0"
}
```

For more information, see Elastic IP addresses in the *Amazon EC2 User Guide*.

- For API details, see RestoreAddressToClassic in *AWS CLI Command Reference*.

`restore-image-from-recycle-bin`

The following code example shows how to use `restore-image-from-recycle-bin`.

AWS CLI

To restore an image from the Recycle Bin

The following `restore-image-from-recycle-bin` example restores AMI ami-0111222333444abcd from the Recycle Bin.

```
aws ec2 restore-image-from-recycle-bin \
    --image-id ami-0111222333444abcd
```

Output:

```
{
    "Return": true
}
```

For more information, see Recover deleted AMIs from the Recycle Bin in the *Amazon EBS User Guide*.

- For API details, see RestoreImageFromRecycleBin in *AWS CLI Command Reference*.

`restore-managed-prefix-list-version`

The following code example shows how to use `restore-managed-prefix-list-version`.

AWS CLI

To restore a prefix list version

The following `restore-managed-prefix-list-version` example restores the entries from version 1 of the specified prefix list.

```
aws ec2 restore-managed-prefix-list-version \
    --prefix-list-id pl-0123456abcabcabc1 \
    --current-version 2 \
    --previous-version 1
```

Output:

```
{
    "PrefixList": {
```

```
        "PrefixListId": "pl-0123456abcabcabc1",
        "AddressFamily": "IPv4",
        "State": "restore-in-progress",
        "PrefixListArn": "arn:aws:ec2:us-west-2:123456789012:prefix-list/
pl-0123456abcabcabc1",
        "PrefixListName": "vpc-cidrs",
        "MaxEntries": 10,
        "Version": 2,
        "OwnerId": "123456789012"
    }
}
```

For more information, see Managed prefix lists in the *Amazon VPC User Guide*.

- For API details, see RestoreManagedPrefixListVersion in *AWS CLI Command Reference*.

`restore-snapshot-from-recycle-bin`

The following code example shows how to use `restore-snapshot-from-recycle-bin`.

AWS CLI

To restore snapshots from the Recycle Bin

The following `restore-snapshot-from-recycle-bin` example restores a snapshot from the Recycle Bin. When you restore a snapshot from the Recycle Bin, the snapshot is immediately available for use, and it is removed from the Recycle Bin. You can use a restored snapshot in the same way that you use any other snapshot in your account.

```
aws ec2 restore-snapshot-from-recycle-bin \
    --snapshot-id snap-01234567890abcdef
```

Output:

```
{
    "SnapshotId": "snap-01234567890abcdef",
    "Description": "Monthly data backup snapshot",
    "Encrypted": false,
    "OwnerId": "123456789012",
    "Progress": "99%",
    "StartTime": "2021-12-01T13:00:00.000000+00:00",
    "State": "recovering",
```

```
    "VolumeId": "vol-ffffffff",
    "VolumeSize": 30
}
```

For more information about Recycle Bin, see Recover deleted snapshots from the Recycle Bin in the *Amazon EBS User Guide*.

- For API details, see RestoreSnapshotFromRecycleBin in *AWS CLI Command Reference*.

`restore-snapshot-tier`

The following code example shows how to use `restore-snapshot-tier`.

AWS CLI

Example 1: To permanently restore an archived snapshot

The following `restore-snapshot-tier` example permanently restores the specified snapshot. Specify the `--snapshot-id` and include the `permanent-restore` option.

```
aws ec2 restore-snapshot-tier \
    --snapshot-id snap-01234567890abcedf \
    --permanent-restore
```

Output:

```
{
    "SnapshotId": "snap-01234567890abcedf",
    "IsPermanentRestore": true
}
```

For more information about snapshot archiving, see Archive Amazon EBS snapshots in the *Amazon EBS User Guide*.

Example 2: To temporarily restore an archived snapshot

The following `restore-snapshot-tier` example temporarily restores the specified snapshot. Omit the `--permanent-restore` option. Specify the `--snapshot-id` and, for `temporary-restore-days`, specify the number of days for which to restore the snapshot. `temporary-restore-days` must be specified in days. The allowed range is 1 to 180. If you do not specify a value, it defaults to 1 day.

```
aws ec2 restore-snapshot-tier \
    --snapshot-id snap-01234567890abcedf \
    --temporary-restore-days 5
```

Output:

```
{
    "SnapshotId": "snap-01234567890abcedf",
    "RestoreDuration": 5,
    "IsPermanentRestore": false
}
```

For more information about snapshot archiving, see Archive Amazon EBS snapshots in the *Amazon EBS User Guide*.

Example 3: To modify the restore period

The following `restore-snapshot-tier` example changes the restore period for the specified snapshot to 10 days.

```
aws ec2 restore-snapshot-tier \
    --snapshot-id snap-01234567890abcedf \
    --temporary-restore-days 10
```

Output:

```
{
    "SnapshotId": "snap-01234567890abcedf",
    "RestoreDuration": 10,
    "IsPermanentRestore": false
}
```

For more information about snapshot archiving, see Archive Amazon EBS snapshots in the *Amazon EBS User Guide*.

Example 4: To modify the restore type

The following `restore-snapshot-tier` example changes the restore type for the specified snapshot from temporary to permanent.

```
aws ec2 restore-snapshot-tier \
```

```
    --snapshot-id snap-01234567890abcedf \
    --permanent-restore
```

Output:

```
{
    "SnapshotId": "snap-01234567890abcedf",
    "IsPermanentRestore": true
}
```

For more information about snapshot archiving, see Archive Amazon EBS snapshots in the *Amazon EBS User Guide*.

- For API details, see RestoreSnapshotTier in *AWS CLI Command Reference*.

`revoke-client-vpn-ingress`

The following code example shows how to use `revoke-client-vpn-ingress`.

AWS CLI

To revoke an authorization rule for a Client VPN endpoint

The following `revoke-client-vpn-ingress` example revokes a rule for internet access (`0.0.0.0/0`) for all groups.

```
aws ec2 revoke-client-vpn-ingress \
    --client-vpn-endpoint-id cvpn-endpoint-123456789abcabcde \
    --target-network-cidr 0.0.0.0/0 \
    --revoke-all-groups
```

Output:

```
{
    "Status": {
        "Code": "revoking"
    }
}
```

For more information, see Authorization Rules in the *AWS Client VPN Administrator Guide*.

- For API details, see RevokeClientVpnIngress in *AWS CLI Command Reference*.

`revoke-security-group-egress`

The following code example shows how to use `revoke-security-group-egress`.

AWS CLI

Example 1: To remove the rule that allows outbound traffic to a specific address range

The following `revoke-security-group-egress` example command removes the rule that grants access to the specified address ranges on TCP port 80.

```
aws ec2 revoke-security-group-egress \
    --group-id sg-026c12253ce15eff7 \
    --ip-permissions
 'IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges=[{CidrIp=10.0.0.0/16}]'
```

This command produces no output.

For more information, see Security groups in the *Amazon EC2 User Guide*.

Example 2: To remove the rule that allows outbound traffic to a specific security group

The following `revoke-security-group-egress` example command removes the rule that grants access to the specified security group on TCP port 80.

```
aws ec2 revoke-security-group-egress \
    --group-id sg-026c12253ce15eff7 \
    --ip-permissions '[{"IpProtocol": "tcp", "FromPort": 443, "ToPort":
 443,"UserIdGroupPairs": [{"GroupId": "sg-06df23a01ff2df86d"}]}]'
```

This command produces no output.

For more information, see Security groups in the *Amazon EC2 User Guide*.

- For API details, see RevokeSecurityGroupEgress in *AWS CLI Command Reference*.

`revoke-security-group-ingress`

The following code example shows how to use `revoke-security-group-ingress`.

AWS CLI

Example 1: To remove a rule from a security group

The following `revoke-security-group-ingress` example removes TCP port 22 access for the `203.0.113.0/24` address range from the specified security group for a default VPC.

```
aws ec2 revoke-security-group-ingress \
    --group-name mySecurityGroup \
    --protocol tcp \
    --port 22 \
    --cidr 203.0.113.0/24
```

Output:

```
{
    "Return": true,
    "RevokedSecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-0abcdef1234567890",
            "GroupId": "sg-1234567890abcdef0",
            "IsEgress": false,
            "IpProtocol": "tcp",
            "FromPort": 22,
            "ToPort": 22,
            "CidrIpv4": "203.0.113.0/24"
        }
    ]
}
```

For more information, see Security groups in the *Amazon EC2 User Guide*.

Example 2: To remove a rule using the IP permissions set

The following `revoke-security-group-ingress` example uses the `ip-permissions` parameter to remove an inbound rule that allows the ICMP message `Destination Unreachable: Fragmentation Needed and Don't Fragment was Set` (Type 3, Code 4).

```
aws ec2 revoke-security-group-ingress \
    --group-id sg-026c12253ce15eff7 \
```

```
    --ip-
permissions IpProtocol=icmp,FromPort=3,ToPort=4,IpRanges=[{CidrIp=0.0.0.0/0}]
```

Output:

```
{
    "Return": true,
    "RevokedSecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-0fedcba9876543210",
            "GroupId": "sg-026c12253ce15eff7",
            "IsEgress": false,
            "IpProtocol": "icmp",
            "FromPort": 3,
            "ToPort": 4,
            "CidrIpv4": "0.0.0.0/0"
        }
    ]
}
```

For more information, see Security groups in the *Amazon EC2 User Guide*.

- For API details, see RevokeSecurityGroupIngress in *AWS CLI Command Reference*.

`run-instances`

The following code example shows how to use `run-instances`.

AWS CLI

Example 1: To launch an instance into a default subnet

The following `run-instances` example launches a single instance of type `t2.micro` into the default subnet for the current Region and associates it with the default subnet for the default VPC for the Region. The key pair is optional if you do not plan to connect to your instance using SSH (Linux) or RDP (Windows).

```
aws ec2 run-instances \
    --image-id ami-0abcdef1234567890 \
    --instance-type t2.micro \
    --key-name MyKeyPair
```

Output:

```
{
    "Instances": [
        {
            "AmiLaunchIndex": 0,
            "ImageId": "ami-0abcdef1234567890",
            "InstanceId": "i-1231231230abcdef0",
            "InstanceType": "t2.micro",
            "KeyName": "MyKeyPair",

```

Example 2: To launch an instance into a non-default subnet and add a public IP address

The following `run-instances` example requests a public IP address for an instance that you're launching into a nondefault subnet. The instance is associated with the specified security group.

```
aws ec2 run-instances \
    --image-id ami-0abcdef1234567890 \
    --instance-type t2.micro \
    --subnet-id subnet-08fc749671b2d077c \
    --security-group-ids sg-0b0384b66d7d692f9 \
    --associate-public-ip-address \
    --key-name MyKeyPair
```

Output:

```
{
    "Instances": [
        {
            "AmiLaunchIndex": 0,
            "ImageId": "ami-0abcdef1234567890",
            "InstanceId": "i-1234567890abcdef2",
            "InstanceType": "t2.micro",
            "KeyName": "MyKeyPair",
            "LaunchTime": "2018-05-10T08:05:20.000Z",
            "Monitoring": {
```

```
                "State": "disabled"
            },
            "Placement": {
                "AvailabilityZone": "us-west-2a",
                "GroupName": "",
                "Tenancy": "default"
            },
            "PrivateDnsName": "ip-10-0-0-162.us-west-2.compute.internal",

                    "MacAddress": "0a:ab:58:e0:67:e3",
                    "NetworkInterfaceId": "eni-0c0a29997760baee2",
                    "OwnerId": "123456789012",
                    "PrivateDnsName": "ip-10-0-0-162.us-west-2.compute.internal",
```

```
                    "PrivateIpAddress": "10.0.0.162",
                    "PrivateIpAddresses": [
                        {
                            "Primary": true,
                            "PrivateDnsName": "ip-10-0-0-162.us-
west-2.compute.internal",
                            "PrivateIpAddress": "10.0.0.162"
                        }
                    ],
                    "SourceDestCheck": true,
                    "Status": "in-use",
                    "SubnetId": "subnet-08fc749671b2d077c",
                    "VpcId": "vpc-1234567890abcdef0",
                    "InterfaceType": "interface"
                }
            ],
            "RootDeviceName": "/dev/xvda",
            "RootDeviceType": "ebs",
            "SecurityGroups": [
                {
                    "GroupName": "MySecurityGroup",
                    "GroupId": "sg-0b0384b66d7d692f9"
                }
            ],
            "SourceDestCheck": true,
            "StateReason": {
                "Code": "pending",
                "Message": "pending"
            },
            "Tags": [],
            "VirtualizationType": "hvm",
            "CpuOptions": {
                "CoreCount": 1,
                "ThreadsPerCore": 1
            },
            "CapacityReservationSpecification": {
                "CapacityReservationPreference": "open"
            },
            "MetadataOptions": {
                "State": "pending",
                "HttpTokens": "optional",
                "HttpPutResponseHopLimit": 1,
                "HttpEndpoint": "enabled"
            }
```

```
        }
    ],
    "OwnerId": "123456789012",
    "ReservationId": "r-02a3f596d91211702"
}
```

Example 3: To launch an instance with additional volumes

The following `run-instances` example uses a block device mapping, specified in mapping.json, to attach additional volumes at launch. A block device mapping can specify EBS volumes, instance store volumes, or both EBS volumes and instance store volumes.

```
aws ec2 run-instances \
    --image-id ami-0abcdef1234567890 \
    --instance-type t2.micro \
    --subnet-id subnet-08fc749671b2d077c \
    --security-group-ids sg-0b0384b66d7d692f9 \
    --key-name MyKeyPair \
    --block-device-mappings file://mapping.json
```

The following mapping adds `/dev/sdh` as an empty EBS volume with a size of 100 GiB.

Contents of `mapping.json`:

```
[
    {
        "DeviceName": "/dev/sdh",
        "Ebs": {
            "VolumeSize": 100
        }
    }
]
```

Alternatively, the following mapping adds `ephemeral1` as an instance store volume.

Contents of `mapping.json`:

```
[
    {
        "DeviceName": "/dev/sdc",
        "VirtualName": "ephemeral1"
    }
```

```
]
```

Output:

```
{
    "Instances": [
        {
            "AmiLaunchIndex": 0,

For more information about block device mappings, see Block device mapping in the *Amazon EC2 User Guide*.

Example 4: To launch an instance and add tags on creation

The following `run-instances` example adds a tag with a key of `webserver` and value of `production` to the instance. The command also applies a tag with a key of `cost-center` and a value of `cc123` to any EBS volume that's created (in this case, the root volume).

```
aws ec2 run-instances \
    --image-id ami-0abcdef1234567890 \
    --instance-type t2.micro \
    --count 1 \
    --subnet-id subnet-08fc749671b2d077c \
    --key-name MyKeyPair \
    --security-group-ids sg-0b0384b66d7d692f9 \
    --tag-specifications
 'ResourceType=instance,Tags=[{Key=webserver,Value=production}]'
 'ResourceType=volume,Tags=[{Key=cost-center,Value=cc123}]'
```

Output:

```
{
    "Instances": [
        {
            "AmiLaunchIndex": 0,
            "ImageId": "ami-0abcdef1234567890",

}
```

Example 5: To launch an instance with user data

The following `run-instances` example passes user data in a file called `my_script.txt` that contains a configuration script for your instance. The script runs at launch.

```
aws ec2 run-instances \
    --image-id ami-0abcdef1234567890 \
    --instance-type t2.micro \
    --count 1 \
    --subnet-id subnet-08fc749671b2d077c \
    --key-name MyKeyPair \
    --security-group-ids sg-0b0384b66d7d692f9 \
    --user-data file://my_script.txt
```

Contents of `my_script.txt`:

```
#!/bin/bash
yum update -y
yum install -y httpd
systemctl start httpd
```

```
systemctl enable httpd
```

Output:

```
{
    "Instances": [
        {
            "AmiLaunchIndex": 0,
            "ImageId": "ami-0abcdef1234567890",

                "HttpEndpoint": "enabled"
            }
        }
    ],
    "OwnerId": "123456789012",
    "ReservationId": "r-02a3f596d91211705"
}
```

For more information about instance user data, see Run commands when you launch an EC2 instance with user data input in the *Amazon EC2 User Guide*.

Example 6: To launch a burstable performance instance

The following `run-instances` example launches a t2.micro instance with the `unlimited` credit option. When you launch a T2 instance, if you do not specify `--credit-specification`, the default is the `standard` credit option. When you launch a T3 instance, the default is the `unlimited` credit option.

```
aws ec2 run-instances \
    --image-id ami-0abcdef1234567890 \
    --instance-type t2.micro \
    --count 1 \
    --subnet-id subnet-08fc749671b2d077c \
    --key-name MyKeyPair \
    --security-group-ids sg-0b0384b66d7d692f9 \
    --credit-specification CpuCredits=unlimited
```

Output:

```
{
    "Instances": [
        {
            "AmiLaunchIndex": 0,
            "ImageId": "ami-0abcdef1234567890",

}
```

For more information about burstable performance instances, see Burstable performance instances in the *Amazon EC2 User Guide*.

- For API details, see RunInstances in *AWS CLI Command Reference*.

`run-scheduled-instances`

The following code example shows how to use `run-scheduled-instances`.

AWS CLI

To launch a Scheduled Instance

The following `run-scheduled-instances` example launches the specified Scheduled Instance in a VPC.

```
aws ec2 run-scheduled-instances \
    --scheduled-instance-id sci-1234-1234-1234-1234-123456789012 \
    --instance-count 1 \
    --launch-specification file://launch-specification.json
```

Contents of `launch-specification.json`:

```
{
    "ImageId": "ami-12345678",
```

```
    "KeyName": "my-key-pair",
    "InstanceType": "c4.large",
    "NetworkInterfaces": [
        {
            "DeviceIndex": 0,
            "SubnetId": "subnet-12345678",
            "AssociatePublicIpAddress": true,
            "Groups": [
                "sg-12345678"
            ]
        }
    ],
    "IamInstanceProfile": {
        "Name": "my-iam-role"
    }
}
```

Output:

```
{
    "InstanceIdSet": [
        "i-1234567890abcdef0"
    ]
}
```

For more information, see Amazon EC2 billing and purchasing options in the *Amazon EC2 User Guide*.

The following `run-scheduled-instances` example launches the specified Scheduled Instance in EC2-Classic.

```
aws ec2 run-scheduled-instances \
    --scheduled-instance-id sci-1234-1234-1234-1234-123456789012 \
    --instance-count 1 \
    --launch-specification file://launch-specification.json
```

Contents of `launch-specification.json`:

```
{
    "ImageId": "ami-12345678",
    "KeyName": "my-key-pair",
    "SecurityGroupIds": [
```

```
        "sg-12345678"
    ],
    "InstanceType": "c4.large",
    "Placement": {
        "AvailabilityZone": "us-west-2b"
    },
    "IamInstanceProfile": {
        "Name": "my-iam-role"
    }
}
```

Output:

```
{
    "InstanceIdSet": [
        "i-1234567890abcdef0"
    ]
}
```

For more information, see Amazon EC2 billing and purchasing options in the *Amazon EC2 User Guide*.

- For API details, see RunScheduledInstances in *AWS CLI Command Reference*.

`search-local-gateway-routes`

The following code example shows how to use `search-local-gateway-routes`.

AWS CLI

To search for routes in a local gateway route table

The following `search-local-gateway-routes` example searches for static routes in the specified local gateway route table.

```
aws ec2 search-local-gateway-routes \
    --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE \
    --filters "Name=type,Values=static"
```

Output:

```
{
```

```
    "Routes": [
        {
            "DestinationCidrBlock": "0.0.0.0/0",
            "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
            "Type": "static",
            "State": "deleted",
            "LocalGatewayRouteTableId": "lgw-rtb-059615ef7EXAMPLE"
        }
    ]
}
```

For more information, see Local gateway route tables in the *AWS Outposts User Guide*.

- For API details, see SearchLocalGatewayRoutes in *AWS CLI Command Reference*.

`search-transit-gateway-multicast-groups`

The following code example shows how to use `search-transit-gateway-multicast-groups`.

AWS CLI

To search one or more transit gateway multicast groups and return the group membership information

The following `search-transit-gateway-multicast-groups` example returns the group membership of the specified multicast group.

```
aws ec2 search-transit-gateway-multicast-groups \
    --transit-gateway-multicast-domain-id tgw-mcast-domain-000fb24d04EXAMPLE
```

Output:

```
{
    "MulticastGroups": [
        {
            "GroupIpAddress": "224.0.1.0",
            "TransitGatewayAttachmentId": "tgw-attach-0372e72386EXAMPLE",
            "SubnetId": "subnet-0187aff814EXAMPLE",
            "ResourceId": "vpc-0065acced4EXAMPLE",
            "ResourceType": "vpc",
            "NetworkInterfaceId": "eni-03847706f6EXAMPLE",
            "GroupMember": false,
```

```
            "GroupSource": true,
            "SourceType": "static"
        }
    ]
}
```

For more information, see Multicast on transit gateways in the *Transit Gateways Guide*.

- For API details, see SearchTransitGatewayMulticastGroups in *AWS CLI Command Reference*.

`search-transit-gateway-routes`

The following code example shows how to use `search-transit-gateway-routes`.

AWS CLI

To search for routes in the specified transit gateway route table

The following `search-transit-gateway-routes` example returns all the routes that are of type `static` in the specified route table.

```
aws ec2 search-transit-gateway-routes \
    --transit-gateway-route-table-id tgw-rtb-0a823edbdeEXAMPLE \
    --filters "Name=type,Values=static"
```

Output:

```
{
    "Routes": [
        {
            "DestinationCidrBlock": "10.0.2.0/24",
            "TransitGatewayAttachments": [
                {
                    "ResourceId": "vpc-4EXAMPLE",
                    "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
                    "ResourceType": "vpc"
                }
            ],
            "Type": "static",
            "State": "active"
        },
        {
            "DestinationCidrBlock": "10.1.0.0/24",
```

```
            "TransitGatewayAttachments": [
                {
                    "ResourceId": "vpc-4EXAMPLE",
                    "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
                    "ResourceType": "vpc"
                }
            ],
            "Type": "static",
            "State": "active"
        }
    ],
    "AdditionalRoutesAvailable": false
}
```

For more information, see Transit gateway route tables in the *Transit Gateways Guide*.

- For API details, see SearchTransitGatewayRoutes in *AWS CLI Command Reference*.

`send-diagnostic-interrupt`

The following code example shows how to use `send-diagnostic-interrupt`.

AWS CLI

To send a diagnostic interrupt

The following `send-diagnostic-interrupt` example sends a diagnostic interrupt to the specified instance.

```
aws ec2 send-diagnostic-interrupt \
    --instance-id i-1234567890abcdef0
```

This command produces no output.

For more information, see Send a diagnostic interrupt to debug an unreachable Amazon EC2 instance in the *Amazon EC2 User Guide*.

- For API details, see SendDiagnosticInterrupt in *AWS CLI Command Reference*.

`start-instances`

The following code example shows how to use `start-instances`.

AWS CLI

To start an Amazon EC2 instance

The following `start-instances` example starts the specified Amazon EBS-backed instance.

```
aws ec2 start-instances \
    --instance-ids i-1234567890abcdef0
```

Output:

```
{
    "StartingInstances": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "CurrentState": {
                "Code": 0,
                "Name": "pending"
            },
            "PreviousState": {
                "Code": 80,
                "Name": "stopped"
            }
        }
    ]
}
```

For more information, see Stop and start Amazon EC2 instances in the *Amazon EC2 User Guide*.

- For API details, see StartInstances in *AWS CLI Command Reference*.

`start-network-insights-access-scope-analysis`

The following code example shows how to use `start-network-insights-access-scope-analysis`.

AWS CLI

To start a Network Insights access scope analysis

The following `start-network-insights-access-scope-analysis` example starts the scope analysis in your AWS account.

```
aws ec2 start-network-insights-access-scope-analysis \
    --network-insights-access-scope-id nis-123456789111
```

Output:

```
{
    "NetworkInsightsAccessScopeAnalysis": {
        "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789222",
        "NetworkInsightsAccessScopeAnalysisArn": "arn:aws:ec2:us-
west-2:123456789012:network-insights-access-scope-analysis/nisa-123456789222",
        "NetworkInsightsAccessScopeId": "nis-123456789111",
        "Status": "running",
        "StartDate": "2022-01-26T00:47:06.814000+00:00"
    }
}
```

For more information, see Getting started with Network Access Analyzer using the AWS CLI in the *Network Access Analyzer Guide*.

- For API details, see StartNetworkInsightsAccessScopeAnalysis in *AWS CLI Command Reference*.

`start-network-insights-analysis`

The following code example shows how to use `start-network-insights-analysis`.

AWS CLI

To analyze a path

The following `start-network-insights-analysis` example analyzes the path between the source and destination. To view the results of the path analysis, use the `describe-network-insights-analyses` command.

```
aws ec2 start-network-insights-analysis \
    --network-insights-path-id nip-0b26f224f1d131fa8
```

Output:

```
{
    "NetworkInsightsAnalysis": {
```

```
        "NetworkInsightsAnalysisId": "nia-02207aa13eb480c7a",
        "NetworkInsightsAnalysisArn": "arn:aws:ec2:us-west-2:123456789012:network-
insights-analysis/nia-02207aa13eb480c7a",
        "NetworkInsightsPathId": "nip-0b26f224f1d131fa8",
        "StartDate": "2021-01-20T22:58:37.495Z",
        "Status": "running"
    }
}
```

For more information, see Getting started using the AWS CLI in the *Reachability Analyzer Guide*.

- For API details, see StartNetworkInsightsAnalysis in *AWS CLI Command Reference*.

`start-vpc-endpoint-service-private-dns-verification`

The following code example shows how to use `start-vpc-endpoint-service-private-dns-verification`.

AWS CLI

To initiate the DNS verification process

The following `start-vpc-endpoint-service-private-dns-verification` example initiates the DNS verification process for the specified endpoint service.

```
aws ec2 start-vpc-endpoint-service-private-dns-verification \
    --service-id vpce-svc-071afff70666e61e0
```

This command produces no output.

For more information, see Manage DNS names in the *AWS PrivateLink User Guide*.

- For API details, see StartVpcEndpointServicePrivateDnsVerification in *AWS CLI Command Reference*.

`stop-instances`

The following code example shows how to use `stop-instances`.

AWS CLI

Example 1: To stop an Amazon EC2 instance

The following `stop-instances` example stops the specified Amazon EBS-backed instance.

```
aws ec2 stop-instances \
    --instance-ids i-1234567890abcdef0
```

Output:

```
{
    "StoppingInstances": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "CurrentState": {
                "Code": 64,
                "Name": "stopping"
            },
            "PreviousState": {
                "Code": 16,
                "Name": "running"
            }
        }
    ]
}
```

For more information, see Stop and Start Your Instance in the *Amazon Elastic Compute Cloud User Guide*.

Example 2: To hibernate an Amazon EC2 instance

The following `stop-instances` example hibernates Amazon EBS-backed instance if the instance is enabled for hibernation and meets the hibernation prerequisites. After the instance is put into hibernation the instance is stopped.

```
aws ec2 stop-instances \
    --instance-ids i-1234567890abcdef0 \
    --hibernate
```

Output:

```
{
    "StoppingInstances": [
```

```
        {
            "CurrentState": {
                "Code": 64,
                "Name": "stopping"
            },
            "InstanceId": "i-1234567890abcdef0",
            "PreviousState": {
                "Code": 16,
                "Name": "running"
            }
        }
    ]
}
```

For more information, see Hibernate your On-Demand Linux instance in the *Amazon Elastic Cloud Compute User Guide*.

- For API details, see StopInstances in *AWS CLI Command Reference*.

`terminate-client-vpn-connections`

The following code example shows how to use `terminate-client-vpn-connections`.

AWS CLI

To terminate a connection to a Client VPN endpoint

The following `terminate-client-vpn-connections` example terminates the specified connection to the Client VPN endpoint.

```
aws ec2 terminate-client-vpn-connections \
    --client-vpn-endpoint-id vpn-endpoint-123456789abcabcde \
    --connection-id cvpn-connection-04edd76f5201e0cb8
```

Output:

```
{
    "ClientVpnEndpointId": "vpn-endpoint-123456789abcabcde",
    "ConnectionStatuses": [
        {
            "ConnectionId": "cvpn-connection-04edd76f5201e0cb8",
```

```
            "PreviousStatus": {
                "Code": "active"
            },
            "CurrentStatus": {
                "Code": "terminating"
            }
        }
    ]
}
```

For more information, see Client Connections in the *AWS Client VPN Administrator Guide*.

- For API details, see TerminateClientVpnConnections in *AWS CLI Command Reference*.

`terminate-instances`

The following code example shows how to use `terminate-instances`.

AWS CLI

To terminate an Amazon EC2 instance

The following `terminate-instances` example terminates the specified instance.

```
aws ec2 terminate-instances \
    --instance-ids i-1234567890abcdef0
```

Output:

```
{
    "TerminatingInstances": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "CurrentState": {
                "Code": 32,
                "Name": "shutting-down"
            },
            "PreviousState": {
                "Code": 16,
                "Name": "running"
            }
        }
```

```
    ]
}
```

For more information, see Launching, listing, and deleting Amazon EC2 instances in the AWS CLI in the *AWS Command Line Interface User Guide*.

- For API details, see TerminateInstances in *AWS CLI Command Reference*.

`unassign-ipv6-addresses`

The following code example shows how to use `unassign-ipv6-addresses`.

AWS CLI

To unassign an IPv6 address from a network interface

The following `unassign-ipv6-addresses` example unassigns the specified IPv6 address from the specified network interface.

```
aws ec2 unassign-ipv6-addresses \
    --ipv6-addresses 2001:db8:1234:1a00:3304:8879:34cf:4071 \
    --network-interface-id eni-23c49b68
```

Output:

```
{
    "NetworkInterfaceId": "eni-23c49b68",
    "UnassignedIpv6Addresses": [
        "2001:db8:1234:1a00:3304:8879:34cf:4071"
    ]
}
```

For more information, see Manage the IPv6 addresses for your EC2 instances in the *Amazon EC2 User Guide*.

- For API details, see UnassignIpv6Addresses in *AWS CLI Command Reference*.

`unassign-private-ip-addresses`

The following code example shows how to use `unassign-private-ip-addresses`.

AWS CLI

To unassign a secondary private IP address from a network interface

The following `unassign-private-ip-addresses` example unassigns the specified private IP address from the specified network interface.

```
aws ec2 unassign-private-ip-addresses \
    --network-interface-id eni-e5aa89a3 \
    --private-ip-addresses 10.0.0.82
```

This command produces no output.

For more information, see Secondary IP addresses for your EC2 instances in the *Amazon EC2 User Guide*.

- For API details, see UnassignPrivateIpAddresses in *AWS CLI Command Reference*.

`unassign-private-nat-gateway-address`

The following code example shows how to use `unassign-private-nat-gateway-address`.

AWS CLI

To unassign a private IP address from your private NAT gateway

The following `unassign-private-nat-gateway-address` example unassigns the specified IP address from the specified private NAT gateway.

```
aws ec2 unassign-private-nat-gateway-address \
    --nat-gateway-id nat-1234567890abcdef0 \
    --private-ip-addresses 10.0.20.197
```

Output:

```
{
    "NatGatewayId": "nat-0ee3edd182361f662",
    "NatGatewayAddresses": [
        {
            "NetworkInterfaceId": "eni-0065a61b324d1897a",
            "PrivateIp": "10.0.20.197",
            "IsPrimary": false,
```

```
            "Status": "unassigning"
        }
    ]
}
```

For more information, see NAT gateways in the *Amazon VPC User Guide*.

- For API details, see UnassignPrivateNatGatewayAddress in *AWS CLI Command Reference*.

`unlock-snapshot`

The following code example shows how to use `unlock-snapshot`.

AWS CLI

To unlock a snapshot

The following `unlock-snapshot` example unlocks the specified snapshot.

```
aws ec2 unlock-snapshot \
    --snapshot-id snap-0b5e733b4a8df6e0d
```

Output:

```
{
    "SnapshotId": "snap-0b5e733b4a8df6e0d"
}
```

For more information, see Snapshot lock in the *Amazon EBS User Guide*.

- For API details, see UnlockSnapshot in *AWS CLI Command Reference*.

`unmonitor-instances`

The following code example shows how to use `unmonitor-instances`.

AWS CLI

To disable detailed monitoring for an instance

The following `unmonitor-instances` example disables detailed monitoring for the specified instance.

```
aws ec2 unmonitor-instances \
    --instance-ids i-1234567890abcdef0
```

Output:

```
{
    "InstanceMonitorings": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "Monitoring": {
                "State": "disabling"
            }
        }
    ]
}
```

For more information, see Manage detailed monitoring for your EC2 instances in the *Amazon EC2 User Guide*.

- For API details, see UnmonitorInstances in *AWS CLI Command Reference*.

`update-security-group-rule-descriptions-egress`

The following code example shows how to use `update-security-group-rule-descriptions-egress`.

AWS CLI

To update the description of an outbound security group rule

The following `update-security-group-rule-descriptions-egress` example updates the description for the security group rule for the specified port and IPv4 address range. The description 'Outbound HTTP access to server 2' replaces any existing description for the rule.

```
aws ec2 update-security-group-rule-descriptions-egress \
    --group-id sg-02f0d35a850ba727f \
    --ip-permissions
 IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges=[{CidrIp=203.0.113.0/24,Description="Outbound
 HTTP access to server 2"}]
```

Output:

```
{
    "Return": true
}
```

For more information, see Security group rules in the *Amazon EC2 User Guide*.

- For API details, see UpdateSecurityGroupRuleDescriptionsEgress in *AWS CLI Command Reference*.

`update-security-group-rule-descriptions-ingress`

The following code example shows how to use `update-security-group-rule-descriptions-ingress`.

AWS CLI

Example 1: To update the description of an inbound security group rule with a CIDR source

The following `update-security-group-rule-descriptions-ingress` example updates the description for the security group rule for the specified port and IPv4 address range. The description 'SSH access from ABC office' replaces any existing description for the rule.

```
aws ec2 update-security-group-rule-descriptions-ingress \
    --group-id sg-02f0d35a850ba727f \
    --ip-permissions
 IpProtocol=tcp,FromPort=22,ToPort=22,IpRanges='[{CidrIp=203.0.113.0/16,Description="SSH
 access from corpnet"}]'
```

Output:

```
{
    "Return": true
}
```

For more information, see Security group rules in the *Amazon EC2 User Guide*.

Example 2: To update the description of an inbound security group rule with a prefix list source

The following `update-security-group-rule-descriptions-ingress` example updates the description for the security group rule for the specified port and prefix list. The description 'SSH access from ABC office' replaces any existing description for the rule.

```
aws ec2 update-security-group-rule-descriptions-ingress \
    --group-id sg-02f0d35a850ba727f \
    --ip-permissions
 IpProtocol=tcp,FromPort=22,ToPort=22,PrefixListIds='[{PrefixListId=pl-12345678,Description=
 access from corpnet"}]'
```

Output:

```
{
    "Return": true
}
```

For more information, see Security group rules in the *Amazon EC2 User Guide*.

- For API details, see UpdateSecurityGroupRuleDescriptionsIngress in *AWS CLI Command Reference*.

`withdraw-byoip-cidr`

The following code example shows how to use `withdraw-byoip-cidr`.

AWS CLI

To stop advertising an address range

The following `withdraw-byoip-cidr` example stops advertising the specified address range.

```
aws ec2 withdraw-byoip-cidr \
    --cidr 203.0.113.25/24
```

Output:

```
{
    "ByoipCidr": {
        "Cidr": "203.0.113.25/24",
        "StatusMessage": "ipv4pool-ec2-1234567890abcdef0",
```

```
        "State": "advertised"
    }
}
```

For more information, see Bring your own IP addresses (BYOIP) to Amazon EC2 in the *Amazon EC2 User Guide*.

- For API details, see WithdrawByoipCidr in *AWS CLI Command Reference*.

Amazon EC2 Instance Connect examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EC2 Instance Connect.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`send-ssh-public-key`

The following code example shows how to use `send-ssh-public-key`.

AWS CLI

To send a an SSH public key to an instance

The following `send-ssh-public-key` example sends the specified SSH public key to the specified instance. The key is used to authenticate the specified user.

```
aws ec2-instance-connect send-ssh-public-key \
    --instance-id i-1234567890abcdef0 \
    --instance-os-user ec2-user \
    --availability-zone us-west-2b \
```

```
    --ssh-public-key file://path/my-rsa-key.pub
```

Contents of `my-rsa-key.pub`:

```
ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAABAQC1a2b3c4d5e6f7a8b9c0dEXAMPLEKEY ec2-
user@example
```

This command produces no output.

For more information, see Connect to a Linux instance using EC2 Instance Connect in the *Amazon EC2 User Guide*.

- For API details, see SendSshPublicKey in *AWS CLI Command Reference*.

Amazon ECR examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon ECR.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

- Actions

Actions

`batch-check-layer-availability`

The following code example shows how to use `batch-check-layer-availability`.

AWS CLI

To check the availability of a layer

The following `batch-check-layer-availability` example checks the availability of a layer with the digest

sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed in the cluster-autoscaler repository.

```
aws ecr batch-check-layer-availability \
    --repository-name cluster-autoscaler \
    --layer-
digests sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed
```

Output:

```
{
    "layers": [
        {
            "layerDigest":
 "sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed",
            "layerAvailability": "AVAILABLE",
            "layerSize": 2777,
            "mediaType": "application/vnd.docker.container.image.v1+json"
        }
    ],
    "failures": []
}
```

For more information, see Pushing an image to an Amazon ECR private repository in the *Amazon ECR User Guide*.

- For API details, see BatchCheckLayerAvailability in *AWS CLI Command Reference*.

batch-delete-image

The following code example shows how to use batch-delete-image.

AWS CLI

Example 1: To delete an image

The following batch-delete-image example deletes an image with the tag precise in the specified repository in the default registry for an account.

```
aws ecr batch-delete-image \
    --repository-name ubuntu \
```

```
    --image-ids imageTag=precise
```

Output:

```
{
    "failures": [],
    "imageIds": [
        {
            "imageTag": "precise",
            "imageDigest":
 "sha256:19665f1e6d1e504117a1743c0a3d3753086354a38375961f2e665416ef4b1b2f"
        }
    ]
}
```

Example 2: To delete multiple images

The following `batch-delete-image` example deletes all images tagged with `prod` and `team1` in the specified repository.

```
aws ecr batch-delete-image \
    --repository-name MyRepository \
    --image-ids imageTag=prod imageTag=team1
```

Output:

```
{
    "imageIds": [
        {
            "imageDigest": "sha256:123456789012",
            "imageTag": "prod"
        },
        {
            "imageDigest": "sha256:123456789111",
            "imageTag": "team1"
        }
    ],
    "failures": []
}
```

For more information, see Deleting an Image in the *Amazon ECR User Guide*.

- For API details, see BatchDeleteImage in *AWS CLI Command Reference*.

`batch-get-image`

The following code example shows how to use `batch-get-image`.

AWS CLI

Example 1: To get an image

The following `batch-get-image` example gets an image with the tag `v1.13.6` in a repository called `cluster-autoscaler` in the default registry for an account.

```
aws ecr batch-get-image \
    --repository-name cluster-autoscaler \
    --image-ids imageTag=v1.13.6
```

Output:

```
{
    "images": [
        {
            "registryId": "123456789111",
            "repositoryName": "cluster-autoscaler",
            "imageId": {
                "imageDigest":
 "sha256:4a1c6567c38904384ebc64e35b7eeddd8451110c299e3368d2210066487d97e5",
                "imageTag": "v1.13.6"
            },
            "imageManifest": "{\n   \"schemaVersion\": 2,\n
 \"mediaType\": \"application/vnd.docker.distribution.manifest.v2+json
\",\n   \"config\": {\n      \"mediaType\": \"application/
vnd.docker.container.image.v1+json\",\n      \"size\": 2777,\n      \"digest

   }\n   ]\n}"
        }
    ],
    "failures": []
}
```

Example 2: To get multiple images

The following `batch-get-image` example displays details of all images tagged with `prod` and `team1` in the specified repository.

```
aws ecr batch-get-image \
    --repository-name MyRepository \
    --image-ids imageTag=prod imageTag=team1
```

Output:

```
{
    "images": [
        {
            "registryId": "123456789012",
            "repositoryName": "MyRepository",
            "imageId": {
                "imageDigest": "sha256:123456789012",
                "imageTag": "prod"
            },
            "imageManifest": "manifestExample1"
        },
        {
            "registryId": "123456789222",
            "repositoryName": "MyRepository",
            "imageId": {
                "imageDigest": "sha256:123456789012",
                "imageTag": "team1"
            },
```

```
            "imageManifest": "manifestExample2"
        }
    ],
    "failures": []
}
```

For more information, see Images in the *Amazon ECR User Guide*.

- For API details, see BatchGetImage in *AWS CLI Command Reference*.

`complete-layer-upload`

The following code example shows how to use `complete-layer-upload`.

AWS CLI

To complete an image layer upload

The following `complete-layer-upload` example completes an image layer upload to the `layer-test` repository.

```
aws ecr complete-layer-upload \
    --repository-name layer-test \
    --upload-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --layer-digests a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111:48074e6d3a68b39aad8ccc002cdad912d4148c0f92b3729323e
```

Output:

```
{
    "uploadId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "layerDigest":
 "sha256:9a77f85878aa1906f2020a0ecdf7a7e962d57e882250acd773383224b3fe9a02",
    "repositoryName": "layer-test",
    "registryId": "123456789012"
}
```

For more information, see Pushing an image to an Amazon ECR private repository in the *Amazon ECR User Guide*.

- For API details, see CompleteLayerUpload in *AWS CLI Command Reference*.

`create-repository`

The following code example shows how to use `create-repository`.

AWS CLI

Example 1: To create a repository

The following `create-repository` example creates a repository inside the specified namespace in the default registry for an account.

```
aws ecr create-repository \
    --repository-name project-a/sample-repo
```

Output:

```
{
    "repository": {
        "registryId": "123456789012",
        "repositoryName": "project-a/sample-repo",
        "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/project-a/
sample-repo"
    }
}
```

For more information, see Creating a Repository in the *Amazon ECR User Guide*.

Example 2: To create a repository configured with image tag immutability

The following `create-repository` example creates a repository configured for tag immutability in the default registry for an account.

```
aws ecr create-repository \
    --repository-name project-a/sample-repo \
    --image-tag-mutability IMMUTABLE
```

Output:

```
{
    "repository": {
        "registryId": "123456789012",
        "repositoryName": "project-a/sample-repo",
```

```
        "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/project-a/
sample-repo",
        "imageTagMutability": "IMMUTABLE"
    }
}
```

For more information, see Image Tag Mutability in the *Amazon ECR User Guide*.

Example 3: To create a repository configured with a scanning configuration

The following `create-repository` example creates a repository configured to perform a vulnerability scan on image push in the default registry for an account.

```
aws ecr create-repository \
    --repository-name project-a/sample-repo \
    --image-scanning-configuration scanOnPush=true
```

Output:

```
{
    "repository": {
        "registryId": "123456789012",
        "repositoryName": "project-a/sample-repo",
        "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/project-a/
sample-repo",
        "imageScanningConfiguration": {
            "scanOnPush": true
        }
    }
}
```

For more information, see Image Scanning in the *Amazon ECR User Guide*.

- For API details, see CreateRepository in *AWS CLI Command Reference*.

`delete-lifecycle-policy`

The following code example shows how to use `delete-lifecycle-policy`.

AWS CLI

To delete the lifecycle policy for a repository

The following `delete-lifecycle-policy` example deletes the lifecycle policy for the `hello-world` repository.

```
aws ecr delete-lifecycle-policy \
    --repository-name hello-world
```

Output:

```
{
    "registryId": "123456789012",
    "repositoryName": "hello-world",
    "lifecyclePolicyText": "{\"rules\":[{\"rulePriority\":1,\"description\":\"Remove
 untagged images.\",\"selection\":{\"tagStatus\":\"untagged\",\"countType\":
\"sinceImagePushed\",\"countUnit\":\"days\",\"countNumber\":10},\"action\":{\"type
\":\"expire\"}}]}",
    "lastEvaluatedAt": 0.0
}
```

For more information, see Automate the cleanup of images by using lifecycle policies in Amazon ECR in the *Amazon ECR User Guide*.

- For API details, see DeleteLifecyclePolicy in *AWS CLI Command Reference*.

`delete-repository-policy`

The following code example shows how to use `delete-repository-policy`.

AWS CLI

To delete the repository policy for a repository

The following `delete-repository-policy` example deletes the repository policy for the `cluster-autoscaler` repository.

```
aws ecr delete-repository-policy \
    --repository-name cluster-autoscaler
```

Output:

```
{
```

```
    "registryId": "123456789012",
    "repositoryName": "cluster-autoscaler",
    "policyText": "{\n  \"Version\" : \"2008-10-17\",\n  \"Statement\" : [ {\n
 \"Sid\" : \"allow public pull\",\n    \"Effect\" : \"Allow\",\n    \"Principal\" :

}
```

For more information, see Private repository policies in Amazon ECR in the *Amazon ECR User Guide*.

- For API details, see DeleteRepositoryPolicy in *AWS CLI Command Reference*.

`delete-repository`

The following code example shows how to use `delete-repository`.

AWS CLI

To delete a repository

The following `delete-repository` example command force deletes the specified repository in the default registry for an account. The `--force` flag is required if the repository contains images.

```
aws ecr delete-repository \
    --repository-name ubuntu \
    --force
```

Output:

```
{
    "repository": {
        "registryId": "123456789012",
        "repositoryName": "ubuntu",
        "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/ubuntu"
    }
}
```

For more information, see Deleting a Repository in the *Amazon ECR User Guide*.

- For API details, see DeleteRepository in *AWS CLI Command Reference*.

`describe-image-scan-findings`

The following code example shows how to use `describe-image-scan-findings`.

AWS CLI

To describe the scan findings for an image

The following `describe-image-scan-findings` example returns the image scan findings for an image using the image digest in the specified repository in the default registry for an account.

```
aws ecr describe-image-scan-findings \
    --repository-name sample-repo \
    --image-
id imageDigest=sha256:74b2c688c700ec95a93e478cdb959737c148df3fbf5ea706abe0318726e885e6
```

Output:

```
{
    "imageScanFindings": {
        "findings": [
            {
                "name": "CVE-2019-5188",
                "description": "A code execution vulnerability exists in the
 directory rehashing functionality of E2fsprogs e2fsck 1.45.4. A specially crafted
 ext4 directory can cause an out-of-bounds write on the stack, resulting in code
 execution. An attacker can corrupt a partition to trigger this vulnerability.",

    },
    "imageScanStatus": {
        "status": "COMPLETE",
        "description": "The scan was completed successfully."
    }
}
```

For more information, see Image Scanning in the *Amazon ECR User Guide*.

- For API details, see DescribeImageScanFindings in *AWS CLI Command Reference*.

`describe-images`

The following code example shows how to use `describe-images`.

AWS CLI

To describe an image in a repository

The following `describe-images` example displays details about an image in the `cluster-autoscaler` repository with the tag `v1.13.6`.

```
aws ecr describe-images \
```

```
    --repository-name cluster-autoscaler \
    --image-ids imageTag=v1.13.6
```

Output:

```
{
    "imageDetails": [
        {
            "registryId": "123456789012",
            "repositoryName": "cluster-autoscaler",
            "imageDigest":
 "sha256:4a1c6567c38904384ebc64e35b7eeddd8451110c299e3368d2210066487d97e5",
            "imageTags": [
                "v1.13.6"
            ],
            "imageSizeInBytes": 48318255,
            "imagePushedAt": 1565128275.0
        }
    ]
}
```

For more information, see Viewing image details in Amazon ECR in the *Amazon ECR User Guide*.

- For API details, see DescribeImages in *AWS CLI Command Reference*.

`describe-repositories`

The following code example shows how to use `describe-repositories`.

AWS CLI

To describe the repositories in a registry

The following `describe-repositories` example describes the repositories in the default registry for an account.

```
aws ecr describe-repositories
```

Output:

```
{
```

```
    "repositories": [
        {
            "registryId": "123456789012",
            "repositoryName": "ubuntu",
            "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/ubuntu"
        },
        {
            "registryId": "123456789012",
            "repositoryName": "test",
            "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/test"
        }
    ]
}
```

For more information, see Viewing the contents and details of a private repository in Amazon ECR in the *Amazon ECR User Guide*.

- For API details, see DescribeRepositories in *AWS CLI Command Reference*.

`get-authorization-token`

The following code example shows how to use `get-authorization-token`.

AWS CLI

To get an authorization token for your default registry

The following `get-authorization-token` example command gets an authorization token for your default registry.

```
aws ecr get-authorization-token
```

Output:

```
{
    "authorizationData": [
        {
            "authorizationToken": "QVdTOkN...",
            "expiresAt": 1448875853.241,
            "proxyEndpoint": "https://123456789012.dkr.ecr.us-west-2.amazonaws.com"
        }
    ]
```

```
}
```

For more information, see Private registry authentication in Amazon ECR in the *Amazon ECR User Guide*.

- For API details, see GetAuthorizationToken in *AWS CLI Command Reference*.

`get-download-url-for-layer`

The following code example shows how to use `get-download-url-for-layer`.

AWS CLI

To get the download URL of a layer

The following `get-download-url-for-layer` example displays the download URL of a layer with the digest `sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed` in the `cluster-autoscaler` repository.

```
aws ecr get-download-url-for-layer \
    --repository-name cluster-autoscaler  \
    --layer-
digest sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed
```

Output:

```
{
    "downloadUrl": "https://prod-us-west-2-starport-layer-bucket.s3.us-
west-2.amazonaws.com/e501-123456789012-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222/

    "layerDigest":
 "sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed"
}
```

For more information, see Pulling an image to your local environment from an Amazon ECR private repository in the *Amazon ECR User Guide*.

- For API details, see GetDownloadUrlForLayer in *AWS CLI Command Reference*.

`get-lifecycle-policy-preview`

The following code example shows how to use `get-lifecycle-policy-preview`.

AWS CLI

To retrieve details for a lifecycle policy preview

The following `get-lifecycle-policy-preview` example retrieves the result of a lifecycle policy preview for the specified repository in the default registry for an account.

```
aws ecr get-lifecycle-policy-preview \
    --repository-name "project-a/amazon-ecs-sample"
```

Output:

```
{
    "registryId": "123456789012",
    "repositoryName": "project-a/amazon-ecs-sample",
    "lifecyclePolicyText": "{\n    \"rules\": [\n        {\n
 \"rulePriority\": 1,\n            \"description\": \"Expire images older than 14
 days\",\n            \"selection\": {\n                \"tagStatus\": \"untagged\",
\n                \"countType\": \"sinceImagePushed\",\n                \"countUnit
\": \"days\",\n                \"countNumber\": 14\n            },\n
 \"action\": {\n                \"type\": \"expire\"\n            }\n        }\n
  ]\n}\n",
    "status": "COMPLETE",
    "previewResults": [],
    "summary": {
        "expiringImageTotalCount": 0
    }
}
```

For more information, see Lifecycle Policies in the *Amazon ECR User Guide*.

- For API details, see GetLifecyclePolicyPreview in *AWS CLI Command Reference*.

`get-lifecycle-policy`

The following code example shows how to use `get-lifecycle-policy`.

AWS CLI

To retrieve a lifecycle policy

The following `get-lifecycle-policy` example displays details of the lifecycle policy for the specified repository in the default registry for the account.

```
aws ecr get-lifecycle-policy \
    --repository-name "project-a/amazon-ecs-sample"
```

Output:

```
{
    "registryId": "123456789012",
    "repositoryName": "project-a/amazon-ecs-sample",
    "lifecyclePolicyText": "{\"rules\":[{\"rulePriority\":1,\"description\":\"Expire
 images older than 14 days\",\"selection\":{\"tagStatus\":\"untagged\",\"countType
\":\"sinceImagePushed\",\"countUnit\":\"days\",\"countNumber\":14},\"action\":
{\"type\":\"expire\"}}]}",
    "lastEvaluatedAt": 1504295007.0
}
```

For more information, see Lifecycle Policies in the *Amazon ECR User Guide*.

- For API details, see GetLifecyclePolicy in *AWS CLI Command Reference*.

`get-login-password`

The following code example shows how to use `get-login-password`.

AWS CLI

To retrieve a password to authenticate to a registry

The following `get-login-password` example displays a password that you can use with a container client of your choice to authenticate to any Amazon ECR registry that your IAM principal has access to.

```
aws ecr get-login-password
```

Output:

```
<password>
```

To use with the Docker CLI, pipe the output of the `get-login-password` command to the `docker login` command. When retrieving the password, ensure that you specify the same Region that your Amazon ECR registry exists in.

```
aws ecr get-login-password \
    --region <region>
 \
| docker login \
    --username AWS \
    --password-stdin <aws_account_id>.dkr.ecr.<region>.amazonaws.com
```

For more information, see Registry Authentication in the *Amazon ECR User Guide*.

- For API details, see GetLoginPassword in *AWS CLI Command Reference*.

`get-repository-policy`

The following code example shows how to use `get-repository-policy`.

AWS CLI

To retrieve the repository policy for a repository

The following `get-repository-policy` example displays details about the repository policy for the `cluster-autoscaler` repository.

```
aws ecr get-repository-policy \
    --repository-name cluster-autoscaler
```

Output:

```
{
    "registryId": "123456789012",
    "repositoryName": "cluster-autoscaler",
    "policyText": "{\n  \"Version\" : \"2008-10-17\",\n  \"Statement\" : [ {\n
 \"Sid\" : \"allow public pull\",\n    \"Effect\" : \"Allow\",\n    \"Principal\" :
 \"*\",\n    \"Action\" : [ \"ecr:BatchCheckLayerAvailability\", \"ecr:BatchGetImage
\", \"ecr:GetDownloadUrlForLayer\" ]\n  } ]\n}"
}
```

For more information, see Private repository policies in Amazon ECR in the *Amazon ECR User Guide*.

- For API details, see GetRepositoryPolicy in *AWS CLI Command Reference*.

`initiate-layer-upload`

The following code example shows how to use `initiate-layer-upload`.

AWS CLI

To initiate an image layer upload

The following `initiate-layer-upload` example initiates an image layer upload to the `layer-test` repository.

```
aws ecr initiate-layer-upload \
    --repository-name layer-test
```

Output:

```
{
    "partSize": 10485760,
    "uploadId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Pushing an image to an Amazon ECR private repository in the *Amazon ECR User Guide*.

- For API details, see InitiateLayerUpload in *AWS CLI Command Reference*.

`list-images`

The following code example shows how to use `list-images`.

AWS CLI

To list the images in a repository

The following `list-images` example displays a list of the images in the `cluster-autoscaler` repository.

```
aws ecr list-images \
    --repository-name cluster-autoscaler
```

Output:

```
{
    "imageIds": [
        {
            "imageDigest":
 "sha256:99c6fb4377e9a420a1eb3b410a951c9f464eff3b7dbc76c65e434e39b94b6570",
            "imageTag": "v1.13.8"
        },
        {
            "imageDigest":
 "sha256:99c6fb4377e9a420a1eb3b410a951c9f464eff3b7dbc76c65e434e39b94b6570",
            "imageTag": "v1.13.7"
        },
        {
            "imageDigest":
 "sha256:4a1c6567c38904384ebc64e35b7eeddd8451110c299e3368d2210066487d97e5",
            "imageTag": "v1.13.6"
        }
    ]
}
```

For more information, see Private images in Amazon ECR in the *Amazon ECR User Guide*.

- For API details, see ListImages in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags for repository

The following `list-tags-for-resource` example displays a list of the tags associated with the `hello-world` repository.

```
aws ecr list-tags-for-resource \
```

```
    --resource-arn arn:aws:ecr:us-west-2:123456789012:repository/hello-world
```

Output:

```
{
    "tags": [
        {
            "Key": "Stage",
            "Value": "Integ"
        }
    ]
}
```

For more information, see Tagging a private repository in Amazon ECR in the *Amazon ECR User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`put-image-scanning-configuration`

The following code example shows how to use `put-image-scanning-configuration`.

AWS CLI

To update the image scanning configuration for a repository

The following `put-image-scanning-configuration` example updates the image scanning configuration for the specified repository.

```
aws ecr put-image-scanning-configuration \
    --repository-name sample-repo \
    --image-scanning-configuration scanOnPush=true
```

Output:

```
{
    "registryId": "123456789012",
    "repositoryName": "sample-repo",
    "imageScanningConfiguration": {
        "scanOnPush": true
    }
}
```

For more information, see Image Scanning in the *Amazon ECR User Guide*.

- For API details, see PutImageScanningConfiguration in *AWS CLI Command Reference*.

`put-image-tag-mutability`

The following code example shows how to use `put-image-tag-mutability`.

AWS CLI

To update the image tag mutability setting for a repository

The following `put-image-tag-mutability` example configures the specified repository for tag immutability. This prevents all image tags within the repository from being overwritten.

```
aws ecr put-image-tag-mutability \
    --repository-name hello-repository \
    --image-tag-mutability IMMUTABLE
```

Output:

```
{
    "registryId": "123456789012",
    "repositoryName": "sample-repo",
    "imageTagMutability": "IMMUTABLE"
}
```

For more information, see Image Tag Mutability in the *Amazon ECR User Guide*.

- For API details, see PutImageTagMutability in *AWS CLI Command Reference*.

`put-image`

The following code example shows how to use `put-image`.

AWS CLI

To retag an image with its manifest

The following `put-image` example creates a new tag in the `hello-world` repository with an existing image manifest.

```
aws ecr put-image \
    --repository-name hello-world \
    --image-tag 2019.08 \
    --image-manifest file://hello-world.manifest.json
```

Contents of `hello-world.manifest.json`:

    }
}
```

For more information, see Retagging an image in Amazon ECR in the *Amazon ECR User Guide*.

- For API details, see PutImage in *AWS CLI Command Reference*.

`put-lifecycle-policy`

The following code example shows how to use `put-lifecycle-policy`.

AWS CLI

To create a lifecycle policy

The following `put-lifecycle-policy` example creates a lifecycle policy for the specified repository in the default registry for an account.

```
aws ecr put-lifecycle-policy \
    --repository-name "project-a/amazon-ecs-sample" \
    --lifecycle-policy-text "file://policy.json"
```

Contents of `policy.json`:

```
{
    "rules": [
        {
            "rulePriority": 1,
            "description": "Expire images older than 14 days",
            "selection": {
                "tagStatus": "untagged",
                "countType": "sinceImagePushed",
                "countUnit": "days",
                "countNumber": 14
            },
            "action": {
                "type": "expire"
```

```
            }
        }
    ]
}
```

Output:

```
{
    "registryId": "<aws_account_id>",
    "repositoryName": "project-a/amazon-ecs-sample",
    "lifecyclePolicyText": "{\"rules\":[{\"rulePriority\":1,\"description\":\"Expire
 images older than 14 days\",\"selection\":{\"tagStatus\":\"untagged\",\"countType
\":\"sinceImagePushed\",\"countUnit\":\"days\",\"countNumber\":14},\"action\":
{\"type\":\"expire\"}}]}"
}
```

For more information, see Lifecycle Policies in the *Amazon ECR User Guide*.

- For API details, see PutLifeCyclePolicy in *AWS CLI Command Reference*.

`set-repository-policy`

The following code example shows how to use `set-repository-policy`.

AWS CLI

To set the repository policy for a repository

The following `set-repository-policy` example attaches a repository policy contained in a file to the `cluster-autoscaler` repository.

```
aws ecr set-repository-policy \
    --repository-name cluster-autoscaler \
    --policy-text file://my-policy.json
```

Contents of `my-policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement" : [
        {
            "Sid" : "allow public pull",
```

```
            "Effect" : "Allow",
            "Principal" : "*",
            "Action" : [
                "ecr:BatchCheckLayerAvailability",
                "ecr:BatchGetImage",
                "ecr:GetDownloadUrlForLayer"
            ]
        }
    ]
}
```

Output:

```
{
    "registryId": "123456789012",
    "repositoryName": "cluster-autoscaler",
    "policyText": "{\n  \"Version\" : \"2008-10-17\",\n  \"Statement\" : [ {\n
 \"Sid\" : \"allow public pull\",\n    \"Effect\" : \"Allow\",\n    \"Principal\" :
 \"*\",\n    \"Action\" : [ \"ecr:BatchCheckLayerAvailability\", \"ecr:BatchGetImage
\", \"ecr:GetDownloadUrlForLayer\" ]\n  } ]\n}"
}
```

For more information, see Setting a private repository policy statement in Amazon ECR in the *Amazon ECR User Guide*.

- For API details, see SetRepositoryPolicy in *AWS CLI Command Reference*.

`start-image-scan`

The following code example shows how to use `start-image-scan`.

AWS CLI

To start an image vulnerability scan

The following `start-image-scan` example starts an image scan for and specified by the image digest in the specified repository.

```
aws ecr start-image-scan \
    --repository-name sample-repo \
    --image-
id imageDigest=sha256:74b2c688c700ec95a93e478cdb959737c148df3fbf5ea706abe0318726e885e6
```

Output:

```
{
    "registryId": "123456789012",
    "repositoryName": "sample-repo",
    "imageId": {
        "imageDigest":
 "sha256:74b2c688c700ec95a93e478cdb959737c148df3fbf5ea706abe0318726e885e6"
    },
    "imageScanStatus": {
        "status": "IN_PROGRESS"
    }
}
```

For more information, see Image Scanning in the *Amazon ECR User Guide*.

- For API details, see StartImageScan in *AWS CLI Command Reference*.

`start-lifecycle-policy-preview`

The following code example shows how to use `start-lifecycle-policy-preview`.

AWS CLI

To create a lifecycle policy preview

The following `start-lifecycle-policy-preview` example creates a lifecycle policy preview defined by a JSON file for the specified repository.

```
aws ecr start-lifecycle-policy-preview \
    --repository-name "project-a/amazon-ecs-sample" \
    --lifecycle-policy-text "file://policy.json"
```

Contents of `policy.json`:

```
{
    "rules": [
        {
            "rulePriority": 1,
            "description": "Expire images older than 14 days",
            "selection": {
                "tagStatus": "untagged",
                "countType": "sinceImagePushed",
```

```
                "countUnit": "days",
                "countNumber": 14
            },
            "action": {
                "type": "expire"
            }
        }
    ]
}
```

Output:

```
{
    "registryId": "123456789012",
    "repositoryName": "project-a/amazon-ecs-sample",
    "lifecyclePolicyText": "{\n    \"rules\": [\n        {\n
 \"rulePriority\": 1,\n            \"description\": \"Expire images older than 14
 days\",\n            \"selection\": {\n                \"tagStatus\": \"untagged\",
\n                \"countType\": \"sinceImagePushed\",\n                \"countUnit
\": \"days\",\n                \"countNumber\": 14\n            },\n
 \"action\": {\n                \"type\": \"expire\"\n            }\n        }\n
  ]\n}\n",
    "status": "IN_PROGRESS"
}
```

For more information, see Creating a lifecycle policy preview in Amazon ECR in the *Amazon ECR User Guide*.

- For API details, see StartLifecyclePolicyPreview in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a repository

The following `tag-resource` example sets a tag with key `Stage` and value `Integ` on the `hello-world` repository.

```
aws ecr tag-resource \
    --resource-arn arn:aws:ecr:us-west-2:123456789012:repository/hello-world \
```

```
    --tags Key=Stage,Value=Integ
```

This command produces no output.

For more information, see Tagging a private repository in Amazon ECR in the *Amazon ECR User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To untag a repository

The following `untag-resource` example removes the tag with the key `Stage` from the `hello-world` repository.

```
aws ecr untag-resource \
    --resource-arn arn:aws:ecr:us-west-2:123456789012:repository/hello-world \
    --tag-keys Stage
```

This command produces no output.

For more information, see Tagging a private repository in Amazon ECR in the *Amazon ECR User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`upload-layer-part`

The following code example shows how to use `upload-layer-part`.

AWS CLI

To upload a layer part

The following `upload-layer-part` example uploads an image layer part to the `layer-test` repository.

```
aws ecr upload-layer-part \
```

```
    --repository-name layer-test \
    --upload-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --part-first-byte 0 \
    --part-last-byte 8323314 \
    --layer-part-blob fileb:///var/lib/docker/image/overlay2/layerdb/sha256/
ff986b10a018b48074e6d3a68b39aad8ccc002cdad912d4148c0f92b3729323e/layer.b64
```

Output:

```
{
    "uploadId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "registryId": "123456789012",
    "lastByteReceived": 8323314,
    "repositoryName": "layer-test"
}
```

For more information, see Pushing an image to an Amazon ECR private repository in the *Amazon ECR User Guide*.

- For API details, see UploadLayerPart in *AWS CLI Command Reference*.

Amazon ECR Public examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon ECR Public.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`batch-delete-image`

The following code example shows how to use `batch-delete-image`.

AWS CLI

Example 1: To delete an image by using image digest ids, the image and all of its tags are deleted within a repository in a public registry

The following `batch-delete-image` example deletes an image by specifying the image digest.

```
aws ecr-public batch-delete-image \
    --repository-name project-a/nginx-web-app \
    --image-
ids imageDigest=sha256:b1f9deb5fe3711a3278379ebbcaefbc5d70a2263135db86bd27a0dae150546c2
```

Output:

```
{
    "imageIds": [
        {
            "imageDigest":
 "sha256:b1f9deb5fe3711a3278379ebbcaefbc5d70a2263135db86bd27a0dae150546c2",
            "imageTag": "latest"
        }
    ],
    "failures": []
}
```

For more information, see Deleting an image in a public repository in the *Amazon ECR Public User Guide*.

Example 2: To delete any image by specifying the tag associated with the image you want to delete from the repository.

The following `batch-delete-image` example deletes an image by specifying the tag associated with the image repository named `project-a/nginx-web-app` in a public registry. If you have only one tag and execute this command, it will remove the image. Otherwise, if you have multiple tags for the same image, specify one, and only the tag is removed from repository and not the image.

```
aws ecr-public batch-delete-image \
    --repository-name project-a/nginx-web-app \
    --image-ids imageTag=_temp
```

Output:

```
{
    "imageIds": [
        {
            "imageDigest":
 "sha256:f7a86a0760e2f8d7eff07e515fc87bf4bac45c35376c06f9a280f15ecad6d7e0",
            "imageTag": "_temp"
        }
    ],
    "failures": []
}
```

For more information, see Deleting an image in a public repository in the *Amazon ECR Public User Guide*.

Example 3: To delete multiple images, you can specify multiple image tags or image digests in the request for a repository in a public registry.

The following `batch-delete-image` example deletes multiple images from a repository named `project-a/nginx-web-app` by specifying multiple image tags or image digests in the request.

```
aws ecr-public batch-delete-image \
    --repository-name project-a/nginx-web-app \
    --image-ids imageTag=temp2.0
  imageDigest=sha256:47ba980bc055353d9c0af89b1894f68faa43ca93856917b8406316be86f01278
```

Output:

```
{
    "imageIds": [
        {
            "imageDigest":
 "sha256:47ba980bc055353d9c0af89b1894f68faa43ca93856917b8406316be86f01278"
        },
        {
            "imageDigest":
 "sha256:f7a86a0760e2f8d7eff07e515fc87bf4bac45c35376c06f9a280f15ecad6d7e0",
            "imageTag": "temp2.0"
        }
    ],
```

```
    "failures": []
}
```

For more information, see Deleting an image in a public repository in the *Amazon ECR Public User Guide*.

Example 4: To delete an image in cross AWS Account using registry-id and imagedigest ids, the image and all of its tags are deleted within a repository in a public registry

The following `batch-delete-image` example deletes an image by specifying the image digest in the cross AWS Account.

```
aws ecr-public batch-delete-image \
    --registry-id 123456789012 \
    --repository-name project-a/nginx-web-app \
    --image-
ids imageDigest=sha256:b1f9deb5fe3711a3278379ebbcaefbc5d70a2263135db86bd27a0dae150546c2
 \
    --region us-east-1
```

Output:

```
{
    "imageIds": [
        {
            "imageDigest":
 "sha256:b1f9deb5fe3711a3278379ebbcaefbc5d70a2263135db86bd27a0dae150546c2",
            "imageTag": "temp2.0"
        }
    ],
    "failures": []
}
```

For more information, see Deleting an image in a public repository in the *Amazon ECR Public User Guide*.

- For API details, see BatchDeleteImage in *AWS CLI Command Reference*.

`create-repository`

The following code example shows how to use `create-repository`.

AWS CLI

Example 1: To create a repository in a public registry

The following `create-repository` example creates a repository named project-a/nginx-web-app in a public registry.

```
aws ecr-public create-repository \
    --repository-name project-a/nginx-web-app
```

Output:

```
{
    "repository": {
        "repositoryArn": "arn:aws:ecr-public::123456789012:repository/project-a/
nginx-web-app",
        "registryId": "123456789012",
        "repositoryName": "project-a/nginx-web-app",
        "repositoryUri": "public.ecr.aws/public-registry-custom-alias/project-a/
nginx-web-app",
        "createdAt": "2024-07-01T21:08:55.131000+00:00"
    },
    "catalogData": {}
}
```

For more information, see Creating a public repository in the *Amazon ECR Public User Guide*.

Example 2: To create a repository in a public registry with short description of the contents of the repository, system and operating architecture that the images in the repository are compatible with

The following `create-repository` example creates a repository named project-a/nginx-web-app in a public registry with short description of the contents of the repository, system and operating architecture that the images in the repository are compatible with.

```
aws ecr-public create-repository \
    --repository-name project-a/nginx-web-app \
    --catalog-data 'description=My project-a ECR Public
 Repository,architectures=ARM,ARM 64,x86,x86-64,operatingSystems=Linux'
```

Output:

```
{
    "repository": {
        "repositoryArn": "arn:aws:ecr-public::123456789012:repository/project-a/
nginx-web-app",
        "registryId": "123456789012",
        "repositoryName": "project-a/nginx-web-app",
        "repositoryUri": "public.ecr.aws/public-registry-custom-alias/project-a/
nginx-web-app",
        "createdAt": "2024-07-01T21:23:20.455000+00:00"
    },
    "catalogData": {
        "description": "My project-a ECR Public Repository",
        "architectures": [
            "ARM",
            "ARM 64",
            "x86",
            "x86-64"
        ],
        "operatingSystems": [
            "Linux"
        ]
    }
}
```

For more information, see Creating a public repository in the *Amazon ECR Public User Guide*.

Example 3: To create a repository in a public registry, along with logoImageBlob, aboutText, usageText and tags information

The following `create-repository` example creates a repository named project-a/nginx-web-app in a public registry, along with logoImageBlob, aboutText, usageText and tags information.

```
aws ecr-public create-repository \
    --cli-input-json file://myfile.json
```

Contents of `myfile.json`:

```
{
    "repositoryName": "project-a/nginx-web-app",
    "catalogData": {
        "description": "My project-a ECR Public Repository",
        "architectures": [
```

```
            "ARM",
            "ARM 64",
            "x86",
            "x86-64"
        ],
        "operatingSystems": [
            "Linux"
        ],
        "logoImageBlob": "iVBORw0KGgoA<<truncated-for-better-reading>>ErkJggg==",
        "aboutText": "## Quick reference\n\nMaintained by: [the Amazon Linux Team]

 Linux?\n\nAmazon Linux is provided by Amazon Web Services (AWS). It is designed
 to provide a stable, secure, and high-performance execution environment for
 applications running on Amazon EC2. The full distribution includes packages that
 enable easy integration with AWS, including launch configuration tools and many
 popular AWS libraries and tools. AWS provides ongoing security and maintenance
 updates to all instances running Amazon Linux.\n\nThe Amazon Linux container image
 contains a minimal set of packages. To install additional packages, [use `yum`]
(https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/managing-software.html).\n\nAWS
 provides two versions of Amazon Linux: [Amazon Linux 2](https://aws.amazon.com/
amazon-linux-2/) and [Amazon Linux AMI](https://aws.amazon.com/amazon-linux-ami/).
\n\nFor information on security updates for Amazon Linux, please refer to [Amazon
 Linux 2 Security Advisories](https://alas.aws.amazon.com/alas2.html) and [Amazon
 Linux AMI Security Advisories](https://alas.aws.amazon.com/). Note that Docker
 Hub's vulnerability scanning for Amazon Linux is currently based on RPM versions,
 which does not reflect the state of backported patches for vulnerabilities.\n
\n## Where can I run Amazon Linux container images?\n\nYou can run Amazon Linux
 container images in any Docker based environment. Examples include, your laptop,
 in Amazon EC2 instances, and Amazon ECS clusters.\n\n## License\n\nAmazon Linux is
 available under the [GNU General Public License, version 2.0](https://github.com/
aws/amazon-linux-docker-images/blob/master/LICENSE). Individual software packages
 are available under their own licenses; run `rpm -qi [package name]` or check
```

```
 `/usr/share/doc/[package name]-*` and `/usr/share/licenses/[package name]-*` for
 details.\n\nAs with all Docker images, these likely also contain other software
 which may be under other licenses (such as Bash, etc from the base distribution,
 along with any direct or indirect dependencies of the primary software being
 contained).\n\nSome additional license information which was able to be auto-
detected might be found in [the `repo-info` repository's `amazonlinux/` directory]
(https://github.com/docker-library/repo-info/tree/master/repos/amazonlinux).\n\n##
 Security\n\nFor information on security updates for Amazon Linux, please refer
 to [Amazon Linux 2 Security Advisories](https://alas.aws.amazon.com/alas2.html)
 and [Amazon Linux AMI Security Advisories](https://alas.aws.amazon.com/). Note
 that Docker Hub's vulnerability scanning for Amazon Linux is currently based
 on RPM versions, which does not reflect the state of backported patches for
 vulnerabilities.",
       "usageText": "## Supported architectures\n\namd64, arm64v8\n\n## Where
 can I run Amazon Linux container images?\n\nYou can run Amazon Linux container
 images in any Docker based environment. Examples include, your laptop, in Amazon
 EC2 instances, and ECS clusters.\n\n## How do I install a software package from
 Extras repository in Amazon Linux 2?\n\nAvailable packages can be listed with the
 `amazon-linux-extras` command. Packages can be installed with the `amazon-linux-
extras install <package>` command. Example: `amazon-linux-extras install rust1`\n
\n## Will updates be available for Amazon Linux containers?\n\nSimilar to the Amazon
 Linux images for Amazon EC2 and on-premises use, Amazon Linux container images will
 get ongoing updates from Amazon in the form of security updates, bug fix updates,
 and other enhancements. Security bulletins for Amazon Linux are available at
 https://alas.aws.amazon.com/\n\n## Will AWS Support the current version of Amazon
 Linux going forward?\n\nYes; in order to avoid any disruption to your existing
 applications and to facilitate migration to Amazon Linux 2, AWS will provide
 regular security updates for Amazon Linux 2018.03 AMI and container image for 2
 years after the final LTS build is announced. You can also use all your existing
 support channels such as AWS Support and Amazon Linux Discussion Forum to continue
 to submit support requests."

`delete-repository-policy`

The following code example shows how to use `delete-repository-policy`.

AWS CLI

To delete a repository policy in a public registry

The following `delete-repository-policy` example delete repository policy for the ECR Public repository in your AWS account.

```
aws ecr-public delete-repository-policy \
    --repository-name project-a/nginx-web-app \
    --region us-east-1
```

Output:

```
{
    "registryId": "123456789012",
    "repositoryName": "project-a/nginx-web-app",
    "policyText": "{\n  \"Version\" : \"2008-10-17\",\n  \"Statement\" : [ {\n
    \"Sid\" : \"AllowPush\",\n    \"Effect\" : \"Allow\",\n    \"Principal
\" : {\n      \"AWS\" : [ \"arn:aws:iam::123456789012:user/eksuser1\",
 \"arn:aws:iam::123456789012:user/admin\" ]\n    },\n    \"Action\" :
 [ \"ecr-public:BatchCheckLayerAvailability\", \"ecr-public:PutImage\",
 \"ecr-public:InitiateLayerUpload\", \"ecr-public:UploadLayerPart\", \"ecr-
public:CompleteLayerUpload\" ]\n  } ]\n}"
}
```

For more information, see Deleting a public repository policy statement in the *Amazon ECR Public User Guide*.

- For API details, see DeleteRepositoryPolicy in *AWS CLI Command Reference*.

`delete-repository`

The following code example shows how to use `delete-repository`.

AWS CLI

To delete a repository in a public registry

The following `delete-repository` example deletes a repository named `project-a/nginx-web-app` from your public registry.

```
aws ecr-public delete-repository \
    --repository-name project-a/nginx-web-app
```

Output:

```
{
    "repository": {
        "repositoryArn": "arn:aws:ecr-public::123456789012:repository/project-a/
nginx-web-app",
        "registryId": "123456789012",
        "repositoryName": "project-a/nginx-web-app",
        "repositoryUri": "public.ecr.aws/public-registry-custom-alias/project-a/
nginx-web-app",
        "createdAt": "2024-07-01T22:14:50.103000+00:00"
    }
}
```

For more information, see Deleting a public repository in the *Amazon ECR Public User Guide*.

- For API details, see DeleteRepository in *AWS CLI Command Reference*.

`describe-image-tags`

The following code example shows how to use `describe-image-tags`.

AWS CLI

Example 1: To describe image tag details in public repository

The following `describe-image-tags` example describe imagetags in the `project-a/nginx-web-app` sample repository.

```
aws ecr-public describe-image-tags \
    --repository-name project-a/nginx-web-app \
    --region us-east-1
```

Output:

```
{
    "imageTagDetails": [
        {
            "imageTag": "latest",
            "createdAt": "2024-07-10T22:29:00-05:00",
            "imageDetail": {
                "imageDigest":
 "sha256:b1f9deb5fe3711a3278379ebbcaefbc5d70a2263135db86bd27a0dae150546c2",
                "imageSizeInBytes": 121956548,
                "imagePushedAt": "2024-07-10T22:29:00-05:00",
                "imageManifestMediaType": "application/
vnd.docker.distribution.manifest.v2+json",
                "artifactMediaType": "application/
vnd.docker.container.image.v1+json"
            }
        }
    ]
}
```

For more information, see Amazon ECR Public images in the *Amazon ECR Public User Guide*.

- For API details, see DescribeImageTags in *AWS CLI Command Reference*.

`describe-images`

The following code example shows how to use `describe-images`.

AWS CLI

Example 1: To describe images in a public registry repository

The following `describe-images` example describes imagesDetails in a repository named `project-a/nginx-web-app` in a public registry.

```
aws ecr-public describe-images \
    --repository-name project-a/nginx-web-app \
    --region us-east-1
```

Output:

```
{
    "imageDetails": [
        {
            "registryId": "123456789012",
            "repositoryName": "project-a/nginx-web-app",
            "imageDigest":

            "imageTags": [
                "temp1.0"
            ],
            "imageSizeInBytes": 123184716,
            "imagePushedAt": "2024-07-23T11:32:49-05:00",
            "imageManifestMediaType": "application/
vnd.docker.distribution.manifest.v2+json",
            "artifactMediaType": "application/vnd.docker.container.image.v1+json"
        },
        {
            "registryId": "123456789012",
            "repositoryName": "project-a/nginx-web-app",
            "imageDigest":
 "sha256:b1f9deb5fe3711a3278379ebbcaefbc5d70a2263135db86bd27a0dae150546c2",
            "imageTags": [
                "temp2.0"
            ],
            "imageSizeInBytes": 121956548,
            "imagePushedAt": "2024-07-23T11:39:38-05:00",
            "imageManifestMediaType": "application/
vnd.docker.distribution.manifest.v2+json",
            "artifactMediaType": "application/vnd.docker.container.image.v1+json"
        },
        {
            "registryId": "123456789012",
            "repositoryName": "project-a/nginx-web-app",
            "imageDigest":
 "sha256:f7a86a0760e2f8d7eff07e515fc87bf4bac45c35376c06f9a280f15ecad6d7e0",
            "imageTags": [
                "temp3.0",
```

```
                "latest"
            ],
            "imageSizeInBytes": 232108879,
            "imagePushedAt": "2024-07-22T00:54:34-05:00",
            "imageManifestMediaType": "application/
vnd.docker.distribution.manifest.v2+json",
            "artifactMediaType": "application/vnd.docker.container.image.v1+json"
        }
    ]
}
```

For more information, see Amazon ECR Public images in the *Amazon ECR Public User Guide*.

Example 2: To describe images from the repository by sort imageTags & imagePushedAt

The following `describe-images` example describe images within repository named project-a/nginx-web-app in a public registry.

```
aws ecr-public describe-images \
    --repository-name project-a/nginx-web-app \
    --query 'sort_by(imageDetails,& imagePushedAt)[*].imageTags[*]' \
    --output text
```

Output:

```
temp3.0 latest
temp1.0
temp2.0
```

For more information, see Amazon ECR Public images in the *Amazon ECR Public User Guide*.

Example 3: To describe images from the repository to generate the last 2 image tags pushed in the repository

The following `describe-images` example gets imagetags details from the repository named `project-a/nginx-web-app` in a public registry and queries the result to display only the first two records.

```
aws ecr-public describe-images \
    --repository-name project-a/nginx-web-app  \
    --query 'sort_by(imageDetails,& imagePushedAt)[*].imageTags[*] | [0:2]' \
    --output text
```

Output:

```
temp3.0 latest
temp1.0
```

For more information, see Amazon ECR Public images in the *Amazon ECR Public User Guide*.

- For API details, see DescribeImages in *AWS CLI Command Reference*.

`describe-registries`

The following code example shows how to use `describe-registries`.

AWS CLI

To describe all registries in a public registry

The following `describe-registries` example describes all registries in your account.

```
aws ecr-public describe-registries
```

Output:

```
{
    "registries": [
        {
            "registryId": "123456789012",
            "registryArn": "arn:aws:ecr-public::123456789012:registry/123456789012",
            "registryUri": "public.ecr.aws/publicregistrycustomalias",
            "verified": false,
            "aliases": [
                {
                    "name": "publicregistrycustomalias",
                    "status": "ACTIVE",
                    "primaryRegistryAlias": true,
                    "defaultRegistryAlias": true
                }
            ]
        }
    ]
}
```

For more information, see Amazon ECR public registries in the *Amazon ECR Public User Guide*.

- For API details, see DescribeRegistries in *AWS CLI Command Reference*.

`describe-repositories`

The following code example shows how to use `describe-repositories`.

AWS CLI

Example 1: To describe a repository in a public registry

The following `describe-repositories` example describes a repository named `project-a/nginx-web-app` in a public registry.

```
aws ecr-public describe-repositories \
    --repository-names project-a/nginx-web-app
```

Output:

```
{
    "repositories": [
        {
            "repositoryArn": "arn:aws:ecr-public::123456789012:repository/project-a/
nginx-web-app",
            "registryId": "123456789012",
            "repositoryName": "project-a/nginx-web-app",
            "repositoryUri": "public.ecr.aws/public-registry-custom-alias/project-a/
nginx-web-app",
            "createdAt": "2024-07-07T00:07:56.526000-05:00"
        }
    ]
}
```

For more information, see Viewing the contents and details of a repository in Amazon ECR public in the *Amazon ECR Public User Guide*.

Example 2: To describe all repositories in a public registry in a table

The following `describe-repositories` example describes all repositories in a public registry and then outputs the repository names into a table format.

```
aws ecr-public describe-repositories \
```

```
    --region us-east-1 \
    --output table \
    --query "repositories[*].repositoryName"
```

Output:

```
-----------------------------
|   DescribeRepositories    |
+---------------------------+

```

For more information, see Viewing the contents and details of a repository in Amazon ECR public in the *Amazon ECR Public User Guide*.

- For API details, see DescribeRepositories in *AWS CLI Command Reference*.

`get-authorization-token`

The following code example shows how to use `get-authorization-token`.

AWS CLI

Example 1: To retrieve an authorization token for any Amazon ECR public registry that the IAM principal has access

The following `get-authorization-token` example gets an authorization token with the AWS CLI and sets it to an environment variable.

```
aws ecr-public get-authorization-token \
    --region us-east-1
```

Output:

```
{
```

```
    "authorizationData": {
        "authorizationToken":
 "QVdTOmV5SndZWGxzYjJKJFHDSFKJHERWUY65IOU36TRYEGFNSDLRIUOTUYTHJKLDFGOcmFUQk9OSFV2UVV4a0x6Sm1
        "expiresAt": "2024-07-25T21:37:26.301000-04:00"
    }
}
```

For more information, see Registry authentication in Amazon ECR public in the *Amazon ECR Public User Guide*.

Example 2: To retrieve an authorization token for any Amazon ECR public registry that the IAM principal has access

The following `get-authorization-token` example gets an authorization token with the AWS CLI and sets it to an environment variable.

```
aws ecr-public get-authorization-token \
    --region us-east-1 \
    --output=text \
    --query 'authorizationData.authorizationToken'
```

Output:

```
QVdTOmV5SndZWGxzYjJKJFHDSFKJHERWUY65IOU36TRYEGFNSDLRIUOTUYTHJKLDFGOcmFUQk9OSFV2UVV4a0x6Sm1ZV
```

For more information, see Registry authentication in Amazon ECR public in the *Amazon ECR Public User Guide*.

- For API details, see GetAuthorizationToken in *AWS CLI Command Reference*.

`get-login-password`

The following code example shows how to use `get-login-password`.

AWS CLI

Example 1: To authenticate docker to an Amazon ECR public registry

The following `get-login-password` example retrieves and displays an authentication token using the GetAuthorizationToken API that you can use to authenticate to an Amazon ECR public registry.

```
aws ecr-public get-login-password \
    --region us-east-1
 \
| docker login \
    --username AWS \
    --password-stdin public.ecr.aws
```

This command produces no output. The authentication token is piped to Docker.

For more information, see Registry authentication in Amazon ECR public in the *Amazon ECR Public User Guide*.

Example 2: To authenticate docker to your own custom AmazonECR public registry

The following `get-login-password` example retrieves and displays an authentication token using the GetAuthorizationToken API that you can use to authenticate to your own custom Amazon ECR public registry.

```
aws ecr-public get-login-password \
    --region us-east-1
 \
| docker login \
    --username AWS \
    --password-stdin public.ecr.aws/<your-public-registry-custom-alias>
```

This command produces no output. The authentication token is piped to Docker.

For more information, see Registry authentication in Amazon ECR public in the *Amazon ECR Public User Guide*.

- For API details, see GetLoginPassword in *AWS CLI Command Reference*.

`get-registry-catalog-data`

The following code example shows how to use `get-registry-catalog-data`.

AWS CLI

To retrieve catalog metadata for a public ECR registry

The following `get-registry-catalog-data` example retrieves catalog metadata for an ECR public registry.

```
aws ecr-public get-registry-catalog-data \
    --region us-east-1
```

Output:

```
{
    "registryCatalogData": {
        "displayName": "YourCustomPublicRepositoryalias"
    }
}
```

For more information, see Updating registry settings in Amazon ECR public in the *Amazon ECR Public User Guide*.

- For API details, see GetRegistryCatalogData in *AWS CLI Command Reference*.

`get-repository-catalog-data`

The following code example shows how to use `get-repository-catalog-data`.

AWS CLI

To retrieve catalog metadata for a repository in a public registry

The following `get-repository-catalog-data` example lists the catalog metadata for the repository `project-a/nginx-web-app` in a public registry.

```
aws ecr-public get-repository-catalog-data \
    --repository-name project-a/nginx-web-app \
    --region us-east-1
```

Output:

```
{
    "catalogData": {
        "description": "My project-a ECR Public Repository",
        "architectures": [
            "ARM",
            "ARM 64",
            "x86",
```

```
            "x86-64"
        ],
        "operatingSystems": [
            "Linux"
        ],
        "logoUrl": "https://d3g9o9u8re44ak.cloudfront.net/logo/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222.png",
        "aboutText": "## Quick reference\n\nMaintained <truncated>",
        "usageText": "## Supported architectures\n\namd64, arm64v8\n\n##
 <truncated>"
    }
}
```

For more information, see Specifying the repository catalog data in Amazon ECR public in the *Amazon ECR Public User Guide*.

- For API details, see GetRepositoryCatalogData in *AWS CLI Command Reference*.

`get-repository-policy`

The following code example shows how to use `get-repository-policy`.

AWS CLI

To get a repository policy associated with the repository

The following `get-repository-policy` example gets a repository policy associated with the repository.

```
aws ecr-public get-repository-policy \
    --repository-name project-a/nginx-web-app \
    --region us-east-1
```

Output:

```
{
    "registryId": "123456789012",
    "repositoryName": "project-a/nginx-web-app",
    "policyText": "{\n  \"Version\" : \"2008-10-17\",\n  \"Statement\" : [ {\n
    \"Sid\" : \"AllowPush\",\n    \"Effect\" : \"Allow\",\n    \"Principal
\" : {\n      \"AWS\" : [ \"arn:aws:iam::123456789012:user/eksuser1\",
 \"arn:aws:iam::123456789012:user/admin\" ]\n    },\n    \"Action\" :
```

```
 [ \"ecr-public:BatchCheckLayerAvailability\", \"ecr-public:PutImage\",
 \"ecr-public:InitiateLayerUpload\", \"ecr-public:UploadLayerPart\", \"ecr-
public:CompleteLayerUpload\" ]\n  } ]\n}"
}
```

For more information, see Use GetRepositoryPolicy with an AWS SDK or CLI in the *Amazon ECR Public User Guide*.

- For API details, see GetRepositoryPolicy in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a public repository in a public registry

The following `list-tags-for-resource` example lists the tags for a resource named `project-a/nginx-web-app` in a public registry.

```
aws ecr-public list-tags-for-resource \
    --resource-arn arn:aws:ecr-public::123456789012:repository/project-a/nginx-web-app \
    --region us-east-1
```

Output:

```
{
    "tags": [
        {
            "Key": "Environment",
            "Value": "Prod"
        },
        {
            "Key": "stack",
            "Value": "dev1"
        },
        {
            "Key": "Name",
            "Value": "project-a/nginx-web-app"
        }
```

```
    ]
}
```

For more information, see Tag an Amazon ECR Public repository in the *Amazon ECR Public User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`put-registry-catalog-data`

The following code example shows how to use `put-registry-catalog-data`.

AWS CLI

To create or update catalog metadata for a public ECR registry

The following `put-registry-catalog-data` example creates or updates catalog metadata for an ECR public registry. Only accounts that have the verified account badge can have a registry display name.

```
aws ecr-public put-registry-catalog-data \
    --region us-east-1 \
    --display-name <YourCustomPublicRepositoryalias>
```

Output:

```
{
    "registryCatalogData": {
        "displayName": "YourCustomPublicRepositoryalias"
    }
}
```

For more information, see Updating registry settings in Amazon ECR public in the *Amazon ECR Public User Guide*.

- For API details, see PutRegistryCatalogData in *AWS CLI Command Reference*.

`put-repository-catalog-data`

The following code example shows how to use `put-repository-catalog-data`.

AWS CLI

To create or update the catalog data for a repository in a public registry

The following `put-repository-catalog-data` example creates or update catalog data for reposiotry named project-a/nginx-web-app in a public registry, along with logoImageBlob, aboutText, usageText and tags information.

```
aws ecr-public put-repository-catalog-data \
    --repository-name project-a/nginx-web-app \
    --cli-input-json file://repository-catalog-data.json \
    --region us-east-1
```

Contents of `repository-catalog-data.json`:

```
{
    "repositoryName": "project-a/nginx-web-app",
    "catalogData": {
        "description": "My project-a ECR Public Repository",
        "architectures": [
            "ARM",
            "ARM 64",
            "x86",
            "x86-64"
        ],
        "operatingSystems": [
            "Linux"
        ],
        "logoImageBlob": "iVBORw0KGgoA<<truncated-for-better-reading>>ErkJggg==",
        "aboutText": "## Quick reference.",
        "usageText": "## Supported architectures are as follows."
    }
}
```

Output:

```
{
    "catalogData": {
        "description": "My project-a ECR Public Repository",
        "architectures": [
            "ARM",
            "ARM 64",
```

```
            "x86",
            "x86-64"
        ],
        "operatingSystems": [
            "Linux"
        ],
        "logoUrl": "https://d3g9o9u8re44ak.cloudfront.net/logo/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222.png",
        "aboutText": "## Quick reference.",
        "usageText": "## Supported architectures are as follows."
    }
}
```

For more information, see Specifying the repository catalog data in Amazon ECR public in the *Amazon ECR Public User Guide*.

- For API details, see PutRepositoryCatalogData in *AWS CLI Command Reference*.

`set-repository-policy`

The following code example shows how to use `set-repository-policy`.

AWS CLI

Example 1: To set a repository policy to allow a pull on the repository

The following `set-repository-policy` example applies an ECR public repository policy to the specified repository to control access permissions.

```
aws ecr-public set-repository-policy \
    --repository-name project-a/nginx-web-app \
    --policy-text file://my-repository-policy.json
```

Contents of `my-repository-policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement" : [
        {
            "Sid" : "allow public pull",
            "Effect" : "Allow",
            "Principal" : "*",
```

```
            "Action" : [
                "ecr:BatchCheckLayerAvailability",
                "ecr:BatchGetImage",
                "ecr:GetDownloadUrlForLayer"
            ]
        }
    ]
}
```

Output:

```
{
    "registryId": "12345678901",
    "repositoryName": "project-a/nginx-web-app",
    "policyText": "{\n  \"Version\" : \"2008-10-17\",\n  \"Statement\" : [ {\n
 \"Sid\" : \"allow public pull\",\n    \"Effect\" : \"Allow\",\n    \"Principal\" :
 \"*\",\n    \"Action\" : [ \"ecr:BatchCheckLayerAvailability\", \"ecr:BatchGetImage
\", \"ecr:GetDownloadUrlForLayer\" ]\n  } ]\n}"
}
```

For more information, see Setting a repository policy statement in the *Amazon ECR Public User Guide*.

Example 2: To set a repository policy to allow an IAM user within your account to push images

The following `set-repository-policy` example allows an IAM user within your account to push images using to an ECR repository in your AWS account using the input file named `file://my-repository-policy.json` as policy text.

```
aws ecr-public set-repository-policy \
    --repository-name project-a/nginx-web-app \
    --policy-text file://my-repository-policy.json
```

Contents of `my-repository-policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "AllowPush",
```

```
            "Effect": "Allow",
            "Principal": {
                "AWS": [
                    "arn:aws:iam::account-id:user/push-pull-user-1",
                    "arn:aws:iam::account-id:user/push-pull-user-2"
                ]
            },
            "Action": [
                "ecr-public:BatchCheckLayerAvailability",
                "ecr-public:PutImage",
                "ecr-public:InitiateLayerUpload",
                "ecr-public:UploadLayerPart",
                "ecr-public:CompleteLayerUpload"
            ]
        }
    ]
}
```

Output:

```
{
    "registryId": "12345678901",
    "repositoryName": "project-a/nginx-web-app",
    "policyText": "{\n  \"Version\" : \"2008-10-17\",\n  \"Statement\" :
 [ {\n    \"Sid\" : \"AllowPush\",\n    \"Effect\" : \"Allow\",\n
 \"Principal\" : {\n      \"AWS\" : [ \"arn:aws:iam::12345678901:user/admin
\", \"arn:aws:iam::12345678901:user/eksuser1\" ]\n    },\n    \"Action\" :
 [ \"ecr-public:BatchCheckLayerAvailability\", \"ecr-public:PutImage\",
 \"ecr-public:InitiateLayerUpload\", \"ecr-public:UploadLayerPart\", \"ecr-
public:CompleteLayerUpload\" ]\n  } ]\n}"
}
```

For more information, see Setting a repository policy statement in the *Amazon ECR Public User Guide*.

Example 3: To set a repository policy to allow an IAM user from different account to push images

The following `set-repository-policy` example allows a specific account to push images using cli input file://my-repository-policy.json in your AWS account.

```
aws ecr-public set-repository-policy \
```

```
    --repository-name project-a/nginx-web-app \
    --policy-text file://my-repository-policy.json
```

Contents of `my-repository-policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "AllowCrossAccountPush",
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::other-or-same-account-id:role/RoleName"
            },
            "Action": [
                "ecr-public:BatchCheckLayerAvailability",
                "ecr-public:PutImage",
                "ecr-public:InitiateLayerUpload",
                "ecr-public:UploadLayerPart",
                "ecr-public:CompleteLayerUpload"
            ]
        }
    ]
}
```

Output:

```
{
    "registryId": "12345678901",
    "repositoryName": "project-a/nginx-web-app",
    "policyText": "{\n  \"Version\" : \"2008-10-17\",\n  \"Statement\" : [ {\n
 \"Sid\" : \"AllowCrossAccountPush\",\n    \"Effect\" : \"Allow\",\n    \"Principal
\" : {\n      \"AWS\" : \"arn:aws:iam::12345678901:role/RoleName\"\n    },\n
 \"Action\" : [ \"ecr-public:BatchCheckLayerAvailability\", \"ecr-public:PutImage
\", \"ecr-public:InitiateLayerUpload\", \"ecr-public:UploadLayerPart\", \"ecr-
public:CompleteLayerUpload\" ]\n  } ]\n}"
}
```

For more information, see Public repository policy examples in the *Amazon ECR Public User Guide*.

- For API details, see SetRepositoryPolicy in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

Example 1: To tags an existing public repository in a public registry

The following `tag-resource` example tags a repository named `project-a/nginx-web-app` in a public registry.

```
aws ecr-public tag-resource \
    --resource-arn arn:aws:ecr-public::123456789012:repository/project-a/nginx-web-app \
    --tags Key=stack,Value=dev \
    --region us-west-2
```

This command produces no output.

For more information, see Tag an Amazon ECR Public repository in the *Amazon ECR Public User Guide*.

Example 2: To tag an existing public repository with multiple tags in a public registry.

The following `tag-resource` example tags an existing repository with multiple tags.

```
aws ecr-public tag-resource \
    --resource-arn arn:aws:ecr-public::123456789012:repository/project-a/nginx-web-app  \
    --tags Key=key1,Value=value1 Key=key2,Value=value2 Key=key3,Value=value3 \
    --region us-west-2
```

This command produces no output.

For more information, see Tag an Amazon ECR Public repository in the *Amazon ECR Public User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

Example 1: To untags an existing public repository in a public registry

The following `untag-resource` example tags a repository named `project-a/nginx-web-app` in a public registry.

```
aws ecr-public untag-resource \
    --resource-arn arn:aws:ecr-public::123456789012:repository/project-a/nginx-web-app \
    --tag-keys stack \
    --region us-west-2
```

This command produces no output.

For more information, see Tag an Amazon ECR Public repository in the *Amazon ECR Public User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

Amazon ECS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon ECS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-capacity-provider`

The following code example shows how to use `create-capacity-provider`.

AWS CLI

To create a capacity provider

The following `create-capacity-provider` example creates a capacity provider that uses an Auto Scaling group named MyASG, has managed scaling and managed termination protection enabled. This configuration is used for Amazon ECS cluster auto scaling.

```
aws ecs create-capacity-provider \
    --name "MyCapacityProvider" \
    --auto-scaling-group-provider "autoScalingGroupArn=arn:aws:autoscaling:us-
west-2:123456789012:autoScalingGroup:a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111:autoScalingGroupName/
MyASG,managedScaling={status=ENABLED,targetCapacity=100},managedTerminationProtection=ENABLE
```

Output:

```
{
    "capacityProvider": {
        "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-
provider/MyCapacityProvider",
        "name": "MyCapacityProvider",
        "status": "ACTIVE",
        "autoScalingGroupProvider": {
            "autoScalingGroupArn": "arn:aws:autoscaling:us-
west-2:123456789012:autoScalingGroup:a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111:autoScalingGroupName/MyASG",
            "managedScaling": {
                "status": "ENABLED",
                "targetCapacity": 100,
                "minimumScalingStepSize": 1,
                "maximumScalingStepSize": 10000,
                "instanceWarmupPeriod": 300
            },
            "managedTerminationProtection": "ENABLED"
        },
        "tags": []
    }
}
```

For more information, see Amazon ECS cluster auto scaling in the *Amazon ECS Developer Guide*.

- For API details, see CreateCapacityProvider in *AWS CLI Command Reference*.

`create-cluster`

The following code example shows how to use `create-cluster`.

AWS CLI

Example 1: To create a new cluster

The following `create-cluster` example creates a cluster named `MyCluster` and enables CloudWatch Container Insights with enhanced observability.

```
aws ecs create-cluster \
    --cluster-name MyCluster \
    --settings name=containerInsights,value=enhanced
```

Output:

```
{
    "cluster": {
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",
        "clusterName": "MyCluster",
        "status": "ACTIVE",
        "registeredContainerInstancesCount": 0,
        "pendingTasksCount": 0,
        "runningTasksCount": 0,
        "activeServicesCount": 0,
        "statistics": [],
        "settings": [
            {
                "name": "containerInsights",
                "value": "enhanced"
            }
        ],
        "tags": []
    }
}
```

For more information, see Creating an Amazon ECS cluster for Fargate workloads in the *Amazon ECS Developer Guide*.

Example 2: To create a new cluster using capacity providers

The following `create-cluster` example creates a cluster and associates two existing capacity providers with it. The `create-capacity-provider` command is used to create a capacity provider. Specifying a default capacity provider strategy is optional, but recommended. In this example, we create a cluster named `MyCluster` and associate the `MyCapacityProvider1` and `MyCapacityProvider2` capacity providers with it. A default capacity provider strategy is specified that spreads the tasks evenly across both capacity providers.

```
aws ecs create-cluster \
    --cluster-name MyCluster \
    --capacity-providers MyCapacityProvider1 MyCapacityProvider2 \
    --default-capacity-provider-
strategy capacityProvider=MyCapacityProvider1,weight=1 capacityProvider=MyCapacityProvider2,
```

Output:

```
{
    "cluster": {
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",
        "clusterName": "MyCluster",
        "status": "PROVISIONING",
        "registeredContainerInstancesCount": 0,
        "pendingTasksCount": 0,
        "runningTasksCount": 0,
        "activeServicesCount": 0,
        "statistics": [],

```

For more information, see Amazon ECS capacity providers for EC2 workloads in the *Amazon ECS Developer Guide*.

Example 3: To create a new cluster with multiple tags

The following `create-cluster` example creates a cluster with multiple tags. For more information about adding tags using shorthand syntax, see Using Shorthand Syntax with the AWS Command Line Interface in the *AWS CLI User Guide*.

```
aws ecs create-cluster \
    --cluster-name MyCluster \
    --tags key=key1,value=value1 key=key2,value=value2
```

Output:

```
{
    "cluster": {
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",
        "clusterName": "MyCluster",
        "status": "ACTIVE",
        "registeredContainerInstancesCount": 0,
        "pendingTasksCount": 0,
        "runningTasksCount": 0,
        "activeServicesCount": 0,
        "statistics": [],
        "tags": [
            {
                "key": "key1",
                "value": "value1"
            },
            {
                "key": "key2",
                "value": "value2"
            }
        ]
    }
}
```

For more information, see Creating an Amazon ECS cluster for Fargate workloads in the *Amazon ECS Developer Guide*.

- For API details, see CreateCluster in *AWS CLI Command Reference*.

create-service

The following code example shows how to use `create-service`.

AWS CLI

Example 1: To create a service with a Fargate task

The following `create-service` example shows how to create a service using a Fargate task.

```
aws ecs create-service \
    --cluster MyCluster \
    --service-name MyService \
    --task-definition sample-fargate:1 \
    --desired-count 2 \
    --launch-type FARGATE \
    --platform-version LATEST \
    --network-configuration
 'awsvpcConfiguration={subnets=[subnet-12344321],securityGroups=[sg-12344321],assignPublicIp
 \
    --tags key=key1,value=value1 key=key2,value=value2 key=key3,value=value3
```

Output:

```
{
    "service": {
        "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/
MyService",
        "serviceName": "MyService",
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",

                "value": "value3"
            }
        ],
        "enableECSManagedTags": false,
        "propagateTags": "NONE"
    }
}
```

For more information, see Creating a Service in the *Amazon ECS Developer Guide*.

Example 2: To create a service using the EC2 launch type

The following `create-service` example shows how to create a service called `ecs-simple-service` with a task that uses the EC2 launch type. The service uses the `sleep360` task definition and it maintains 1 instantiation of the task.

```
aws ecs create-service \
    --cluster MyCluster \
    --service-name ecs-simple-service \
    --task-definition sleep360:2 \
    --desired-count 1
```

Output:

```
{
    "service": {
        "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/ecs-
simple-service",
        "serviceName": "ecs-simple-service",
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",
        "loadBalancers": [],
        "serviceRegistries": [],
```

```
        "status": "ACTIVE",
        "desiredCount": 1,
        "runningCount": 0,
        "pendingCount": 0,
        "launchType": "EC2",
        "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-definition/
sleep360:2",
        "deploymentConfiguration": {
            "maximumPercent": 200,
            "minimumHealthyPercent": 100
        },
        "deployments": [
            {
                "id": "ecs-svc/1234567890123456789",
                "status": "PRIMARY",
                "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-
definition/sleep360:2",
                "desiredCount": 1,
                "pendingCount": 0,
                "runningCount": 0,
                "createdAt": 1557206498.798,
                "updatedAt": 1557206498.798,
                "launchType": "EC2"
            }
        ],
        "events": [],
        "createdAt": 1557206498.798,
        "placementConstraints": [],
        "placementStrategy": [],
        "schedulingStrategy": "REPLICA",
        "enableECSManagedTags": false,
        "propagateTags": "NONE"
    }
}
```

For more information, see Creating a Service in the *Amazon ECS Developer Guide*.

Example 3: To create a service that uses an external deployment controller

The following `create-service` example creates a service that uses an external deployment controller.

```
aws ecs create-service \
```

```
    --cluster MyCluster \
    --service-name MyService \
    --deployment-controller type=EXTERNAL \
    --desired-count 1
```

Output:

```
{
    "service": {
        "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/
MyService",
        "serviceName": "MyService",
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",
        "loadBalancers": [],
        "serviceRegistries": [],
        "status": "ACTIVE",
        "desiredCount": 1,
        "runningCount": 0,
        "pendingCount": 0,
        "launchType": "EC2",
        "deploymentConfiguration": {
            "maximumPercent": 200,
            "minimumHealthyPercent": 100
        },
        "taskSets": [],
        "deployments": [],
        "roleArn": "arn:aws:iam::123456789012:role/aws-service-role/
ecs.amazonaws.com/AWSServiceRoleForECS",
        "events": [],
        "createdAt": 1557128207.101,
        "placementConstraints": [],
        "placementStrategy": [],
        "schedulingStrategy": "REPLICA",
        "deploymentController": {
            "type": "EXTERNAL"
        },
        "enableECSManagedTags": false,
        "propagateTags": "NONE"
    }
}
```

For more information, see Creating a Service in the *Amazon ECS Developer Guide*.

Example 4: To create a new service behind a load balancer

The following `create-service` example shows how to create a service that is behind a load balancer. You must have a load balancer configured in the same Region as your container instance. This example uses the `--cli-input-json` option and a JSON input file called `ecs-simple-service-elb.json` with the following content.

```
aws ecs create-service \
    --cluster MyCluster \
    --service-name ecs-simple-service-elb \
    --cli-input-json file://ecs-simple-service-elb.json
```

Contents of `ecs-simple-service-elb.json`:

```
{
    "serviceName": "ecs-simple-service-elb",
    "taskDefinition": "ecs-demo",
    "loadBalancers": [
        {
            "loadBalancerName": "EC2Contai-EcsElast-123456789012",
            "containerName": "simple-demo",
            "containerPort": 80
        }
    ],
    "desiredCount": 10,
    "role": "ecsServiceRole"
}
```

Output:

```
{
    "service": {
        "status": "ACTIVE",
        "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-definition/ecs-
demo:1",
        "pendingCount": 0,
        "loadBalancers": [
            {
                "containerName": "ecs-demo",
                "containerPort": 80,
                "loadBalancerName": "EC2Contai-EcsElast-123456789012"
```

```
            }
        ],
        "roleArn": "arn:aws:iam::123456789012:role/ecsServiceRole",
        "desiredCount": 10,
        "serviceName": "ecs-simple-service-elb",
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",
        "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/ecs-simple-
service-elb",
        "deployments": [
            {
                "status": "PRIMARY",
                "pendingCount": 0,
                "createdAt": 1428100239.123,
                "desiredCount": 10,
                "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-
definition/ecs-demo:1",
                "updatedAt": 1428100239.123,
                "id": "ecs-svc/1234567890123456789",
                "runningCount": 0
            }
        ],
        "events": [],
        "runningCount": 0
    }
}
```

For more information, see Use load balancing to distribute Amazon ECS service traffic in the *Amazon ECS Developer Guide*.

Example 5: To configure Amazon EBS volumes at service creation

The following `create-service` example shows how to configure Amazon EBS volumes for each task managed by the service. You must have an Amazon ECS infrastructure role configured with the `AmazonECSInfrastructureRolePolicyForVolumes` managed policy attached. You must specify a task definition with the same volume name as in the `create-service` request. This example uses the `--cli-input-json` option and a JSON input file called `ecs-simple-service-ebs.json` with the following content.

```
aws ecs create-service \
    --cli-input-json file://ecs-simple-service-ebs.json
```

Contents of `ecs-simple-service-ebs.json`:

```
{
    "cluster": "mycluster",
    "taskDefinition": "mytaskdef",
    "serviceName": "ecs-simple-service-ebs",
    "desiredCount": 2,
    "launchType": "FARGATE",
    "networkConfiguration":{
        "awsvpcConfiguration":{
            "assignPublicIp": "ENABLED",
            "securityGroups": ["sg-12344321"],
            "subnets":["subnet-12344321"]
        }
    },
    "volumeConfigurations": [
        {
            "name": "myEbsVolume",
            "managedEBSVolume": {
                "roleArn":"arn:aws:iam::123456789012:role/ecsInfrastructureRole",
                "volumeType": "gp3",
                "sizeInGiB": 100,
                "iops": 3000,
                "throughput": 125,
                "filesystemType": "ext4"
            }
        }
    ]
}
```

Output:

```
{
    "service": {
        "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/mycluster/ecs-
simple-service-ebs",
        "serviceName": "ecs-simple-service-ebs",
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/mycluster",
        "loadBalancers": [],
        "serviceRegistries": [],
        "status": "ACTIVE",
        "desiredCount": 2,
        "runningCount": 0,

For more information, see Use Amazon EBS volumes with Amazon ECS in the *Amazon ECS Developer Guide*.

- For API details, see CreateService in *AWS CLI Command Reference*.

create-task-set

The following code example shows how to use `create-task-set`.

AWS CLI

To create a task set

The following `create-task-set` example creates a task set in a service that uses an external deployment controller.

```
aws ecs create-task-set \
    --cluster MyCluster \
    --service MyService \
    --task-definition MyTaskDefinition:2 \
    --network-
configuration "awsvpcConfiguration={subnets=[subnet-12344321],securityGroups=[sg-12344321]}"
```

Output:

```
{
    "taskSet": {
        "id": "ecs-svc/1234567890123456789",
        "taskSetArn": "arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/
MyService/ecs-svc/1234567890123456789",
        "status": "ACTIVE",
        "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-definition/
MyTaskDefinition:2",
        "computedDesiredCount": 0,
        "pendingCount": 0,

        "stabilityStatus": "STABILIZING",
        "stabilityStatusAt": 1557128360.711
    }
}
```

For more information, see Deploy Amazon ECS services using a third-party controller in the *Amazon ECS Developer Guide*.

- For API details, see CreateTaskSet in *AWS CLI Command Reference*.

`delete-account-setting`

The following code example shows how to use `delete-account-setting`.

AWS CLI

To delete the account settings for a specific IAM user or IAM role

The following `delete-account-setting` example deletes the account settings for the specific IAM user or IAM role.

```
aws ecs delete-account-setting \
    --name serviceLongArnFormat \
    --principal-arn arn:aws:iam::123456789012:user/MyUser
```

Output:

```
{
    "setting": {
        "name": "serviceLongArnFormat",
        "value": "enabled",
        "principalArn": "arn:aws:iam::123456789012:user/MyUser"
    }
}
```

For more information, see Access Amazon ECS features with account settings in the *Amazon ECS Developer Guide*.

- For API details, see DeleteAccountSetting in *AWS CLI Command Reference*.

`delete-attributes`

The following code example shows how to use `delete-attributes`.

AWS CLI

To delete one or more custom attributes from an Amazon ECS resource

The following `delete-attributes` example deletes an attribute with the name `stack` from a container instance.

```
aws ecs delete-attributes \
    --attributes name=stack,targetId=arn:aws:ecs:us-west-2:123456789012:container-instance/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "attributes": [
        {
            "name": "stack",
            "targetId": "arn:aws:ecs:us-west-2:123456789012:container-instance/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "value": "production"
        }
    ]
}
```

For more information, see Define which container instances Amazon ECS uses for tasks in the *Amazon ECS Developer Guide*.

- For API details, see DeleteAttributes in *AWS CLI Command Reference*.

`delete-capacity-provider`

The following code example shows how to use `delete-capacity-provider`.

AWS CLI

Example 1: To delete a capacity provider using the Amazon Resource Name (ARN)

The following `delete-capacity-provider` example deletes a capacity provider by specifying the Amazon Resource Name (ARN) of the capacity provider. The ARN as well as the status of the capacity provider deletion can be retrieved using the `describe-capacity-providers` command.

```
aws ecs delete-capacity-provider \
    --capacity-provider arn:aws:ecs:us-west-2:123456789012:capacity-provider/
ExampleCapacityProvider
```

Output:

```
{
    "capacityProvider": {
        "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-
provider/ExampleCapacityProvider",
        "name": "ExampleCapacityProvider",
        "status": "ACTIVE",
        "autoScalingGroupProvider": {
            "autoScalingGroupArn": "arn:aws:autoscaling:us-
west-2:123456789012:autoScalingGroup:a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111:autoScalingGroupName/MyAutoScalingGroup",
            "managedScaling": {
                "status": "ENABLED",
                "targetCapacity": 100,
                "minimumScalingStepSize": 1,
                "maximumScalingStepSize": 10000
            },
            "managedTerminationProtection": "DISABLED"
        },
        "updateStatus": "DELETE_IN_PROGRESS",
        "tags": []
    }
}
```

For more information, see Deleting an Amazon ECS capacity provider in the *Amazon ECS Developer Guide*.

Example 2: To delete a capacity provider using the name

The following `delete-capacity-provider` example deletes a capacity provider by specifying the short name of the capacity provider. The short name as well as the status of the capacity provider deletion can be retrieved using the `describe-capacity-providers` command.

```
aws ecs delete-capacity-provider \
    --capacity-provider ExampleCapacityProvider
```

Output:

```
{
    "capacityProvider": {
        "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-
provider/ExampleCapacityProvider",
        "name": "ExampleCapacityProvider",
        "status": "ACTIVE",
        "autoScalingGroupProvider": {
            "autoScalingGroupArn": "arn:aws:autoscaling:us-
west-2:123456789012:autoScalingGroup:a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111:autoScalingGroupName/MyAutoScalingGroup",
            "managedScaling": {
                "status": "ENABLED",
                "targetCapacity": 100,
                "minimumScalingStepSize": 1,
                "maximumScalingStepSize": 10000
            },
            "managedTerminationProtection": "DISABLED"
        },
        "updateStatus": "DELETE_IN_PROGRESS",
        "tags": []
    }
}
```

For more information, see Deleting an Amazon ECS capacity provider in the *Amazon ECS Developer Guide*.

- For API details, see DeleteCapacityProvider in *AWS CLI Command Reference*.

`delete-cluster`

The following code example shows how to use `delete-cluster`.

AWS CLI

To delete an empty cluster

The following `delete-cluster` example deletes the specified empty cluster.

```
aws ecs delete-cluster \
    --cluster MyCluster
```

Output:

```
{
    "cluster": {
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",
        "status": "INACTIVE",
        "clusterName": "MyCluster",
        "registeredContainerInstancesCount": 0,
        "pendingTasksCount": 0,
        "runningTasksCount": 0,
        "activeServicesCount": 0,
        "statistics": [],
        "tags": []
    }
}
```

For more information, see Deleting an Amazon ECS cluster in the *Amazon ECS Developer Guide*.

- For API details, see DeleteCluster in *AWS CLI Command Reference*.

`delete-service`

The following code example shows how to use `delete-service`.

AWS CLI

To delete a service

The following `delete-service` example deletes the specified service from a cluster. You can include the `--force` parameter to delete a service even if it has not been scaled to zero tasks.

```
aws ecs delete-service \
```

```
    --cluster MyCluster \
    --service MyService1 \
    --force
```

Output:

```
{
    "service": {
        "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/
MyService1",
        "serviceName": "MyService1",
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",

}
```

For more information, see Deploy Amazon ECS services using a third-party controller in the *Amazon ECS Developer Guide*.

- For API details, see DeleteTaskSet in *AWS CLI Command Reference*.

`deregister-container-instance`

The following code example shows how to use `deregister-container-instance`.

AWS CLI

To deregister a container instance from a cluster

The following `deregister-container-instance` example deregisters a container instance from the specified cluster. If there are still tasks running in the container instance, you must either stop those tasks before deregistering, or use the `--force` option.

```
aws ecs deregister-container-instance \
    --cluster arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \
    --container-instance arn:aws:ecs:us-west-2:123456789012:container-instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --force
```

Output:

```
{
    "containerInstance": {
        "remainingResources": [
            {
                "integerValue": 1024,
                "doubleValue": 0.0,
                "type": "INTEGER",
                "longValue": 0,
                "name": "CPU"
            },
            {
                "integerValue": 985,
                "doubleValue": 0.0,
                "type": "INTEGER",
                "longValue": 0,
                "name": "MEMORY"
            },
            {
                "type": "STRINGSET",
                "integerValue": 0,
                "name": "PORTS",
                "stringSetValue": [

- For API details, see DeregisterContainerInstance in *AWS CLI Command Reference*.

`deregister-task-definition`

The following code example shows how to use `deregister-task-definition`.

AWS CLI

To deregister a task definition

The following `deregister-task-definition` example deregisters the first revision of the `curler` task definition in your default region. In the output, the task definition status shows `INACTIVE`.

```
aws ecs deregister-task-definition \
    --task-definition curler:1
```

Output:

```
{
    "taskDefinition": {
        "status": "INACTIVE",
        "family": "curler",
        "volumes": [],
        "taskDefinitionArn": "arn:aws:ecs:us-west-2:123456789012:task-definition/
curler:1",
        "containerDefinitions": [
            {
                "environment": [],
                "name": "curler",
                "mountPoints": [],
                "image": "curl:latest",

                "memory": 256,
                "command": [
                    "curl -v http://example.com/"
                ],
                "essential": true,
                "volumesFrom": []
            }
```

```
        ],
        "revision": 1
    }
}
```

For more information, see Amazon ECS task definitions in the *Amazon ECS Developer Guide*.

- For API details, see DeregisterTaskDefinition in *AWS CLI Command Reference*.

`describe-capacity-providers`

The following code example shows how to use `describe-capacity-providers`.

AWS CLI

Example 1: To describe all capacity providers

The following `describe-capacity-providers` example retrieves details about all capacity providers.

```
aws ecs describe-capacity-providers
```

Output:

```
{
    "capacityProviders": [
        {
            "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-
provider/MyCapacityProvider",
            "name": "MyCapacityProvider",
            "status": "ACTIVE",
            "autoScalingGroupProvider": {
                "autoScalingGroupArn": "arn:aws:autoscaling:us-
west-2:123456789012:autoScalingGroup:a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111:autoScalingGroupName/MyAutoScalingGroup",
                "managedScaling": {
                    "status": "ENABLED",
                    "targetCapacity": 100,
                    "minimumScalingStepSize": 1,
                    "maximumScalingStepSize": 1000
                },
                "managedTerminationProtection": "ENABLED"
            },
```

```
            "tags": []
        },
        {
            "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-
provider/FARGATE",
            "name": "FARGATE",
            "status": "ACTIVE",
            "tags": []
        },
        {
            "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-
provider/FARGATE_SPOT",
            "name": "FARGATE_SPOT",
            "status": "ACTIVE",
            "tags": []
        }
    ]
}
```

For more information, see Amazon ECS capacity providers for EC2 workloads in the *Amazon ECS Developer Guide*.

Example 2: To describe a specific capacity providers

The following `describe-capacity-providers` example retrieves details about a specific capacity provider. Using the `--include TAGS` parameter will add the tags associated with the capacity provider to the output.

```
aws ecs describe-capacity-providers \
    --capacity-providers MyCapacityProvider \
    --include TAGS
```

Output:

```
{
    "capacityProviders": [
        {
            "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-
provider/MyCapacityProvider",
            "name": "MyCapacityProvider",
            "status": "ACTIVE",
            "autoScalingGroupProvider": {
```

```
                "autoScalingGroupArn": "arn:aws:autoscaling:us-
west-2:123456789012:autoScalingGroup:a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111:autoScalingGroupName/MyAutoScalingGroup",
                "managedScaling": {
                    "status": "ENABLED",
                    "targetCapacity": 100,
                    "minimumScalingStepSize": 1,
                    "maximumScalingStepSize": 1000
                },
                "managedTerminationProtection": "ENABLED"
            },
            "tags": [
                {
                    "key": "environment",
                    "value": "production"
                }
            ]
        }
    ]
}
```

For more information, see Amazon ECS capacity providers for EC2 workloads in the *Amazon ECS Developer Guide*.

- For API details, see DescribeCapacityProviders in *AWS CLI Command Reference*.

`describe-clusters`

The following code example shows how to use `describe-clusters`.

AWS CLI

Example 1: To describe a cluster

The following `describe-clusters` example retrieves details about the specified cluster.

```
aws ecs describe-clusters \
    --clusters default
```

Output:

```
{
    "clusters": [
```

```
        {
            "status": "ACTIVE",
            "clusterName": "default",
            "registeredContainerInstancesCount": 0,
            "pendingTasksCount": 0,
            "runningTasksCount": 0,
            "activeServicesCount": 1,
            "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/default"
        }
    ],
    "failures": []
}
```

For more information, see Amazon ECS Clusters in the *Amazon ECS Developer Guide*.

Example 2: To describe a cluster with the attachment option

The following `describe-clusters` example specifies the ATTACHMENTS option. It retrieves details about the specified cluster and a list of resources attached to the cluster in the form of attachments. When using a capacity provider with a cluster, the resources, either AutoScaling plans or scaling policies, will be represented as asp or as_policy ATTACHMENTS.

```
aws ecs describe-clusters \
    --include ATTACHMENTS \
    --clusters sampleCluster
```

Output:

```
{
    "clusters": [

`describe-container-instances`

The following code example shows how to use `describe-container-instances`.

AWS CLI

To describe container instance

The following `describe-container-instances` example retrieves details for a container instance in the `update` cluster, using the container instance UUID as an identifier.

```
aws ecs describe-container-instances \
```

```
    --cluster update \
    --container-instances a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "failures": [],
    "containerInstances": [
        {
            "status": "ACTIVE",
            "registeredResources": [
                {
                    "integerValue": 2048,

`describe-services`

The following code example shows how to use `describe-services`.

AWS CLI

To describe a service

The following `describe-services` example retrieves details for the `my-http-service` service in the default cluster.

```
aws ecs describe-services \
    --services my-http-service
```

Output:

```
{
    "services": [
```

```
        {
            "status": "ACTIVE",
            "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-definition/
amazon-ecs-sample:1",

```

For more information, see Amazon ECS task definitions in the *Amazon ECS Developer Guide*.

- For API details, see DescribeTaskDefinition in *AWS CLI Command Reference*.

`describe-task-sets`

The following code example shows how to use `describe-task-sets`.

AWS CLI

To describe a task set

The following `describe-task-sets` example describes a task set in a service that uses an external deployer.

```
aws ecs describe-task-sets \
```

```
    --cluster MyCluster \
    --service MyService \
    --task-sets arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/MyService/ecs-
svc/1234567890123456789
```

Output:

```
{
    "taskSets": [
        {
            "id": "ecs-svc/1234567890123456789",
            "taskSetArn": "arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/
MyService/ecs-svc/1234567890123456789",
            "status": "ACTIVE",
            "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-definition/

- For API details, see DescribeTaskSets in *AWS CLI Command Reference*.

`describe-tasks`

The following code example shows how to use `describe-tasks`.

AWS CLI

Example 1: To describe a single task tasks

The following `describe-tasks` example retrieves the details of a task in a cluster. You can specify the task by using either the ID or full ARN of the task. This example uses the full ARN of the task.

```
aws ecs describe-tasks \
    --cluster MyCluster \
    --tasks arn:aws:ecs:us-west-2:123456789012:task/
MyCluster/4d590253bb114126b7afa7b58EXAMPLE
```

Output:

```
{
    "tasks": [
        {
            "attachments": [],
            "attributes": [
                {
                    "name": "ecs.cpu-architecture",
                    "value": "x86_64"
                }
            ],
            "availabilityZone": "us-west-2b",
            "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",

    ],
    "failures": []
}
```

For more information, see Amazon ECS Task Definitions in the *Amazon ECS Developer Guide*.

Example 2: To describe multiple tasks

The following `describe-tasks` example retrieves the details of multiple tasks in a cluster. You can specify the task by using either the ID or full ARN of the task. This example uses the full IDs of the tasks.

```
aws ecs describe-tasks \
    --cluster MyCluster \
    --tasks "74de0355a10a4f979ac495c14EXAMPLE" "d789e94343414c25b9f6bd59eEXAMPLE"
```

Output:

```
{
    "tasks": [
        {
            "attachments": [
                {
                    "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
                    "type": "ElasticNetworkInterface",
                    "status": "ATTACHED",
                    "details": [
                        {

    "failures": []
}
```

For more information, see Amazon ECS Task Definitions in the *Amazon ECS Developer Guide*.

- For API details, see DescribeTasks in *AWS CLI Command Reference*.

`execute-command`

The following code example shows how to use `execute-command`.

AWS CLI

To run an interactive /bin/sh command

The following `execute-command` example runs an interactive /bin/sh command against a container named MyContainer for a task with an id of `arn:aws:ecs:us-west-2:123456789012:task/MyCluster/d789e94343414c25b9f6bd59eEXAMPLE`.

```
aws ecs execute-command \
    --cluster MyCluster \
    --task arn:aws:ecs:us-west-2:123456789012:task/MyCluster/
d789e94343414c25b9f6bd59eEXAMPLE \
    --container MyContainer \
    --interactive \
    --command "/bin/sh"
```

This command produces no output.

For more information, see Using Amazon ECS Exec for debugging in the *Amazon ECS Developer Guide*.

- For API details, see ExecuteCommand in *AWS CLI Command Reference*.

`get-task-protection`

The following code example shows how to use `get-task-protection`.

AWS CLI

To retrieve the protection status of a task in an ECS service

The following `get-task-protection` example retrieves the protection status of ECS tasks that belong to Amazon ECS service.

```
aws ecs get-task-protection \
    --cluster ECS-project-update-cluster \
    --tasks c43ed3b1331041f289316f958adb6a24
```

Output:

```
{
    "protectedTasks": [
        {
            "taskArn": "arn:aws:ecs:us-west-2:123456789012:task/
c43ed3b1331041f289316f958adb6a24",
            "protectionEnabled": false
        }
    ],
    "failures": []
}
```

For more formation on task protection, see Protect your Amazon ECS tasks from being terminated by scale-in events in the *Amazon ECS Developer Guide*.

- For API details, see GetTaskProtection in *AWS CLI Command Reference*.

`list-account-settings`

The following code example shows how to use `list-account-settings`.

AWS CLI

Example 1: To view the account settings for an account

The following `list-account-settings` example displays the effective account settings for an account.

```
aws ecs list-account-settings \
    --effective-settings
```

Output:

```
{
    "settings": [
        {
            "name": "containerInstanceLongArnFormat",
            "value": "enabled",
            "principalArn": "arn:aws:iam::123456789012:root"
        },
        {
            "name": "serviceLongArnFormat",
            "value": "enabled",
            "principalArn": "arn:aws:iam::123456789012:root"
        },
        {
            "name": "taskLongArnFormat",
            "value": "enabled",
            "principalArn": "arn:aws:iam::123456789012:root"
        }
    ]
}
```

For more information, see Access Amazon ECS features with account settings in the *Amazon ECS Developer Guide*.

Example 2: To view the account settings for a specific IAM user or IAM role

The following `list-account-settings` example displays the account settings for the specified IAM user or IAM role.

```
aws ecs list-account-settings \
    --principal-arn arn:aws:iam::123456789012:user/MyUser
```

Output:

```
{
    "settings": [
        {
            "name": "serviceLongArnFormat",
            "value": "enabled",
            "principalArn": "arn:aws:iam::123456789012:user/MyUser"
        }
    ]
```

```
}
```

For more information, see Access Amazon ECS features with account settings in the *Amazon ECS Developer Guide*.

- For API details, see ListAccountSettings in *AWS CLI Command Reference*.

`list-attributes`

The following code example shows how to use `list-attributes`.

AWS CLI

To list the container instances that contain a specific attribute

The following `list-attributes` example lists the attributes for container instances that have the `stack=production` attribute in the default cluster.

```
aws ecs list-attributes \
    --target-type container-instance \
    --attribute-name stack \
    --attribute-value production \
    --cluster default
```

Output:

```
{
    "attributes": [
        {
            "name": "stack",
            "targetId": "arn:aws:ecs:us-west-2:123456789012:container-instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "value": "production"
        }
    ]
}
```

For more information, see Amazon ECS Container Agent Configuration in the *Amazon ECS Developer Guide*.

- For API details, see ListAttributes in *AWS CLI Command Reference*.

`list-clusters`

The following code example shows how to use `list-clusters`.

AWS CLI

To list your available clusters

The following `list-clusters` example lists all of the available clusters.

```
aws ecs list-clusters
```

Output:

```
{
    "clusterArns": [
        "arn:aws:ecs:us-west-2:123456789012:cluster/MyECSCluster1",
        "arn:aws:ecs:us-west-2:123456789012:cluster/AnotherECSCluster"
    ]
}
```

For more information, see Amazon ECS clusters in the *Amazon ECS Developer Guide*.

- For API details, see ListClusters in *AWS CLI Command Reference*.

`list-container-instances`

The following code example shows how to use `list-container-instances`.

AWS CLI

To list the container instances in a cluster

The following `list-container-instances` example lists all of the available container instances in a cluster.

```
aws ecs list-container-instances \
    --cluster MyCluster
```

Output:

```
{
    "containerInstanceArns": [
        "arn:aws:ecs:us-west-2:123456789012:container-instance/MyCluster/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "arn:aws:ecs:us-west-2:123456789012:container-instance/MyCluster/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
    ]
}
```

For more information, see Amazon EC2 container instances for Amazon ECS in the *Amazon ECS Developer Guide*.

- For API details, see ListContainerInstances in *AWS CLI Command Reference*.

`list-service-deployments`

The following code example shows how to use `list-service-deployments`.

AWS CLI

To list service deployments

The following `list-service-deployments` example retrieves the service deployments for the service named `example-service`.

```
aws ecs list-service-deployments \
    --service arn:aws:ecs:us-west-2:123456789012:service/example-cluster/example-
service
```

Output:

```
{
    "serviceDeployments": [
        {
            "serviceDeploymentArn": "arn:aws:ecs:us-west-2:123456789012:service-
deployment/example-cluster/example-service/ejGvqq2ilnbKT9qj0vLJe",
            "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/example-
cluster/example-service",
            "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/example-
cluster",
            "startedAt": "2024-10-31T08:03:32.510000-04:00",
```

```
            "createdAt": "2024-10-31T08:03:30.917000-04:00",
            "finishedAt": "2024-10-31T08:05:04.527000-04:00",
            "targetServiceRevisionArn": "arn:aws:ecs:us-west-2:123456789012:service-
revision/example-cluster/example-service/1485800978477494678",
            "status": "SUCCESSFUL"
        }
    ]
}
```

For more information, see View service history using Amazon ECS service deployments in the *Amazon ECS Developer Guide*.

- For API details, see ListServiceDeployments in *AWS CLI Command Reference*.

`list-services-by-namespace`

The following code example shows how to use `list-services-by-namespace`.

AWS CLI

To list the services in a namespace

The following `list-services-by-namespace` example lists all of the services configured for the specified namespace in your default Region.

```
aws ecs list-services-by-namespace \
    --namespace service-connect
```

Output:

```
{
    "serviceArns": [
        "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/MyService",
        "arn:aws:ecs:us-west-2:123456789012:service/tutorial/service-connect-nginx-
service"
    ]
}
```

For more information, see Service Connect in the *Amazon ECS Developer Guide*.

- For API details, see ListServicesByNamespace in *AWS CLI Command Reference*.

`list-services`

The following code example shows how to use `list-services`.

AWS CLI

To list the services in a cluster

The following `list-services` example shows how to list the services running in a cluster.

```
aws ecs list-services \
    --cluster MyCluster
```

Output:

```
{
    "serviceArns": [
        "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/MyService"
    ]
}
```

For more information, see Amazon ECS services in the *Amazon ECS Developer Guide*.

- For API details, see ListServices in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags for a resource

The following `list-tags-for-resource` example lists the tags for a specific cluster.

```
aws ecs list-tags-for-resource \
    --resource-arn arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster
```

Output:

```
{
    "tags": [
```

```
        {
            "key": "key1",
            "value": "value1"
        },
        {
            "key": "key2",
            "value": "value2"
        },
        {
            "key": "key3",
            "value": "value3"
        }
    ]
}
```

For more information, see Tagging Amazon ECS resources in the *Amazon ECS Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`list-task-definition-families`

The following code example shows how to use `list-task-definition-families`.

AWS CLI

Example 1: To list the registered task definition families

The following `list-task-definition-families` example lists all of the registered task definition families.

```
aws ecs list-task-definition-families
```

Output:

```
{
    "families": [
        "node-js-app",
        "web-timer",
        "hpcc",
        "hpcc-c4-8xlarge"
    ]
}
```

For more information, see Amazon ECS task definition parameters for Fargate in the *Amazon ECS Developer Guide*.

Example 2: To filter the registered task definition families

The following `list-task-definition-families` example lists the task definition revisions that start with "hpcc".

```
aws ecs list-task-definition-families \
    --family-prefix hpcc
```

Output:

```
{
    "families": [
        "hpcc",
        "hpcc-c4-8xlarge"
    ]
}
```

For more information, see Amazon ECS task definition parameters for Fargate in the *Amazon ECS Developer Guide*.

- For API details, see ListTaskDefinitionFamilies in *AWS CLI Command Reference*.

`list-task-definitions`

The following code example shows how to use `list-task-definitions`.

AWS CLI

Example 1: To list the registered task definitions

The following `list-task-definitions` example lists all of the registered task definitions.

```
aws ecs list-task-definitions
```

Output:

```
{
    "taskDefinitionArns": [
        "arn:aws:ecs:us-west-2:123456789012:task-definition/sleep300:2",
```

```
        "arn:aws:ecs:us-west-2:123456789012:task-definition/sleep360:1",
        "arn:aws:ecs:us-west-2:123456789012:task-definition/wordpress:3",
        "arn:aws:ecs:us-west-2:123456789012:task-definition/wordpress:4",
        "arn:aws:ecs:us-west-2:123456789012:task-definition/wordpress:5",
        "arn:aws:ecs:us-west-2:123456789012:task-definition/wordpress:6"
    ]
}
```

For more information, see Amazon ECS task definitions in the *Amazon ECS Developer Guide*.

Example 2: To list the registered task definitions in a family

The following `list-task-definitions` example lists the task definition revisions of a specified family.

```
aws ecs list-task-definitions \
    --family-prefix wordpress
```

Output:

```
{
    "taskDefinitionArns": [
        "arn:aws:ecs:us-west-2:123456789012:task-definition/wordpress:3",
        "arn:aws:ecs:us-west-2:123456789012:task-definition/wordpress:4",
        "arn:aws:ecs:us-west-2:123456789012:task-definition/wordpress:5",
        "arn:aws:ecs:us-west-2:123456789012:task-definition/wordpress:6"
    ]
}
```

For more information, see Amazon ECS task definitions in the *Amazon ECS Developer Guide*.

- For API details, see ListTaskDefinitions in *AWS CLI Command Reference*.

`list-tasks`

The following code example shows how to use `list-tasks`.

AWS CLI

Example 1: To list the tasks in a cluster

The following `list-tasks` example lists all of the tasks in a cluster.

```
aws ecs list-tasks \
    --cluster default
```

Output:

```
{
    "taskArns": [
        "arn:aws:ecs:us-west-2:123456789012:task/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
        "arn:aws:ecs:us-west-2:123456789012:task/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222"
    ]
}
```

For more information, see Amazon ECS task definitions in the *Amazon ECS Developer Guide*.

Example 2: To list the tasks on a particular container instance

The following `list-tasks` example lists the tasks on a container instance, using the container instance UUID as a filter.

```
aws ecs list-tasks \
    --cluster default \
    --container-instance a1b2c3d4-5678-90ab-cdef-EXAMPLE33333
```

Output:

```
{
    "taskArns": [
        "arn:aws:ecs:us-west-2:123456789012:task/a1b2c3d4-5678-90ab-cdef-
EXAMPLE44444"
    ]
}
```

For more information, see Amazon ECS task definitions in the *Amazon ECS Developer Guide*.

- For API details, see ListTasks in *AWS CLI Command Reference*.

`monitor-express-gateway-service`

The following code example shows how to use `monitor-express-gateway-service`.

AWS CLI

Example 1: To monitor an Express Gateway Service deployment

The following `monitor-express-gateway-service` example monitors an Express Gateway Service deployment, showing all resources associated with the service.

```
aws ecs monitor-express-gateway-service \
    --service-arn arn:aws:ecs:us-west-2:123456789012:service/my-cluster/my-express-gateway-service
```

This command produces no output. It displays an interactive monitoring interface.

For more information, see Express Gateway Service in the *Amazon Elastic Container Service Developer Guide*.

Example 2: To monitor only resources that changed in the latest deployment

The following `monitor-express-gateway-service` example monitors an Express Gateway Service but only shows resources that have changed in the most recent deployment.

```
aws ecs monitor-express-gateway-service \
    --service-arn arn:aws:ecs:us-west-2:123456789012:service/my-cluster/my-express-gateway-service \
    --resource-view DEPLOYMENT
```

This command produces no output. It displays an interactive monitoring interface.

For more information, see Express Gateway Service in the *Amazon Elastic Container Service Developer Guide*.

Example 3: To monitor with a custom timeout

The following `monitor-express-gateway-service` example monitors an Express Gateway Service with a timeout of 60 minutes instead of the default 30 minutes.

```
aws ecs monitor-express-gateway-service \
    --service-arn my-express-gateway-service \
    --timeout 60
```

This command produces no output. It displays an interactive monitoring interface. The interface provides the following controls:

Press up / down keys to scroll up or down through the resource listPress q to quit the monitoring sessionStatus bar shows a spinner indicating active monitoring

The command requires a terminal (TTY) and will continue monitoring until manually stopped by the user or the timeout is reached.

For more information, see Express Gateway Service in the *Amazon Elastic Container Service Developer Guide*.

- For API details, see MonitorExpressGatewayService in *AWS CLI Command Reference*.

`put-account-setting-default`

The following code example shows how to use `put-account-setting-default`.

AWS CLI

To modify the default account settings

The following `put-account-setting-default` example modifies the default account setting for all IAM users or roles on your account. These changes apply to the entire AWS account unless an IAM user or role explicitly overrides these settings for themselves.

```
aws ecs put-account-setting-default \
    --name serviceLongArnFormat \
    --value enabled
```

Output:

```
{
    "setting": {
        "name": "serviceLongArnFormat",
        "value": "enabled",
        "principalArn": "arn:aws:iam::123456789012:root"
    }
}
```

For more information, see Access Amazon ECS features with account settings in the *Amazon ECS Developer Guide*.

- For API details, see PutAccountSettingDefault in *AWS CLI Command Reference*.

`put-account-setting`

The following code example shows how to use `put-account-setting`.

AWS CLI

Example 1: To modify the account setting for your IAM user account

The following `put-account-setting` example sets the `containerInsights` account setting to `enhanced` for your IAM user account. This turns on Container Insights with enhanced observability.

```
aws ecs put-account-setting \
    --name containerInsights \
    --value enhanced
```

Output:

```
{
    "setting": {
        "name": "containerInsights",
        "value": "enhanced",
        "principalArn": "arn:aws:iam::123456789012:user/johndoe",
        "type": "user"
    }
}
```

For more information, see Modifying Account Settings in the *Amazon ECS Developer Guide*.

Example 2: To modify the account setting for a specified IAM user or IAM role

The following `put-account-setting` example modifies the `serviceLongArnFormat` account setting for the specified IAM user or IAM role.

```
aws ecs put-account-setting \
    --name serviceLongArnFormat \
    --value enabled \
    --principal-arn arn:aws:iam::123456789012:user/MyUser
```

Output:

```
{
```

```
    "setting": {
        "name": "serviceLongArnFormat",
        "value": "enabled",
        "principalArn": "arn:aws:iam::123456789012:user/MyUser"
    }
}
```

For more information, see Modifying Account Settings in the *Amazon ECS Developer Guide*.

- For API details, see PutAccountSetting in *AWS CLI Command Reference*.

`put-attributes`

The following code example shows how to use `put-attributes`.

AWS CLI

To create an attribute and associate it with an Amazon ECS resource

The following `put-attributes` example applies an attribute with the name stack and the value production to a container instance.

```
aws ecs put-attributes \
    --attributes name=stack,value=production,targetId=arn:aws:ecs:us-
west-2:123456789012:container-instance/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "attributes": [
        {
            "name": "stack",
            "targetId": "arn:aws:ecs:us-west-2:123456789012:container-instance/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "value": "production"
        }
    ]
}
```

For more information, see Define which container instances Amazon ECS uses for tasks in the *Amazon ECS Developer Guide*.

- For API details, see PutAttributes in *AWS CLI Command Reference*.

put-cluster-capacity-providers

The following code example shows how to use `put-cluster-capacity-providers`.

AWS CLI

Example 1: To add an existing capacity provider to a cluster

The following `put-cluster-capacity-providers` example adds an existing capacity provider to a cluster. The `create-capacity-provider` command is used to create a capacity provider. The `describe-clusters` command is used to describe the current capacity providers and the default capacity provider strategy associated with a cluster. When adding a new capacity provider to a cluster, you must specify all existing capacity providers in addition to the new capacity provider you want to associate with the cluster. You must also specify the default capacity provider strategy to associate with the cluster. In this example, the `MyCluster` cluster has the `MyCapacityProvider1` capacity provider associated with it and you want to add the `MyCapacityProvider2` capacity provider and include it in the default capacity provider strategy so tasks are spread evenly across both capacity providers.

```
aws ecs put-cluster-capacity-providers \
    --cluster MyCluster \
    --capacity-providers MyCapacityProvider1 MyCapacityProvider2 \
    --default-capacity-provider-
strategy capacityProvider=MyCapacityProvider1,weight=1 capacityProvider=MyCapacityProvider2,
```

Output:

```

        ],
        "attachmentsStatus": "UPDATE_IN_PROGRESS"
    }
}
```

For more information, see Amazon ECS capacity providers for EC2 workloads in the *Amazon ECS Developer Guide*.

Example 2: To remove a capacity provider from a cluster

The following `put-cluster-capacity-providers` example removes a capacity provider from a cluster. The `describe-clusters` command is used to describe the current capacity providers associated with a cluster. When removing a capacity provider from a cluster, you must specify the capacity providers you want to remain associated with the cluster as well as the default capacity provider strategy to associate with the cluster. In this example, the cluster has the `MyCapacityProvider1` and `MyCapacityProvider2` capacity providers associated with it and you want to remove the `MyCapacityProvider2` capacity provider, so you specify only `MyCapacityProvider1` in the command along with the updated default capacity provider strategy.

```
aws ecs put-cluster-capacity-providers \
    --cluster MyCluster \
    --capacity-providers MyCapacityProvider1 \
    --default-capacity-provider-
strategy capacityProvider=MyCapacityProvider1,weight=1,base=0
```

Output:

```
{
    "cluster": {
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",
        "clusterName": "MyCluster",
        "status": "ACTIVE",
        "registeredContainerInstancesCount": 0,
```

```
        "runningTasksCount": 0,
        "pendingTasksCount": 0,
        "activeServicesCount": 0,
        "statistics": [],
        "tags": [],
        "settings": [
            {
                "name": "containerInsights",
                "value": "enabled"
            }
        ],
        "capacityProviders": [
            "MyCapacityProvider1"
        ],
        "defaultCapacityProviderStrategy": [
            {
                "capacityProvider": "MyCapacityProvider1",
                "weight": 1,
                "base": 0
            }
        ],
        "attachments": [
            {
                "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
                "type": "as_policy",
                "status": "ACTIVE",
                "details": [

                "status": "DELETING",
                "details": [
                    {
```

```
                        "name": "capacityProviderName",
                        "value": "MyCapacityProvider2"
                    },
                    {
                        "name": "scalingPolicyName",
                        "value": "ECSManagedAutoScalingPolicy-a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222"
                    }
                ]
            }
        ],
        "attachmentsStatus": "UPDATE_IN_PROGRESS"
    }
}
```

For more information, see Amazon ECS capacity providers for EC2 workloads in the *Amazon ECS Developer Guide*.

Example 3: To remove all capacity providers from a cluster

The following `put-cluster-capacity-providers` example removes all existing capacity providers from the cluster.

```
aws ecs put-cluster-capacity-providers \
    --cluster MyCluster \
    --capacity-providers [] \
    --default-capacity-provider-strategy []
```

Output:

```
{
    "cluster": {
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",
        "clusterName": "MyCluster",
        "status": "ACTIVE",
        "registeredContainerInstancesCount": 0,
        "runningTasksCount": 0,
        "pendingTasksCount": 0,
        "activeServicesCount": 0,
        "statistics": [],
        "tags": [],
        "settings": [
            {
```

```
                "name": "containerInsights",
                "value": "enabled"
            }
        ],
        "capacityProviders": [],
        "defaultCapacityProviderStrategy": [],
        "attachments": [
            {
                "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
                "type": "as_policy",
                "status": "DELETING",
                "details": [
                    {
                        "name": "capacityProviderName",
                        "value": "MyCapacityProvider1"
                    },
                    {
                        "name": "scalingPolicyName",
                        "value": "ECSManagedAutoScalingPolicy-a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111"
                    }
                ]
            },
            {
                "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
                "type": "as_policy",
                "status": "DELETING",
                "details": [
                    {
                        "name": "capacityProviderName",
                        "value": "MyCapacityProvider2"
                    },
                    {
                        "name": "scalingPolicyName",
                        "value": "ECSManagedAutoScalingPolicy-a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222"
                    }
                ]
            }
        ],
        "attachmentsStatus": "UPDATE_IN_PROGRESS"
    }
}
```

For more information, see Amazon ECS capacity providers for EC2 workloads in the *Amazon ECS Developer Guide*.

- For API details, see PutClusterCapacityProviders in *AWS CLI Command Reference*.

`register-task-definition`

The following code example shows how to use `register-task-definition`.

AWS CLI

Example 1: To register a task definition with a JSON file

The following `register-task-definition` example registers a task definition to the specified family. The container definitions are saved in JSON format at the specified file location.

```
aws ecs register-task-definition \
    --cli-input-json file://<path_to_json_file>/sleep360.json
```

Contents of `sleep360.json`:

```
{
    "containerDefinitions": [
        {
            "name": "sleep",
            "image": "busybox",
            "cpu": 10,
            "command": [
                "sleep",
                "360"
            ],
            "memory": 10,
            "essential": true
        }
    ],
    "family": "sleep360"
}
```

Output:

```
{
```

```
    "taskDefinition": {
        "status": "ACTIVE",
        "family": "sleep360",
        "placementConstraints": [],
        "compatibilities": [
            "EXTERNAL",
            "EC2"
        ],
        "volumes": [],
        "taskDefinitionArn": "arn:aws:ecs:us-west-2:123456789012:task-definition/
sleep360:1",
        "containerDefinitions": [
            {
                "environment": [],
                "name": "sleep",
                "mountPoints": [],
                "image": "busybox",
                "cpu": 10,
                "portMappings": [],
                "command": [
                    "sleep",
                    "360"
                ],
                "memory": 10,
                "essential": true,
                "volumesFrom": []
            }
        ],
        "revision": 1
    }
}
```

For more information, see Example Amazon ECS task definitions in the *Amazon ECS Developer Guide*.

Example 2: To register a task definition with a JSON string parameter

The following `register-task-definition` example registers a task definition using container definitions provided as a JSON string parameter with escaped double quotes.

```
aws ecs register-task-definition \
    --family sleep360 \
```

```
    --container-definitions "[{\"name\":\"sleep\",\"image\":\"busybox\",\"cpu\":10,
\"command\":[\"sleep\",\"360\"],\"memory\":10,\"essential\":true}]"
```

Output:

```
{
    "taskDefinition": {
        "status": "ACTIVE",
        "family": "sleep360",
        "placementConstraints": [],
        "compatibilities": [
            "EXTERNAL",
            "EC2"
        ],
        "volumes": [],
        "taskDefinitionArn": "arn:aws:ecs:us-west-2:123456789012:task-definition/
sleep360:1",
        "containerDefinitions": [
            {
                "environment": [],
                "name": "sleep",
                "mountPoints": [],
                "image": "busybox",
                "cpu": 10,
                "portMappings": [],
                "command": [
                    "sleep",
                    "360"
                ],
                "memory": 10,
                "essential": true,
                "volumesFrom": []
            }
        ],
        "revision": 1
    }
}
```

For more information, see Creating an Amazon ECS task definition using the console in the *Amazon ECS Developer Guide*.

- For API details, see RegisterTaskDefinition in *AWS CLI Command Reference*.

`run-task`

The following code example shows how to use `run-task`.

AWS CLI

Example 1: To run a task on your default cluster

The following `run-task` example runs a task on the default cluster and uses a client token.

```
aws ecs run-task \
    --cluster default \
    --task-definition sleep360:1 \
    --client-token a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "tasks": [
        {
            "attachments": [],
            "attributes": [
                {
                    "name": "ecs.cpu-architecture",
                    "value": "x86_64"
                }
            ],
            "availabilityZone": "us-west-2b",
            "capacityProviderName": "example-capacity-provider",
            "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/default",
            "containerInstanceArn": "arn:aws:ecs:us-west-2:123456789012:container-
instance/default/bc4d2ec611d04bb7bb97e83ceEXAMPLE",
            "containers": [
                {

        }
    ],
    "failures": []
}
```

For more information, see Running an application as a standalone task in the *Amazon ECS Developer Guide*.

Example 2: To configure an Amazon EBS volume for a standalone task

The following `run-task` example configures an encrypted Amazon EBS volume for a Fargate task on the default cluster. You must have an Amazon ECS infrastructure role configured with the `AmazonECSInfrastructureRolePolicyForVolumes` managed policy attached. You must specify a task definition with the same volume name as in the `run-task` request. This example uses the `--cli-input-json` option and a JSON input file called `ebs.json`.

```
aws ecs run-task \
    --cli-input-json file://ebs.json
```

Contents of `ebs.json`:

```
{
    "cluster": "default",
    "taskDefinition": "mytaskdef",
    "launchType": "FARGATE",
    "networkConfiguration":{
        "awsvpcConfiguration":{
            "assignPublicIp": "ENABLED",
            "securityGroups": ["sg-12344321"],
            "subnets":["subnet-12344321"]
        }
    },
    "volumeConfigurations": [
        {
            "name": "myEBSVolume",
            "managedEBSVolume": {
                "volumeType": "gp3",
                "sizeInGiB": 100,

`start-task`

The following code example shows how to use `start-task`.

AWS CLI

Example 1: To start a new task

The following `start-task` example starts a task using the latest revision of the `sleep360` task definition on the specified container instance in the default cluster.

```
aws ecs start-task \
    --task-definition sleep360 \
    --container-instances 765936fadbdd46b5991a4bd70c2a43d4
```

Output:

```
{
    "tasks": [
        {
            "taskArn": "arn:aws:ecs:us-west-2:123456789012:task/
default/666fdccc2e2d4b6894dd422f4eeee8f8",

```

For more information, see Schedule your containers on Amazon ECS in the *Amazon ECS Developer Guide*.

Example 2: To configure an Amazon EBS volume at task start

The following `start-task` example configures an encrypted Amazon EBS volume for a task on the specified container instance. You must have an Amazon ECS infrastructure role configured with the `AmazonECSInfrastructureRolePolicyForVolumes` managed policy attached. You must specify a task definition with the same volume name as in the `start-task` request. This example uses the `--cli-input-json` option and a JSON input file called `ebs.json` with the following content.

```
aws ecs start-task \
    --cli-input-json file://ebs.json \
    --container-instances 765936fadbdd46b5991a4bd70c2a43d4
```

Contents of `ebs.json`:

```
{
    "cluster": "default",
    "taskDefinition": "mytaskdef",
    "networkConfiguration":{
        "awsvpcConfiguration":{
            "assignPublicIp": "ENABLED",
            "securityGroups": ["sg-12344321"],
            "subnets":["subnet-12344321"]
        }
```

```
    },
    "volumeConfigurations": [
        {
            "name": "myEBSVolume",
            "managedEBSVolume": {
                "volumeType": "gp3",
                "sizeInGiB": 100,
                "roleArn":"arn:aws:iam::123456789012:role/ecsInfrastructureRole",
                "encrypted": true,
                "kmsKeyId": "arn:aws:kms:region:123456789012:key/a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222"
            }
        }
    ]
}
```

Output:

```
{
    "tasks": [
        {
            "attachments": [
                {
                    "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
                    "type": "ElasticNetworkInterface",
                    "status": "PRECREATED",

`stop-task`

The following code example shows how to use `stop-task`.

AWS CLI

To stop a task

The following `stop-task` example stops the specified task from running in the default cluster.

```
aws ecs stop-task \
    --task 666fdccc2e2d4b6894dd422f4eeee8f8
```

Output:

```
{
    "task": {
        "taskArn": "arn:aws:ecs:us-west-2:123456789012:task/
default/666fdccc2e2d4b6894dd422f4eeee8f8",
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/default",
```

```

        "launchType": "EC2",
        "attachments": [],
        "tags": []
    }
}
```

For more information, see Amazon ECS standalone tasks in the *Amazon ECS Developer Guide*.

- For API details, see StopTask in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

Example 1: To tag a resource

The following `tag-resource` example adds a single tag to the specified resource.

```
aws ecs tag-resource \
    --resource-arn arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \
    --tags key=key1,value=value1
```

This command produces no output.

For more information, see Tagging Amazon ECS resources in the *Amazon ECS Developer Guide*.

Example 2: To add multiple tags to a resource

The following `tag-resource` example adds multiple tags to the specified resource.

```
aws ecs tag-resource \
    --resource-arn arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \
    --tags key=key1,value=value1 key=key2,value=value2 key=key3,value=value3
```

This command produces no output.

For more information, see Tagging Amazon ECS resources in the *Amazon ECS Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a resource

The following `untag-resource` example removes the listed tags from the specified resource.

```
aws ecs untag-resource \
    --resource-arn arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \
    --tag-keys key1,key2
```

This command produces no output.

For more information, see Tagging Amazon ECS resources in the *Amazon ECS Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

update-capacity-provider

The following code example shows how to use update-capacity-provider.

AWS CLI

To update the capacity provider in an ECS cluster

The following update-capacity-provider example shows how we can modify the parameters of the capacity provider in an ECS cluster.

```
aws ecs update-capacity-provider \
    --name Infra-ECS-Cluster-ECS-project-update-cluster-d6bb6d5b-
EC2CapacityProvider-3fIpdkLywwFt \
    --auto-scaling-group-
provider "managedScaling={status=DISABLED,targetCapacity=50,minimumScalingStepSize=2,maximum
```

Output:

```
{
    "capacityProvider": {
        "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-
provider/Infra-ECS-Cluster-ECS-project-update-cluster-d6bb6d5b-
EC2CapacityProvider-3fIpdkLywwFt",
        "name": "Infra-ECS-Cluster-ECS-project-update-cluster-d6bb6d5b-
EC2CapacityProvider-3fIpdkLywwFt",
        "status": "ACTIVE",
        "autoScalingGroupProvider": {
            "autoScalingGroupArn": "arn:aws:autoscaling:us-
west-2:123456789012:autoScalingGroup:a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111:autoScalingGroupName/Infra-ECS-Cluster-ECS-project-update-cluster-
d6bb6d5b-ECSAutoScalingGroup-f44jrQHS2nRB",
            "managedScaling": {
                "status": "ENABLED",
                "targetCapacity": 100,
                "minimumScalingStepSize": 1,
                "maximumScalingStepSize": 10000,
                "instanceWarmupPeriod": 300
            },
            "managedTerminationProtection": "DISABLED",
            "managedDraining": "ENABLED"
        },
        "updateStatus": "UPDATE_IN_PROGRESS",
```

```
        "tags": []
    }
}
```

For more information on Capacity Provider, see Amazon ECS capacity providers for the EC2 launch type in the *Amazon ECS Developer Guide*.

- For API details, see UpdateCapacityProvider in *AWS CLI Command Reference*.

`update-cluster-settings`

The following code example shows how to use `update-cluster-settings`.

AWS CLI

To modify the settings for your cluster

The following `update-cluster-settings` example enables CloudWatch Container Insights with enhanced observability for the `MyCluster` cluster.

```
aws ecs update-cluster-settings \
    --cluster MyCluster \
    --settings name=containerInsights,value=enhanced
```

Output:

```
{
    "cluster": {
        "clusterArn": "arn:aws:ecs:us-esat-1:123456789012:cluster/MyCluster",
        "clusterName": "default",
        "status": "ACTIVE",
        "registeredContainerInstancesCount": 0,
        "runningTasksCount": 0,
        "pendingTasksCount": 0,
        "activeServicesCount": 0,
        "statistics": [],
        "tags": [],
        "settings": [
            {
                "name": "containerInsights",
                "value": "enhanced"
            }
        ]
```

```
    }
}
```

For more information, see Modifying Account Settings in the *Amazon ECS Developer Guide*.

- For API details, see UpdateClusterSettings in *AWS CLI Command Reference*.

`update-cluster`

The following code example shows how to use `update-cluster`.

AWS CLI

Example 1: To update an ECS cluster to enable containerInsights

The following `update-cluster` example updates the containerInsights value to `enabled` in an already created cluster. By default, it is disabled.

```
aws ecs update-cluster \
    --cluster ECS-project-update-cluster \
    --settings name=containerInsights,value=enabled
```

Output:

```
{
    "cluster": {
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/ECS-project-
update-cluster",
        "clusterName": "ECS-project-update-cluster",
        "status": "ACTIVE",
        "registeredContainerInstancesCount": 0,
        "runningTasksCount": 0,
        "pendingTasksCount": 0,
        "activeServicesCount": 0,
        "statistics": [],
        "tags": [],
        "settings": [
            {
                "name": "containerInsights",
                "value": "enabled"
            }
        ],
        "capacityProviders": [
```

```

        }
    }
}
```

Example 2: To update an ECS cluster to set a default Service Connect namespace

The following `update-cluster` example updates an ECS cluster by setting a default Service Connect namespace.

```
aws ecs update-cluster \
    --cluster ECS-project-update-cluster \
    --service-connect-defaults namespace=test
```

Output:

```
{
    "cluster": {
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/ECS-project-
update-cluster",

        }
    }
}
```

For more information on Service Connect, see Use Service Connect to connect Amazon ECS services with short names in the *Amazon ECS Developer Guide*.

- For API details, see UpdateCluster in *AWS CLI Command Reference*.

`update-container-agent`

The following code example shows how to use `update-container-agent`.

AWS CLI

To update the container agent on an Amazon ECS container instance

The following `update-container-agent` example updates the container agent on the specified container instance in the default cluster.

```
aws ecs update-container-agent \
    --cluster default \
    --container-instance a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "containerInstance": {
        "status": "ACTIVE",
        "agentUpdateStatus": "PENDING",
        "versionInfo": {
            "agentVersion": "1.0.0",
            "agentHash": "4023248",
            "dockerVersion": "DockerVersion: 1.5.0"
        }
    }
}
```

For more information, see Updating the Amazon ECS container agent in the *Amazon ECS Developer Guide*.

- For API details, see UpdateContainerAgent in *AWS CLI Command Reference*.

update-container-instances-state

The following code example shows how to use `update-container-instances-state`.

AWS CLI

To update the state of a container instance

The following `update-container-instances-state` example updates the state of the specified container instance to `DRAINING` which will remove it from the cluster is it registered to.

```
aws ecs update-container-instances-state \
    --container-instances 765936fadbdd46b5991a4bd70c2a43d4 \
    --status DRAINING
```

Output:

```
{
    "containerInstances": [
        {
            "containerInstanceArn": "arn:aws:ecs:us-west-2:123456789012:container-
instance/default/765936fadbdd46b5991a4bd70c2a43d4",

`update-service-primary-task-set`

The following code example shows how to use `update-service-primary-task-set`.

AWS CLI

To update the primary task set for a service

The following `update-service-primary-task-set` example updates the primary task set for the specified service.

```
aws ecs update-service-primary-task-set \
    --cluster MyCluster \
    --service MyService \
    --primary-task-set arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/
MyService/ecs-svc/1234567890123456789
```

Output:

```
{
    "taskSet": {
        "id": "ecs-svc/1234567890123456789",
        "taskSetArn": "arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/
MyService/ecs-svc/1234567890123456789",
        "status": "PRIMARY",
        "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-definition/

- For API details, see UpdateServicePrimaryTaskSet in *AWS CLI Command Reference*.

`update-service`

The following code example shows how to use `update-service`.

AWS CLI

Example 1: To change the task definition used in a service

The following `update-service` example updates the `my-http-service` service to use the `amazon-ecs-sample` task definition.

```
aws ecs update-service \
    --cluster test \
    --service my-http-service \
    --task-definition amazon-ecs-sample
```

Output:

```
{
```

```
    "service": {
        "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/test/my-http-
service",

    }
}
```

For more information, see Update an Amazon ECS service using the console in the *Amazon ECS Developer Guide*.

Example 2: To change the number of tasks in a service

The following `update-service` example updates the desired task count of the service `my-http-service` from to 2.

```
aws ecs update-service \
    --cluster MyCluster \
    --service my-http-service \
    --desired-count 2
```

Output:

```
{
    "service": {
        "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/my-http-
service",

    }
}
```

For more information, see Updating an Amazon ECS service using the console in the *Amazon ECS Developer Guide*.

Example 3: To configure Amazon EBS volumes for attachment at service update

The following `update-service` example updates the service `my-http-service` to use Amazon EBS volumes. You must have an Amazon ECS infrastructure role configured with the `AmazonECSInfrastructureRolePolicyForVolumes` managed policy attached. You must also specify a task definition with the same volume name as in the `update-service` request and with `configuredAtLaunch` set to `true`. This example uses the `--cli-input-json` option and a JSON input file called `ebs.json`.

```
aws ecs update-service \
    --cli-input-json file://ebs.json
```

Contents of `ebs.json`:

```
{
    "cluster": "mycluster",
    "taskDefinition": "mytaskdef",
    "service": "my-http-service",
    "desiredCount": 2,
    "volumeConfigurations": [
        {
            "name": "myEbsVolume",
            "managedEBSVolume": {
                "roleArn":"arn:aws:iam::123456789012:role/ecsInfrastructureRole",
                "volumeType": "gp3",
                "sizeInGiB": 100,
                "iops": 3000,
                "throughput": 125,
                "filesystemType": "ext4"
            }
        }
```

```
    ]
}
```

Output:

```
{
    "service": {
        "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/mycluster/my-http-
service",

```

For more information, see Use Amazon EBS volumes with Amazon ECS in the *Amazon ECS Developer Guide*.

Example 4: To update a service to no longer use Amazon EBS volumes

The following `update-service` example updates the service `my-http-service` to no longer use Amazon EBS volumes. You must specify a task definition revision with `configuredAtLaunch` set to `false`.

```
aws ecs update-service \
    --cluster mycluster \
    --task-definition mytaskdef \
    --service my-http-service \
    --desired-count 2 \
    --volume-configurations "[]"
```

Output:

```
{
    "service": {
        "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/mycluster/my-http-
service",
        "serviceName": "my-http-service",
        "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/mycluster",
        "loadBalancers": [],
        "serviceRegistries": [],
        "status": "ACTIVE",
        "desiredCount": 2,
        "runningCount": 2,
        "pendingCount": 0,
        "launchType": "FARGATE",

    }
```

```
}
```

For more information, see Updating an Amazon ECS service using the console in the *Amazon ECS Developer Guide*.

- For API details, see UpdateService in *AWS CLI Command Reference*.

`update-task-protection`

The following code example shows how to use `update-task-protection`.

AWS CLI

Example 1: To enable task protection for ECS tasks

The following `update-task-protection` example protects your ECS task from termination during scale-in from Deployments or Service AutoScaling. You can specify custom expiration period for task protection from 1 up to 2,880 minutes (48 hours). If you do not specify expiration period, enabling task protection default time is 2 hours.

```
aws ecs update-task-protection \
    --cluster ECS-project-update-cluster \
    --tasks c43ed3b1331041f289316f958adb6a24 \
    --protection-enabled \
    --expires-in-minutes 300
```

Output:

```
{
"protectedTasks": [
    {
        "taskArn": "arn:aws:ecs:us-west-2:123456789012:task/
c43ed3b1331041f289316f958adb6a24",
        "protectionEnabled": true,
        "expirationDate": "2024-09-14T19:53:36.687000-05:00"
    }
],
"failures": []
}
```

Example 2: To disable task protection for ECS tasks

The following `update-task-protection` example disables the tasks protected from scale in from Deployments or Service AutoScaling.

```
aws ecs update-task-protection \
    --cluster ECS-project-update-cluster \
    --tasks c43ed3b1331041f289316f958adb6a24 \
    --no-protection-enabled
```

Output:

```
{
    "protectedTasks": [
        {
            "taskArn": "arn:aws:ecs:us-west-2:123456789012:task/
c43ed3b1331041f289316f958adb6a24",
            "protectionEnabled": false
        }
    ],
    "failures": []
}
```

For more formation on task protection, see Protect your Amazon ECS tasks from being terminated by scale-in events in the *Amazon ECS Developer Guide*.

- For API details, see UpdateTaskProtection in *AWS CLI Command Reference*.

`update-task-set`

The following code example shows how to use `update-task-set`.

AWS CLI

To update a task set

The following `update-task-set` example updates a task set to adjust the scale.

```
aws ecs update-task-set \
    --cluster MyCluster \
    --service MyService \
    --task-set arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/MyService/ecs-
svc/1234567890123456789 \
```

```
    --scale value=50,unit=PERCENT
```

Output:

```
{
    "taskSet": {
        "id": "ecs-svc/1234567890123456789",
        "taskSetArn": "arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/
MyService/ecs-svc/1234567890123456789",
        "status": "ACTIVE",
        "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-definition/

Amazon EFS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EFS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-file-system`

The following code example shows how to use `create-file-system`.

AWS CLI

To create an encrypted file system

The following `create-file-system` example creates an encrypted file system using the default CMK. It also adds the tag `Name=my-file-system`.

```
aws efs create-file-system \
    --performance-mode generalPurpose \
    --throughput-mode bursting \
    --encrypted \
    --tags Key=Name,Value=my-file-system
```

Output:

```
{
    "OwnerId": "123456789012",
```

```
    "CreationToken": "console-d7f56c5f-e433-41ca-8307-9d9c0example",
    "FileSystemId": "fs-c7a0456e",
    "FileSystemArn": "arn:aws:elasticfilesystem:us-west-2:123456789012:file-system/
fs-48499b4d",
    "CreationTime": 1595286880.0,
    "LifeCycleState": "creating",
    "Name": "my-file-system",
    "NumberOfMountTargets": 0,
    "SizeInBytes": {
        "Value": 0,
        "ValueInIA": 0,
        "ValueInStandard": 0
    },
    "PerformanceMode": "generalPurpose",
    "Encrypted": true,
    "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
    "ThroughputMode": "bursting",
    "Tags": [
        {
            "Key": "Name",
            "Value": "my-file-system"
        }
    ]
}
```

For more information, see Creating Amazon EFS file systems in the *Amazon Elastic File System User Guide*.

- For API details, see CreateFileSystem in *AWS CLI Command Reference*.

`create-mount-target`

The following code example shows how to use `create-mount-target`.

AWS CLI

To create a mount target

The following `create-mount-target` example creates a mount target for the specified file system.

```
aws efs create-mount-target \
```

```
    --file-system-id fs-c7a0456e \
    --subnet-id subnet-02bf4c428bexample \
    --security-groups sg-068f739363example
```

Output:

```
{
    "OwnerId": "123456789012",
    "MountTargetId": "fsmt-f9a14450",
    "FileSystemId": "fs-c7a0456e",
    "SubnetId": "subnet-02bf4c428bexample",
    "LifeCycleState": "creating",
    "IpAddress": "10.0.1.24",
    "NetworkInterfaceId": "eni-02d542216aexample",
    "AvailabilityZoneId": "use2-az2",
    "AvailabilityZoneName": "us-west-2b",
    "VpcId": "vpc-0123456789abcdef0"
}
```

For more information, see Creating mount targets in the *Amazon Elastic File System User Guide*.

- For API details, see CreateMountTarget in *AWS CLI Command Reference*.

`delete-file-system`

The following code example shows how to use `delete-file-system`.

AWS CLI

To delete a file system

The following `delete-file-system` example deletes the specified file system.

```
aws efs delete-file-system \
    --file-system-id fs-c7a0456e
```

This command produces no output.

For more information, see Deleting an Amazon EFS file system in the *Amazon Elastic File System User Guide*.

- For API details, see DeleteFileSystem in *AWS CLI Command Reference*.

`delete-mount-target`

The following code example shows how to use `delete-mount-target`.

AWS CLI

To delete a mount target

The following `delete-mount-target` example deletes the specified mount target.

```
aws efs delete-mount-target \
    --mount-target-id fsmt-f9a14450
```

This command produces no output.

For more information, see Creating mount targets in the *Amazon Elastic File System User Guide*.

- For API details, see DeleteMountTarget in *AWS CLI Command Reference*.

`describe-file-systems`

The following code example shows how to use `describe-file-systems`.

AWS CLI

To describe a file system

The following `describe-file-systems` example describes the specified file system.

```
aws efs describe-file-systems \
    --file-system-id fs-c7a0456e
```

Output:

```
{
    "FileSystems": [
        {
            "OwnerId": "123456789012",
            "CreationToken": "console-d7f56c5f-e433-41ca-8307-9d9c0example",
            "FileSystemId": "fs-c7a0456e",
            "FileSystemArn": "arn:aws:elasticfilesystem:us-west-2:123456789012:file-
system/fs-48499b4d",
```

```
            "CreationTime": 1595286880.0,
            "LifeCycleState": "available",
            "Name": "my-file-system",
            "NumberOfMountTargets": 3,
            "SizeInBytes": {
                "Value": 6144,
                "Timestamp": 1600991437.0,
                "ValueInIA": 0,
                "ValueInStandard": 6144
            },
            "PerformanceMode": "generalPurpose",
            "Encrypted": true,
            "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
            "ThroughputMode": "bursting",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "my-file-system"
                }
            ]
        }
    ]
}
```

For more information, see Managing Amazon EFS file systems in the *Amazon Elastic File System User Guide*.

- For API details, see DescribeFileSystems in *AWS CLI Command Reference*.

`describe-mount-targets`

The following code example shows how to use `describe-mount-targets`.

AWS CLI

To describe a mount target

The following `describe-mount-targets` example describes the specified mount target.

```
aws efs describe-mount-targets \
    --mount-target-id fsmt-f9a14450
```

Output:

```
{
    "MountTargets": [
        {
            "OwnerId": "123456789012",
            "MountTargetId": "fsmt-f9a14450",
            "FileSystemId": "fs-c7a0456e",
            "SubnetId": "subnet-02bf4c428bexample",
            "LifeCycleState": "creating",
            "IpAddress": "10.0.1.24",
            "NetworkInterfaceId": "eni-02d542216aexample",
            "AvailabilityZoneId": "use2-az2",
            "AvailabilityZoneName": "us-west-2b",
            "VpcId": "vpc-0123456789abcdef0"
        }
    ]
}
```

For more information, see Creating mount targets in the *Amazon Elastic File System User Guide*.

- For API details, see DescribeMountTargets in *AWS CLI Command Reference*.

`describe-tags`

The following code example shows how to use `describe-tags`.

AWS CLI

To describe the tags for a file system

The following `describe-tags` example describes the tags for the specified file system.

```
aws efs describe-tags \
    --file-system-id fs-c7a0456e
```

Output:

```
{
    "Tags": [
        {
            "Key": "Name",
```

```
            "Value": "my-file-system"
        },
        {
            "Key": "Department",
            "Value": "Business Intelligence"
        }
    ]
}
```

For more information, see Managing file system tags in the *Amazon Elastic File System User Guide*.

- For API details, see DescribeTags in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To retrieve the tags for a resource

The following `list-tags-for-resource` example retrieves the tags associated with the specified file system.

```
aws efs list-tags-for-resource \
    --resource-id fs-c7a0456e
```

Output:

```
{
    "Tags": [
        {
            "Key": "Name",
            "Value": "my-file-system"
        },
        {
            "Key": "Department",
            "Value": "Business Intelligence"
        }
    ]
}
```

For more information, see Managing file system tags in the *Amazon Elastic File System User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a resource

The following `tag-resource` example adds the tag `Department=Business Intelligence` to the specified file system.

```
aws efs tag-resource \
    --resource-id fs-c7a0456e \
    --tags Key=Department,Value="Business Intelligence"
```

This command produces no output.

For more information, see Managing file system tags in the *Amazon Elastic File System User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a resource

The following `untag-resource` example removes the tag with the `Department` tag key from the specified file system.

```
aws efs untag-resource \
    --resource-id fs-c7a0456e \
    --tag-keys Department
```

This command produces no output.

For more information, see Managing file system tags in the *Amazon Elastic File System User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

Amazon EKS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EKS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`associate-access-policy`

The following code example shows how to use `associate-access-policy`.

AWS CLI

To associate an access policy and its scope to the access entry of the cluster

The following `associate-access-policy` example associates an access policy and its scope to the access entry of the specified cluster.

```
aws eks associate-access-policy \
    --cluster-name eks-customer \
    --principal-arn arn:aws:iam::123456789012:role/Admin \
    --policy-arn arn:aws:eks::aws:cluster-access-policy/AmazonEKSEditPolicy \
    --access-scope type=namespace,namespaces=default
```

Output:

```
{
    "clusterName": "eks-customer",
    "principalArn": "arn:aws:iam::123456789012:role/Admin",
    "associatedAccessPolicy": {
        "policyArn": "arn:aws:eks::aws:cluster-access-policy/AmazonEKSEditPolicy",
        "accessScope": {
            "type": "namespace",
            "namespaces": [
                "default"
            ]
        },
        "associatedAt": "2025-05-24T15:59:51.981000-05:00",
        "modifiedAt": "2025-05-24T15:59:51.981000-05:00"
    }
}
```

For more information, see Associate access policies with access entries in the *Amazon EKS User Guide*.

- For API details, see AssociateAccessPolicy in *AWS CLI Command Reference*.

`associate-encryption-config`

The following code example shows how to use `associate-encryption-config`.

AWS CLI

To associates an encryption configuration to an existing cluster

The following `associate-encryption-config` example enable's encryption on an existing EKS clusters that do not already have encryption enabled.

```
aws eks associate-encryption-config \
    --cluster-name my-eks-cluster \
    --encryption-config '[{"resources":["secrets"],"provider":
{"keyArn":"arn:aws:kms:region-code:account:key/key"}}]'
```

Output:

```
{
    "update": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
```

```
        "status": "InProgress",
        "type": "AssociateEncryptionConfig",
        "params": [
            {
                "type": "EncryptionConfig",
                "value": "[{\"resources\":[\"secrets\"],\"provider\":{\"keyArn\":
\"arn:aws:kms:region-code:account:key/key\"}}]"
            }
        ],
        "createdAt": "2024-03-14T11:01:26.297000-04:00",
        "errors": []
    }
}
```

For more information, see Enabling secret encryption on an existing cluster in the *Amazon EKS User Guide*.

- For API details, see AssociateEncryptionConfig in *AWS CLI Command Reference*.

`associate-identity-provider-config`

The following code example shows how to use `associate-identity-provider-config`.

AWS CLI

To associate an identity provider with your Amazon EKS cluster

The following `associate-identity-provider-config` example associates an identity provider to your Amazon EKS Cluster.

```
aws eks associate-identity-provider-config \
    --cluster-name my-eks-cluster \
    --oidc 'identityProviderConfigName=my-identity-provider,issuerUrl=https://
oidc.eks.us-west-2.amazonaws.com/
id/38D6A4619A0A69E342B113ED7F1A7652,clientId=kubernetes,usernameClaim=email,usernamePrefix=m
username-prefix,groupsClaim=my-claim,groupsPrefix=my-groups-
prefix,requiredClaims={Claim1=value1,Claim2=value2}' \
    --tags env=dev
```

Output:

```
{
```

```
    "update": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "status": "InProgress",
        "type": "AssociateIdentityProviderConfig",
        "params": [
            {
                "type": "IdentityProviderConfig",
                "value": "[{\"type\":\"oidc\",\"name\":\"my-identity-provider\"}]"
            }
        ],
        "createdAt": "2024-04-11T13:46:49.648000-04:00",
        "errors": []
    },
    "tags": {
        "env": "dev"
    }
}
```

For more information, see Authenticate users for your cluster from an OpenID Connect identity provider - Associate an OIDC identity provider in the *Amazon EKS User Guide*.

- For API details, see AssociateIdentityProviderConfig in *AWS CLI Command Reference*.

`create-access-entry`

The following code example shows how to use `create-access-entry`.

AWS CLI

Example 1: To create the access entry for EKS cluster

The following `create-access-entry` example creates an access entry that allows an IAM principal to access the EKS cluster.

```
aws eks create-access-entry \
    --cluster-name eks-customer \
    --principal-arn arn:aws:iam::123456789012:user/eks-user
```

Output:

```
{
    "accessEntry": {
```

```
        "clusterName": "eks-customer",
        "principalArn": "arn:aws:iam::123456789012:user/eks-user",
        "kubernetesGroups": [],
        "accessEntryArn": "arn:aws:eks:us-west-2:123456789012:access-entry/eks-
customer/user/123456789012/eks-user/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "createdAt": "2025-04-14T22:45:48.097000-05:00",
        "modifiedAt": "2025-04-14T22:45:48.097000-05:00",
        "tags": {},
        "username": "arn:aws:iam::123456789012:user/eks-user",
        "type": "STANDARD"
    }
}
```

For more information, see Create access entries in the *Amazon EKS User Guide*.

Example 2: To create the access entry for EKS cluster by specifying the type of access entry

The following `create-access-entry` example creates an access entry of type `EC2_LINUX` in the EKS cluster. By default, a type `STANDARD` access entry is created. Apart from the default, if we specify any other access entry types, an IAM role ARN needs to be passed in the CLI.

```
aws eks create-access-entry \
    --cluster-name eks-customer \
    --principal-arn arn:aws:iam::123456789012:role/admin-test-ip \
    --type EC2_LINUX
```

Output:

```
{
    "accessEntry": {
        "clusterName": "eks-customer",
        "principalArn": "arn:aws:iam::123456789012:role/admin-test-ip",
        "kubernetesGroups": [
            "system:nodes"
        ],
        "accessEntryArn": "arn:aws:eks:us-west-2:123456789012:access-entry/eks-
customer/role/123456789012/admin-test-ip/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "createdAt": "2025-05-06T19:42:45.453000-05:00",
        "modifiedAt": "2025-05-06T19:42:45.453000-05:00",
        "tags": {},
        "username": "system:node:{{EC2PrivateDNSName}}",
        "type": "EC2_LINUX"
    }
```

```
}
```

For more information, see Create access entries in the *Amazon EKS User Guide*.

- For API details, see CreateAccessEntry in *AWS CLI Command Reference*.

`create-addon`

The following code example shows how to use `create-addon`.

AWS CLI

Example 1: To create an Amazon EKS add-on with default compatible version for the respective EKS cluster version

The following `create-addon` example command creates an Amazon EKS add-on with default compatible version for the respective EKS cluster version.

```
aws eks create-addon \
    --cluster-name my-eks-cluster \
    --addon-name my-eks-addon \
    --service-account-role-arn arn:aws:iam::123456789012:role/role-name
```

Output:

```
{
    "addon": {
        "addonName": "my-eks-addon",
        "clusterName": "my-eks-cluster",
        "status": "CREATING",
        "addonVersion": "v1.15.1-eksbuild.1",
        "health": {
            "issues": []
        },
        "addonArn": "arn:aws:eks:us-west-2:123456789012:addon/my-eks-cluster/my-eks-
addon/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "createdAt": "2024-03-14T12:20:03.264000-04:00",
        "modifiedAt": "2024-03-14T12:20:03.283000-04:00",
        "serviceAccountRoleArn": "arn:aws:iam::123456789012:role/role-name",
        "tags": {}
    }
}
```

For more information, see Managing Amazon EKS add-ons - Creating an add-on in the *Amazon EKS User Guide*.

Example 2: To create an Amazon EKS add-on with specific add-on version

The following `create-addon` example command creates an Amazon EKS add-on with specific add-on version.

```
aws eks create-addon \
    --cluster-name my-eks-cluster \
    --addon-name my-eks-addon \
    --service-account-role-arn arn:aws:iam::123456789012:role/role-name \
    --addon-version v1.16.4-eksbuild.2
```

Output:

```
{
    "addon": {
        "addonName": "my-eks-addon",
        "clusterName": "my-eks-cluster",
        "status": "CREATING",
        "addonVersion": "v1.16.4-eksbuild.2",
        "health": {
            "issues": []
        },
        "addonArn": "arn:aws:eks:us-west-2:123456789012:addon/my-eks-cluster/my-eks-
addon/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "createdAt": "2024-03-14T12:30:24.507000-04:00",
        "modifiedAt": "2024-03-14T12:30:24.521000-04:00",
        "serviceAccountRoleArn": "arn:aws:iam::123456789012:role/role-name",
        "tags": {}
    }
}
```

For more information, see Managing Amazon EKS add-ons - Creating an add-on in the *Amazon EKS User Guide*.

Example 3: To create an Amazon EKS add-on with custom configuration values and resolve conflicts details

The following `create-addon` example command creates an Amazon EKS add-on with custom configuration values and resolves conflicts details.

```
aws eks create-addon \
    --cluster-name my-eks-cluster \
    --addon-name my-eks-addon \
    --service-account-role-arn arn:aws:iam::123456789012:role/role-name \
    --addon-version v1.16.4-eksbuild.2 \
    --configuration-values '{"resources":{"limits":{"cpu":"100m"}}}' \
    --resolve-conflicts OVERWRITE
```

Output:

```
{
    "addon": {
        "addonName": "my-eks-addon",
        "clusterName": "my-eks-cluster",
        "status": "CREATING",
        "addonVersion": "v1.16.4-eksbuild.2",
        "health": {
            "issues": []
        },
        "addonArn": "arn:aws:eks:us-west-2:123456789012:addon/my-eks-cluster/my-eks-
addon/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
        "createdAt": "2024-03-14T12:35:58.313000-04:00",
        "modifiedAt": "2024-03-14T12:35:58.327000-04:00",
        "serviceAccountRoleArn": "arn:aws:iam::123456789012:role/role-name",
        "tags": {},
        "configurationValues": "{\"resources\":{\"limits\":{\"cpu\":\"100m\"}}}"
    }
}
```

For more information, see Managing Amazon EKS add-ons - Creating an add-on in the *Amazon EKS User Guide*.

Example 4: To create an Amazon EKS add-on with custom JSON configuration values file

The following `create-addon` example command creates an Amazon EKS add-on with custom configuration values and resolve conflicts details.

```
aws eks create-addon \
    --cluster-name my-eks-cluster \
    --addon-name my-eks-addon \
    --service-account-role-arn arn:aws:iam::123456789012:role/role-name \
    --addon-version v1.16.4-eksbuild.2 \
```

```
    --configuration-values 'file://configuration-values.json' \
    --resolve-conflicts OVERWRITE \
    --tags '{"eks-addon-key-1": "value-1" , "eks-addon-key-2": "value-2"}'
```

Contents of `configuration-values.json`:

```
{
    "resources": {
        "limits": {
            "cpu": "150m"
        }
    },
    "env": {
        "AWS_VPC_K8S_CNI_LOGLEVEL": "ERROR"
    }
}
```

Output:

```
{
    "addon": {
        "addonName": "my-eks-addon",
        "clusterName": "my-eks-cluster",
        "status": "CREATING",
        "addonVersion": "v1.16.4-eksbuild.2",
        "health": {
            "issues": []
        },
        "addonArn": "arn:aws:eks:us-west-2:123456789012:addon/my-eks-cluster/my-eks-
addon/a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
        "createdAt": "2024-03-14T13:10:51.763000-04:00",
        "modifiedAt": "2024-03-14T13:10:51.777000-04:00",
        "serviceAccountRoleArn": "arn:aws:iam::123456789012:role/role-name",
        "tags": {
            "eks-addon-key-1": "value-1",
            "eks-addon-key-2": "value-2"
        },
        "configurationValues": "{\n    \"resources\": {\n        \"limits\":
 {\n            \"cpu\": \"150m\"\n        }\n    },\n    \"env\": {\n
 \"AWS_VPC_K8S_CNI_LOGLEVEL\": \"ERROR\"\n    }\n}"
    }
}
```

For more information, see Managing Amazon EKS add-ons - Creating an add-on in the *Amazon EKS User Guide*.

Example 5: To create an Amazon EKS add-on with custom YAML configuration values file

The following `create-addon` example command creates an Amazon EKS add-on with custom configuration values and resolve conflicts details.

```
aws eks create-addon \
    --cluster-name my-eks-cluster \
    --addon-name my-eks-addon \
    --service-account-role-arn arn:aws:iam::123456789012:role/role-name \
    --addon-version v1.16.4-eksbuild.2 \
    --configuration-values 'file://configuration-values.yaml' \
    --resolve-conflicts OVERWRITE \
    --tags '{"eks-addon-key-1": "value-1" , "eks-addon-key-2": "value-2"}'
```

Contents of `configuration-values.yaml`:

```
resources:
    limits:
        cpu: '100m'
env:
    AWS_VPC_K8S_CNI_LOGLEVEL: 'DEBUG'
```

Output:

```
{
    "addon": {
        "addonName": "my-eks-addon",
        "clusterName": "my-eks-cluster",
        "status": "CREATING",
        "addonVersion": "v1.16.4-eksbuild.2",
        "health": {
            "issues": []
        },
        "addonArn": "arn:aws:eks:us-west-2:123456789012:addon/my-eks-cluster/my-eks-
addon/a1b2c3d4-5678-90ab-cdef-EXAMPLE55555",
        "createdAt": "2024-03-14T13:15:45.220000-04:00",
        "modifiedAt": "2024-03-14T13:15:45.237000-04:00",
        "serviceAccountRoleArn": "arn:aws:iam::123456789012:role/role-name",
        "tags": {
            "eks-addon-key-3": "value-3",
```

```
            "eks-addon-key-4": "value-4"
        },
        "configurationValues": "resources:\n    limits:\n        cpu: '100m'\nenv:\n
    AWS_VPC_K8S_CNI_LOGLEVEL: 'INFO'"
    }
}
```

For more information, see Managing Amazon EKS add-ons - Creating an add-on in the *Amazon EKS User Guide*.

- For API details, see CreateAddon in *AWS CLI Command Reference*.

`create-cluster`

The following code example shows how to use `create-cluster`.

AWS CLI

Example 1: To create a new cluster

The following `create-cluster` example creates a cluster named `prod` in your default region.

```
aws eks create-cluster \
    --name prod \
    --role-arn arn:aws:iam::123456789012:role/eks-service-role-
AWSServiceRoleForAmazonEKS-J7ONKE3BQ4PI \
    --resources-vpc-config subnetIds=subnet-6782e71e,subnet-
e7e761ac,securityGroupIds=sg-6979fe18
```

Output:

```
{
    "cluster": {
        "name": "prod",
        "arn": "arn:aws:eks:us-west-2:123456789012:cluster/prod",
        "createdAt": 1527808069.147,
        "version": "1.10",
        "roleArn": "arn:aws:iam::123456789012:role/eks-service-role-
AWSServiceRoleForAmazonEKS-J7ONKE3BQ4PI",
        "resourcesVpcConfig": {
            "subnetIds": [
                "subnet-6782e71e",
                "subnet-e7e761ac"
```

```
            ],
            "securityGroupIds": [
                "sg-6979fe18"
            ],
            "vpcId": "vpc-950809ec"
        },
        "status": "CREATING",
        "certificateAuthority": {}
    }
}
```

For more information, see Create an Amazon EKS cluster in the *Amazon EKS User Guide*.

Example 2: To create a new cluster with private endpoint access and logging enabled

The following `create-cluster` example creates a cluster named `example` in your default region with public endpoint access disabled, private endpoint access enabled, and all logging types enabled.

```
aws eks create-cluster \
    --name example \
    --kubernetes-version 1.12 \
    --role-arn arn:aws:iam::123456789012:role/example-cluster-
ServiceRole-1XWBQWYSFRE2Q \
    --resources-vpc-
config subnetIds=subnet-0a188dccd2f9a632f,subnet-09290d93da4278664,subnet-0f21dd86e0e91134a,
 \
    --logging '{"clusterLogging":[{"types":
["api","audit","authenticator","controllerManager","scheduler"],"enabled":true}]}'
```

Output:

```
{
    "cluster": {
        "name": "example",
        "arn": "arn:aws:eks:us-west-2:123456789012:cluster/example",
        "createdAt": 1565804921.901,
        "version": "1.12",
        "roleArn": "arn:aws:iam::123456789012:role/example-cluster-
ServiceRole-1XWBQWYSFRE2Q",
        "resourcesVpcConfig": {
            "subnetIds": [
                "subnet-0a188dccd2f9a632f",
```

```
                "subnet-09290d93da4278664",
                "subnet-0f21dd86e0e91134a",
                "subnet-0173dead68481a583",
                "subnet-051f70a57ed6fcab6",
                "subnet-01322339c5c7de9b4"
            ],
            "securityGroupIds": [
                "sg-0c5b580845a031c10"
            ],
            "vpcId": "vpc-0f622c01f68d4afec",
            "endpointPublicAccess": false,
            "endpointPrivateAccess": true
        },
        "logging": {
            "clusterLogging": [
                {
                    "types": [
                        "api",
                        "audit",
                        "authenticator",
                        "controllerManager",
                        "scheduler"
                    ],
                    "enabled": true
                }
            ]
        },
        "status": "CREATING",
        "certificateAuthority": {},
        "platformVersion": "eks.3"
    }
}
```

For more information, see Create an Amazon EKS cluster in the *Amazon EKS User Guide*.

- For API details, see CreateCluster in *AWS CLI Command Reference*.

`create-fargate-profile`

The following code example shows how to use `create-fargate-profile`.

AWS CLI

Example 1: To create an EKS Fargate profile for a selector with a namespace

The following `create-fargate-profile` example creates an EKS Fargate Profile for a selector with a namespace.

```
aws eks create-fargate-profile \
    --cluster-name my-eks-cluster \
    --pod-execution-role-arn arn:aws:iam::123456789012:role/role-name \
    --fargate-profile-name my-fargate-profile \
    --selectors '[{"namespace": "default"}]'
```

Output:

```
{
    "fargateProfile": {
        "fargateProfileName": "my-fargate-profile",
        "fargateProfileArn": "arn:aws:eks:us-west-2:123456789012:fargateprofile/my-
eks-cluster/my-fargate-profile/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "clusterName": "my-eks-cluster",
        "createdAt": "2024-03-19T12:38:47.368000-04:00",
        "podExecutionRoleArn": "arn:aws:iam::123456789012:role/role-name",
        "subnets": [
            "subnet-09d912bb63ef21b9a",
            "subnet-04ad87f71c6e5ab4d",
            "subnet-0e2907431c9988b72"
        ],
        "selectors": [
            {
                "namespace": "default"
            }
        ],
        "status": "CREATING",
        "tags": {}
    }
}
```

For more information, see AWS Fargate profile - Creating a Fargate profile in the *Amazon EKS User Guide*.

Example 2: To create an EKS Fargate profile for a selector with a namespace and labels

The following `create-fargate-profile` example creates an EKS Fargate Profile for a selector with a namespace and labels.

```
aws eks create-fargate-profile \
    --cluster-name my-eks-cluster \
    --pod-execution-role-arn arn:aws:iam::123456789012:role/role-name \
    --fargate-profile-name my-fargate-profile \
    --selectors '[{"namespace": "default", "labels": {"labelname1":
 "labelvalue1"}}]'
```

Output:

```
{
    "fargateProfile": {
        "fargateProfileName": "my-fargate-profile",
        "fargateProfileArn": "arn:aws:eks:us-west-2:123456789012:fargateprofile/my-
eks-cluster/my-fargate-profile/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "clusterName": "my-eks-cluster",
        "createdAt": "2024-03-19T12:33:48.125000-04:00",
        "podExecutionRoleArn": "arn:aws:iam::123456789012:role/role-name",
        "subnets": [
            "subnet-09d912bb63ef21b9a",
            "subnet-04ad87f71c6e5ab4d",
            "subnet-0e2907431c9988b72"
        ],
        "selectors": [
            {
                "namespace": "default",
                "labels": {
                    "labelname1": "labelvalue1"
                }
            }
        ],
        "status": "CREATING",
        "tags": {}
    }
}
```

For more information, see AWS Fargate profile - Creating a Fargate profile in the *Amazon EKS User Guide*.

Example 3: To create an EKS Fargate profile for a selector with a namespace and labels, along with IDs of subnets to launch a Pod into

The following `create-fargate-profile` example create EKS Fargate Profile for a selector with a namespace and labels, along with IDs of subnets to launch a Pod into.

```
aws eks create-fargate-profile \
    --cluster-name my-eks-cluster \
    --pod-execution-role-arn arn:aws:iam::123456789012:role/role-name \
    --fargate-profile-name my-fargate-profile \
    --selectors '[{"namespace": "default", "labels": {"labelname1":
 "labelvalue1"}}]' \
    --subnets '["subnet-09d912bb63ef21b9a", "subnet-04ad87f71c6e5ab4d",
 "subnet-0e2907431c9988b72"]'
```

Output:

```
{
    "fargateProfile": {
        "fargateProfileName": "my-fargate-profile",
        "fargateProfileArn": "arn:aws:eks:us-west-2:123456789012:fargateprofile/my-
eks-cluster/my-fargate-profile/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
        "clusterName": "my-eks-cluster",
        "createdAt": "2024-03-19T12:35:58.640000-04:00",
        "podExecutionRoleArn": "arn:aws:iam::123456789012:role/role-name",
        "subnets": [
            "subnet-09d912bb63ef21b9a",
            "subnet-04ad87f71c6e5ab4d",
            "subnet-0e2907431c9988b72"
        ],
        "selectors": [
            {
                "namespace": "default",
                "labels": {
                    "labelname1": "labelvalue1"
                }
            }
        ],
        "status": "CREATING",
        "tags": {}
    }
}
```

For more information, see AWS Fargate profile - Creating a Fargate profile in the *Amazon EKS User Guide*.

Example 4: To create an EKS Fargate profile for a selector with multiple namespaces and labels, along with IDs of subnets to launch a Pod into

The following `create-fargate-profile` example creates an EKS Fargate Profile for a selector with multiple namespace and labels, along with IDs of subnets to launch a Pod into.

```
aws eks create-fargate-profile \
    --cluster-name my-eks-cluster \
    --pod-execution-role-arn arn:aws:iam::123456789012:role/role-name \
    --fargate-profile-name my-fargate-profile \
    --selectors '[{"namespace": "default1", "labels": {"labelname1": "labelvalue1",
 "labelname2": "labelvalue2"}}, {"namespace": "default2", "labels": {"labelname1":
 "labelvalue1", "labelname2": "labelvalue2"}}]' \
    --subnets '["subnet-09d912bb63ef21b9a", "subnet-04ad87f71c6e5ab4d",
 "subnet-0e2907431c9988b72"]' \
    --tags '{"eks-fargate-profile-key-1": "value-1" , "eks-fargate-profile-key-2":
 "value-2"}'
```

Output:

```
{
    "fargateProfile": {
        "fargateProfileName": "my-fargate-profile",
        "fargateProfileArn": "arn:aws:eks:us-west-2:123456789012:fargateprofile/my-
eks-cluster/my-fargate-profile/a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
        "clusterName": "my-eks-cluster",
        "createdAt": "2024-03-19T12:15:55.271000-04:00",
        "podExecutionRoleArn": "arn:aws:iam::123456789012:role/role-name",
        "subnets": [
            "subnet-09d912bb63ef21b9a",
            "subnet-04ad87f71c6e5ab4d",
            "subnet-0e2907431c9988b72"
        ],
        "selectors": [
            {
                "namespace": "default1",
                "labels": {
                    "labelname2": "labelvalue2",
                    "labelname1": "labelvalue1"
                }
            },
            {
                "namespace": "default2",
```

```
                "labels": {
                    "labelname2": "labelvalue2",
                    "labelname1": "labelvalue1"
                }
            }
        ],
        "status": "CREATING",
        "tags": {
            "eks-fargate-profile-key-2": "value-2",
            "eks-fargate-profile-key-1": "value-1"
        }
    }
}
```

For more information, see AWS Fargate profile - Creating a Fargate profile in the *Amazon EKS User Guide*.

Example 5: To create an EKS Fargate profile with a wildcard selector for namespaces and labels, along with IDs of subnets to launch a Pod into

The following `create-fargate-profile` example creates an EKS Fargate Profile for a selector with multiple namespace and labels, along with IDs of subnets to launch a Pod into.

```
aws eks create-fargate-profile \
    --cluster-name my-eks-cluster \
    --pod-execution-role-arn arn:aws:iam::123456789012:role/role-name \
    --fargate-profile-name my-fargate-profile \
    --selectors '[{"namespace": "prod*", "labels": {"labelname*?": "*value1"}},
 {"namespace": "*dev*", "labels": {"labelname*?": "*value*"}}]' \

`create-nodegroup`

The following code example shows how to use `create-nodegroup`.

AWS CLI

Example 1: To create a managed node group for an Amazon EKS cluster

The following `create-nodegroup` example creates a managed node group for an Amazon EKS cluster.

```
aws eks create-nodegroup \
    --cluster-name my-eks-cluster \
    --nodegroup-name my-eks-nodegroup \
    --node-role arn:aws:iam::123456789012:role/role-name \
    --
subnets "subnet-0e2907431c9988b72" "subnet-04ad87f71c6e5ab4d" "subnet-09d912bb63ef21b9a"
 \
    --scaling-config minSize=1,maxSize=3,desiredSize=1
```

Output:

```
{
    "nodegroup": {
        "nodegroupName": "my-eks-nodegroup",
        "nodegroupArn": "arn:aws:eks:us-west-2:123456789012:nodegroup/my-eks-
cluster/my-eks-nodegroup/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "clusterName": "my-eks-cluster",
        "version": "1.26",
        "releaseVersion": "1.26.12-20240329",

```

```
        },
        "tags": {}
    }
}
```

For more information, see Creating a managed node group in the *Amazon EKS User Guide*.

Example 2: To create a managed node group for an Amazon EKS cluster with custom instance-types and disk-size

The following `create-nodegroup` example creates a managed node group for an Amazon EKS cluster with custom instance-types and disk-size.

```
aws eks create-nodegroup \
    --cluster-name my-eks-cluster \
    --nodegroup-name my-eks-nodegroup \
    --node-role arn:aws:iam::123456789012:role/role-name \
    --
subnets "subnet-0e2907431c9988b72" "subnet-04ad87f71c6e5ab4d" "subnet-09d912bb63ef21b9a"
 \
    --scaling-config minSize=1,maxSize=3,desiredSize=1 \
    --capacity-type ON_DEMAND \
    --instance-types 'm5.large' \
    --disk-size 50
```

Output:

```
{
    "nodegroup": {
        "nodegroupName": "my-eks-nodegroup",
        "nodegroupArn": "arn:aws:eks:us-west-2:123456789012:nodegroup/my-eks-
cluster/my-eks-nodegroup/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "clusterName": "my-eks-cluster",

        ],
        "amiType": "AL2_x86_64",
        "nodeRole": "arn:aws:iam::123456789012:role/role-name",
        "diskSize": 50,
        "health": {
            "issues": []
        },
        "updateConfig": {
            "maxUnavailable": 1
        },
        "tags": {}
    }
}
```

For more information, see Creating a managed node group in the *Amazon EKS User Guide*.

Example 3: To create a managed node group for an Amazon EKS cluster with custom instance-types, disk-size, ami-type, capacity-type, update-config, labels, taints and tags

The following `create-nodegroup` example creates a managed node group for an Amazon EKS cluster with custom instance-types, disk-size, ami-type, capacity-type, update-config, labels, taints and tags.

```
aws eks create-nodegroup  \
    --cluster-name my-eks-cluster \
    --nodegroup-name my-eks-nodegroup \
    --node-role arn:aws:iam::123456789012:role/role-name \
    --
subnets "subnet-0e2907431c9988b72" "subnet-04ad87f71c6e5ab4d" "subnet-09d912bb63ef21b9a"
 \
    --scaling-config minSize=1,maxSize=5,desiredSize=4 \
    --instance-types 't3.large' \
    --disk-size 50 \
    --ami-type AL2_x86_64 \
```

```
    --capacity-type SPOT \
    --update-config maxUnavailable=2 \
    --labels '{"my-eks-nodegroup-label-1": "value-1" , "my-eks-nodegroup-label-2":
 "value-2"}' \
    --taints '{"key": "taint-key-1" , "value": "taint-value-1", "effect":
 "NO_EXECUTE"}' \
    --tags '{"my-eks-nodegroup-key-1": "value-1" , "my-eks-nodegroup-key-2":
 "value-2"}'
```

Output:

```
{
    "nodegroup": {
        "nodegroupName": "my-eks-nodegroup",
        "nodegroupArn": "arn:aws:eks:us-west-2:123456789012:nodegroup/my-eks-
cluster/my-eks-nodegroup/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",

                "effect": "NO_EXECUTE"
            }
        ],
        "diskSize": 50,
        "health": {
            "issues": []
        },
        "updateConfig": {
            "maxUnavailable": 2
        },
        "tags": {
            "my-eks-nodegroup-key-1": "value-1",
            "my-eks-nodegroup-key-2": "value-2"
        }
    }
}
```

For more information, see Creating a managed node group in the *Amazon EKS User Guide*.

- For API details, see CreateNodegroup in *AWS CLI Command Reference*.

`create-pod-identity-association`

The following code example shows how to use `create-pod-identity-association`.

AWS CLI

Example 1: To create an EKS Pod Identity association in EKS cluster

The following `create-pod-identity-association` example creates an EKS Pod Identity association between a service account in the EKS cluster and an IAM role.

```
aws eks create-pod-identity-association \
    --cluster-name eks-customer \
    --namespace default \
    --service-account default \
    --role-arn arn:aws:iam::123456789012:role/my-role
```

Output:

```
{
    "association": {
        "clusterName": "eks-customer",
        "namespace": "default",
        "serviceAccount": "default",
        "roleArn": "arn:aws:iam::123456789012:role/my-role",
        "associationArn": "arn:aws:eks:us-
west-2:123456789012:podidentityassociation/eks-customer/a-8mvwvh57cu74mgcst",
        "associationId": "a-8mvwvh57cu74mgcst",
        "tags": {},
        "createdAt": "2025-05-24T19:40:13.961000-05:00",
        "modifiedAt": "2025-05-24T19:40:13.961000-05:00"
    }
}
```

For more information, see Learn how EKS Pod Identity grants pods access to AWS services in the *Amazon EKS User Guide*.

Example 2: To create an EKS Pod Identity association in EKS cluster with tags

The following `create-pod-identity-association` example creates an EKS Pod Identity association between a service account and an IAM role in the EKS cluster with tags.

```
aws eks create-pod-identity-association \
    --cluster-name eks-customer \
    --namespace default \
    --service-account default \
    --role-arn arn:aws:iam::123456789012:role/my-role \
    --tags Key1=value1,Key2=value2
```

Output:

```
{
    "association": {
        "clusterName": "eks-customer",
        "namespace": "default",
        "serviceAccount": "default",
        "roleArn": "arn:aws:iam::123456789012:role/my-role",
        "associationArn": "arn:aws:eks:us-
west-2:123456789012:podidentityassociation/eks-customer/a-9njjin9gfghecgoda",
        "associationId": "a-9njjin9gfghecgoda",
        "tags": {
```

```
            "Key2": "value2",
            "Key1": "value1"
        },
        "createdAt": "2025-05-24T19:52:14.135000-05:00",
        "modifiedAt": "2025-05-24T19:52:14.135000-05:00"
    }
}
```

For more information, see Learn how EKS Pod Identity grants pods access to AWS services in the *Amazon EKS User Guide*.

- For API details, see CreatePodIdentityAssociation in *AWS CLI Command Reference*.

`delete-access-entry`

The following code example shows how to use `delete-access-entry`.

AWS CLI

To delete an access entry associated with the cluster

The following `delete-access-entry` example deletes an access entry associated with the EKS cluster named `eks-customer`.

```
aws eks delete-access-entry \
    --cluster-name eks-customer \
    --principal-arn arn:aws:iam::123456789012:role/Admin
```

This command produces no output.

For more information, see Delete access entries in the *Amazon EKS User Guide*.

- For API details, see DeleteAccessEntry in *AWS CLI Command Reference*.

`delete-addon`

The following code example shows how to use `delete-addon`.

AWS CLI

Example 1: To delete an Amazon EKS add-on but preserve the add-on software on the EKS cluster

The following `delete-addon` example command deletes an Amazon EKS add-on but preserve the add-on software on the EKS Cluster.

```
aws eks delete-addon \
    --cluster-name my-eks-cluster \
    --addon-name my-eks-addon \
    --preserve
```

Output:

```
{
    "addon": {
        "addonName": "my-eks-addon",
        "clusterName": "my-eks-cluster",
        "status": "DELETING",
        "addonVersion": "v1.9.3-eksbuild.7",
        "health": {
            "issues": []
        },
        "addonArn": "arn:aws:eks:us-west-2:123456789012:addon/my-eks-cluster/my-eks-
addon/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "createdAt": "2024-03-14T11:49:09.009000-04:00",
        "modifiedAt": "2024-03-14T12:03:49.776000-04:00",
        "tags": {}
    }
}
```

For more information, see Remove an Amazon EKS add-on from a cluster in the *Amazon EKS User Guide*.

Example 2: To delete an Amazon EKS add-on and also delete the add-on software from the EKS cluster

The following `delete-addon` example command deletes an Amazon EKS add-on and also delete the add-on software from the EKS Cluster.

```
aws eks delete-addon \
    --cluster-name my-eks-cluster \
    --addon-name my-eks-addon
```

Output:

```
{
    "addon": {
        "addonName": "my-eks-addon",
        "clusterName": "my-eks-cluster",
        "status": "DELETING",
        "addonVersion": "v1.15.1-eksbuild.1",
        "health": {
            "issues": []
        },
        "addonArn": "arn:aws:eks:us-west-2:123456789012:addon/my-eks-cluster/my-eks-
addon/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "createdAt": "2024-03-14T11:45:31.983000-04:00",
        "modifiedAt": "2024-03-14T11:58:40.136000-04:00",
        "serviceAccountRoleArn": "arn:aws:iam::123456789012:role/role-name",
        "tags": {}
    }
}
```

For more information, see Remove an Amazon EKS add-on from a cluster in the *Amazon EKS User Guide*.

- For API details, see DeleteAddon in *AWS CLI Command Reference*.

`delete-cluster`

The following code example shows how to use `delete-cluster`.

AWS CLI

To delete an Amazon EKS cluster control plane

The following `delete-cluster` example deletes an Amazon EKS cluster control plane.

```
aws eks delete-cluster \
    --name my-eks-cluster
```

Output:

```
{
    "cluster": {
        "name": "my-eks-cluster",
        "arn": "arn:aws:eks:us-west-2:123456789012:cluster/my-eks-cluster",
```

`delete-fargate-profile`

The following code example shows how to use `delete-fargate-profile`.

AWS CLI

To delete an EKS Fargate profile

The following `delete-fargate-profile` example creates an EKS Fargate Profile for a selector with a namespace.

```
aws eks delete-fargate-profile \
    --cluster-name my-eks-cluster \
    --fargate-profile-name my-fargate-profile
```

Output:

```
{
    "fargateProfile": {
        "fargateProfileName": "my-fargate-profile",
        "fargateProfileArn": "arn:aws:eks:us-west-2:123456789012:fargateprofile/my-
eks-cluster/my-fargate-profile/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "clusterName": "my-eks-cluster",
        "createdAt": "2024-03-19T11:48:39.975000-04:00",
        "podExecutionRoleArn": "arn:aws:iam::123456789012:role/role-name",
        "subnets": [
            "subnet-09d912bb63ef21b9a",
            "subnet-04ad87f71c6e5ab4d",
            "subnet-0e2907431c9988b72"
        ],
        "selectors": [
            {
                "namespace": "default",
                "labels": {
                    "foo": "bar"
                }
            }
        ],
        "status": "DELETING",
        "tags": {}
    }
}
```

For more information, see AWS Fargate profile - Deleting a Fargate in the *Amazon EKS User Guide*.

- For API details, see DeleteFargateProfile in *AWS CLI Command Reference*.

delete-nodegroup

The following code example shows how to use `delete-nodegroup`.

AWS CLI

To delete a managed node group for an Amazon EKS cluster

The following `delete-nodegroup` example deletes a managed node group for an Amazon EKS cluster.

```
aws eks delete-nodegroup \
    --cluster-name my-eks-cluster \
    --nodegroup-name my-eks-nodegroup
```

Output:

```
{
    "nodegroup": {
        "nodegroupName": "my-eks-nodegroup",
        "nodegroupArn": "arn:aws:eks:us-west-2:123456789012:nodegroup/my-eks-

            "my-eks-nodegroup-key-1": "value-1",
            "my-eks-nodegroup-key-2": "value-2"
        }
    }
}
```

For more information, see Delete a managed node group from your cluster in the *Amazon EKS User Guide*.

- For API details, see DeleteNodegroup in *AWS CLI Command Reference*.

`delete-pod-identity-association`

The following code example shows how to use `delete-pod-identity-association`.

AWS CLI

To delete the EKS Pod Identity association

The following `delete-pod-identity-association` example deletes the EKS Pod Identity association with association ID `a-9njjin9gfghecgocd` from the EKS cluster named `eks-customer`.

```
aws eks delete-pod-identity-association \
    --cluster-name eks-customer \
    --association-id a-9njjin9gfghecgocd
```

Output:

```
{
    "association": {
        "clusterName": "eks-customer",
        "namespace": "default",
        "serviceAccount": "default",
        "roleArn": "arn:aws:iam::123456789012:role/s3-role",
        "associationArn": "arn:aws:eks:us-
west-2:123456789012:podidentityassociation/eks-customer/a-9njjin9gfghecgocd",
        "associationId": "a-9njjin9gfghecgocd",
        "tags": {
            "Key2": "value2",
            "Key1": "value1"
        },
        "createdAt": "2025-05-24T19:52:14.135000-05:00",
        "modifiedAt": "2025-05-25T21:10:56.923000-05:00"
    }
}
```

For more information, see Learn how EKS Pod Identity grants pods access to AWS services in the *Amazon EKS User Guide*.

- For API details, see DeletePodIdentityAssociation in *AWS CLI Command Reference*.

`deregister-cluster`

The following code example shows how to use `deregister-cluster`.

AWS CLI

To deregisters a connected cluster to remove it from the Amazon EKS control plane

The following `deregister-cluster` example deregisters a connected cluster to remove it from the Amazon EKS control plane.

```
aws eks deregister-cluster \
    --name my-eks-anywhere-cluster
```

Output:

```
{
    "cluster": {
        "name": "my-eks-anywhere-cluster",
        "arn": "arn:aws:eks:us-west-2:123456789012:cluster/my-eks-anywhere-cluster",
        "createdAt": "2024-04-12T12:38:37.561000-04:00",
        "status": "DELETING",
        "tags": {},
        "connectorConfig": {
            "activationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "activationExpiry": "2024-04-15T12:38:37.082000-04:00",
            "provider": "EKS_ANYWHERE",
            "roleArn": "arn:aws:iam::123456789012:role/AmazonEKSConnectorAgentRole"
        }
    }
}
```

For more information, see Deregistering a cluster in the *Amazon EKS User Guide*.

- For API details, see DeregisterCluster in *AWS CLI Command Reference*.

`describe-access-entry`

The following code example shows how to use `describe-access-entry`.

AWS CLI

To describe the access entry for EKS cluster

The following `describe-access-entry` example describes an access entry for the EKS cluster.

```
aws eks describe-access-entry \
    --cluster-name eks-customer \
    --principal-arn arn:aws:iam::123456789012:user/eks-admin-user
```

Output:

```
{
    "accessEntry": {
        "clusterName": "eks-customer",
        "principalArn": "arn:aws:iam::123456789012:user/eks-admin-user",
```

```
        "kubernetesGroups": [],
        "accessEntryArn": "arn:aws:eks:us-west-2:123456789012:access-entry/eks-
customer/user/123456789012/eks-admin-user/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "createdAt": "2025-04-14T22:45:48.097000-05:00",
        "modifiedAt": "2025-04-14T22:45:48.097000-05:00",
        "tags": {},
        "username": "arn:aws:iam::123456789012:user/eks-admin-user",
        "type": "STANDARD"
    }
}
```

For more information, see Grant IAM users access to Kubernetes with EKS access entries in the *Amazon EKS User Guide*.

- For API details, see DescribeAccessEntry in *AWS CLI Command Reference*.

`describe-addon-configuration`

The following code example shows how to use `describe-addon-configuration`.

AWS CLI

Example 1: To describe the configuration options available when creating or updating Amazon vpc-cni AddOns

The following `describe-addon-configuration` example returns the all the available configuration schema you use when an add-on is created or updated for vpc-cni add-on with respective version.

```
aws eks describe-addon-configuration \
    --addon-name vpc-cni \
    --addon-version v1.15.1-eksbuild.1
```

Output:

```
{
    "addonName": "vpc-cni",
    "addonVersion": "v1.15.1-eksbuild.1",
    "configurationSchema": "{\"$ref\":\"#/definitions/VpcCni\",\"$schema\":\"http://

}

For more information, see Determine fields you can customize for Amazon EKS add-ons in the *Amazon EKS User Guide*.

Example 2: To describe the configuration options available when creating or updating Amazon coredns AddOns

The following `describe-addon-configuration` example returns all the available configuration schema you use when an add-on is created or updated for coredns add-on with respective version.

```
aws eks describe-addon-configuration \
    --addon-name coredns \
    --addon-version v1.8.7-eksbuild.4
```

Output:

```
{
    "addonName": "coredns",
    "addonVersion": "v1.8.7-eksbuild.4",
    "configurationSchema": "{\"$ref\":\"#/definitions/Coredns\",\"$schema
\":\"http://json-schema.org/draft-06/schema#\",\"definitions\":{\"Coredns\":
{\"additionalProperties\":false,\"properties\":{\"computeType\":{\"type\":

 installation\",\"type\":\"string\"},\"nodeSelector\":{\"additionalProperties\":
{\"type\":\"string\"},\"type\":\"object\"},\"replicaCount\":{\"type\":\"integer
\"},\"resources\":{\"$ref\":\"#/definitions/Resources\"}},\"title\":\"Coredns\",
\"type\":\"object\"},\"Limits\":{\"additionalProperties\":false,\"properties\":
{\"cpu\":{\"type\":\"string\"},\"memory\":{\"type\":\"string\"}},\"title\":\"Limits
\",\"type\":\"object\"},\"Resources\":{\"additionalProperties\":false,\"properties
\":{\"limits\":{\"$ref\":\"#/definitions/Limits\"},\"requests\":{\"$ref\":\"#/
definitions/Limits\"}},\"title\":\"Resources\",\"type\":\"object\"}}}"
}
```

For more information, see Determine fields you can customize for Amazon EKS add-ons in the *Amazon EKS User Guide*.

- For API details, see DescribeAddonConfiguration in *AWS CLI Command Reference*.

`describe-addon-versions`

The following code example shows how to use `describe-addon-versions`.

AWS CLI

Example 1: To list all the available addons for EKS Cluster

The following `describe-addon-versions` example list all the available AWS addons.

```
aws eks describe-addon-versions  \
    --query 'sort_by(addons  &owner)[].{publisher: publisher, owner: owner,
 addonName: addonName, type: type}' \
    --output table
```

Output:

```

Example 2: To list all the available addons for specified Kubernetes version supported for EKS

The following `describe-addon-versions` example list all the available addons for specified Kubernetes version supported for EKS.

```
aws eks describe-addon-versions  \
    --kubernetes-version=1.26 \
    --query 'sort_by(addons  &owner)[].{publisher: publisher, owner: owner,
 addonName: addonName, type: type}' \
    --output table
```

Output:

```

```

```
                }
            },
            {
                "namespace": "*dev*",
                "labels": {
                    "labelname*?": "*value*"
                }
            }
        ],
        "status": "ACTIVE",
        "tags": {
            "eks-fargate-profile-key-2": "value-2",
            "eks-fargate-profile-key-1": "value-1"
        }
    }
}
```

For more information, see Define which Pods use AWS Fargate when launched in the *Amazon EKS User Guide*.

- For API details, see DescribeFargateProfile in *AWS CLI Command Reference*.

`describe-identity-provider-config`

The following code example shows how to use `describe-identity-provider-config`.

AWS CLI

To describe an identity provider configuration associated to your Amazon EKS Cluster

The following `describe-identity-provider-config` example describes an identity provider configuration associated to your Amazon EKS Cluster.

```
aws eks describe-identity-provider-config \
    --cluster-name my-eks-cluster \
    --identity-provider-config type=oidc,name=my-identity-provider
```

Output:

```
{
    "identityProviderConfig": {
```

```
        "oidc": {
            "identityProviderConfigName": "my-identity-provider",
            "identityProviderConfigArn": "arn:aws:eks:us-
west-2:123456789012:identityproviderconfig/my-eks-cluster/oidc/my-identity-provider/

    }
}
```

For more information, see Authenticate users for your cluster from an OpenID Connect identity provider in the *Amazon EKS User Guide*.

- For API details, see DescribeIdentityProviderConfig in *AWS CLI Command Reference*.

`describe-insight`

The following code example shows how to use `describe-insight`.

AWS CLI

To get the details of an insight for an EKS cluster using its ID

The following `describe-insight` example returns the details about the insight specified using the cluster name and insight ID.

```
aws eks describe-insight \
```

```
    --cluster-name eks-customer \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "insight": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "name": "Kubelet version skew",

```

For more information, see View cluster insights in the *Amazon EKS User Guide*.

- For API details, see DescribeInsight in *AWS CLI Command Reference*.

`describe-nodegroup`

The following code example shows how to use `describe-nodegroup`.

AWS CLI

To describe a managed node group for an Amazon EKS cluster

The following `describe-nodegroup` example describes a managed node group for an Amazon EKS cluster.

```
aws eks describe-nodegroup \
    --cluster-name my-eks-cluster \
    --nodegroup-name my-eks-nodegroup
```

Output:

```
{
    "nodegroup": {
        "nodegroupName": "my-eks-nodegroup",
        "nodegroupArn": "arn:aws:eks:us-west-2:123456789012:nodegroup/my-eks-

```

For more information, see Simplify node lifecycle with managed node groups in the *Amazon EKS User Guide*.

- For API details, see DescribeNodegroup in *AWS CLI Command Reference*.

`describe-pod-identity-association`

The following code example shows how to use `describe-pod-identity-association`.

AWS CLI

To provide the details about Pod Identity association

The following `describe-pod-identity-association` example describes a Pod Identity association in the EKS cluster.

```
aws eks describe-pod-identity-association \
    --cluster-name eks-customer \
    --association-id a-9njjin9gfghecgocd
```

Output:

```
{
    "association": {
        "clusterName": "eks-customer",
```

```
        "namespace": "default",
        "serviceAccount": "default",
        "roleArn": "arn:aws:iam::123456789012:role/my-role",
        "associationArn": "arn:aws:eks:us-
west-2:123456789012:podidentityassociation/eks-customer/a-9njjin9gfghecgocd",
        "associationId": "a-9njjin9gfghecgocd",
        "tags": {
            "Key2": "value2",
            "Key1": "value1"
        },
        "createdAt": "2025-05-24T19:52:14.135000-05:00",
        "modifiedAt": "2025-05-24T19:52:14.135000-05:00"
    }
}
```

For more information, see Learn how EKS Pod Identity grants pods access to AWS services in the *Amazon EKS User Guide*.

- For API details, see DescribePodIdentityAssociation in *AWS CLI Command Reference*.

`describe-update`

The following code example shows how to use `describe-update`.

AWS CLI

Example 1: To describe an update for a cluster

The following `describe-update` example describes an update for a cluster named.

```
aws eks describe-update \
    --name my-eks-cluster \
    --update-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "update": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "status": "Successful",
        "type": "EndpointAccessUpdate",
        "params": [
            {
```

```
                "type": "EndpointPublicAccess",
                "value": "false"
            },
            {
                "type": "EndpointPrivateAccess",
                "value": "true"
            }
        ],
        "createdAt": "2024-03-14T10:01:26.297000-04:00",
        "errors": []
    }
}
```

For more information, see Updating an Amazon EKS cluster Kubernetes version in the *Amazon EKS User Guide*.

Example 2: To describe an update for a cluster

The following `describe-update` example describes an update for a cluster named.

```
aws eks describe-update \
    --name my-eks-cluster \
    --update-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "update": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "status": "Successful",
        "type": "AssociateEncryptionConfig",
        "params": [
            {
                "type": "EncryptionConfig",
                "value": "[{\"resources\":[\"secrets\"],\"provider\":{\"keyArn\":
\"arn:aws:kms:region-code:account:key/key\"}}]"
            }
        ],
        "createdAt": "2024-03-14T11:01:26.297000-04:00",
        "errors": []
    }
}
```

For more information, see Updating an Amazon EKS cluster Kubernetes version in the *Amazon EKS User Guide*.

Example 3: To describe an update for a cluster

The following `describe-update` example describes an update for a cluster named.

```
aws eks describe-update \
    --name my-eks-cluster \
    --update-id a1b2c3d4-5678-90ab-cdef-EXAMPLE33333
```

Output:

```
{
    "update": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
        "status": "Successful",
        "type": "VersionUpdate",
        "params": [
            {
                "type": "Version",
                "value": "1.29"
            },
            {
                "type": "PlatformVersion",
                "value": "eks.1"
            }
        ],
        "createdAt": "2024-03-14T12:05:26.297000-04:00",
        "errors": []
    }
}
```

For more information, see Updating an Amazon EKS cluster Kubernetes version in the *Amazon EKS User Guide*.

- For API details, see DescribeUpdate in *AWS CLI Command Reference*.

`disassociate-access-policy`

The following code example shows how to use `disassociate-access-policy`.

AWS CLI

To disassociate the access policy from an access entry

The following `disassociate-access-policy` example removes the access policy associated with the access entry.

```
aws eks disassociate-access-policy \
    --cluster-name eks-customer \
    --principal-arn arn:aws:iam::123456789012:role/Admin \
    --policy-arn arn:aws:eks::aws:cluster-access-policy/AmazonEKSEditPolicy
```

This command produces no output.

For more information, see Associate access policies with access entries in the *Amazon EKS User Guide*.

- For API details, see DisassociateAccessPolicy in *AWS CLI Command Reference*.

`disassociate-identity-provider-config`

The following code example shows how to use `disassociate-identity-provider-config`.

AWS CLI

To disassociate an identity provider from your Amazon EKS Cluster

The following `disassociate-identity-provider-config` example disassociates an identity provider to your Amazon EKS Cluster.

```
aws eks disassociate-identity-provider-config \
    --cluster-name my-eks-cluster \
    --identity-provider-config 'type=oidc,name=my-identity-provider'
```

Output:

```
{
    "update": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "status": "InProgress",
        "type": "DisassociateIdentityProviderConfig",
        "params": [
```

```
            {
                "type": "IdentityProviderConfig",
                "value": "[]"
            }
        ],
        "createdAt": "2024-04-11T13:53:43.314000-04:00",
        "errors": []
    }
}
```

For more information, see Authenticate users for your cluster from an OpenID Connect identity provider - Disassociate an OIDC identity provider from your cluster in the *Amazon EKS User Guide*.

- For API details, see DisassociateIdentityProviderConfig in *AWS CLI Command Reference*.

`get-token`

The following code example shows how to use `get-token`.

AWS CLI

Example 1: To get an authentication token for an Amazon EKS Cluster named `my-eks-cluster`

The following `get-token` example gets an authentication token for an Amazon EKS Cluster named my-eks-cluster.

```
aws eks get-token \
    --cluster-name my-eks-cluster
```

Output:

```
{
    "kind": "ExecCredential",
    "apiVersion": "client.authentication.k8s.io/v1beta1",
    "spec": {},
    "status": {
        "expirationTimestamp": "2024-04-11T20:59:56Z",
        "token": "k8s-aws-v1.EXAMPLE_TOKEN_DATA_STRING..."
    }
}
```

For more information, see Connect kubectl to an EKS cluster by creating a kubeconfig file in the *Amazon EKS User Guide*.

Example 2: To get an authentication token for an Amazon EKS Cluster named `my-eks-cluster` by assuming a role ARN for credentials when signing the token

The following `get-token` example gets an authentication token for an Amazon EKS Cluster named my-eks-cluster by assuming this roleARN for credentials when signing the token.

```
aws eks get-token \
    --cluster-name my-eks-cluster \
    --role-arn arn:aws:iam::123456789012:role/eksctl-EKS-Linux-Cluster-v1-24-cluster-ServiceRole-j1k7AfTIQtnM
```

Output:

```
{
    "kind": "ExecCredential",
    "apiVersion": "client.authentication.k8s.io/v1beta1",
    "spec": {},
    "status": {
        "expirationTimestamp": "2024-04-11T21:05:26Z",
        "token": "k8s-aws-v1.EXAMPLE_TOKEN_DATA_STRING..."
    }
}
```

For more information, see Connect kubectl to an EKS cluster by creating a kubeconfig file in the *Amazon EKS User Guide*.

- For API details, see GetToken in *AWS CLI Command Reference*.

`list-access-entries`

The following code example shows how to use `list-access-entries`.

AWS CLI

To list the access entries for an EKS cluster

The following `list-access-entries` example returns the list of access entries associated with the EKS cluster `eks-customer`.

```
aws eks list-access-entries \
    --cluster-name eks-customer
```

Output:

```
{
    "accessEntries": [
        "arn:aws:iam::123456789012:role/Admin",
        "arn:aws:iam::123456789012:role/admin-test-ip",
        "arn:aws:iam::123456789012:role/assume-worker-node-role",
        "arn:aws:iam::123456789012:user/eks-admin-user"
    ]
}
```

For more information, see Grant IAM users access to Kubernetes with EKS access entries in the *Amazon EKS User Guide*.

- For API details, see ListAccessEntries in *AWS CLI Command Reference*.

`list-access-policies`

The following code example shows how to use `list-access-policies`.

AWS CLI

To list all available access policies

The following `list-access-policies` example returns the list of all available access policies.

```
aws eks list-access-policies
```

Output:

```
{
    "accessPolicies": [
        {
            "name": "AmazonEKSAdminPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/AmazonEKSAdminPolicy"
        },
        {
            "name": "AmazonEKSAdminViewPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/AmazonEKSAdminViewPolicy"
```

```
        },
        {
            "name": "AmazonEKSAutoNodePolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/AmazonEKSAutoNodePolicy"
        },
        {
            "name": "AmazonEKSBlockStorageClusterPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/
AmazonEKSBlockStorageClusterPolicy"
        },
        {
            "name": "AmazonEKSBlockStoragePolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/
AmazonEKSBlockStoragePolicy"
        },
        {
            "name": "AmazonEKSClusterAdminPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/
AmazonEKSClusterAdminPolicy"
        },
        {
            "name": "AmazonEKSComputeClusterPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/
AmazonEKSComputeClusterPolicy"
        },
        {
            "name": "AmazonEKSComputePolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/AmazonEKSComputePolicy"
        },
        {
            "name": "AmazonEKSEditPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/AmazonEKSEditPolicy"
        },
        {
            "name": "AmazonEKSHybridPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/AmazonEKSHybridPolicy"
        },
        {
            "name": "AmazonEKSLoadBalancingClusterPolicy",

AmazonEKSLoadBalancingClusterPolicy"
        },
        {
            "name": "AmazonEKSLoadBalancingPolicy",
```

```
            "arn": "arn:aws:eks::aws:cluster-access-policy/
AmazonEKSLoadBalancingPolicy"
        },
        {
            "name": "AmazonEKSNetworkingClusterPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/
AmazonEKSNetworkingClusterPolicy"
        },
        {
            "name": "AmazonEKSNetworkingPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/
AmazonEKSNetworkingPolicy"
        },
        {
            "name": "AmazonEKSViewPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/AmazonEKSViewPolicy"
        },
        {
            "name": "AmazonEMRJobPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/AmazonEMRJobPolicy"
        },
        {
            "name": "AmazonSagemakerHyperpodClusterPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/
AmazonSagemakerHyperpodClusterPolicy"
        },
        {
            "name": "AmazonSagemakerHyperpodControllerPolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/
AmazonSagemakerHyperpodControllerPolicy"
        },
        {
            "name": "AmazonSagemakerHyperpodSystemNamespacePolicy",
            "arn": "arn:aws:eks::aws:cluster-access-policy/
AmazonSagemakerHyperpodSystemNamespacePolicy"
        }
    ]
}
```

For more information, see Associate access policies with access entries in the *Amazon EKS User Guide*.

- For API details, see ListAccessPolicies in *AWS CLI Command Reference*.

`list-addons`

The following code example shows how to use `list-addons`.

AWS CLI

To list all the installed add-ons in your Amazon EKS cluster named `my-eks-cluster`

The following `list-addons` example lists all the installed add-ons in your Amazon EKS cluster named my-eks-cluster.

```
aws eks list-addons \
    --cluster-name my-eks-cluster
```

Output:

```
{
    "addons": [
        "kube-proxy",
        "vpc-cni"
    ]
}
```

For more information, see Amazon EKS add-ons in the *Amazon EKS User Guide*.

- For API details, see ListAddons in *AWS CLI Command Reference*.

`list-associated-access-policies`

The following code example shows how to use `list-associated-access-policies`.

AWS CLI

To list the access policies associated with an access entry

The following `list-associated-access-policies` example returns the list of access policies associated with an access entry in the EKS cluster.

```
aws eks list-associated-access-policies \
    --cluster-name eks-customer \
    --principal-arn arn:aws:iam::123456789012:role/Admin
```

Output:

```
{
    "associatedAccessPolicies": [
        {
            "policyArn": "arn:aws:eks::aws:cluster-access-policy/
AmazonEKSAdminPolicy",
            "accessScope": {
                "type": "cluster",
                "namespaces": []
            },
            "associatedAt": "2025-05-24T17:26:22.935000-05:00",
            "modifiedAt": "2025-05-24T17:26:22.935000-05:00"
        }
    ],
    "clusterName": "eks-customer",
    "principalArn": "arn:aws:iam::123456789012:role/Admin"
}
```

For more information, see Grant IAM users access to Kubernetes with EKS access entries in the *Amazon EKS User Guide*.

- For API details, see ListAssociatedAccessPolicies in *AWS CLI Command Reference*.

`list-clusters`

The following code example shows how to use `list-clusters`.

AWS CLI

To list all the installed add-ons in your Amazon EKS cluster named `my-eks-cluster`

The following `list-clusters` example lists all the installed add-ons in your Amazon EKS cluster named my-eks-cluster.

```
aws eks list-clusters
```

Output:

```
{
    "clusters": [
        "prod",
```

```
        "qa",
        "stage",
        "my-eks-cluster"
    ]
}
```

For more information, see Amazon EKS cluster lifecycle and configuration in the *Amazon EKS User Guide*.

- For API details, see ListClusters in *AWS CLI Command Reference*.

`list-fargate-profiles`

The following code example shows how to use `list-fargate-profiles`.

AWS CLI

To list all the fargate profiles in your Amazon EKS cluster named `my-eks-cluster`

The following `list-fargate-profiles` example lists all the fargate profiles in your Amazon EKS cluster named my-eks-cluster.

```
aws eks list-fargate-profiles \
    --cluster-name my-eks-cluster
```

Output:

```
{
    "fargateProfileNames": [
        "my-fargate-profile"
    ]
}
```

For more information, see Define which Pods use AWS Fargate when launched in the *Amazon EKS User Guide*.

- For API details, see ListFargateProfiles in *AWS CLI Command Reference*.

`list-identity-provider-configs`

The following code example shows how to use `list-identity-provider-configs`.

AWS CLI

To list identity providers associated to an Amazon EKS Cluster

The following `list-identity-provider-configs` example lists identity provider associated to an Amazon EKS Cluster.

```
aws eks list-identity-provider-configs \
    --cluster-name my-eks-cluster
```

Output:

```
{
    "identityProviderConfigs": [
        {
            "type": "oidc",
            "name": "my-identity-provider"
        }
    ]
}
```

For more information, see Authenticate users for your cluster from an OpenID Connect identity provider in the *Amazon EKS User Guide*.

- For API details, see ListIdentityProviderConfigs in *AWS CLI Command Reference*.

`list-insights`

The following code example shows how to use `list-insights`.

AWS CLI

To list all insights for the specified cluster

The following `list-insights` example returns the list of all insights checked against the specified cluster.

```
aws eks list-insights \
    --cluster-name eks-customer
```

Output:

```
{
    "insights": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "name": "Kubelet version skew",
            "category": "UPGRADE_READINESS",
            "kubernetesVersion": "1.33",
            "lastRefreshTime": "2025-05-24T11:22:50-05:00",
            "lastTransitionTime": "2025-05-24T11:22:50-05:00",
            "description": "Checks for kubelet versions of worker nodes in the
 cluster to see if upgrade would cause noncompliance with supported Kubernetes
 kubelet version skew policy.",
            "insightStatus": {
                "status": "PASSING",
                "reason": "Node kubelet versions match the cluster control plane
 version."
            }
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "name": "EKS add-on version compatibility",
            "category": "UPGRADE_READINESS",
            "kubernetesVersion": "1.33",

            "description": "Checks for any cluster health issues that prevent
 successful upgrade to the next Kubernetes version on EKS.",
            "insightStatus": {
```

```
                "status": "PASSING",
                "reason": "No cluster health issues detected."
            }
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "name": "kube-proxy version skew",
            "category": "UPGRADE_READINESS",
            "kubernetesVersion": "1.33",
            "lastRefreshTime": "2025-05-24T11:22:50-05:00",
            "lastTransitionTime": "2025-05-24T11:22:50-05:00",
            "description": "Checks version of kube-proxy in cluster to see if
 upgrade would cause noncompliance with supported Kubernetes kube-proxy version skew
 policy.",
            "insightStatus": {
                "status": "PASSING",
                "reason": "kube-proxy versions match the cluster control plane
 version."
            }
        }
    ]
}
```

For more information, see View cluster insights in the *Amazon EKS User Guide*.

- For API details, see ListInsights in *AWS CLI Command Reference*.

`list-nodegroups`

The following code example shows how to use `list-nodegroups`.

AWS CLI

To list all the node groups in an Amazon EKS cluster

The following `list-nodegroups` example list all the node groups in an Amazon EKS cluster.

```
aws eks list-nodegroups \
    --cluster-name my-eks-cluster
```

Output:

```
{
```

```
    "nodegroups": [
        "my-eks-managed-node-group",
        "my-eks-nodegroup"
    ]
}
```

For more information, see Simplify node lifecycle with managed node groups in the *Amazon EKS User Guide*.

- For API details, see ListNodegroups in *AWS CLI Command Reference*.

`list-pod-identity-associations`

The following code example shows how to use `list-pod-identity-associations`.

AWS CLI

Example 1: To list the Pod Identity associations in an EKS cluster

The following `list-pod-identity-associations` example returns the list of Pod Identity associations associated with the EKS cluster named `eks-customer` in all namespaces and service accounts.

```
aws eks list-pod-identity-associations \
    --cluster-name eks-customer
```

Output:

```
{
    "associations": [
        {
            "clusterName": "eks-customer",
            "namespace": "default",
            "serviceAccount": "default",
            "associationArn": "arn:aws:eks:us-
west-2:123456789012:podidentityassociation/eks-customer/a-9njjin9gfghecgocd",
            "associationId": "a-9njjin9gfghecgocd"
        },
        {
            "clusterName": "eks-customer",
            "namespace": "kube-system",
            "serviceAccount": "eks-customer",
```

```
            "associationArn": "arn:aws:eks:us-
west-2:123456789012:podidentityassociation/eks-customer/a-dvtacahdvjn01ffbc",
            "associationId": "a-dvtacahdvjn01ffbc"
        },
        {
            "clusterName": "eks-customer",
            "namespace": "kube-system",
            "serviceAccount": "coredns",
            "associationArn": "arn:aws:eks:us-
west-2:123456789012:podidentityassociation/eks-customer/a-yrpsdroc4ei7k6xps",
            "associationId": "a-yrpsdroc4ei7k6xps"
        }
    ]
}
```

For more information, see Learn how EKS Pod Identity grants pods access to AWS services in the *Amazon EKS User Guide*.

Example 2: To list the Pod Identity associations in an EKS cluster based on namespace and service account

The following `list-pod-identity-associations` example returns the list of Pod Identity associations in the EKS cluster based on namespace and service account.

```
aws eks list-pod-identity-associations \
    --cluster-name eks-customer \
    --namespace kube-system \
    --service-account eks-customer
```

Output:

```
{
    "associations": [
        {
            "clusterName": "eks-customer",
            "namespace": "kube-system",
            "serviceAccount": "eks-customer",
            "associationArn": "arn:aws:eks:us-
west-2:123456789012:podidentityassociation/eks-customer/a-dvtacahdvjn01ffbc",
            "associationId": "a-dvtacahdvjn01ffbc"
        }
    ]
```

```
}
```

For more information, see Learn how EKS Pod Identity grants pods access to AWS services in the *Amazon EKS User Guide*.

- For API details, see ListPodIdentityAssociations in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

Example 1: To list all the tags for an Amazon EKS Cluster ARN

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS Cluster ARN.

```
aws eks list-tags-for-resource \
    --resource-arn arn:aws:eks:us-west-2:123456789012:cluster/my-eks-cluster
```

Output:

```
{
    "tags": {
        "aws:cloudformation:stack-name": "eksctl-my-eks-cluster-cluster",
        "alpha.eksctl.io/cluster-name": "my-eks-cluster",
        "karpenter.sh/discovery": "my-eks-cluster",
        "aws:cloudformation:stack-id": "arn:aws:cloudformation:us-
west-2:123456789012:stack/eksctl-my-eks-cluster-cluster/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
        "auto-delete": "no",
        "eksctl.cluster.k8s.io/v1alpha1/cluster-name": "my-eks-cluster",
        "EKS-Cluster-Name": "my-eks-cluster",
        "alpha.eksctl.io/cluster-oidc-enabled": "true",
        "aws:cloudformation:logical-id": "ControlPlane",
        "alpha.eksctl.io/eksctl-version": "0.173.0-dev
+a7ee89342.2024-03-01T03:40:57Z",
        "Name": "eksctl-my-eks-cluster-cluster/ControlPlane"
    }
}
```

For more information, see Organize Amazon EKS resources with tags in the *Amazon EKS User Guide*.

Example 2: To list all the tags for an Amazon EKS Node group ARN

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS Node group ARN.

```
aws eks list-tags-for-resource \
    --resource-arn arn:aws:eks:us-west-2:123456789012:nodegroup/my-eks-cluster/my-eks-managed-node-group/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "tags": {
        "aws:cloudformation:stack-name": "eksctl-my-eks-cluster-nodegroup-my-eks-managed-node-group",
        "aws:cloudformation:stack-id": "arn:aws:cloudformation:us-west-2:123456789012:stack/eksctl-my-eks-cluster-nodegroup-my-eks-managed-node-group/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
        "eksctl.cluster.k8s.io/v1alpha1/cluster-name": "my-eks-cluster",
        "EKS-Cluster-Name": "my-eks-cluster",
        "alpha.eksctl.io/nodegroup-type": "managed",
        "NodeGroup Name 1": "my-eks-managed-node-group",
        "k8s.io/cluster-autoscaler/enabled": "true",
        "nodegroup-role": "worker",
        "alpha.eksctl.io/cluster-name": "my-eks-cluster",
        "alpha.eksctl.io/nodegroup-name": "my-eks-managed-node-group",
        "karpenter.sh/discovery": "my-eks-cluster",
        "NodeGroup Name 2": "AmazonLinux-Linux-Managed-NG-v1-26-v1",
        "auto-delete": "no",
        "k8s.io/cluster-autoscaler/my-eks-cluster": "owned",
        "aws:cloudformation:logical-id": "ManagedNodeGroup",
        "alpha.eksctl.io/eksctl-version": "0.173.0-dev+a7ee89342.2024-03-01T03:40:57Z"
    }
}
```

For more information, see Organize Amazon EKS resources with tags in the *Amazon EKS User Guide*.

Example 3: To list all the tags on an Amazon EKS Fargate profil ARNe

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS Fargate profile ARN.

```
aws eks list-tags-for-resource  \
    --resource-arn arn:aws:eks:us-west-2:123456789012:fargateprofile/my-eks-cluster/my-fargate-profile/a1b2c3d4-5678-90ab-cdef-EXAMPLE44444
```

Output:

```
{
    "tags": {
        "eks-fargate-profile-key-2": "value-2",
        "eks-fargate-profile-key-1": "value-1"
    }
}
```

For more information, see Organize Amazon EKS resources with tags in the *Amazon EKS User Guide*.

Example 4: To list all the tags for an Amazon EKS Add-on ARN

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS Add-on ARN.

```
aws eks list-tags-for-resource \
    --resource-arn arn:aws:eks:us-west-2:123456789012:addon/my-eks-cluster/vpc-cni/a1b2c3d4-5678-90ab-cdef-EXAMPLE55555
```

Output:

```
{
    "tags": {
        "eks-addon-key-2": "value-2",
        "eks-addon-key-1": "value-1"
    }
}
```

For more information, see Organize Amazon EKS resources with tags in the *Amazon EKS User Guide*.

Example 5: To list all the tags for an Amazon EKS OIDC identity provider ARN

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS OIDC identity provider ARN.

```
aws eks list-tags-for-resource \
    --resource-arn arn:aws:eks:us-west-2:123456789012:identityproviderconfig/my-eks-cluster/oidc/my-identity-provider/a1b2c3d4-5678-90ab-cdef-EXAMPLE66666
```

Output:

```
{
    "tags": {
        "my-identity-provider": "test"
    }
}
```

For more information, see Organize Amazon EKS resources with tags in the *Amazon EKS User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`list-updates`

The following code example shows how to use `list-updates`.

AWS CLI

Example 1: To list the updates for a cluster

The following `list-updates` example lists the current updates for a cluster named `example` in your default region.

```
aws eks list-updates \
    --name example
```

Output:

```
{
    "updateIds": [
```

```
        "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    ]
}
```

Example 2: To list all the update IDs for an Amazon EKS Node group

The following `list-updates` example lists all the update IDs for an Amazon EKS Node group.

```
aws eks list-updates \
    --name my-eks-cluster \
    --nodegroup-name my-eks-managed-node-group
```

Output:

```
{
    "updateIds": [
        "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
    ]
}
```

Example 3: To list all the update IDs for an Amazon EKS add-on

The following `list-updates` example lists all the update IDs for an Amazon EKS Add-on.

```
aws eks list-updates \
    --name my-eks-cluster \
    --addon-name vpc-cni
```

Output:

```
{
    "updateIds": [
        "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
    ]
}
```

For more information, see Update existing cluster to new Kubernetes version in the *Amazon EKS User Guide*.

- For API details, see ListUpdates in *AWS CLI Command Reference*.

register-cluster

The following code example shows how to use `register-cluster`.

AWS CLI

Example 1: To register an external EKS_ANYWHERE Kubernetes cluster to Amazon EKS

The following `register-cluster` example registers an external EKS_ANYWHERE Kubernetes cluster to Amazon EKS.

```
aws eks register-cluster \
    --name my-eks-anywhere-cluster \
    --connector-config 'roleArn=arn:aws:iam::123456789012:role/
AmazonEKSConnectorAgentRole,provider=EKS_ANYWHERE'
```

Output:

```
{
    "cluster": {
        "name": "my-eks-anywhere-cluster",
        "arn": "arn:aws:eks:us-west-2:123456789012:cluster/my-eks-anywhere-cluster",
        "createdAt": "2024-04-12T12:38:37.561000-04:00",
        "status": "PENDING",
        "tags": {},
        "connectorConfig": {
            "activationId": "xxxxxxxxACTIVATION_IDxxxxxxxx",
            "activationCode": "xxxxxxxxACTIVATION_CODExxxxxxxx",
            "activationExpiry": "2024-04-15T12:38:37.082000-04:00",
            "provider": "EKS_ANYWHERE",
            "roleArn": "arn:aws:iam::123456789012:role/AmazonEKSConnectorAgentRole"
        }
    }
}
```

For more information, see Connecting an external cluster in the *Amazon EKS User Guide*.

Example 2: To register any external Kubernetes cluster to Amazon EKS

The following `register-cluster` example registers an external EKS_ANYWHERE Kubernetes cluster to Amazon EKS.

```
aws eks register-cluster \
```

```
    --name my-eks-anywhere-cluster \
    --connector-config 'roleArn=arn:aws:iam::123456789012:role/
AmazonEKSConnectorAgentRole,provider=OTHER'
```

Output:

```
{
    "cluster": {
        "name": "my-onprem-k8s-cluster",
        "arn": "arn:aws:eks:us-west-2:123456789012:cluster/my-onprem-k8s-cluster",
        "createdAt": "2024-04-12T12:42:10.861000-04:00",
        "status": "PENDING",
        "tags": {},
        "connectorConfig": {
            "activationId": "xxxxxxxxACTIVATION_IDxxxxxxxx",
            "activationCode": "xxxxxxxxACTIVATION_CODExxxxxxxx",
            "activationExpiry": "2024-04-15T12:42:10.339000-04:00",
            "provider": "OTHER",
            "roleArn": "arn:aws:iam::123456789012:role/AmazonEKSConnectorAgentRole"
        }
    }
}
```

For more information, see Connecting an external cluster in the *Amazon EKS User Guide*.

- For API details, see RegisterCluster in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

Example 1: To add the specified tags to an Amazon EKS Cluster

The following `tag-resource` example adds the specified tags to an Amazon EKS Cluster.

```
aws eks tag-resource \
    --resource-arn arn:aws:eks:us-west-2:123456789012:cluster/my-eks-cluster \
    --tags 'my-eks-cluster-test-1=test-value-1,my-eks-cluster-dev-1=dev-value-2'
```

This command produces no output.

For more information, see Organize Amazon EKS resources with tags in the *Amazon EKS User Guide*.

Example 2: To add the specified tags to an Amazon EKS Node group

The following `tag-resource` example adds the specified tags to an Amazon EKS Node group.

```
aws eks tag-resource \
    --resource-arn arn:aws:eks:us-west-2:123456789012:nodegroup/my-eks-cluster/my-eks-managed-node-group/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --tags 'my-eks-nodegroup-test-1=test-value-1,my-eks-nodegroup-dev-1=dev-value-2'
```

This command produces no output.

For more information, see Organize Amazon EKS resources with tags in the *Amazon EKS User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

Example 1: To deletes the specified tags from an Amazon EKS Cluster

The following `untag-resource` example deletes the specified tags from an Amazon EKS Cluster.

```
aws eks untag-resource \
    --resource-arn arn:aws:eks:us-west-2:123456789012:cluster/my-eks-cluster \
    --tag-keys "my-eks-cluster-test-1" "my-eks-cluster-dev-1"
```

This command produces no output.

For more information, see Organize Amazon EKS resources with tags in the *Amazon EKS User Guide*.

Example 2: To deletes the specified tags from an Amazon EKS Node group

The following `untag-resource` example deletes the specified tags from an Amazon EKS Node group.

```
aws eks untag-resource \
    --resource-arn arn:aws:eks:us-west-2:123456789012:nodegroup/my-eks-cluster/my-eks-managed-node-group/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --tag-keys "my-eks-nodegroup-test-1" "my-eks-nodegroup-dev-1"
```

This command produces no output.

For more information, see Organize Amazon EKS resources with tags in the *Amazon EKS User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-access-entry`

The following code example shows how to use `update-access-entry`.

AWS CLI

To update an access entry for an EKS cluster

The following `update-access-entry` example updates an access entry for the EKS cluster by adding the Kubernetes group `tester`.

```
aws eks update-access-entry \
    --cluster-name eks-customer \
    --principal-arn arn:aws:iam::123456789012:role/Admin \
    --kubernetes-groups tester
```

Output:

```
{
    "accessEntry": {
        "clusterName": "eks-customer",
        "principalArn": "arn:aws:iam::123456789012:role/Admin",

        "type": "STANDARD"
    }
}
```

For more information, see Update access entries in the *Amazon EKS User Guide*.

- For API details, see UpdateAccessEntry in *AWS CLI Command Reference*.

`update-addon`

The following code example shows how to use `update-addon`.

AWS CLI

Example 1: To update an Amazon EKS add-on with service account role ARN

The following `update-addon` example command updates an Amazon EKS add-on with service account role ARN.

```
aws eks update-addon \
    --cluster-name my-eks-cluster \
    --addon-name vpc-cni \
    --service-account-role-arn arn:aws:iam::123456789012:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-YfakrqOC1UTm
```

Output:

```
{
    "update": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "status": "InProgress",
        "type": "AddonUpdate",
        "params": [
            {
                "type": "ServiceAccountRoleArn",
                "value": "arn:aws:iam::123456789012:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-YfakrqOC1UTm"
            }
```

```
        ],
        "createdAt": "2024-04-12T16:04:55.614000-04:00",
        "errors": []
    }
}
```

For more information, see Managing Amazon EKS add-ons - Updating an add-on in the *Amazon EKS User Guide*.

Example 2: To update an Amazon EKS add-on with specific add-on version

The following `update-addon` example command updates an Amazon EKS add-on with specific add-on version.

```
aws eks update-addon \
    --cluster-name my-eks-cluster \
    --addon-name vpc-cni \
    --service-account-role-arn arn:aws:iam::123456789012:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-YfakrqOC1UTm \
    --addon-version v1.16.4-eksbuild.2
```

Output:

```
{
    "update": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "status": "InProgress",
        "type": "AddonUpdate",
        "params": [
            {
                "type": "AddonVersion",
                "value": "v1.16.4-eksbuild.2"
            },
            {
                "type": "ServiceAccountRoleArn",
                "value": "arn:aws:iam::123456789012:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-YfakrqOC1UTm"
            }
        ],
        "createdAt": "2024-04-12T16:07:16.550000-04:00",
        "errors": []
    }
```

```
}
```

For more information, see Managing Amazon EKS add-ons - Updating an add-on in the *Amazon EKS User Guide*.

Example 3: To update an Amazon EKS add-on with custom configuration values and resolve conflicts details

The following `update-addon` example command updates an Amazon EKS add-on with custom configuration values and resolve conflicts details.

```
aws eks update-addon \
    --cluster-name my-eks-cluster \
    --addon-name vpc-cni \
    --service-account-role-arn arn:aws:iam::123456789012:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-YfakrqOC1UTm \
    --addon-version v1.16.4-eksbuild.2 \
    --configuration-values '{"resources": {"limits":{"cpu":"100m"}, "requests":{"cpu":"50m"}}}' \
    --resolve-conflicts PRESERVE
```

Output:

```
{
    "update": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
        "status": "InProgress",
        "type": "AddonUpdate",
        "params": [
            {
                "type": "AddonVersion",
                "value": "v1.16.4-eksbuild.2"
            },
            {
                "type": "ServiceAccountRoleArn",
                "value": "arn:aws:iam::123456789012:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-YfakrqOC1UTm"
            },
            {
                "type": "ResolveConflicts",
                "value": "PRESERVE"
            },
```

```
            {
                "type": "ConfigurationValues",
                "value": "{\"resources\": {\"limits\":{\"cpu\":\"100m\"}, \"requests
\":{\"cpu\":\"50m\"}}}"
            }
        ],
        "createdAt": "2024-04-12T16:16:27.363000-04:00",
        "errors": []
    }
}
```

For more information, see Managing Amazon EKS add-ons - Updating an add-on in the *Amazon EKS User Guide*.

Example 4: To update an Amazon EKS add-on with custom JSON configuration values file

The following `update-addon` example command updates an Amazon EKS add-on with custom JSON configuration values and resolve conflicts details.

```
aws eks update-addon \
    --cluster-name my-eks-cluster \
    --addon-name vpc-cni \
    --service-account-role-arn arn:aws:iam::123456789012:role/eksctl-my-eks-cluster-
addon-vpc-cni-Role1-YfakrqOC1UTm \
    --addon-version v1.17.1-eksbuild.1 \
    --configuration-values 'file://configuration-values.json' \
    --resolve-conflicts PRESERVE
```

Contents of `configuration-values.json`:

```
{
    "resources": {
        "limits": {
            "cpu": "100m"
        },
        "requests": {
            "cpu": "50m"
        }
    },
    "env": {
        "AWS_VPC_K8S_CNI_LOGLEVEL": "ERROR"
    }
```

```
}
```

Output:

```
{
    "update": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
        "status": "InProgress",
        "type": "AddonUpdate",
        "params": [
            {
                "type": "AddonVersion",
                "value": "v1.17.1-eksbuild.1"
            },
            {
                "type": "ServiceAccountRoleArn",
                "value": "arn:aws:iam::123456789012:role/eksctl-my-eks-cluster-
addon-vpc-cni-Role1-YfakrqOC1UTm"
            },
            {
                "type": "ResolveConflicts",
                "value": "PRESERVE"
            },
            {
                "type": "ConfigurationValues",
                "value": "{\n    \"resources\": {\n        \"limits\": {\n
  \"cpu\": \"100m\"\n        },\n        \"requests\": {\n            \"cpu\": \"50m
\"\n        }\n    },\n    \"env\": {\n        \"AWS_VPC_K8S_CNI_LOGLEVEL\": \"ERROR
\"\n    }\n}"
            }
        ],
        "createdAt": "2024-04-12T16:22:55.519000-04:00",
        "errors": []
    }
}
```

For more information, see Managing Amazon EKS add-ons - Updating an add-on in the *Amazon EKS User Guide*.

Example 5: To update an Amazon EKS add-on with custom YAML configuration values file

The following `update-addon` example command updates an Amazon EKS add-on with custom YAML configuration values and resolve conflicts details.

```
aws eks update-addon \
    --cluster-name my-eks-cluster \
    --addon-name vpc-cni \
    --service-account-role-arn arn:aws:iam::123456789012:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-YfakrqOC1UTm \
    --addon-version v1.18.0-eksbuild.1 \
    --configuration-values 'file://configuration-values.yaml' \
    --resolve-conflicts PRESERVE
```

Contents of `configuration-values.yaml`:

```
resources:
    limits:
        cpu: '100m'
    requests:
        cpu: '50m'
env:
    AWS_VPC_K8S_CNI_LOGLEVEL: 'DEBUG'
```

Output:

```
{
    "update": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE55555",
        "status": "InProgress",
        "type": "AddonUpdate",
        "params": [
            {
                "type": "AddonVersion",
                "value": "v1.18.0-eksbuild.1"
            },
            {
                "type": "ServiceAccountRoleArn",
                "value": "arn:aws:iam::123456789012:role/eksctl-my-eks-cluster-addon-vpc-cni-Role1-YfakrqOC1UTm"
            },
            {
                "type": "ResolveConflicts",
                "value": "PRESERVE"
            },
            {
                "type": "ConfigurationValues",
```

```
                "value": "resources:\n    limits:\n        cpu: '100m'\n
 requests:\n        cpu: '50m'\nenv:\n    AWS_VPC_K8S_CNI_LOGLEVEL: 'DEBUG'"
            }
        ],
        "createdAt": "2024-04-12T16:25:07.212000-04:00",
        "errors": []
    }
}
```

For more information, see Managing Amazon EKS add-ons - Updating an add-on in the *Amazon EKS User Guide*.

- For API details, see UpdateAddon in *AWS CLI Command Reference*.

`update-cluster-config`

The following code example shows how to use `update-cluster-config`.

AWS CLI

Example 1: To update cluster endpoint access

The following `update-cluster-config` example updates a cluster to disable endpoint public access and enable private endpoint access.

```
aws eks update-cluster-config \
    --name example \
    --resources-vpc-config endpointPublicAccess=false,endpointPrivateAccess=true
```

Output:

```
{
    "update": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "status": "InProgress",
        "type": "EndpointAccessUpdate",
        "params": [
            {
                "type": "EndpointPublicAccess",
                "value": "false"
            },
            {
```

```
                "type": "EndpointPrivateAccess",
                "value": "true"
            }
        ],
        "createdAt": 1565806986.506,
        "errors": []
    }
}
```

For more information, see Cluster API server endpoint in the *Amazon EKS User Guide*.

Example 2: To enable logging for a cluster

The following `update-cluster-config` example enables all cluster control plane logging types for a cluster named `example`.

```
aws eks update-cluster-config \
    --name example \
    --logging '{"clusterLogging":[{"types":
["api","audit","authenticator","controllerManager","scheduler"],"enabled":true}]}'
```

Output:

```
{
    "update": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "status": "InProgress",
        "type": "LoggingUpdate",
        "params": [
            {
                "type": "ClusterLogging",
                "value": "{\"clusterLogging\":[{\"types\":[\"api\",\"audit\",
\"authenticator\",\"controllerManager\",\"scheduler\"],\"enabled\":true}]}"
            }
        ],
        "createdAt": 1565807210.37,
        "errors": []
    }
}
```

For more information, see Send control plane logs to CloudWatch Logs in the *Amazon EKS User Guide*.

- For API details, see UpdateClusterConfig in *AWS CLI Command Reference*.

`update-cluster-version`

The following code example shows how to use `update-cluster-version`.

AWS CLI

To updates an Amazon EKS cluster named `my-eks-cluster` to the specified Kubernetes version

The following `update-cluster-version` example updates an Amazon EKS cluster to the specified Kubernetes version.

```
aws eks update-cluster-version \
    --name my-eks-cluster \
    --kubernetes-version 1.27
```

Output:

```
{
    "update": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "status": "InProgress",
        "type": "VersionUpdate",
        "params": [
            {
                "type": "Version",
                "value": "1.27"
            },
            {
                "type": "PlatformVersion",
                "value": "eks.16"
            }
        ],
        "createdAt": "2024-04-12T16:56:01.082000-04:00",
        "errors": []
    }
}
```

For more information, see Updating an Amazon EKS cluster Kubernetes version in the *Amazon EKS User Guide*.

- For API details, see UpdateClusterVersion in *AWS CLI Command Reference*.

`update-kubeconfig`

The following code example shows how to use `update-kubeconfig`.

AWS CLI

Example 1: To configure your kubectl by creating or updating the kubeconfig so that you can connect to an Amazon EKS Cluster named `my-eks-cluster`

The following `update-kubeconfig` example configures your kubectl by creating or updating the kubeconfig so that you can connect to an Amazon EKS Cluster named my-eks-cluster.

```
aws eks update-kubeconfig \
    --name my-eks-cluster
```

Output:

```
Updated context arn:aws:eks:us-west-2:123456789012:cluster/my-eks-cluster in /Users/
xxx/.kube/config
```

For more information, see Creating or updating a kubeconfig file for an Amazon EKS cluster in the *Amazon EKS User Guide*.

Example 2: To configure your kubectl by creating or updating the kubeconfig (with role-arn option to assume a role for cluster authentication) so that you can connect to an Amazon EKS Cluster named `my-eks-cluster`

The following `update-kubeconfig` example configures your kubectl by creating or updating the kubeconfig (with role-arn option to assume a role for cluster authentication) so that you can connect to an Amazon EKS Cluster named my-eks-cluster.

```
aws eks update-kubeconfig \
    --name my-eks-cluster \
    --role-arn arn:aws:iam::123456789012:role/eksctl-EKS-Linux-Cluster-v1-24-
cluster-ServiceRole-j1k7AfTIQtnM
```

Output:

```
Updated context arn:aws:eks:us-west-2:123456789012:cluster/my-eks-cluster in /Users/
xxx/.kube/config
```

For more information, see Creating or updating a kubeconfig file for an Amazon EKS cluster in the *Amazon EKS User Guide*.

Example 3: To configure your kubectl by creating or updating the kubeconfig (with role-arn option to assume a role for cluster authentication along with custom cluster alias and user-alias) so that you can connect to an Amazon EKS Cluster named `my-eks-cluster`

The following `update-kubeconfig` example configures your kubectl by creating or updating the kubeconfig (with role-arn option to assume a role for cluster authentication along with custom cluster alias and user-alias) so that you can connect to an Amazon EKS Cluster named my-eks-cluster.

```
aws eks update-kubeconfig \
    --name my-eks-cluster \
    --role-arn arn:aws:iam::123456789012:role/eksctl-EKS-Linux-Cluster-v1-24-
cluster-ServiceRole-j1k7AfTIQtnM \
    --alias stage-eks-cluster \
    --user-alias john
```

Output:

```
Updated context stage-eks-cluster in /Users/dubaria/.kube/config
```

For more information, see Creating or updating a kubeconfig file for an Amazon EKS cluster in the *Amazon EKS User Guide*.

Example 4: To print kubeconfig file entries for review and configure your kubectl so that you can connect to an Amazon EKS Cluster named `my-eks-cluster`

The following `update-kubeconfig` example configures your kubectl by creating or updating the kubeconfig (with role-arn option to assume a role for cluster authentication along with custom cluster alias and user-alias) so that you can connect to an Amazon EKS Cluster named my-eks-cluster.

```
aws eks update-kubeconfig \
    --name my-eks-cluster \
```

```
    --role-arn arn:aws:iam::123456789012:role/eksctl-EKS-Linux-Cluster-v1-24-
cluster-ServiceRole-j1k7AfTIQtnM \
    --alias stage-eks-cluster \
    --user-alias john \
    --verbose
```

Output:

```
Updated context stage-eks-cluster in /Users/dubaria/.kube/config
Entries:

context:
cluster: arn:aws:eks:us-west-2:123456789012:cluster/my-eks-cluster
user: john
name: stage-eks-cluster

name: john
user:
exec:
    apiVersion: client.authentication.k8s.io/v1beta1
    args:
    - --region
    - us-west-2
    - eks
    - get-token
    - --cluster-name
    - my-eks-cluster
    - --output
    - json
    - --role
    - arn:aws:iam::123456789012:role/eksctl-EKS-Linux-Cluster-v1-24-cluster-
ServiceRole-j1k7AfTIQtnM
    command: aws

server: https://DALSJ343KE23J3RN45653DSKJTT647TYD.yl4.us-west-2.eks.amazonaws.com
name: arn:aws:eks:us-west-2:123456789012:cluster/my-eks-cluster
```

For more information, see Creating or updating a kubeconfig file for an Amazon EKS cluster in the *Amazon EKS User Guide*.

- For API details, see UpdateKubeconfig in *AWS CLI Command Reference*.

update-nodegroup-config

The following code example shows how to use update-nodegroup-config.

AWS CLI

Example 1: To update a managed node group to add new labels and taint to EKS worker node for an Amazon EKS cluster

The following update-nodegroup-config example updates a managed node group to add new labels and taint to EKS worker node for an Amazon EKS cluster.

```
aws eks update-nodegroup-config \
    --cluster-name my-eks-cluster \
    --nodegroup-name my-eks-nodegroup \
    --labels 'addOrUpdateLabels={my-eks-nodegroup-label-1=value-1,my-eks-nodegroup-label-2=value-2}' \
    --taints 'addOrUpdateTaints=[{key=taint-key-1,value=taint-value-1,effect=NO_EXECUTE}]'
```

Output:

```
{
    "update": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "status": "InProgress",
        "type": "ConfigUpdate",
        "params": [
            {
                "type": "LabelsToAdd",
                "value": "{\"my-eks-nodegroup-label-2\":\"value-2\",\"my-eks-nodegroup-label-1\":\"value-1\"}"
            },
            {
                "type": "TaintsToAdd",
                "value": "[{\"effect\":\"NO_EXECUTE\",\"value\":\"taint-value-1\",\"key\":\"taint-key-1\"}]"
            }
        ],
        "createdAt": "2024-04-08T12:05:19.161000-04:00",
        "errors": []
    }
}
```

For more information, see Updating a managed node group in the *Amazon EKS User Guide*.

Example 2: To update a managed node group to remove labels and taint for the EKS worker node for an Amazon EKS cluster

The following `update-nodegroup-config` example updates a managed node group to remove labels and taint for the EKS worker node for an Amazon EKS cluster.

```
aws eks update-nodegroup-config \
    --cluster-name my-eks-cluster \
    --nodegroup-name my-eks-nodegroup \
    --labels 'removeLabels=my-eks-nodegroup-label-1, my-eks-nodegroup-label-2' \
    --taints 'removeTaints=[{key=taint-key-1,value=taint-
value-1,effect=NO_EXECUTE}]'
```

Output:

```
{
    "update": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "status": "InProgress",
        "type": "ConfigUpdate",
        "params": [
            {
                "type": "LabelsToRemove",
                "value": "[\"my-eks-nodegroup-label-1\",\"my-eks-nodegroup-
label-2\"]"
            },
            {
                "type": "TaintsToRemove",
                "value": "[{\"effect\":\"NO_EXECUTE\",\"value\":\"taint-value-1\",
\"key\":\"taint-key-1\"}]"
            }
        ],
        "createdAt": "2024-04-08T12:17:31.817000-04:00",
        "errors": []
    }
}
```

For more information, see Updating a managed node group in the *Amazon EKS User Guide*.

Example 3: To update a managed node group to remove and add labels and taint for the EKS worker node for an Amazon EKS cluster

The following `update-nodegroup-config` example updates a managed node group to remove and add labels and taint for the EKS worker node for an Amazon EKS cluster.

```
aws eks update-nodegroup-config \
    --cluster-name my-eks-cluster \
    --nodegroup-name my-eks-nodegroup \
    --labels 'addOrUpdateLabels={my-eks-nodegroup-new-label-1=new-value-1,my-eks-nodegroup-new-label-2=new-value-2},removeLabels=my-eks-nodegroup-label-1, my-eks-nodegroup-label-2' \
    --taints 'addOrUpdateTaints=[{key=taint-new-key-1,value=taint-new-value-1,effect=PREFER_NO_SCHEDULE}],removeTaints=[{key=taint-key-1,value=taint-value-1,effect=NO_EXECUTE}]'
```

Output:

```
{
    "update": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
        "status": "InProgress",
        "type": "ConfigUpdate",
        "params": [
            {
                "type": "LabelsToAdd",
                "value": "{\"my-eks-nodegroup-new-label-1\":\"new-value-1\",\"my-eks-nodegroup-new-label-2\":\"new-value-2\"}"
            },
            {
                "type": "LabelsToRemove",
                "value": "[\"my-eks-nodegroup-label-1\",\"my-eks-nodegroup-label-2\"]"
            },
            {
                "type": "TaintsToAdd",
                "value": "[{\"effect\":\"PREFER_NO_SCHEDULE\",\"value\":\"taint-new-value-1\",\"key\":\"taint-new-key-1\"}]"
            },
            {
                "type": "TaintsToRemove",
                "value": "[{\"effect\":\"NO_EXECUTE\",\"value\":\"taint-value-1\",\"key\":\"taint-key-1\"}]"
            }
        ],
        "createdAt": "2024-04-08T12:30:55.486000-04:00",
```

```
        "errors": []
    }
}
```

For more information, see Updating a managed node group in the *Amazon EKS User Guide*.

Example 4: To update a managed node group to update scaling-config and update-config for the EKS worker node for an Amazon EKS cluster

The following `update-nodegroup-config` example updates a managed node group to update scaling-config and update-config for the EKS worker node for an Amazon EKS cluster.

```
aws eks update-nodegroup-config \
    --cluster-name my-eks-cluster \
    --nodegroup-name my-eks-nodegroup \
    --scaling-config minSize=1,maxSize=5,desiredSize=2 \
    --update-config maxUnavailable=2
```

Output:

```
{
    "update": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
        "status": "InProgress",
        "type": "ConfigUpdate",
        "params": [
            {
                "type": "MinSize",
                "value": "1"
            },
            {
                "type": "MaxSize",
                "value": "5"
            },
            {
                "type": "DesiredSize",
                "value": "2"
            },
            {
                "type": "MaxUnavailable",
                "value": "2"
            }
        ],
```

```
        "createdAt": "2024-04-08T12:35:17.036000-04:00",
        "errors": []
    }
}
```

For more information, see Updating a managed node group in the *Amazon EKS User Guide*.

- For API details, see UpdateNodegroupConfig in *AWS CLI Command Reference*.

`update-nodegroup-version`

The following code example shows how to use `update-nodegroup-version`.

AWS CLI

Example 1: To update the Kubernetes version or AMI version of an Amazon EKS managed node group to the latest available version

The following `update-nodegroup-version` example updates the Kubernetes version or AMI version of an Amazon EKS managed node group to the latest available version for your Kubernetes cluster.

```
aws eks update-nodegroup-version \
    --cluster-name my-eks-cluster \
    --nodegroup-name my-eks-nodegroup \
    --no-force
```

Output:

```
{
    "update": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "status": "InProgress",
        "type": "VersionUpdate",
        "params": [
            {
                "type": "Version",
                "value": "1.26"
            },
            {
                "type": "ReleaseVersion",
                "value": "1.26.12-20240329"
            }
```

```
        ],
        "createdAt": "2024-04-08T13:16:00.724000-04:00",
        "errors": []
    }
}
```

For more information, see Updating a managed node group in the *Amazon EKS User Guide*.

Example 2: To update the Kubernetes version or AMI version of an Amazon EKS managed node group to a specified AMI release version

The following `update-nodegroup-version` example updates the Kubernetes version or AMI version of an Amazon EKS managed node group to the specified AMI release version.

```
aws eks update-nodegroup-version \
    --cluster-name my-eks-cluster \
    --nodegroup-name my-eks-nodegroup \
    --kubernetes-version '1.26' \
    --release-version '1.26.12-20240307' \
    --no-force
```

Output:

```
{
    "update": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "status": "InProgress",
        "type": "VersionUpdate",
        "params": [
            {
                "type": "Version",
                "value": "1.26"
            },
            {
                "type": "ReleaseVersion",
                "value": "1.26.12-20240307"
            }
        ],
        "createdAt": "2024-04-08T13:13:58.595000-04:00",
        "errors": []
    }
}
```

For more information, see Updating a managed node group - <https://docs.aws.amazon.com/eks/latest/userguide/update-managed-node-group.html>` in the *Amazon EKS User Guide*.

- For API details, see UpdateNodegroupVersion in *AWS CLI Command Reference*.

`update-pod-identity-association`

The following code example shows how to use `update-pod-identity-association`.

AWS CLI

To update the EKS Pod Identity association

The following `update-pod-identity-association` example updates an EKS Pod Identity association by changing the associated IAM role from `arn:aws:iam::123456789012:role/my-role` to `arn:aws:iam::123456789012:role/s3-role` for association ID `a-9njjin9gfghecgocd`. This API only allows updating the associated IAM role.

```
aws eks update-pod-identity-association \
    --cluster-name eks-customer \
    --association-id a-9njjin9gfghecgocd \
    --role-arn arn:aws:iam::123456789012:role/s3-role
```

Output:

```
{
    "association": {
        "clusterName": "eks-customer",
        "namespace": "default",
        "serviceAccount": "default",
        "roleArn": "arn:aws:iam::123456789012:role/s3-role",
        "associationArn": "arn:aws:eks:us-
west-2:123456789012:podidentityassociation/eks-customer/a-9njjin9gfghecgocd",
        "associationId": "a-9njjin9gfghecgocd",
        "tags": {
            "Key2": "value2",
            "Key1": "value1"
        },
        "createdAt": "2025-05-24T19:52:14.135000-05:00",
        "modifiedAt": "2025-05-25T21:01:53.120000-05:00"
    }
}
```

For more information, see Learn how EKS Pod Identity grants pods access to AWS services in the *Amazon EKS User Guide*.

- For API details, see UpdatePodIdentityAssociation in *AWS CLI Command Reference*.

Elastic Beanstalk examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Elastic Beanstalk.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`abort-environment-update`

The following code example shows how to use `abort-environment-update`.

AWS CLI

To abort a deployment

The following `abort-environment-update` example aborts a running application version deployment for an environment named `my-env`.

```
aws elasticbeanstalk abort-environment-update \
    --environment-name my-env
```

This command produces no output.

For more information, see Deploying applications to Elastic Beanstalk environments in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see AbortEnvironmentUpdate in *AWS CLI Command Reference*.

`check-dns-availability`

The following code example shows how to use `check-dns-availability`.

AWS CLI

To check the availability of a CNAME

The following `check-dns-availability` example checks the availability of the subdomain `my-cname.elasticbeanstalk.com`.

```
aws elasticbeanstalk check-dns-availability \
    --cname-prefix my-cname
```

Output:

```
{
    "Available": true,
    "FullyQualifiedCNAME": "my-cname.elasticbeanstalk.com"
}
```

For more information, see Your Elastic Beanstalk environment's Domain name in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see CheckDnsAvailability in *AWS CLI Command Reference*.

`create-application-version`

The following code example shows how to use `create-application-version`.

AWS CLI

To create a new application version

The following `create-application-version` example creates a new version, "v1" of an application named "MyApp".

```
aws elasticbeanstalk create-application-version \
    --application-name MyApp \
    --version-label v1 \
    --description MyAppv1 \
```

```
    --source-bundle S3Bucket="amzn-s3-demo-bucket",S3Key="sample.war" \
    --auto-create-application
```

The application will be created automatically if it does not already exist, due to the auto-create-application option. The source bundle is a .war file stored in an s3 bucket named "amzn-s3-demo-bucket" that contains the Apache Tomcat sample application.

Output:

```
{
    "ApplicationVersion": {
        "ApplicationName": "MyApp",
        "VersionLabel": "v1",
        "Description": "MyAppv1",
        "DateCreated": "2015-02-03T23:01:25.412Z",
        "DateUpdated": "2015-02-03T23:01:25.412Z",
        "SourceBundle": {
            "S3Bucket": "amzn-s3-demo-bucket",
            "S3Key": "sample.war"
        }
    }
}
```

For more information, see Managing application versions in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see CreateApplicationVersion in *AWS CLI Command Reference*.

`create-application`

The following code example shows how to use `create-application`.

AWS CLI

To create a new application

The following `create-application` example creates a new application named "MyApp".

```
aws elasticbeanstalk create-application \
    --application-name MyApp \
    --description "my application"
```

The `create-application` command only configures the application's name and description. To upload source code for the application, create an initial version of the application using `create-application-version`. `create-application-version` also has an `auto-create-application` option that lets you create the application and the application version in one step.

Output:

```
{
    "Application": {
        "ApplicationName": "MyApp",
        "ConfigurationTemplates": [],
        "DateUpdated": "2015-02-12T18:32:21.181Z",
        "Description": "my application",
        "DateCreated": "2015-02-12T18:32:21.181Z"
    }
}
```

For more information, see Managing Elastic Beanstalk applications in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see CreateApplication in *AWS CLI Command Reference*.

`create-configuration-template`

The following code example shows how to use `create-configuration-template`.

AWS CLI

To create a configuration template

The following `create-configuration-template` example creates a configuration template named `my-app-v1` from the settings applied to an environment with the id `e-rpqsewtp2j`.

```
aws elasticbeanstalk create-configuration-template \
    --application-name my-app \
    --template-name my-app-v1 \
    --environment-id e-rpqsewtp2j
```

Output:

```
{
```

```
    "ApplicationName": "my-app",
    "TemplateName": "my-app-v1",
    "DateCreated": "2015-08-12T18:40:39Z",
    "DateUpdated": "2015-08-12T18:40:39Z",
    "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8"
}
```

For more information, see Using Elastic Beanstalk saved configurations in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see CreateConfigurationTemplate in *AWS CLI Command Reference*.

`create-environment`

The following code example shows how to use `create-environment`.

AWS CLI

Example 1: To create a new environment for an application

The following `create-environment` example creates a new environment for version "v1" of a java application named "my-app".

```
aws elasticbeanstalk create-environment \
    --application-name my-app \
    --environment-name my-env \
    --cname-prefix my-app \
    --version-label v1 \
    --solution-stack-name "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java
 8"
```

Output:

```
{
    "ApplicationName": "my-app",
    "EnvironmentName": "my-env",
    "VersionLabel": "v1",
    "Status": "Launching",
    "EnvironmentId": "e-izqpassy4h",
    "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java
 8",
    "CNAME": "my-app.elasticbeanstalk.com",
```

```
    "Health": "Grey",
    "Tier": {
        "Type": "Standard",
        "Name": "WebServer",
        "Version": " "
    },
    "DateUpdated": "2015-02-03T23:04:54.479Z",
    "DateCreated": "2015-02-03T23:04:54.479Z"
}
```

v1 is the label of an application version previously uploaded with create-application-version.

For more information, see Creating an Elastic Beanstalk environment in the *AWS Elastic Beanstalk Developer Guide*.

Example 2: To specify a JSON file to define environment configuration options

The following `create-environment` example specifies that a JSON file with the name `myoptions.json` should be used to override values obtained from the solution stack or the configuration template.

```
aws elasticbeanstalk create-environment \
    --environment-name sample-env \
    --application-name sampleapp \
    --option-settings file://myoptions.json
```

`myoptions.json` is a JSON object defining several settings.

Contents of `myoptions.json`:

```
[
    {
        "Namespace": "aws:elb:healthcheck",
        "OptionName": "Interval",
        "Value": "15"
    },
    {
        "Namespace": "aws:elb:healthcheck",
        "OptionName": "Timeout",
        "Value": "8"
    },
    {
```

```
        "Namespace": "aws:elb:healthcheck",
        "OptionName": "HealthyThreshold",
        "Value": "2"
    },
    {
        "Namespace": "aws:elb:healthcheck",
        "OptionName": "UnhealthyThreshold",
        "Value": "3"
    }
]
```

Output:

```
{
    "ApplicationName": "sampleapp",
    "EnvironmentName": "sample-env",
    "Status": "Launching",
    "EnvironmentId": "e-a1b2c3d4e5",
    "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java
 8",
    "Health": "Grey",
    "Tier": {
        "Type": "Standard",
        "Name": "WebServer",
        "Version": " "
    },
    "DateUpdated": "2015-02-03T23:04:54.479Z",
    "DateCreated": "2015-02-03T23:04:54.479Z"
}
```

For more information, see Configuration options in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see CreateEnvironment in *AWS CLI Command Reference*.

`create-storage-location`

The following code example shows how to use `create-storage-location`.

AWS CLI

To create a storage location

The following `create-storage-location` example creates a storage location in Amazon S3.

```
aws elasticbeanstalk create-storage-location
```

Output:

```
{
    "S3Bucket": "elasticbeanstalk-us-west-2-0123456789012"
}
```

For more information, see Using Elastic Beanstalk with Amazon S3 in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see CreateStorageLocation in *AWS CLI Command Reference*.

`delete-application-version`

The following code example shows how to use `delete-application-version`.

AWS CLI

To delete an application version

The following `delete-application-version` example deletes an application version named `22a0-stage-150819_182129` for an application named `my-app`.

```
aws elasticbeanstalk delete-application-version \
    --version-label 22a0-stage-150819_182129 \
    --application-name my-app
```

This command produces no output.

For more information, see Managing application versions in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see DeleteApplicationVersion in *AWS CLI Command Reference*.

`delete-application`

The following code example shows how to use `delete-application`.

AWS CLI

To delete an application

The following `delete-application` example deletes an application named `my-app`.

```
aws elasticbeanstalk delete-application \
    --application-name my-app
```

This command produces no output.

For more information, see Managing Elastic Beanstalk applications in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see DeleteApplication in *AWS CLI Command Reference*.

`delete-configuration-template`

The following code example shows how to use `delete-configuration-template`.

AWS CLI

To delete a configuration template

The following `delete-configuration-template` example deletes a configuration template named `my-template` for an application named `my-app`.

```
aws elasticbeanstalk delete-configuration-template \
    --template-name my-template \
    --application-name my-app
```

This command produces no output.

For more information, see Using Elastic Beanstalk saved configurations in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see DeleteConfigurationTemplate in *AWS CLI Command Reference*.

`delete-environment-configuration`

The following code example shows how to use `delete-environment-configuration`.

AWS CLI

To delete a draft configuration

The following `delete-environment-configuration` example deletes a draft configuration for an environment named `my-env`.

```
aws elasticbeanstalk delete-environment-configuration \
    --environment-name my-env \
    --application-name my-app
```

This command produces no output.

For more information, see Setting configuration options after environment creation in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see DeleteEnvironmentConfiguration in *AWS CLI Command Reference*.

`describe-application-versions`

The following code example shows how to use `describe-application-versions`.

AWS CLI

To view information about an application version

The following `describe-application-versions` example retrieves information about an application version labeled `v2`.

```
aws elasticbeanstalk describe-application-versions \
    --application-name my-app \
    --version-labels "v2"
```

Output:

```
{
    "ApplicationVersions": [
        {
            "ApplicationName": "my-app",
            "VersionLabel": "v2",
            "Description": "update cover page",
            "DateCreated": "2015-07-23T01:32:26.079Z",
            "DateUpdated": "2015-07-23T01:32:26.079Z",
            "SourceBundle": {
                "S3Bucket": "elasticbeanstalk-us-west-2-123456789012",
                "S3Key": "my-app/5026-stage-150723_224258.war"
```

```
            }
        },
        {
            "ApplicationName": "my-app",
            "VersionLabel": "v1",
            "Description": "initial version",
            "DateCreated": "2015-07-23T22:26:10.816Z",
            "DateUpdated": "2015-07-23T22:26:10.816Z",
            "SourceBundle": {
                "S3Bucket": "elasticbeanstalk-us-west-2-123456789012",
                "S3Key": "my-app/5026-stage-150723_222618.war"
            }
        }
    ]
}
```

For more information, see Managing application versions in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see DescribeApplicationVersions in *AWS CLI Command Reference*.

`describe-applications`

The following code example shows how to use `describe-applications`.

AWS CLI

To view a list of applications

The following `describe-applications` example retrieves information about applications in the current region.

```
aws elasticbeanstalk describe-applications
```

Output:

```
{
    "Applications": [
        {
            "ApplicationName": "ruby",
            "ConfigurationTemplates": [],
            "DateUpdated": "2015-08-13T21:05:44.376Z",
```

```
            "Versions": [
                "Sample Application"
            ],
            "DateCreated": "2015-08-13T21:05:44.376Z"
        },
        {
            "ApplicationName": "pythonsample",
            "Description": "Application created from the EB CLI using \"eb init\"",
            "Versions": [
                "Sample Application"
            ],
            "DateCreated": "2015-08-13T19:05:43.637Z",
            "ConfigurationTemplates": [],
            "DateUpdated": "2015-08-13T19:05:43.637Z"
        },
        {
            "ApplicationName": "nodejs-example",
            "ConfigurationTemplates": [],
            "DateUpdated": "2015-08-06T17:50:02.486Z",
            "Versions": [
                "add elasticache",
                "First Release"
            ],
            "DateCreated": "2015-08-06T17:50:02.486Z"
        }
    ]
}
```

For more information, see Managing Elastic Beanstalk applications in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see DescribeApplications in *AWS CLI Command Reference*.

`describe-configuration-options`

The following code example shows how to use `describe-configuration-options`.

AWS CLI

To view configuration options for an environment

The following `describe-configuration-options` example retrieves descriptions of all available configuration options for an environment named `my-env`.

```
aws elasticbeanstalk describe-configuration-options \
    --environment-name my-env \
    --application-name my-app
```

Output:

```
{
    "Options": [
        {
            "Name": "JVMOptions",
            "UserDefined": false,
            "DefaultValue": "Xms=256m,Xmx=256m,XX:MaxPermSize=64m,JVM Options=",
            "ChangeSeverity": "RestartApplicationServer",
            "Namespace": "aws:cloudformation:template:parameter",
            "ValueType": "KeyValueList"
        },
        {
            "Name": "Interval",
            "UserDefined": false,
            "DefaultValue": "30",
            "ChangeSeverity": "NoInterruption",
            "Namespace": "aws:elb:healthcheck",
            "MaxValue": 300,
            "MinValue": 5,
            "ValueType": "Scalar"
        },
        {
            "Name": "LowerThreshold",
            "UserDefined": false,
            "DefaultValue": "2000000",
            "ChangeSeverity": "NoInterruption",
            "Namespace": "aws:autoscaling:trigger",
            "MinValue": 0,
            "ValueType": "Scalar"
        },
        {
            "Name": "ListenerEnabled",
            "UserDefined": false,
            "DefaultValue": "true",
            "ChangeSeverity": "Unknown",
            "Namespace": "aws:elb:listener",
            "ValueType": "Boolean"
        }
```

```
    ]
}
```

Available configuration options vary per platform and configuration version. For more information about namespaces and supported options, see Configuration options in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see DescribeConfigurationOptions in *AWS CLI Command Reference*.

`describe-configuration-settings`

The following code example shows how to use `describe-configuration-settings`.

AWS CLI

To view configurations settings for an environment

The following `describe-configuration-settings` example retrieves configuration settings for an environment named `my-env`.

```
aws elasticbeanstalk describe-configuration-settings \
    --environment-name my-env \
    --application-name my-app
```

Output:

```
{
    "ConfigurationSettings": [
        {
            "ApplicationName": "my-app",
            "EnvironmentName": "my-env",
            "Description": "Environment created from the EB CLI using \"eb create
\"",
            "DeploymentStatus": "deployed",
            "DateCreated": "2015-08-13T19:16:25Z",
            "OptionSettings": [
                {
                    "OptionName": "Availability Zones",
                    "ResourceName": "AWSEBAutoScalingGroup",
                    "Namespace": "aws:autoscaling:asg",
                    "Value": "Any"
                },
```

```
                {
                    "OptionName": "Cooldown",
                    "ResourceName": "AWSEBAutoScalingGroup",
                    "Namespace": "aws:autoscaling:asg",
                    "Value": "360"
                },
                {
                    "OptionName": "ConnectionDrainingTimeout",
                    "ResourceName": "AWSEBLoadBalancer",
                    "Namespace": "aws:elb:policies",
                    "Value": "20"
                },
                {
                    "OptionName": "ConnectionSettingIdleTimeout",
                    "ResourceName": "AWSEBLoadBalancer",
                    "Namespace": "aws:elb:policies",
                    "Value": "60"
                }
            ],
            "DateUpdated": "2015-08-13T23:30:07Z",
            "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8
 Java 8"
        }
    ]
}
```

For more information about namespaces and supported options, see Configuration options in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see DescribeConfigurationSettings in *AWS CLI Command Reference*.

`describe-environment-health`

The following code example shows how to use `describe-environment-health`.

AWS CLI

To view environment health

The following `describe-environment-health` example retrieves overall health information for an environment named `my-env`.

```
aws elasticbeanstalk describe-environment-health \
```

```
    --environment-name my-env \
    --attribute-names All
```

Output:

```
{
    "Status": "Ready",
    "EnvironmentName": "my-env",
    "Color": "Green",
    "ApplicationMetrics": {
        "Duration": 10,
        "Latency": {
            "P99": 0.004,
            "P75": 0.002,
            "P90": 0.003,
            "P95": 0.004,
            "P85": 0.003,
            "P10": 0.001,
            "P999": 0.004,
            "P50": 0.001
        },
        "RequestCount": 45,
        "StatusCodes": {
            "Status3xx": 0,
            "Status2xx": 45,
            "Status5xx": 0,
            "Status4xx": 0
        }
    },
    "RefreshedAt": "2015-08-20T21:09:18Z",
    "HealthStatus": "Ok",
    "InstancesHealth": {
        "Info": 0,
        "Ok": 1,
        "Unknown": 0,
        "Severe": 0,
        "Warning": 0,
        "Degraded": 0,
        "NoData": 0,
        "Pending": 0
    },
    "Causes": []
}
```

Health information is only available for environments with enhanced health reporting enabled. For more information, see Enhanced health reporting and monitoring in Elastic Beanstalk in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see DescribeEnvironmentHealth in *AWS CLI Command Reference*.

`describe-environment-resources`

The following code example shows how to use `describe-environment-resources`.

AWS CLI

To view information about the AWS resources in your environment

The following `describe-environment-resources` example retrieves information about resources in an environment named `my-env`.

```
aws elasticbeanstalk describe-environment-resources \
    --environment-name my-env
```

Output:

```
{
    "EnvironmentResources": {
        "EnvironmentName": "my-env",
        "AutoScalingGroups": [
            {
                "Name": "awseb-e-qu3fyyjyjs-stack-AWSEBAutoScalingGroup-
QSB2ZO88SXZT"
            }
        ],
        "Triggers": [],
        "LoadBalancers": [
            {
                "Name": "awseb-e-q-AWSEBLoa-1EEPZ0K98BIF0"
            }
        ],
        "Queues": [],
        "Instances": [
            {
                "Id": "i-0c91c786"
            }
        ],
```

```
        "LaunchConfigurations": [
            {
                "Name": "awseb-e-qu3fyyjyjs-stack-
AWSEBAutoScalingLaunchConfiguration-1UUVQIBC96TQ2"
            }
        ]
    }
}
```

For more information, see Using the Elastic Beanstalk environment management console in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see DescribeEnvironmentResources in *AWS CLI Command Reference*.

`describe-environments`

The following code example shows how to use `describe-environments`.

AWS CLI

To view information about an environment

The following `describe-environments` example retrieves information about an environment named `my-env`.

```
aws elasticbeanstalk describe-environments \
    --environment-names my-env
```

Output:

```
{
    "Environments": [
        {
            "ApplicationName": "my-app",
            "EnvironmentName": "my-env",
            "VersionLabel": "7f58-stage-150812_025409",

            "EnvironmentId": "e-rpqsewtp2j",
            "EndpointURL": "awseb-e-w-AWSEBLoa-1483140XB0Q4L-109QXY8121.us-
west-2.elb.amazonaws.com",
            "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8
 Java 8",
```

```
            "CNAME": "my-env.elasticbeanstalk.com",
            "Health": "Green",
            "AbortableOperationInProgress": false,
            "Tier": {
                "Version": " ",
                "Type": "Standard",
                "Name": "WebServer"
            },
            "DateUpdated": "2015-08-12T18:16:55.019Z",
            "DateCreated": "2015-08-07T20:48:49.599Z"
        }
    ]
}
```

For more information, see Managing Elastic Beanstalk environments in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see DescribeEnvironments in *AWS CLI Command Reference*.

`describe-events`

The following code example shows how to use `describe-events`.

AWS CLI

To view events for an environment

The following `describe-events` example retrieves events for an environment named `my-env`.

```
aws elasticbeanstalk describe-events \
    --environment-name my-env
```

Output:

```
{
    "Events": [
        {
            "ApplicationName": "my-app",
            "EnvironmentName": "my-env",
            "Message": "Environment health has transitioned from Info to Ok.",
            "EventDate": "2015-08-20T07:06:53.535Z",
            "Severity": "INFO"
        },
```

```
        {
            "ApplicationName": "my-app",
            "EnvironmentName": "my-env",
            "Severity": "INFO",
            "RequestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Message": "Environment update completed successfully.",
            "EventDate": "2015-08-20T07:06:02.049Z"
        },
        {
            "ApplicationName": "my-app",
            "EnvironmentName": "my-env",
            "Severity": "INFO",
            "RequestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Message": "Using elasticbeanstalk-us-west-2-123456789012 as Amazon S3
 storage bucket for environment data.",
            "EventDate": "2015-08-13T19:16:27.561Z"
        },
        {
            "ApplicationName": "my-app",
            "EnvironmentName": "my-env",
            "Severity": "INFO",
            "RequestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Message": "createEnvironment is starting.",
            "EventDate": "2015-08-13T19:16:26.581Z"
        }
    ]
}
```

For more information, see Viewing an Elastic Beanstalk environment's event stream in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see DescribeEvents in *AWS CLI Command Reference*.

`describe-instances-health`

The following code example shows how to use `describe-instances-health`.

AWS CLI

To view environment health

The following `describe-instances-health` example retrieves health information for instances in an environment named `my-env`.

```
aws elasticbeanstalk describe-instances-health \
    --environment-name my-env \
    --attribute-names All
```

Output:

```
{
    "InstanceHealthList": [
        {
            "InstanceId": "i-08691cc7",
            "ApplicationMetrics": {
                "Duration": 10,
                "Latency": {
                    "P99": 0.006,
                    "P75": 0.002,
                    "P90": 0.004,
                    "P95": 0.005,
                    "P85": 0.003,
                    "P10": 0.0,
                    "P999": 0.006,
                    "P50": 0.001
                },
                "RequestCount": 48,
                "StatusCodes": {
                    "Status3xx": 0,
                    "Status2xx": 47,
                    "Status5xx": 0,
                    "Status4xx": 1
                }
            },
            "System": {
                "LoadAverage": [
                    0.0,
                    0.02,
                    0.05
                ],
                "CPUUtilization": {
                    "SoftIRQ": 0.1,
                    "IOWait": 0.2,
                    "System": 0.3,
                    "Idle": 97.8,
                    "User": 1.5,
                    "IRQ": 0.0,
```

```
                    "Nice": 0.1
                }
            },
            "Color": "Green",
            "HealthStatus": "Ok",
            "LaunchedAt": "2015-08-13T19:17:09Z",
            "Causes": []
        }
    ],
    "RefreshedAt": "2015-08-20T21:09:08Z"
}
```

Health information is only available for environments with enhanced health reporting enabled. For more information, see Enhanced health reporting and monitoring in Elastic Beanstalk in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see DescribeInstancesHealth in *AWS CLI Command Reference*.

`list-available-solution-stacks`

The following code example shows how to use `list-available-solution-stacks`.

AWS CLI

To view solution stacks

The following `list-available-solution-stacks` example lists solution stacks for all currently available platform configurations and any that you have used in the past.

```
aws elasticbeanstalk list-available-solution-stacks
```

Output:

```
{
    "SolutionStacks": [
        "64bit Amazon Linux 2015.03 v2.0.0 running Node.js",
        "64bit Amazon Linux 2015.03 v2.0.0 running PHP 5.6",
        "64bit Amazon Linux 2015.03 v2.0.0 running PHP 5.5",
        "64bit Amazon Linux 2015.03 v2.0.0 running PHP 5.4",
        "64bit Amazon Linux 2015.03 v2.0.0 running Python 3.4",
        "64bit Amazon Linux 2015.03 v2.0.0 running Python 2.7",
        "64bit Amazon Linux 2015.03 v2.0.0 running Python",
```

```
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.2 (Puma)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.2 (Passenger Standalone)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.1 (Puma)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.1 (Passenger Standalone)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.0 (Puma)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.0 (Passenger Standalone)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 1.9.3",
        "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8",
        "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 7 Java 7",
        "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 7 Java 6",
        "64bit Windows Server Core 2012 R2 running IIS 8.5",
        "64bit Windows Server 2012 R2 running IIS 8.5",
        "64bit Windows Server 2012 running IIS 8",
        "64bit Windows Server 2008 R2 running IIS 7.5",
        "64bit Amazon Linux 2015.03 v2.0.0 running Docker 1.6.2",

            "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Node.js"
        }
    ]
}
```

For more information, see Elastic Beanstalk supported platforms in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see ListAvailableSolutionStacks in *AWS CLI Command Reference*.

`rebuild-environment`

The following code example shows how to use `rebuild-environment`.

AWS CLI

To rebuild an environment

The following `rebuild-environment` example terminates and recreates the resources in an environment named `my-env`.

```
aws elasticbeanstalk rebuild-environment \
    --environment-name my-env
```

This command produces no output.

For more information, see Rebuilding Elastic Beanstalk environments in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see RebuildEnvironment in *AWS CLI Command Reference*.

`request-environment-info`

The following code example shows how to use `request-environment-info`.

AWS CLI

To request tailed logs

The following `request-environment-info` example requests logs from an environment named `my-env`.

```
aws elasticbeanstalk request-environment-info \
    --environment-name my-env \
    --info-type tail
```

This command produces no output.

After requesting logs, retrieve their location with retrieve-environment-info.

For more information, see Viewing logs from Amazon EC2 instances in your Elastic Beanstalk environment in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see RequestEnvironmentInfo in *AWS CLI Command Reference*.

`restart-app-server`

The following code example shows how to use `restart-app-server`.

AWS CLI

To restart application servers

The following `restart-app-server` example restarts application servers on all instances in an environment named `my-env`.

```
aws elasticbeanstalk restart-app-server \
    --environment-name my-env
```

This command produces no output.

For more information, see Environment actions in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see RestartAppServer in *AWS CLI Command Reference*.

`retrieve-environment-info`

The following code example shows how to use `retrieve-environment-info`.

AWS CLI

To retrieve tailed logs

The following `retrieve-environment-info` example retrieves a link to logs from an environment named `my-env`.

```
aws elasticbeanstalk retrieve-environment-info \
    --environment-name my-env \
    --info-type tail
```

Output:

```
{
    "EnvironmentInfo": [
        {
            "SampleTimestamp": "2015-08-20T22:23:17.703Z",
            "Message": "https://elasticbeanstalk-us-
west-2-0123456789012.s3.amazonaws.com/resources/environments/
```

```
logs/tail/e-fyqyju3yjs/i-09c1c867/TailLogs-1440109397703.out?
AWSAccessKeyId=AKGPT4J56IAJ2EUBL5CQ&Expires=1440195891&Signature=n
%2BEalOV6A2HIOx4Rcfb7LT16bBM%3D",
            "InfoType": "tail",
            "Ec2InstanceId": "i-09c1c867"
        }
    ]
}
```

View the link in a browser. Prior to retrieval, logs must be requested with request-environment-info.

For more information, see Viewing logs from Amazon EC2 instances in your Elastic Beanstalk environment in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see RetrieveEnvironmentInfo in *AWS CLI Command Reference*.

`swap-environment-cnames`

The following code example shows how to use `swap-environment-cnames`.

AWS CLI

To swap environment CNAMES

The following `swap-environment-cnames` example swaps the assigned subdomains of two environments.

```
aws elasticbeanstalk swap-environment-cnames \
    --source-environment-name my-env-blue \
    --destination-environment-name my-env-green
```

This command produces no output.

For more information, see Blue/Green deployments with Elastic Beanstalk in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see SwapEnvironmentCnames in *AWS CLI Command Reference*.

`terminate-environment`

The following code example shows how to use `terminate-environment`.

AWS CLI

To terminate an environment

The following `terminate-environment` example terminates an Elastic Beanstalk environment named `my-env`.

```
aws elasticbeanstalk terminate-environment \
    --environment-name my-env
```

Output:

```
{
    "ApplicationName": "my-app",
    "EnvironmentName": "my-env",
    "Status": "Terminating",
    "EnvironmentId": "e-fh2eravpns",
    "EndpointURL": "awseb-e-f-AWSEBLoa-1I9XUMP4-8492WNUP202574.us-
west-2.elb.amazonaws.com",
    "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java
 8",
    "CNAME": "my-env.elasticbeanstalk.com",
    "Health": "Grey",
    "AbortableOperationInProgress": false,
    "Tier": {
        "Version": " ",
        "Type": "Standard",
        "Name": "WebServer"
    },
    "DateUpdated": "2015-08-12T19:05:54.744Z",
    "DateCreated": "2015-08-12T18:52:53.622Z"
}
```

For more information, see Terminate an Elastic Beanstalk environment in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see TerminateEnvironment in *AWS CLI Command Reference*.

`update-application-version`

The following code example shows how to use `update-application-version`.

AWS CLI

To change an application version's description

The following `update-application-version` example updates the description of an application version named `22a0-stage-150819_185942`.

```
aws elasticbeanstalk update-application-version \
    --version-label 22a0-stage-150819_185942 \
    --application-name my-app \
    --description "new description"
```

Output:

```
{
    "ApplicationVersion": {
        "ApplicationName": "my-app",
        "VersionLabel": "22a0-stage-150819_185942",
        "Description": "new description",
        "DateCreated": "2015-08-19T18:59:17.646Z",
        "DateUpdated": "2015-08-20T22:53:28.871Z",
        "SourceBundle": {
            "S3Bucket": "elasticbeanstalk-us-west-2-0123456789012",
            "S3Key": "my-app/22a0-stage-150819_185942.war"
        }
    }
}
```

For more information, see Managing application versions in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see UpdateApplicationVersion in *AWS CLI Command Reference*.

`update-application`

The following code example shows how to use `update-application`.

AWS CLI

To change an application's description

The following `update-application` example updates the description of an application named `my-app`.

```
aws elasticbeanstalk update-application \
    --application-name my-app \
    --description "my Elastic Beanstalk application"
```

Output:

```
{
    "Application": {
        "ApplicationName": "my-app",
        "Description": "my Elastic Beanstalk application",
        "Versions": [
            "2fba-stage-150819_234450",
            "bf07-stage-150820_214945",
            "93f8",
            "fd7c-stage-150820_000431",
            "22a0-stage-150819_185942"
        ],
        "DateCreated": "2015-08-13T19:15:50.449Z",
        "ConfigurationTemplates": [],
        "DateUpdated": "2015-08-20T22:34:56.195Z"
    }
}
```

For more information, see Managing Elastic Beanstalk applications in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see UpdateApplication in *AWS CLI Command Reference*.

`update-configuration-template`

The following code example shows how to use `update-configuration-template`.

AWS CLI

To update a configuration template

The following `update-configuration-template` example removes the configured CloudWatch custom health metrics configuration `ConfigDocument` from a saved configuration template named `my-template`.

```
aws elasticbeanstalk update-configuration-template \
    --template-name my-template \
```

```
    --application-name my-app \
    --options-to-
remove Namespace=aws:elasticbeanstalk:healthreporting:system,OptionName=ConfigDocument
```

Output:

```
{
    "ApplicationName": "my-app",
    "TemplateName": "my-template",
    "DateCreated": "2015-08-20T22:39:31Z",
    "DateUpdated": "2015-08-20T22:43:11Z",
    "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8"
}
```

For more information about namespaces and supported options, see Configuration options in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see UpdateConfigurationTemplate in *AWS CLI Command Reference*.

`update-environment`

The following code example shows how to use `update-environment`.

AWS CLI

Example 1: To update an environment to a new version

The following `update-environment` example updates an environment named "my-env" to version "v2" of the application to which it belongs.

```
aws elasticbeanstalk update-environment \
    --environment-name my-env \
    --version-label v2
```

This command requires that the "my-env" environment already exists and belongs to an application that has a valid application version with the label "v2".

Output:

```
{
    "ApplicationName": "my-app",
    "EnvironmentName": "my-env",
```

```
    "VersionLabel": "v2",
    "Status": "Updating",
    "EnvironmentId": "e-szqipays4h",
    "EndpointURL": "awseb-e-i-AWSEBLoa-1RDLX6TC9VUAO-0123456789.us-
west-2.elb.amazonaws.com",
    "SolutionStackName": "64bit Amazon Linux running Tomcat 7",
    "CNAME": "my-env.elasticbeanstalk.com",
    "Health": "Grey",
    "Tier": {
        "Version": " ",
        "Type": "Standard",
        "Name": "WebServer"
    },
    "DateUpdated": "2015-02-03T23:12:29.119Z",
    "DateCreated": "2015-02-03T23:04:54.453Z"
}
```

Example 2: To set an environment variable

The following `update-environment` example sets the value of the "PARAM1" variable in the "my-env" environment to "ParamValue".

```
aws elasticbeanstalk update-environment \
    --environment-name my-env \
    --option-
settings Namespace=aws:elasticbeanstalk:application:environment,OptionName=PARAM1,Value=Para
```

Output:

```
{
    "ApplicationName": "my-app",
    "EnvironmentName": "my-env",
    "VersionLabel": "v2",
    "Status": "Updating",
    "EnvironmentId": "e-szqipays4h",
    "EndpointURL": "awseb-e-i-AWSEBLoa-1RDLX6TC9VUAO-0123456789.us-
west-2.elb.amazonaws.com",
    "SolutionStackName": "64bit Amazon Linux running Tomcat 7",
    "CNAME": "my-env.elasticbeanstalk.com",
    "Health": "Grey",
    "AbortableOperationInProgress": true,
    "Tier": {
        "Version": " ",
```

```
        "Type": "Standard",
        "Name": "WebServer"
    },
    "DateUpdated": "2015-02-03T23:20:15.351Z",
    "DateCreated": "2015-02-03T23:04:54.453Z"
}
```

The `option-settings` parameter takes a namespace in addition to the name and value of the variable. Elastic Beanstalk supports several namespaces for options in addition to environment variables.

Example 3: To configure option settings from a file

The following `update-environment` example configures several options in the `aws:elb:loadbalancer` namespace from a file.

```
aws elasticbeanstalk update-environment \
    --environment-name my-env \
    --option-settings file://options.json
```

Contents of `options.json`:

```
[
    {
        "Namespace": "aws:elb:healthcheck",
        "OptionName": "Interval",
        "Value": "15"
    },
    {
        "Namespace": "aws:elb:healthcheck",
        "OptionName": "Timeout",
        "Value": "8"
    },
    {
        "Namespace": "aws:elb:healthcheck",
        "OptionName": "HealthyThreshold",
        "Value": "2"
    },
    {
        "Namespace": "aws:elb:healthcheck",
        "OptionName": "UnhealthyThreshold",
        "Value": "3"
```

```
    }
]
```

Output:

```
{
    "ApplicationName": "my-app",
    "EnvironmentName": "my-env",
    "VersionLabel": "7f58-stage-150812_025409",
    "Status": "Updating",
    "EnvironmentId": "e-wtp2rpqsej",
    "EndpointURL": "awseb-e-w-AWSEBLoa-14XB83101Q4L-104QXY80921.us-
west-2.elb.amazonaws.com",
    "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java
 8",
    "CNAME": "my-env.elasticbeanstalk.com",
    "Health": "Grey",
    "AbortableOperationInProgress": true,
    "Tier": {
        "Version": " ",
        "Type": "Standard",
        "Name": "WebServer"
    },
    "DateUpdated": "2015-08-12T18:15:23.804Z",
    "DateCreated": "2015-08-07T20:48:49.599Z"
}
```

For more information about namespaces and supported options, see Configuration options in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see UpdateEnvironment in *AWS CLI Command Reference*.

`validate-configuration-settings`

The following code example shows how to use `validate-configuration-settings`.

AWS CLI

To validate configuration settings

The following `validate-configuration-settings` example validates a CloudWatch custom metrics config document.

```
aws elasticbeanstalk validate-configuration-settings \
    --application-name my-app \
    --environment-name my-env \
    --option-settings file://options.json
```

Contents of `options.json`:

```
[
    {
        "Namespace": "aws:elasticbeanstalk:healthreporting:system",
        "OptionName": "ConfigDocument",
        "Value": "{\"CloudWatchMetrics\": {\"Environment\":
 {\"ApplicationLatencyP99.9\": null,\"InstancesSevere\": 60,
\"ApplicationLatencyP90\": 60,\"ApplicationLatencyP99\": null,
\"ApplicationLatencyP95\": 60,\"InstancesUnknown\": 60,\"ApplicationLatencyP85\":
 60,\"InstancesInfo\": null,\"ApplicationRequests2xx\": null,\"InstancesDegraded
\": null,\"InstancesWarning\": 60,\"ApplicationLatencyP50\": 60,
\"ApplicationRequestsTotal\": null,\"InstancesNoData\": null,\"InstancesPending
\": 60,\"ApplicationLatencyP10\": null,\"ApplicationRequests5xx\": null,
\"ApplicationLatencyP75\": null,\"InstancesOk\": 60,\"ApplicationRequests3xx\":
 null,\"ApplicationRequests4xx\": null},\"Instance\": {\"ApplicationLatencyP99.9\":
 null,\"ApplicationLatencyP90\": 60,\"ApplicationLatencyP99\": null,
\"ApplicationLatencyP95\": null,\"ApplicationLatencyP85\": null,\"CPUUser\": 60,
\"ApplicationRequests2xx\": null,\"CPUIdle\": null,\"ApplicationLatencyP50\":
 null,\"ApplicationRequestsTotal\": 60,\"RootFilesystemUtil\": null,
\"LoadAverage1min\": null,\"CPUIrq\": null,\"CPUNice\": 60,\"CPUIowait\": 60,
\"ApplicationLatencyP10\": null,\"LoadAverage5min\": null,\"ApplicationRequests5xx
\": null,\"ApplicationLatencyP75\": 60,\"CPUSystem\": 60,\"ApplicationRequests3xx\":
 60,\"ApplicationRequests4xx\": null,\"InstanceHealth\": null,\"CPUSoftirq\": 60}},
\"Version\": 1}"
    }
]
```

If the options that you specify are valid for the specified environment, Elastic Beanstalk returns an empty Messages array.

Output:

```
{
    "Messages": []
}
```

If validation fails, the response will include information about the error.

Output:

```
{
    "Messages": [
        {
            "OptionName": "ConfigDocumet",
            "Message": "Invalid option specification (Namespace:
 'aws:elasticbeanstalk:healthreporting:system', OptionName: 'ConfigDocumet'):
 Unknown configuration setting.",
            "Namespace": "aws:elasticbeanstalk:healthreporting:system",
            "Severity": "error"
        }
    ]
}
```

For more information about namespaces and supported options, see Configuration options in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see ValidateConfigurationSettings in *AWS CLI Command Reference*.

Elastic Load Balancing - Version 1 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Elastic Load Balancing - Version 1.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-tags`

The following code example shows how to use `add-tags`.

AWS CLI

To add a tag to a load balancer

The following `add-tags` example adds tags to the specified load balancer.

```
aws elb add-tags \
    --load-balancer-names my-load-balancer \
    --tags "Key=project,Value=lima" "Key=department,Value=digital-media"
```

This command produces no output.

For more information, see Tag your Classic Load Balancer in the *Classic Load Balancers Guide*.

- For API details, see AddTags in *AWS CLI Command Reference*.

`apply-security-groups-to-load-balancer`

The following code example shows how to use `apply-security-groups-to-load-balancer`.

AWS CLI

To associate a security group with a load balancer in a VPC

The following `apply-security-groups-to-load-balancer` example associates a security group with the specified load balancer in a VPC.

```
aws elb apply-security-groups-to-load-balancer \
    --load-balancer-name my-load-balancer \
    --security-groups sg-fc448899
```

Output:

```
{
    "SecurityGroups": [
        "sg-fc448899"
    ]
}
```

For more information, see Configure security groups for your Classic Load Balancer in the *Classic Load Balancers Guide*.

- For API details, see ApplySecurityGroupsToLoadBalancer in *AWS CLI Command Reference*.

`attach-load-balancer-to-subnets`

The following code example shows how to use `attach-load-balancer-to-subnets`.

AWS CLI

To attach subnets to a load balancer

The following `attach-load-balancer-to-subnets` example adds the specified subnet to the set of configured subnets for the specified load balancer.

```
aws elb attach-load-balancer-to-subnets \
    --load-balancer-name my-load-balancer \
    --subnets subnet-0ecac448
```

Output:

```
{
    "Subnets": [
        "subnet-15aaab61",
        "subnet-0ecac448"
    ]
}
```

For more information, see Configure subnets for your Classic Load Balancer in the *Classic Load Balancers User Guide*.

- For API details, see AttachLoadBalancerToSubnets in *AWS CLI Command Reference*.

`configure-health-check`

The following code example shows how to use `configure-health-check`.

AWS CLI

To specify the health check settings for your backend EC2 instances

The following `configure-health-check` example specifies the health check settings used to evaluate the health of your backend EC2 instances.

```
aws elb configure-health-check \
    --load-balancer-name my-load-balancer \
```

```
    --health-check Target=HTTP:80/
png,Interval=30,UnhealthyThreshold=2,HealthyThreshold=2,Timeout=3
```

Output:

```
{
    "HealthCheck": {
        "HealthyThreshold": 2,
        "Interval": 30,
        "Target": "HTTP:80/png",
        "Timeout": 3,
        "UnhealthyThreshold": 2
    }
}
```

For more information, see Health checks for the instances for your Classic Load Balancer in the *Classic Load Balancers User Guide*.

- For API details, see ConfigureHealthCheck in *AWS CLI Command Reference*.

`create-app-cookie-stickiness-policy`

The following code example shows how to use `create-app-cookie-stickiness-policy`.

AWS CLI

To generate a stickiness policy for your HTTPS load balancer

The following `create-app-cookie-stickiness-policy` example generates a stickiness policy that follows the sticky session lifetimes of the application-generated cookie.

```
aws elb create-app-cookie-stickiness-policy \
    --load-balancer-name my-load-balancer \
    --policy-name my-app-cookie-policy \
    --cookie-name my-app-cookie
```

This command produces no output.

For more information, see Configure sticky sessions for your Classic Load Balancer in the *Classic Load Balancers User Guide*.

- For API details, see CreateAppCookieStickinessPolicy in *AWS CLI Command Reference*.

`create-lb-cookie-stickiness-policy`

The following code example shows how to use `create-lb-cookie-stickiness-policy`.

AWS CLI

To generate a duration-based stickiness policy for your HTTPS load balancer

The following `create-lb-cookie-stickiness-policy` example generates a stickiness policy with sticky session lifetimes controlled by the specified expiration period.

```
aws elb create-lb-cookie-stickiness-policy \
    --load-balancer-name my-load-balancer \
    --policy-name my-duration-cookie-policy \
    --cookie-expiration-period 60
```

This command produces no output.

For more information, see Configure sticky sessions for your Classic Load Balancer in the *Classic Load Balancers User Guide*.

- For API details, see CreateLbCookieStickinessPolicy in *AWS CLI Command Reference*.

`create-load-balancer-listeners`

The following code example shows how to use `create-load-balancer-listeners`.

AWS CLI

Example 1: To create HTTP listeners for a load balancer

The following `create-load-balancer-listeners` example creates a listener for your load balancer at port 80 using the HTTP protocol.

```
aws elb create-load-balancer-listeners \
    --load-balancer-name my-load-balancer \
    --
listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80"
```

This command produces no output.

For more information, see Listeners for your Classic Load Balancer in the *Classic Load Balancers User Guide*.

Example 2: To create HTTPS listeners for a load balancer

The following `create-load-balancer-listeners` example creates a listener for your load balancer at port 443 using the HTTPS protocol.

```
aws elb create-load-balancer-listeners \
    --load-balancer-name my-load-balancer \
    --
listeners "Protocol=HTTPS,LoadBalancerPort=443,InstanceProtocol=HTTP,InstancePort=80"
```

This command produces no output.

For more information, see Configure an HTTPS listener for your Classic Load Balancer in the *Classic Load Balancers User Guide*.

- For API details, see CreateLoadBalancerListeners in *AWS CLI Command Reference*.

`create-load-balancer-policy`

The following code example shows how to use `create-load-balancer-policy`.

AWS CLI

Example 1: To create a policy that enables Proxy Protocol on a load balancer

The following `create-load-balancer-policy` example creates a policy that enables Proxy Protocol on the specified load balancer.

```
aws elb create-load-balancer-policy \
    --load-balancer-name my-load-balancer \
    --policy-name my-ProxyProtocol-policy \
    --policy-type-name ProxyProtocolPolicyType \
    --policy-attributes AttributeName=ProxyProtocol,AttributeValue=true
```

This command produces no output.

For more information, see Configure proxy protocol for your Classic Load Balancer in the *Classic Load Balancers User Guide*.

Example 2: To create an SSL negotiation policy using the recommended security policy

The following `create-load-balancer-policy` example creates an SSL negotiation policy for the specified HTTPS load balancer using the recommended security policy.

```
aws elb create-load-balancer-policy \
    --load-balancer-name my-load-balancer \
    --policy-name my-SSLNegotiation-policy \
    --policy-type-name SSLNegotiationPolicyType \
    --policy-attributes AttributeName=Reference-Security-
Policy,AttributeValue=ELBSecurityPolicy-2015-03
```

This command produces no output.

For more information, see SSL negotiation configurations for Classic Load Balancers in the *Classic Load Balancers User Guide*.

Example 3: To create an SSL negotiation policy using a custom security policy

The following `create-load-balancer-policy` example creates an SSL negotiation policy for your HTTPS load balancer using a custom security policy by enabling the protocols and the ciphers.

```
aws elb create-load-balancer-policy \
    --load-balancer-name my-load-balancer \
    --policy-name my-SSLNegotiation-policy \
    --policy-type-name SSLNegotiationPolicyType \
    --policy-attributes AttributeName=Protocol-
SSLv3,AttributeValue=true AttributeName=Protocol-
TLSv1.1,AttributeValue=true AttributeName=DHE-RSA-AES256-
SHA256,AttributeValue=true AttributeName=Server-Defined-Cipher-
Order,AttributeValue=true
```

This command produces no output.

For more information, see Update the SSL negotiation configuration of your Classic Load Balancer in the *Classic Load Balancers User Guide*.

Example 4: To create a public key policy

The following `create-load-balancer-policy` example creates a public key policy.

```
aws elb create-load-balancer-policy \
    --load-balancer-name my-load-balancer \
    --policy-name my-PublicKey-policy \
    --policy-type-name PublicKeyPolicyType \
```

```
    --policy-
attributes AttributeName=PublicKey,AttributeValue=MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQ
+dS74kj//c6x7ROtusUaeQCTgIUkayttRDWchuqo1pHC1u
+n5xxXnBBe2ejbb2WRsKIQ5rXEeixsjFpFsojpSQKkzhVGI6mJVZBJDVKSHmswnwLBdofLhzvllpovBPTHe
+o4haAWvDBALJU0pkSI1FecPHcs2hwxf14zHoXy1e2k36A64nXW43wtfx5qcVSIxtCEOjnYRg7RPvybaGfQ
+v6Iaxb/+7J5kEvZhTFQId+bSiJImF1FSUT1W1xwzBZPUbcUkkXDj45vC2s3Z8E
+Lk7a3uZhvsQHLZnrfuWjBWGWvZ/MhZYgEXAMPLE
```

This command produces no output.

For more information, see Create a Classic Load Balancer with an HTTPS listener in the *Classic Load Balancers User Guide*.

Example 5: To create a backend server authentication policy

The following `create-load-balancer-policy` example creates a backend server authentication policy that enables authentication on your backend instance using a public key policy.

```
aws elb create-load-balancer-policy \
    --load-balancer-name my-load-balancer \
    --policy-name my-authentication-policy \
    --policy-type-name BackendServerAuthenticationPolicyType \
    --policy-attributes AttributeName=PublicKeyPolicyName,AttributeValue=my-
PublicKey-policy
```

This command produces no output.

For more information, see Create a Classic Load Balancer with an HTTPS listener in the *Classic Load Balancers User Guide*.

- For API details, see CreateLoadBalancerPolicy in *AWS CLI Command Reference*.

`create-load-balancer`

The following code example shows how to use `create-load-balancer`.

AWS CLI

Example 1: To create an HTTP load balancer

The following `create-load-balancer` example creates a load balancer with an HTTP listener in a VPC.

```
aws elb create-load-balancer \
    --load-balancer-name my-load-balancer \
    --
listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80"
 \
    --subnets subnet-15aaab61 \
    --security-groups sg-a61988c3
```

Output:

```
{
    "DNSName": "my-load-balancer-1234567890.us-west-2.elb.amazonaws.com"
}
```

The following `create-load-balancer` example creates a load balancer with an HTTP listener in EC2-Classic.

```
aws elb create-load-balancer \
    --load-balancer-name my-load-balancer \
    --
listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80"
 \
    --availability-zones us-west-2a us-west-2b
```

Output:

```
{
    "DNSName": "my-load-balancer-123456789.us-west-2.elb.amazonaws.com"
}
```

For more information, see Create an internet-facing Classic Load Balancer in the *Classic Load Balancers User Guide*.

Example 2: To create an HTTPS load balancer

The following `create-load-balancer` example creates a load balancer with an HTTPS listener in a VPC.

```
aws elb create-load-balancer \
    --load-balancer-name my-load-balancer \
```

```
    --
listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80" "Protoco
certificate/my-server-cert" \
    --subnets subnet-15aaab61 \
    --security-groups sg-a61988c3
```

Output:

```
{
    "DNSName": "my-load-balancer-1234567890.us-west-2.elb.amazonaws.com"
}
```

The following `create-load-balancer` example creates a load balancer with an HTTPS listener in EC2-Classic.

```
aws elb create-load-balancer \
    --load-balancer-name my-load-balancer \
    --
listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80" "Protoco
certificate/my-server-cert" \
    --availability-zones us-west-2a us-west-2b
```

Output:

```
{
    "DNSName": "my-load-balancer-123456789.us-west-2.elb.amazonaws.com"
}
```

For more information, see Create a Classic Load Balancer with an HTTPS listener in the *Classic Load Balancers User Guide*.

Example 3: To create an internal load balancer

The following `create-load-balancer` example creates an internal load balancer with an HTTP listener in a VPC.

```
aws elb create-load-balancer \
    --load-balancer-name my-load-balancer \
    --
listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80"
 \
```

```
    --scheme internal \
    --subnets subnet-a85db0df \
    --security-groups sg-a61988c3
```

Output:

```
{
    "DNSName": "internal-my-load-balancer-123456789.us-west-2.elb.amazonaws.com"
}
```

For more information, see Create an internal Classic Load Balancer in the *Classic Load Balancers User Guide*.

- For API details, see CreateLoadBalancer in *AWS CLI Command Reference*.

`delete-load-balancer-listeners`

The following code example shows how to use `delete-load-balancer-listeners`.

AWS CLI

To delete a listener from your load balancer

The following `delete-load-balancer-listeners` example deletes the listener for the specified port from the specified load balancer.

```
aws elb delete-load-balancer-listeners \
    --load-balancer-name my-load-balancer \
    --load-balancer-ports 80
```

This command produces no output.

For more information, see Listeners for your Classic Load Balancer in the *Classic Load Balancers User Guide*.

- For API details, see DeleteLoadBalancerListeners in *AWS CLI Command Reference*.

`delete-load-balancer-policy`

The following code example shows how to use `delete-load-balancer-policy`.

AWS CLI

To delete a policy from your load balancer

The following `delete-load-balancer-policy` example deletes the specified policy from the specified load balancer. The policy must not be enabled on any listener.

```
aws elb delete-load-balancer-policy \
    --load-balancer-name my-load-balancer \
    --policy-name my-duration-cookie-policy
```

This command produces no output.

For more information, see Configure sticky sessions for your Classic Load Balancer in the *Classic Load Balancers User Guide*.

- For API details, see DeleteLoadBalancerPolicy in *AWS CLI Command Reference*.

`delete-load-balancer`

The following code example shows how to use `delete-load-balancer`.

AWS CLI

To delete a load balancer

The following `delete-load-balancer` example deletes the specified load balancer.

```
aws elb delete-load-balancer \
    --load-balancer-name my-load-balancer
```

This command produces no output.

For more information, see Create an internet-facing Classic Load Balancer in the *Classic Load Balancers User Guide*.

- For API details, see DeleteLoadBalancer in *AWS CLI Command Reference*.

`deregister-instances-from-load-balancer`

The following code example shows how to use `deregister-instances-from-load-balancer`.

AWS CLI

To deregister instances from a load balancer

The following `deregister-instances-from-load-balancer` example deregisters the specified instance from the specified load balancer.

```
aws elb deregister-instances-from-load-balancer \
    --load-balancer-name my-load-balancer \
    --instances i-d6f6fae3
```

Output:

```
{
    "Instances": [
        {
            "InstanceId": "i-207d9717"
        },
        {
            "InstanceId": "i-afefb49b"
        }
    ]
}
```

For more information, see Register instances with your Classic Load Balancer in the *Classic Load Balancers User Guide*.

- For API details, see DeregisterInstancesFromLoadBalancer in *AWS CLI Command Reference*.

`describe-account-limits`

The following code example shows how to use `describe-account-limits`.

AWS CLI

To describe your Classic Load Balancer limits

The following `describe-account-limits` example displays details about the Classic Load Balancer limits for your AWS account.

```
aws elb describe-account-limits
```

Output:

```
{
    "Limits": [
        {
            "Name": "classic-load-balancers",
            "Max": "20"
        },
        {
            "Name": "classic-listeners",
            "Max": "100"
        },
        {
            "Name": "classic-registered-instances",
            "Max": "1000"
        }
    ]
}
```

For more information, see Quotas for your Classic Load Balancer in the *Classic Load Balancers User Guide*.

- For API details, see DescribeAccountLimits in *AWS CLI Command Reference*.

`describe-instance-health`

The following code example shows how to use `describe-instance-health`.

AWS CLI

Example 1: To describe the health of the instances for a load balancer

The following `describe-instance-health` example describes the health of the instances for the specified load balancer.

```
aws elb describe-instance-health \
    --load-balancer-name my-load-balancer
```

Output:

```
{
```

```
    "InstanceStates": [
        {
            "InstanceId": "i-207d9717",
            "ReasonCode": "N/A",
            "State": "InService",
            "Description": "N/A"
        },
        {
            "InstanceId": "i-afefb49b",
            "ReasonCode": "N/A",
            "State": "InService",
            "Description": "N/A"
        }
    ]
}
```

For more information, see Health checks for the instances for your Classic Load Balancer in the *Classic Load Balancers User Guide*.

Example 2: To describe the health of an instance for a load balancer

The following `describe-instance-health` example describes the health of the specified instance for the specified load balancer.

```
aws elb describe-instance-health \
    --load-balancer-name my-load-balancer \
    --instances i-7299c809
```

The following is an example response for an instance that is registering.

Output:

```
{
    "InstanceStates": [
        {
            "InstanceId": "i-7299c809",
            "ReasonCode": "ELB",
            "State": "OutOfService",
            "Description": "Instance registration is still in progress."
        }
    ]
}
```

The following is an example response for an unhealthy instance.

Output:

```
{
    "InstanceStates": [
        {
            "InstanceId": "i-7299c809",
            "ReasonCode": "Instance",
            "State": "OutOfService",
            "Description": "Instance has failed at least the UnhealthyThreshold
 number of health checks consecutively."
        }
    ]
}
```

For more information, see Troubleshoot a Classic Load Balancer: Health checks in the *Classic Load Balancers User Guide*.

- For API details, see DescribeInstanceHealth in *AWS CLI Command Reference*.

`describe-load-balancer-attributes`

The following code example shows how to use `describe-load-balancer-attributes`.

AWS CLI

To describe the attributes of a load balancer

The following `describe-load-balancer-attributes` example describes the attributes of the specified load balancer.

```
aws elb describe-load-balancer-attributes \
    --load-balancer-name my-load-balancer
```

Output:

```
{
    "LoadBalancerAttributes": {
        "ConnectionDraining": {
            "Enabled": false,
            "Timeout": 300
```

```
        },
        "CrossZoneLoadBalancing": {
            "Enabled": true
        },
        "ConnectionSettings": {
            "IdleTimeout": 30
        },
        "AccessLog": {
            "Enabled": false
        }
    }
}
```

For more information, see Configure your Classic Load Balancer in the *Classic Load Balancers User Guide*.

- For API details, see DescribeLoadBalancerAttributes in *AWS CLI Command Reference*.

`describe-load-balancer-policies`

The following code example shows how to use `describe-load-balancer-policies`.

AWS CLI

Example 1: To describe all policies associated with a load balancer

The following `describe-load-balancer-policies` example describes all of the policies associated with the specified load balancer.

```
aws elb describe-load-balancer-policies \
    --load-balancer-name my-load-balancer
```

Output:

```
{
    "PolicyDescriptions": [
        {
            "PolicyAttributeDescriptions": [
                {
                    "AttributeName": "ProxyProtocol",
                    "AttributeValue": "true"
                }
            ],
```

```
            "PolicyName": "my-ProxyProtocol-policy",
            "PolicyTypeName": "ProxyProtocolPolicyType"
        },
        {
            "PolicyAttributeDescriptions": [
                {
                    "AttributeName": "CookieName",
                    "AttributeValue": "my-app-cookie"
                }
            ],
            "PolicyName": "my-app-cookie-policy",
            "PolicyTypeName": "AppCookieStickinessPolicyType"
        },
        {
            "PolicyAttributeDescriptions": [
                {
                    "AttributeName": "CookieExpirationPeriod",
                    "AttributeValue": "60"
                }
            ],
            "PolicyName": "my-duration-cookie-policy",
            "PolicyTypeName": "LBCookieStickinessPolicyType"
        }
    ]
}
```

For more information, see Configure your Classic Load Balancer in the *Classic Load Balancers User Guide*.

Example 2: To describe a specific policy associated with a load balancer

The following `describe-load-balancer-policies` example describes the specified policy associated with the specified load balancer.

```
aws elb describe-load-balancer-policies \
    --load-balancer-name my-load-balancer \
    --policy-names my-authentication-policy
```

Output:

```
{
    "PolicyDescriptions": [
        {
```

```
            "PolicyAttributeDescriptions": [
                {
                    "AttributeName": "PublicKeyPolicyName",
                    "AttributeValue": "my-PublicKey-policy"
                }
            ],
            "PolicyName": "my-authentication-policy",
            "PolicyTypeName": "BackendServerAuthenticationPolicyType"
        }
    ]
}
```

For more information, see Create a Classic Load Balancer with an HTTPS listener in the *Classic Load Balancers User Guide*.

- For API details, see DescribeLoadBalancerPolicies in *AWS CLI Command Reference*.

`describe-load-balancer-policy-types`

The following code example shows how to use `describe-load-balancer-policy-types`.

AWS CLI

To describe the load balancer policy types defined by Elastic Load Balancing

The following `describe-load-balancer-policy-types` example describes the load balancer policy types that you can use to create policy configurations for your load balancer.

```
aws elb describe-load-balancer-policy-types
```

Output:

```
{
    "PolicyTypeDescriptions": [
        {
            "PolicyAttributeTypeDescriptions": [
                {
                    "Cardinality": "ONE",
                    "AttributeName": "ProxyProtocol",
                    "AttributeType": "Boolean"
                }
            ],
            "PolicyTypeName": "ProxyProtocolPolicyType",
```

```
            "Description": "Policy that controls whether to include the IP address
 and port of the originating request for TCP messages. This policy operates on TCP/
SSL listeners only"
        },
        {
            "PolicyAttributeTypeDescriptions": [
                {
                    "Cardinality": "ONE",
                    "AttributeName": "PublicKey",
                    "AttributeType": "String"
                }
            ],
            "PolicyTypeName": "PublicKeyPolicyType",
            "Description": "Policy containing a list of public keys to
 accept when authenticating the back-end server(s). This policy cannot be
 applied directly to back-end servers or listeners but must be part of a
 BackendServerAuthenticationPolicyType."
        },
        {
            "PolicyAttributeTypeDescriptions": [
                {
                    "Cardinality": "ONE",
                    "AttributeName": "CookieName",
                    "AttributeType": "String"
                }
            ],
            "PolicyTypeName": "AppCookieStickinessPolicyType",
            "Description": "Stickiness policy with session lifetimes controlled by
 the lifetime of the application-generated cookie. This policy can be associated
 only with HTTP/HTTPS listeners."
        },
        {
            "PolicyAttributeTypeDescriptions": [
                {
                    "Cardinality": "ZERO_OR_ONE",
                    "AttributeName": "CookieExpirationPeriod",
                    "AttributeType": "Long"
                }
            ],
            "PolicyTypeName": "LBCookieStickinessPolicyType",
            "Description": "Stickiness policy with session lifetimes controlled
 by the browser (user-agent) or a specified expiration period. This policy can be
 associated only with HTTP/HTTPS listeners."
        },
```

```
        {
            "PolicyAttributeTypeDescriptions": [
                {
                    "Cardinality": "ZERO_OR_ONE",
                    "AttributeName": "Reference-Security-Policy",
                    "AttributeType": "String"
                },
                {
                    "Cardinality": "ZERO_OR_ONE",
                    "AttributeName": "Protocol-TLSv1.2",
                    "AttributeType": "Boolean"
                },
                {
                    "Cardinality": "ZERO_OR_ONE",
                    "AttributeName": "Server-Defined-Cipher-Order",
                    "AttributeType": "Boolean"
                },
                {
                    "Cardinality": "ZERO_OR_ONE",
                    "AttributeName": "ECDHE-RSA-AES128-GCM-SHA256",
                    "AttributeType": "Boolean"
                }
            ],
            "PolicyTypeName": "SSLNegotiationPolicyType",
            "Description": "Listener policy that defines the ciphers and protocols
 that will be accepted by the load balancer. This policy can be associated only with
 HTTPS/SSL listeners."
        },
        {
            "PolicyAttributeTypeDescriptions": [
                {
                    "Cardinality": "ONE_OR_MORE",
                    "AttributeName": "PublicKeyPolicyName",
                    "AttributeType": "PolicyName"
                }
            ],
            "PolicyTypeName": "BackendServerAuthenticationPolicyType",
            "Description": "Policy that controls authentication to back-
end server(s) and contains one or more policies, such as an instance of a
 PublicKeyPolicyType. This policy can be associated only with back-end servers that
 are using HTTPS/SSL."
        }
    ]
```

```
}
```

For more information, see Configure your Classic Load Balancer in the *Classic Load Balancers User Guide*.

- For API details, see DescribeLoadBalancerPolicyTypes in *AWS CLI Command Reference*.

`describe-load-balancers`

The following code example shows how to use `describe-load-balancers`.

AWS CLI

Example 1: To describe your load balancers

The following `describe-load-balancers` example describes all of your load balancers.

```
aws elb describe-load-balancers
```

Output:

```
{
    "LoadBalancerDescriptions": [
        {
            "Subnets": [
                "subnet-15aaab61"
            ],
            "CanonicalHostedZoneNameID": "Z3DZXE0EXAMPLE",
            "CanonicalHostedZoneName": "my-load-balancer-1234567890.us-
west-2.elb.amazonaws.com",
            "ListenerDescriptions": [
                {
                    "Listener": {
                        "InstancePort": 80,
                        "LoadBalancerPort": 80,
                        "Protocol": "HTTP",
                        "InstanceProtocol": "HTTP"
                    },
                    "PolicyNames": []
                },
                {
                    "Listener": {
                        "InstancePort": 443,
```

```
                        "SSLCertificateId": "arn:aws:iam::123456789012:server-
certificate/my-server-cert",
                        "LoadBalancerPort": 443,

        }
    ]
}
```

For more information, see What is a Classic Load Balancer? in the *Classic Load Balancers User Guide*.

Example 2: To describe one of your load balancers

The following `describe-load-balancers` example describes the specified load balancer.

```
aws elb describe-load-balancers \
    --load-balancer-names my-load-balancer
```

The following example response is for an HTTPS load balancer in a VPC.

Output:

```
{
    "LoadBalancerDescriptions": [
        {
            "Subnets": [
```

```
                "subnet-15aaab61"
            ],
            "CanonicalHostedZoneNameID": "Z3DZXE0EXAMPLE",
            "CanonicalHostedZoneName": "my-load-balancer-1234567890.us-
west-2.elb.amazonaws.com",
            "ListenerDescriptions": [
                {
                    "Listener": {
                        "InstancePort": 80,
                        "LoadBalancerPort": 80,
                        "Protocol": "HTTP",
                        "InstanceProtocol": "HTTP"
                    },
                    "PolicyNames": []
                },
                {
                    "Listener": {
                        "InstancePort": 443,

                {
                    "InstanceId": "i-207d9717"
                },
                {
                    "InstanceId": "i-afefb49b"
                }
            ],
            "DNSName": "my-load-balancer-1234567890.us-west-2.elb.amazonaws.com",
            "SecurityGroups": [
                "sg-a61988c3"
            ],
            "Policies": {
                "LBCookieStickinessPolicies": [
                    {
                        "PolicyName": "my-duration-cookie-policy",
                        "CookieExpirationPeriod": 60
                    }
                ],
                "AppCookieStickinessPolicies": [],
                "OtherPolicies": [
                    "my-PublicKey-policy",
                    "my-authentication-policy",
                    "my-SSLNegotiation-policy",
                    "my-ProxyProtocol-policy",
                    "ELBSecurityPolicy-2015-03"
                ]
            },
            "LoadBalancerName": "my-load-balancer",
            "CreatedTime": "2015-03-19T03:24:02.650Z",
            "AvailabilityZones": [
                "us-west-2a"
            ],
            "Scheme": "internet-facing",
            "SourceSecurityGroup": {
                "OwnerAlias": "123456789012",
                "GroupName": "my-elb-sg"
            }
        }
    ]
}
```

For more information, see What is a Classic Load Balancer? in the *Classic Load Balancers User Guide*.

- For API details, see DescribeLoadBalancers in *AWS CLI Command Reference*.

`describe-tags`

The following code example shows how to use `describe-tags`.

AWS CLI

To describe the tags assigned to a load balancer

The following `describe-tags` example describes the tags assigned to the specified load balancer.

```
aws elb describe-tags \
    --load-balancer-names my-load-balancer
```

Output:

```
{
    "TagDescriptions": [
        {
            "Tags": [
                {
                    "Value": "lima",
                    "Key": "project"
                },
                {
                    "Value": "digital-media",
                    "Key": "department"
                }
            ],
            "LoadBalancerName": "my-load-balancer"
        }
    ]
}
```

For more information, see Tag your Classic Load Balancer in the *Classic Load Balancers User Guide*.

- For API details, see DescribeTags in *AWS CLI Command Reference*.

`detach-load-balancer-from-subnets`

The following code example shows how to use `detach-load-balancer-from-subnets`.

AWS CLI

To detach load balancers from subnets

The following `detach-load-balancer-from-subnets` example detaches the specified load balancer from the specified subnet.

```
aws elb detach-load-balancer-from-subnets \
    --load-balancer-name my-load-balancer \
    --subnets subnet-0ecac448
```

Output:

```
{
    "Subnets": [
        "subnet-15aaab61"
    ]
}
```

For more information, see Configure subnets for your Classic Load Balancer in the *Classic Load Balancers User Guide*.

- For API details, see DetachLoadBalancerFromSubnets in *AWS CLI Command Reference*.

`disable-availability-zones-for-load-balancer`

The following code example shows how to use `disable-availability-zones-for-load-balancer`.

AWS CLI

To disable Availability Zones for a load balancer

The following `disable-availability-zones-for-load-balancer` example removes the specified Availability Zone from the set of Availability Zones for the specified load balancer.

```
aws elb disable-availability-zones-for-load-balancer \
```

```
    --load-balancer-name my-load-balancer \
    --availability-zones us-west-2a
```

Output:

```
{
    "AvailabilityZones": [
        "us-west-2b"
    ]
}
```

For more information, see Configure subnets for your Classic Load Balancer in the *Classic Load Balancers User Guide*.

- For API details, see DisableAvailabilityZonesForLoadBalancer in *AWS CLI Command Reference*.

`enable-availability-zones-for-load-balancer`

The following code example shows how to use `enable-availability-zones-for-load-balancer`.

AWS CLI

To enable Availability Zones for a load balancer

The following `enable-availability-zones-for-load-balancer` example adds the specified Availability Zone to the specified load balancer.

```
aws elb enable-availability-zones-for-load-balancer \
    --load-balancer-name my-load-balancer \
    --availability-zones us-west-2b
```

Output:

```
{
    "AvailabilityZones": [
        "us-west-2a",
        "us-west-2b"
    ]
}
```

For more information, see Configure subnets for your Classic Load Balancer in the *Classic Load Balancers Guide*.

- For API details, see EnableAvailabilityZonesForLoadBalancer in *AWS CLI Command Reference*.

`modify-load-balancer-attributes`

The following code example shows how to use `modify-load-balancer-attributes`.

AWS CLI

To modify the attributes of a load balancer

The following `modify-load-balancer-attributes` example modifies the `CrossZoneLoadBalancing` attribute of the specified load balancer.

```
aws elb modify-load-balancer-attributes \
    --load-balancer-name my-load-balancer \
    --load-balancer-attributes "{\"CrossZoneLoadBalancing\":{\"Enabled\":true}}"
```

Output:

```
{
    "LoadBalancerAttributes": {
        "CrossZoneLoadBalancing": {
            "Enabled": true
        }
    },
    "LoadBalancerName": "my-load-balancer"
}
```

For more information, see Configure cross-zone load balancing for your Classic Load Balancer in the *Classic Load Balancers Guide*.

The following `modify-load-balancer-attributes` example modifies the `ConnectionDraining` attribute of the specified load balancer.

```
aws elb modify-load-balancer-attributes \
    --load-balancer-name my-load-balancer \
    --load-balancer-attributes "{\"ConnectionDraining\":{\"Enabled\":true,\"Timeout
\":300}}"
```

Output:

```
{
    "LoadBalancerAttributes": {
        "ConnectionDraining": {
            "Enabled": true,
            "Timeout": 300
        }
    },
    "LoadBalancerName": "my-load-balancer"
}
```

For more information, see Configure connection draining for your Classic Load Balancer in the *Classic Load Balancers Guide*.

- For API details, see ModifyLoadBalancerAttributes in *AWS CLI Command Reference*.

`register-instances-with-load-balancer`

The following code example shows how to use `register-instances-with-load-balancer`.

AWS CLI

To register instances with a load balancer

The following `register-instances-with-load-balancer` example registers the specified instance with the specified load balancer.

```
aws elb register-instances-with-load-balancer \
    --load-balancer-name my-load-balancer \
    --instances i-d6f6fae3
```

Output:

```
{
    "Instances": [
        {
            "InstanceId": "i-d6f6fae3"
        },
        {
            "InstanceId": "i-207d9717"
        },
```

```
        {
            "InstanceId": "i-afefb49b"
        }
    ]
}
```

For more information, see Register instances with your Classic Load Balancer in the *Classic Load Balancers Guide*.

- For API details, see RegisterInstancesWithLoadBalancer in *AWS CLI Command Reference*.

`remove-tags`

The following code example shows how to use `remove-tags`.

AWS CLI

To remove tags from a load balancer

The following `remove-tags` example removes a tag from the specified load balancer.

```
aws elb remove-tags \
    --load-balancer-names my-load-balancer \
    --tags project
```

This command produces no output.

For more information, see Tag your Classic Load Balancer in the *Classic Load Balancers Guide*.

- For API details, see RemoveTags in *AWS CLI Command Reference*.

`set-load-balancer-listener-ssl-certificate`

The following code example shows how to use `set-load-balancer-listener-ssl-certificate`.

AWS CLI

To update the SSL certificate for an HTTPS load balancer

The following `set-load-balancer-listener-ssl-certificate` example replaces the existing SSL certificate for the specified HTTPS load balancer.

```
aws elb set-load-balancer-listener-ssl-certificate \
    --load-balancer-name my-load-balancer \
    --load-balancer-port 443 \
    --ssl-certificate-id arn:aws:iam::123456789012:server-certificate/new-server-
cert
```

This command produces no output.

For more information, see Replace the SSL certificate for your Classic Load Balancer in the *Classic Load Balancers Guide*.

- For API details, see SetLoadBalancerListenerSslCertificate in *AWS CLI Command Reference*.

`set-load-balancer-policies-for-backend-server`

The following code example shows how to use `set-load-balancer-policies-for-backend-server`.

AWS CLI

Example 1: To replace the policies associated with a port for a backend instance

The following `set-load-balancer-policies-for-backend-server` example replaces the policies that are currently associated with the specified port.

```
aws elb set-load-balancer-policies-for-backend-server \
    --load-balancer-name my-load-balancer \
    --instance-port 80 \
    --policy-names my-ProxyProtocol-policy
```

This command produces no output.

For more information, see Configure proxy protocol for your Classic Load Balancer in the *Classic Load Balancers Guide*.

Example 2: To remove all policies that are currently associated with a port on your backend instance

The following `set-load-balancer-policies-for-backend-server` example removes all policies associated with the specified port.

```
aws elb set-load-balancer-policies-for-backend-server \
```

```
    --load-balancer-name my-load-balancer \
    --instance-port 80 \
    --policy-names []
```

This command produces no output.

To confirm that the policies are removed, use the `describe-load-balancer-policies` command.

For more information, see Configure proxy protocol for your Classic Load Balancer in the *Classic Load Balancers Guide*.

- For API details, see SetLoadBalancerPoliciesForBackendServer in *AWS CLI Command Reference*.

`set-load-balancer-policies-of-listener`

The following code example shows how to use `set-load-balancer-policies-of-listener`.

AWS CLI

Example 1: To replace the policies associated with a listener

The following `set-load-balancer-policies-of-listener` example replaces the policies that are currently associated with the specified listener.

```
aws elb set-load-balancer-policies-of-listener \
    --load-balancer-name my-load-balancer \
    --load-balancer-port 443 \
    --policy-names my-SSLNegotiation-policy
```

This command produces no output.

For more information, see Update the SSL negotiation configuration of your Classic Load Balancer in the *Classic Load Balancers Guide*.

Example 2: To remove all policies associated with your listener

The following `set-load-balancer-policies-of-listener` example removes all policies that are currently associated with the specified listener.

```
aws elb set-load-balancer-policies-of-listener \
    --load-balancer-name my-load-balancer \
```

```
    --load-balancer-port 443 \
    --policy-names []
```

This command produces no output.

To confirm that the policies are removed from the load balancer, use the `describe-load-balancer-policies` command.

For more information, see Update the SSL negotiation configuration of your Classic Load Balancer in the *Classic Load Balancers Guide*.

- For API details, see SetLoadBalancerPoliciesOfListener in *AWS CLI Command Reference*.

Elastic Load Balancing - Version 2 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Elastic Load Balancing - Version 2.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-listener-certificates`

The following code example shows how to use `add-listener-certificates`.

AWS CLI

To add a certificate to a secure listener

The following `add-listener-certificates` example adds the specified certificate to the specified secure listener.

```
aws elbv2 add-listener-certificates \
```

```
    --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/
my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \
    --certificates CertificateArn=arn:aws:acm:us-west-2:123456789012:certificate/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Certificates": [
        {
            "CertificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "IsDefault": false
        }
    ]
}
```

For more information, see SSL certificates for your Application Load Balancer in the *Application Load Balancers Guide*.

- For API details, see AddListenerCertificates in *AWS CLI Command Reference*.

`add-tags`

The following code example shows how to use `add-tags`.

AWS CLI

To add tags to a load balancer

The following `add-tags` example adds the `project` and `department` tags to the specified load balancer.

```
aws elbv2 add-tags \
    --resource-arns arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
    --tags "Key=project,Value=lima" "Key=department,Value=digital-media"
```

This command produces no output.

For more information, see Tag an Application Load Balancer in the *Application Load Balancers Guide*.

- For API details, see AddTags in *AWS CLI Command Reference*.

`create-listener`

The following code example shows how to use `create-listener`.

AWS CLI

Example 1: To create an HTTP listener

The following `create-listener` example creates an HTTP listener for the specified Application Load Balancer that forwards requests to the specified target group.

```
aws elbv2 create-listener \
    --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
    --protocol HTTP \
    --port 80 \
    --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

Output:

```
{
    "Listeners": [
        {
            "ListenerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/
f2f7dc8efc522ab2",
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
            "Port": 80,
            "Protocol": "HTTP",
            "DefaultActions": [
                {
                    "Type": "forward",
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                    "ForwardConfig": {
                        "TargetGroups": [
                            {

                    "TargetGroupStickinessConfig": {
                        "Enabled": false
                    }
                }
            }
        ]
    }
]
}
```

For more information, see Create an HTTP listener for your Application Load Balancer in the *Application Load Balancers Guide*.

Example 2: To create an HTTPS listener

The following `create-listener` example creates an HTTPS listener for the specified Application Load Balancer that forwards requests to the specified target group. You must specify an SSL certificate for an HTTPS listener. You can create and manage certificates using AWS Certificate Manager (ACM). Alternatively, you can create a certificate using SSL/TLS tools, get the certificate signed by a certificate authority (CA), and upload the certificate to AWS Identity and Access Management (IAM).

```
aws elbv2 create-listener \
    --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
    --protocol HTTPS \
    --port 443 \
    --certificates CertificateArn=arn:aws:acm:us-west-2:123456789012:certificate/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --ssl-policy ELBSecurityPolicy-2016-08 \
    --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

Output:

```
{
    "Listeners": [
        {
```

```
            "ListenerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener/app/my-load-
balancer/50dc6c495c0c9188/0467ef3c8400ae65",
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
            "Port": 443,
            "Protocol": "HTTPS",
            "Certificates": [
                {
                    "CertificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
                }
            ],
            "SslPolicy": "ELBSecurityPolicy-2016-08",
            "DefaultActions": [
                {
                    "Type": "forward",
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                    "ForwardConfig": {
                        "TargetGroups": [
                            {
                                "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                                "Weight": 1
                            }
                        ],
                        "TargetGroupStickinessConfig": {
                            "Enabled": false
                        }
                    }
                }
            ]
        }
    ]
}
```

For more information, see Create an HTTPS listener for your Application Load Balancer in the *Application Load Balancers Guide*.

Example 3: To create a TCP listener

The following `create-listener` example creates a TCP listener for the specified Network Load Balancer that forwards requests to the specified target group.

```
aws elbv2 create-listener \
    --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/net/my-network-load-balancer/5d1b75f4f1cee11e \
    --protocol TCP \
    --port 80 \
    --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-tcp-targets/b6bba954d1361c78
```

Output:

```
{
    "Listeners": [
        {
            "ListenerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener/net/my-network-load-
balancer/5d1b75f4f1cee11e/1a2b3c4d5e6f7a8b",
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/net/my-network-load-balancer/5d1b75f4f1cee11e",
            "Port": 80,
            "Protocol": "TCP",
            "DefaultActions": [
                {
                    "Type": "forward",
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-tcp-targets/b6bba954d1361c78",
                    "ForwardConfig": {
                        "TargetGroups": [
                            {
                                "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-tcp-targets/b6bba954d1361c78",
                                "Weight": 1
                            }
                        ],
                        "TargetGroupStickinessConfig": {
                            "Enabled": false
                        }
                    }
                }
            ]
        }
```

```
    ]
}
```

For more information, see Create a listener for your Network Load Balancer in the *Network Load Balancers Guide*.

Example 4: To create a TLS listener

The following `create-listener` example creates a TLS listener for the specified Network Load Balancer that forwards requests to the specified target group. You must specify an SSL certificate for a TLS listener.

```
aws elbv2 create-listener \
    --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
    --protocol TLS \
    --port 443 \
    --certificates CertificateArn=arn:aws:acm:us-west-2:123456789012:certificate/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --ssl-policy ELBSecurityPolicy-2016-08 \
    --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

Output:

```
{
    "Listeners": [
        {
            "ListenerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener/app/my-load-
balancer/50dc6c495c0c9188/2b3c4d5e6f7a8b9c",
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
            "Port": 443,
            "Protocol": "TLS",
            "Certificates": [
                {
                    "CertificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
                }
            ],
            "SslPolicy": "ELBSecurityPolicy-2016-08",
            "DefaultActions": [
```

```
                {
                    "Type": "forward",
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                    "ForwardConfig": {
                        "TargetGroups": [
                            {
                                "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                                "Weight": 1
                            }
                        ],
                        "TargetGroupStickinessConfig": {
                            "Enabled": false
                        }
                    }
                }
            ]
        }
    ]
}
```

For more information, see Server certificates for your Network Load Balancer in the *Network Load Balancers Guide*.

Example 5: To create a UDP listener

The following `create-listener` example creates a UDP listener for the specified Network Load Balancer that forwards requests to the specified target group.

```
aws elbv2 create-listener \
    --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/net/my-network-load-balancer/5d1b75f4f1cee11e \
    --protocol UDP \
    --port 53 \
    --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-tcp-targets/b6bba954d1361c78
```

Output:

```
{
    "Listeners": [
        {
```

```
            "ListenerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener/net/my-network-load-
balancer/5d1b75f4f1cee11e/3c4d5e6f7a8b9c0d",
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/net/my-network-load-balancer/5d1b75f4f1cee11e",
            "Port": 53,
            "Protocol": "UDP",
            "DefaultActions": [
                {
                    "Type": "forward",
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-tcp-targets/b6bba954d1361c78",
                    "ForwardConfig": {
                        "TargetGroups": [
                            {
                                "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-tcp-targets/b6bba954d1361c78",
                                "Weight": 1
                            }
                        ],
                        "TargetGroupStickinessConfig": {
                            "Enabled": false
                        }
                    }
                }
            ]
        }
    ]
}
```

For more information, see Create a listener for your Network Load Balancer in the *Network Load Balancers Guide*.

Example 6: To create a listener for the specified gateway and forwarding

The following `create-listener` example creates a listener for the specified Gateway Load Balancer that forwards requests to the specified target group.

```
aws elbv2 create-listener \
    --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/gwy/my-gateway-load-balancer/e0f9b3d5c7f7d3d6 \
    --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-glb-targets/007ca469fae3bb1615
```

Output:

```
{
    "Listeners": [
        {
            "ListenerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener/gwy/my-agw-lb-example2/e0f9b3d5c7f7d3d6/
afc127db15f925de",
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/gwy/my-agw-lb-example2/e0f9b3d5c7f7d3d6",
            "DefaultActions": [
                {
                    "Type": "forward",
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/test-tg-agw-2/007ca469fae3bb1615",
                    "ForwardConfig": {
                        "TargetGroups": [
                            {
                                "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/test-tg-agw-2/007ca469fae3bb1615"
                            }
                        ]
                    }
                }
            ]
        }
    ]
}
```

For more information, see Getting started with Gateway Load Balancers using the AWS CLI in the *Gateway Load Balancers Guide*.

- For API details, see CreateListener in *AWS CLI Command Reference*.

`create-load-balancer`

The following code example shows how to use `create-load-balancer`.

AWS CLI

Example 1: To create an Internet-facing load balancer

The following `create-load-balancer` example creates an Internet-facing Application Load Balancer and enables the Availability Zones for the specified subnets.

```
aws elbv2 create-load-balancer \
    --name my-load-balancer \
    --subnets subnet-b7d581c0 subnet-8360a9e7
```

Output:

```
{
    "LoadBalancers": [
        {
            "Type": "application",
            "Scheme": "internet-facing",
            "IpAddressType": "ipv4",
            "VpcId": "vpc-3ac0fb5f",
            "AvailabilityZones": [
                {
                    "ZoneName": "us-west-2a",
                    "SubnetId": "subnet-8360a9e7"
                },
                {
                    "ZoneName": "us-west-2b",
                    "SubnetId": "subnet-b7d581c0"
                }
            ],
            "CreatedTime": "2017-08-25T21:26:12.920Z",
            "CanonicalHostedZoneId": "Z2P70J7EXAMPLE",
            "DNSName": "my-load-balancer-424835706.us-west-2.elb.amazonaws.com",
            "SecurityGroups": [
                "sg-5943793c"
            ],
            "LoadBalancerName": "my-load-balancer",
            "State": {
                "Code": "provisioning"
            },
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188"
        }
    ]
}
```

For more information, see Create an Application Load Balancer in the *Application Load Balancers Guide*.

Example 2: To create an internal load balancer

The following `create-load-balancer` example creates an internal Application Load Balancer and enables the Availability Zones for the specified subnets.

```
aws elbv2 create-load-balancer \
    --name my-internal-load-balancer \
    --scheme internal \
    --subnets subnet-b7d581c0 subnet-8360a9e7
```

Output:

```
{
    "LoadBalancers": [
        {
            "Type": "application",
            "Scheme": "internal",
            "IpAddressType": "ipv4",
            "VpcId": "vpc-3ac0fb5f",
            "AvailabilityZones": [
                {
                    "ZoneName": "us-west-2a",
                    "SubnetId": "subnet-8360a9e7"
                },
                {
                    "ZoneName": "us-west-2b",
                    "SubnetId": "subnet-b7d581c0"
                }
            ],
            "CreatedTime": "2016-03-25T21:29:48.850Z",
            "CanonicalHostedZoneId": "Z2P70J7EXAMPLE",
            "DNSName": "internal-my-internal-load-balancer-1529930873.us-
west-2.elb.amazonaws.com",
            "SecurityGroups": [
                "sg-5943793c"
            ],
            "LoadBalancerName": "my-internal-load-balancer",
            "State": {
                "Code": "provisioning"
            },
```

```
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-internal-load-balancer/5b49b8d4303115c2"
        }
    ]
}
```

For more information, see Create an Application Load Balancer in the *Application Load Balancers Guide*.

Example 3: To create a Network Load Balancer

The following `create-load-balancer` example creates an Internet-facing Network Load Balancer and enables the Availability Zone for the specified subnet. It uses a subnet mapping to associate the specified Elastic IP address with the network interface used by the load balancer nodes for the Availability Zone.

```
aws elbv2 create-load-balancer \
    --name my-network-load-balancer \
    --type network \
    --subnet-mappings SubnetId=subnet-b7d581c0,AllocationId=eipalloc-64d5890a
```

Output:

```
{
    "LoadBalancers": [
        {
            "Type": "network",
            "Scheme": "internet-facing",
            "IpAddressType": "ipv4",
            "VpcId": "vpc-3ac0fb5f",
            "AvailabilityZones": [
                {
                    "LoadBalancerAddresses": [
                        {
                            "IpAddress": "35.161.207.171",
                            "AllocationId": "eipalloc-64d5890a"
                        }
                    ],
                    "ZoneName": "us-west-2b",
                    "SubnetId": "subnet-5264e837"
                }
            ],
```

```
            "CreatedTime": "2017-10-15T22:41:25.657Z",
            "CanonicalHostedZoneId": "Z2P70J7EXAMPLE",
            "DNSName": "my-network-load-balancer-5d1b75f4f1cee11e.elb.us-
west-2.amazonaws.com",
            "LoadBalancerName": "my-network-load-balancer",
            "State": {
                "Code": "provisioning"
            },
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/net/my-network-load-balancer/5d1b75f4f1cee11e"
        }
    ]
}
```

For more information, see Create a Network Load Balancer in the *Network Load Balancers Guide*.

Example 4: To create a Gateway Load Balancer

The following `create-load-balancer` example creates a Gateway Load Balancer and enables the Availability Zones for the specified subnets.

```
aws elbv2 create-load-balancer \
    --name my-gateway-load-balancer \
    --type gateway \
    --subnets subnet-dc83f691 subnet-a62583f9
```

Output:

```
{
    "LoadBalancers": [
        {
            "Type": "gateway",
            "VpcId": "vpc-838475fe",
            "AvailabilityZones": [
                {
                    "ZoneName": "us-west-2b",
                    "SubnetId": "subnet-a62583f9"
                },
            {
                    "ZoneName": "us-west-2a",
                    "SubnetId": "subnet-dc83f691"
                }
            ],
```

```
            "CreatedTime": "2021-07-14T19:33:43.324000+00:00",
            "LoadBalancerName": "my-gateway-load-balancer",
            "State": {
                "Code": "provisioning"
            },
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/gwy/my-gateway-load-balancer/dfbb5a7d32cdee79"
        }
    ]
}
```

For more information, see Getting started with Gateway Load Balancers using the AWS CLI in the *Gateway Load Balancers Guide*.

- For API details, see CreateLoadBalancer in *AWS CLI Command Reference*.

`create-rule`

The following code example shows how to use `create-rule`.

AWS CLI

Example 1: To create a rule using a path condition and a forward action

The following `create-rule` example creates a rule that forwards requests to the specified target group if the URL contains the specified pattern.

```
aws elbv2 create-rule \
    --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/
my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \
    --priority 5 \
    --conditions file://conditions-pattern.json \
    --actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

Contents of `conditions-pattern.json`:

```
[
    {
        "Field": "path-pattern",
        "PathPatternConfig": {
            "Values": ["/images/*"]
```

```
        }
    }
]
```

Output:

```
{
    "Rules": [
        {
            "RuleArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/
f2f7dc8efc522ab2/1291d13826f405c3",
            "Priority": "5",
            "Conditions": [
                {
                    "Field": "path-pattern",
                    "Values": [
                        "/images/*"
                    ],
                    "PathPatternConfig": {
                        "Values": [
                            "/images/*"
                        ]
                    }
                }
            ],
            "Actions": [
                {
                    "Type": "forward",
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                    "ForwardConfig": {
                        "TargetGroups": [
                            {
                                "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                                "Weight": 1
                            }
                        ],
                        "TargetGroupStickinessConfig": {
                            "Enabled": false
                        }
                    }
```

```
                }
            ],
            "IsDefault": false
        }
    ]
}
```

For more information, see Add a listener rule for your Application Load Balancer in the *Application Load Balancers Guide*.

Example 2: To create a rule using a host condition and a fixed response

The following `create-rule` example creates a rule that provides a fixed response if the hostname in the host header matches the specified hostname.

```
aws elbv2 create-rule \
    --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \
    --priority 10 \
    --conditions file://conditions-host.json \
    --actions file://actions-fixed-response.json
```

Contents of `conditions-host.json`:

```
[
    {
        "Field": "host-header",
        "HostHeaderConfig": {
            "Values": ["*.example.com"]
        }
    }
]
```

Contents of `actions-fixed-response.json`:

```
[
    {
        "Type": "fixed-response",
        "FixedResponseConfig": {
            "MessageBody": "Hello world",
            "StatusCode": "200",
            "ContentType": "text/plain"
```

```
        }
    }
]
```

Output:

```
{
    "Rules": [
        {
            "RuleArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/
f2f7dc8efc522ab2/a7e3b2c1d4f56789",
            "Priority": "10",
            "Conditions": [
                {
                    "Field": "host-header",
                    "Values": [
                        "*.example.com"
                    ],
                    "HostHeaderConfig": {
                        "Values": [
                            "*.example.com"
                        ]
                    }
                }
            ],
            "Actions": [
                {
                    "Type": "fixed-response",
                    "FixedResponseConfig": {
                        "MessageBody": "Hello world",
                        "StatusCode": "200",
                        "ContentType": "text/plain"
                    }
                }
            ],
            "IsDefault": false
        }
    ]
}
```

For more information, see Add a listener rule for your Application Load Balancer in the *Application Load Balancers Guide*.

Example 3: To create a rule using a source IP address condition, an authenticate action, and a forward action

The following `create-rule` example creates a rule that authenticates the user if the source IP address matches the specified IP address, and forwards the request to the specified target group if authentication is successful.

```
aws elbv2 create-rule \
    --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/
my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \
    --priority 20 \
    --conditions file://conditions-source-ip.json \
    --actions file://actions-authenticate.json
```

Contents of `conditions-source-ip.json`:

```
[
    {
        "Field": "source-ip",
        "SourceIpConfig": {
            "Values": ["192.0.2.0/24", "198.51.100.10/32"]
        }
    }
]
```

Contents of `actions-authenticate.json`:

```
[
    {
        "Type": "authenticate-oidc",
        "AuthenticateOidcConfig": {
            "Issuer": "https://idp-issuer.com",
            "AuthorizationEndpoint": "https://authorization-endpoint.com",
            "TokenEndpoint": "https://token-endpoint.com",
            "UserInfoEndpoint": "https://user-info-endpoint.com",
            "ClientId": "abcdefghijklmnopqrstuvwxyz123456789",
            "ClientSecret": "12345678901234567890123456789O",
            "SessionCookieName": "my-cookie",
            "SessionTimeout": 3600,
            "Scope": "email",
            "AuthenticationRequestExtraParams": {
                "display": "page",
```

```
                "prompt": "login"
            },
            "OnUnauthenticatedRequest": "deny"
        },
        "Order": 1
    },
    {
        "Type": "forward",
        "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
        "Order": 2
    }
]
```

Output:

```
{
    "Rules": [
        {
            "RuleArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/

                        "Scope": "email",
                        "SessionTimeout": 3600,
                        "AuthenticationRequestExtraParams": {
                            "display": "page",
                            "prompt": "login"
                        },
                        "OnUnauthenticatedRequest": "deny"
                    },
                    "Order": 1
                },
                {
                    "Type": "forward",
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                    "Order": 2,
                    "ForwardConfig": {
                        "TargetGroups": [
                            {
                                "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                                "Weight": 1
                            }
                        ],
                        "TargetGroupStickinessConfig": {
                            "Enabled": false
                        }
                    }
                }
            ],
            "IsDefault": false
        }
    ]
}
```

For more information, see Add a listener rule for your Application Load Balancer in the *Application Load Balancers Guide*.

- For API details, see CreateRule in *AWS CLI Command Reference*.

`create-target-group`

The following code example shows how to use `create-target-group`.

AWS CLI

Example 1: To create a target group for an Application Load Balancer

The following `create-target-group` example creates a target group for an Application Load Balancer where you register targets by instance ID (the target type is `instance`). This target group uses the HTTP protocol, port 80, and the default health check settings for an HTTP target group.

```
aws elbv2 create-target-group \
    --name my-targets \
    --protocol HTTP \
    --port 80 \
    --target-type instance \
    --vpc-id vpc-3ac0fb5f
```

Output:

```
{
    "TargetGroups": [
        {
            "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
            "TargetGroupName": "my-targets",
            "Protocol": "HTTP",
            "Port": 80,
            "VpcId": "vpc-3ac0fb5f",
            "HealthCheckProtocol": "HTTP",
            "HealthCheckPort": "traffic-port",
            "HealthCheckEnabled": true,
            "HealthCheckIntervalSeconds": 30,
            "HealthCheckTimeoutSeconds": 5,
            "HealthyThresholdCount": 5,
            "UnhealthyThresholdCount": 2,
            "HealthCheckPath": "/",
            "Matcher": {
                "HttpCode": "200"
            },
```

```
            "TargetType": "instance",
            "ProtocolVersion": "HTTP1",
            "IpAddressType": "ipv4"
        }
    ]
}
```

For more information, see Create a target group in the *User Guide for Application Load Balancers*.

Example 2: To create a target group to route traffic from an Application Load Balancer to a Lambda function

The following `create-target-group` example creates a target group for an Application Load Balancer where the target is a Lambda function (the target type is `lambda`). Health checks are disabled for this target group by default.

```
aws elbv2 create-target-group \
    --name my-lambda-target \
    --target-type lambda
```

Output:

```
{
    "TargetGroups": [
        {
            "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-lambda-target/a3003e085dbb8ddc",
            "TargetGroupName": "my-lambda-target",
            "HealthCheckEnabled": false,
            "HealthCheckIntervalSeconds": 35,
            "HealthCheckTimeoutSeconds": 30,
            "HealthyThresholdCount": 5,
            "UnhealthyThresholdCount": 2,
            "HealthCheckPath": "/",
            "Matcher": {
                "HttpCode": "200"
            },
            "TargetType": "lambda",
            "IpAddressType": "ipv4"
        }
    ]
```

```
}
```

For more information, see Lambda functions as targets in the *User Guide for Application Load Balancers*.

Example 3: To create a target group for a Network Load Balancer

The following `create-target-group` example creates a target group for a Network Load Balancer where you register targets by IP address (the target type is `ip`). This target group uses the TCP protocol, port 80, and the default health check settings for a TCP target group.

```
aws elbv2 create-target-group \
    --name my-ip-targets \
    --protocol TCP \
    --port 80 \
    --target-type ip \
    --vpc-id vpc-3ac0fb5f
```

Output:

```
{
    "TargetGroups": [
        {
            "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-ip-targets/b6bba954d1361c78",
            "TargetGroupName": "my-ip-targets",
            "Protocol": "TCP",
            "Port": 80,
            "VpcId": "vpc-3ac0fb5f",
            "HealthCheckEnabled": true,
            "HealthCheckProtocol": "TCP",
            "HealthCheckPort": "traffic-port",
            "HealthCheckIntervalSeconds": 30,
            "HealthCheckTimeoutSeconds": 10,
            "HealthyThresholdCount": 5,
            "UnhealthyThresholdCount": 2,
            "TargetType": "ip",
            "IpAddressType": "ipv4"
        }
    ]
}
```

For more information, see Create a target group in the *User Guide for Network Load Balancers*.

Example 4: To create a target group to route traffic from a Network Load Balancer to an Application Load Balancer

The following `create-target-group` example creates a target group for a Network Load Balancer where you register an Application Load Balancer as a target (the target type is `alb`).

aws elbv2 create-target-group --name my-alb-target --protocol TCP --port 80 --target-type alb --vpc-id vpc-3ac0fb5f

Output:

```
{
    "TargetGroups": [
        {
            "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-alb-target/a3003e085dbb8ddc",
            "TargetGroupName": "my-alb-target",
            "Protocol": "TCP",
            "Port": 80,
            "VpcId": "vpc-838475fe",
            "HealthCheckProtocol": "HTTP",
            "HealthCheckPort": "traffic-port",
            "HealthCheckEnabled": true,
            "HealthCheckIntervalSeconds": 30,
            "HealthCheckTimeoutSeconds": 6,
            "HealthyThresholdCount": 5,
            "UnhealthyThresholdCount": 2,
            "HealthCheckPath": "/",
            "Matcher": {
                "HttpCode": "200-399"
            },
            "TargetType": "alb",
            "IpAddressType": "ipv4"
        }
    ]
}
```

For more information, see Create a target group with an Application Load Balancer as the target in the *User Guide for Network Load Balancers*.

Example 5: To create a target group for a Gateway Load Balancer

The following `create-target-group` example creates a target group for a Gateway Load Balancer where the target is an instance, and the target group protocol is GENEVE.

```
aws elbv2 create-target-group \
    --name my-glb-targetgroup \
    --protocol GENEVE \
    --port 6081 \
    --target-type instance \
    --vpc-id vpc-838475fe
```

Output:

```
{
    "TargetGroups": [
        {
            "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-glb-targetgroup/00c3d57eacd6f40b6f",
            "TargetGroupName": "my-glb-targetgroup",
            "Protocol": "GENEVE",
            "Port": 6081,
            "VpcId": "vpc-838475fe",
            "HealthCheckProtocol": "TCP",
            "HealthCheckPort": "80",
            "HealthCheckEnabled": true,
            "HealthCheckIntervalSeconds": 10,
            "HealthCheckTimeoutSeconds": 5,
            "HealthyThresholdCount": 5,
            "UnhealthyThresholdCount": 2,
            "TargetType": "instance"
        }
    ]
}
```

For more information, see Create a target group <https://docs.aws.amazon.com/elasticloadbalancing/latest/gateway/create-target-group.html>`__ in the *Gateway Load Balancer User Guide*.

- For API details, see CreateTargetGroup in *AWS CLI Command Reference*.

`delete-listener`

The following code example shows how to use `delete-listener`.

AWS CLI

To delete a listener

The following `delete-listener` example deletes the specified listener.

```
aws elbv2 delete-listener \
    --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/
my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

This command produces no output.

For more information, see Delete a listener for your Application Load Balancer in the *Application Load Balancers Guide*.

- For API details, see DeleteListener in *AWS CLI Command Reference*.

`delete-load-balancer`

The following code example shows how to use `delete-load-balancer`.

AWS CLI

To delete a load balancer

The following `delete-load-balancer` example deletes the specified load balancer.

```
aws elbv2 delete-load-balancer \
    --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```

This command produces no output.

For more information, see Delete an Application Load Balancer in the *Application Load Balancers Guide*.

- For API details, see DeleteLoadBalancer in *AWS CLI Command Reference*.

`delete-rule`

The following code example shows how to use `delete-rule`.

AWS CLI

To delete a rule

The following `delete-rule` example deletes the specified rule.

```
aws elbv2 delete-rule \
    --rule-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/
app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/1291d13826f405c3
```

This command produces no output.

For more information, see Delete a listener rule for your Application Load Balancer in the *Application Load Balancers Guide*.

- For API details, see DeleteRule in *AWS CLI Command Reference*.

`delete-target-group`

The following code example shows how to use `delete-target-group`.

AWS CLI

To delete a target group

The following `delete-target-group` example deletes the specified target group.

```
aws elbv2 delete-target-group \
    --target-group-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

This command produces no output.

For more information, see Delete a load balancer in the *Application Load Balancer Guide*.

- For API details, see DeleteTargetGroup in *AWS CLI Command Reference*.

`deregister-targets`

The following code example shows how to use `deregister-targets`.

AWS CLI

Example 1: To deregister a target from a target group

The following `deregister-targets` example removes the specified instance from the specified target group.

```
aws elbv2 deregister-targets \
    --target-group-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067 \
    --targets Id=i-1234567890abcdef0
```

This command produces no output.

For more information, see Register targets with your Application Load Balancer target group in the *Application Load Balancers Guide*.

Example 2: To deregister a target registered using port overrides

The following `deregister-targets` example removes an instance from a target group that was registered using port overrides.

```
aws elbv2 deregister-targets \
    --target-group-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-internal-targets/3bb63f11dfb0faf9 \
    --targets Id=i-1234567890abcdef0,Port=80 Id=i-1234567890abcdef0,Port=766
```

This command produces no output.

For more information, see Register targets with your Application Load Balancer target group in the *Application Load Balancers Guide*.

- For API details, see DeregisterTargets in *AWS CLI Command Reference*.

`describe-account-limits`

The following code example shows how to use `describe-account-limits`.

AWS CLI

To describe your Elastic Load Balancing limits

The following `describe-account-limits` example displays the Elastic Load Balancing limits for your AWS account in the current Region.

```
aws elbv2 describe-account-limits
```

Output:

```
{
    "Limits": [
        {
            "Name": "target-groups",
            "Max": "3000"
        },
        {
            "Name": "targets-per-application-load-balancer",
            "Max": "1000"
        },
        {
            "Name": "listeners-per-application-load-balancer",
            "Max": "50"
        },
        {
            "Name": "rules-per-application-load-balancer",
            "Max": "100"
        },
        {
            "Name": "network-load-balancers",
            "Max": "50"
        },
        {
            "Name": "targets-per-network-load-balancer",
            "Max": "3000"
        },
        {
            "Name": "targets-per-availability-zone-per-network-load-balancer",
            "Max": "500"
        },
        {
            "Name": "listeners-per-network-load-balancer",
            "Max": "50"
        },
        {
            "Name": "condition-values-per-alb-rule",
```

```
            "Max": "5"
        },
        {
            "Name": "condition-wildcards-per-alb-rule",
            "Max": "5"
        },
        {
            "Name": "target-groups-per-application-load-balancer",
            "Max": "100"
        },
        {
            "Name": "target-groups-per-action-on-application-load-balancer",
            "Max": "5"
        },
        {
            "Name": "target-groups-per-action-on-network-load-balancer",
            "Max": "1"
        },
        {
            "Name": "certificates-per-application-load-balancer",
            "Max": "25"
        },
        {
            "Name": "certificates-per-network-load-balancer",
            "Max": "25"
        },
        {
            "Name": "targets-per-target-group",
            "Max": "1000"
        },
        {
            "Name": "target-id-registrations-per-application-load-balancer",
            "Max": "1000"
        },
        {
            "Name": "network-load-balancer-enis-per-vpc",
            "Max": "1200"
        },
        {
            "Name": "application-load-balancers",
            "Max": "50"
        },
        {
            "Name": "gateway-load-balancers",
```

```
            "Max": "100"
        },
        {
            "Name": "gateway-load-balancers-per-vpc",
            "Max": "100"
        },
        {
            "Name": "geneve-target-groups",
            "Max": "100"
        },
        {
            "Name": "targets-per-availability-zone-per-gateway-load-balancer",
            "Max": "300"
        }
    ]
}
```

For more information, see Quotas for your Application Load Balancers in the *Application Load Balancers Guide* and Quotas for your Network Load Balancers in the *Network Load Balancers Guide*.

- For API details, see DescribeAccountLimits in *AWS CLI Command Reference*.

`describe-listener-certificates`

The following code example shows how to use `describe-listener-certificates`.

AWS CLI

To describe the certificates for a secure listener

The following `describe-listener-certificates` example describes the certificates for the specified secure listener.

```
aws elbv2 describe-listener-certificates \
    --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/
my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

Output:

```
{
```

```
    "Certificates": [
        {
            "CertificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "IsDefault": false
        },
        {
            "CertificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "IsDefault": false
        },
        {
            "CertificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/
a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "IsDefault": true
        }
    ]
}
```

For more information, see SSL certificates for your Application Load Balancer in the *Application Load Balancers Guide*.

- For API details, see DescribeListenerCertificates in *AWS CLI Command Reference*.

`describe-listeners`

The following code example shows how to use `describe-listeners`.

AWS CLI

Example 1: To describe a listener

The following `describe-listeners` example describes the specified listener.

```
aws elbv2 describe-listeners \
    --listener-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/
app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

Output:

```
{
    "Listeners": [
```

```
        {
            "Port": 80,
            "Protocol": "HTTP",
            "DefaultActions": [
                {
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                    "Type": "forward"
                }
            ],
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
            "ListenerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2"
        }
    ]
}
```

Example 2: To describe the listeners for a load balancer

The following `describe-listeners` example describes the listeners for the specified load balancer.

```
aws elbv2 describe-listeners \
    --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```

Output:

```
{
    "Listeners": [
        {
            "Port": 443,
            "Protocol": "HTTPS",
            "DefaultActions": [
                {
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                    "Type": "forward"
                }
            ],
            "SslPolicy": "ELBSecurityPolicy-2015-05",
            "Certificates": [
```

```
                {
                    "CertificateArn": "arn:aws:iam::123456789012:server-certificate/
my-server-cert"
                }
            ],
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
            "ListenerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/0467ef3c8400ae65"
        },
        {
            "Port": 80,
            "Protocol": "HTTP",
            "DefaultActions": [
                {
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                    "Type": "forward"
                }
            ],
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
            "ListenerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2"
        }
    ]
}
```

For more information, see Listeners for your Application Load Balancers in the *Application Load Balancers Guide*.

- For API details, see DescribeListeners in *AWS CLI Command Reference*.

`describe-load-balancer-attributes`

The following code example shows how to use `describe-load-balancer-attributes`.

AWS CLI

To describe load balancer attributes

The following `describe-load-balancer-attributes` example displays the attributes of the specified load balancer.

```
aws elbv2 describe-load-balancer-attributes \
    --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```

The following example output shows the attributes for an Application Load Balancer.

Output:

```
{
    "Attributes": [
        {
            "Value": "false",
            "Key": "access_logs.s3.enabled"
        },
        {
            "Value": "",
            "Key": "access_logs.s3.bucket"
        },
        {
            "Value": "",
            "Key": "access_logs.s3.prefix"
        },
        {
            "Value": "60",
            "Key": "idle_timeout.timeout_seconds"
        },
        {
            "Value": "false",
            "Key": "deletion_protection.enabled"
        },
        {
            "Value": "true",
            "Key": "routing.http2.enabled"
        }
    ]
}
```

The following example output includes the attributes for a Network Load Balancer.

Output:

```
{
    "Attributes": [
```

```
        {
            "Value": "false",
            "Key": "access_logs.s3.enabled"
        },
        {
            "Value": "",
            "Key": "access_logs.s3.bucket"
        },
        {
            "Value": "",
            "Key": "access_logs.s3.prefix"
        },
        {
            "Value": "false",
            "Key": "deletion_protection.enabled"
        },
        {
            "Value": "false",
            "Key": "load_balancing.cross_zone.enabled"
        }
    ]
}
```

For more information, see Edit attributes for your Application Load Balancer in the *Application Load Balancers Guide*.

- For API details, see DescribeLoadBalancerAttributes in *AWS CLI Command Reference*.

`describe-load-balancers`

The following code example shows how to use `describe-load-balancers`.

AWS CLI

Example 1: To describe a load balancer

The following `describe-load-balancers` example describes the specified load balancer.

```
aws elbv2 describe-load-balancers \
    --load-balancer-arns arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```

Output:

```
{
    "LoadBalancers": [
        {
            "Type": "application",
            "Scheme": "internet-facing",

    ]
}
```

For more information, see Application Load Balancers in the *Application Load Balancers Guide*.

- For API details, see DescribeLoadBalancers in *AWS CLI Command Reference*.

`describe-rules`

The following code example shows how to use `describe-rules`.

AWS CLI

Example 1: To describe a rule

The following `describe-rules` example displays details for the specified rule.

```
aws elbv2 describe-rules \
    --rule-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/
app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/9683b2d02a6cabee
```

Output:

```
{
    "Rules": [
        {
            "RuleArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/
f2f7dc8efc522ab2/9683b2d02a6cabee",
            "Priority": "10",
            "Conditions": [
                {
                    "Field": "path-pattern",
                    "Values": [
                        "/img/*"
                    ],
                    "PathPatternConfig": {
```

```
                        "Values": [
                            "/img/*"
                        ]
                    }
                }
            ],
            "Actions": [
                {
                    "Type": "forward",
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                    "ForwardConfig": {
                        "TargetGroups": [
                            {
                                "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                                "Weight": 1
                            }
                        ],
                        "TargetGroupStickinessConfig": {
                            "Enabled": false
                        }
                    }
                }
            ],
            "IsDefault": false
        }
    ]
}
```

For more information, see Listener rules for your Application Load Balancer in the *Application Load Balancers Guide*.

Example 2: To describe the rules for a listener

The following `describe-rules` example displays details for the rules for the specified listener. The output includes the default rule and any other rules that you've added.

```
aws elbv2 describe-rules \
    --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/
my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

Output:

```
{
    "Rules": [
        {
            "RuleArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/
f2f7dc8efc522ab2/9683b2d02a6cabee",
            "Priority": "10",
            "Conditions": [
                {
                    "Field": "path-pattern",
                    "Values": [
                        "/img/*"
                    ],
                    "PathPatternConfig": {
                        "Values": [
                            "/img/*"
                        ]
                    }
                }
            ],
            "Actions": [
                {
                    "Type": "forward",
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                    "ForwardConfig": {
                        "TargetGroups": [
                            {
                                "TargetGroupArn": "arn:aws:elasticloadbalancing:us-

west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                                "Weight": 1
                            }
                        ],
                        "TargetGroupStickinessConfig": {
                            "Enabled": false
                        }
                    }
                }
            ],
            "IsDefault": true
        }
    ]
}
```

For more information, see Listener rules for your Application Load Balancer in the *Application Load Balancers Guide*.

- For API details, see DescribeRules in *AWS CLI Command Reference*.

`describe-ssl-policies`

The following code example shows how to use `describe-ssl-policies`.

AWS CLI

Example 1: To list the policies used for SSL negotiation by load balancer type

The following `describe-ssl-policies` example displays the names of the polices that you can use for SSL negotiation with an Application Load Balancer. The example uses the `--query` parameter to display only the names of the policies.

```
aws elbv2 describe-ssl-policies \
    --load-balancer-type application \
    --query SslPolicies[*].Name
```

Output:

```
[
    "ELBSecurityPolicy-2016-08",
    "ELBSecurityPolicy-TLS13-1-2-2021-06",
    "ELBSecurityPolicy-TLS13-1-2-Res-2021-06",
    "ELBSecurityPolicy-TLS13-1-2-Ext1-2021-06",
    "ELBSecurityPolicy-TLS13-1-2-Ext2-2021-06",
    "ELBSecurityPolicy-TLS13-1-1-2021-06",
    "ELBSecurityPolicy-TLS13-1-0-2021-06",
    "ELBSecurityPolicy-TLS13-1-3-2021-06",
    "ELBSecurityPolicy-TLS-1-2-2017-01",
    "ELBSecurityPolicy-TLS-1-1-2017-01",
    "ELBSecurityPolicy-TLS-1-2-Ext-2018-06",
    "ELBSecurityPolicy-FS-2018-06",
    "ELBSecurityPolicy-2015-05",
    "ELBSecurityPolicy-TLS-1-0-2015-04",
    "ELBSecurityPolicy-FS-1-2-Res-2019-08",
    "ELBSecurityPolicy-FS-1-1-2019-08",
    "ELBSecurityPolicy-FS-1-2-2019-08",
    "ELBSecurityPolicy-FS-1-2-Res-2020-10"
]
```

Example 2: To list the policies that support a specific protocol

The following `describe-ssl-policies` example displays the names of the polices that support the TLS 1.3 protocol. The example uses the `--query` parameter to display only the names of the policies.

```
aws elbv2 describe-ssl-policies \
    --load-balancer-type application \
    --query "SslPolicies[?contains(SslProtocols,'TLSv1.3')].Name"
```

Output:

```
[
    "ELBSecurityPolicy-TLS13-1-2-2021-06",
    "ELBSecurityPolicy-TLS13-1-2-Res-2021-06",
    "ELBSecurityPolicy-TLS13-1-2-Ext1-2021-06",
    "ELBSecurityPolicy-TLS13-1-2-Ext2-2021-06",
    "ELBSecurityPolicy-TLS13-1-1-2021-06",
    "ELBSecurityPolicy-TLS13-1-0-2021-06",
    "ELBSecurityPolicy-TLS13-1-3-2021-06"
]
```

Example 3: To display the ciphers for a policy

The following `describe-ssl-policies` example displays the names of the ciphers for the specified policy. The example uses the `--query` parameter to display only the cipher names. The first cipher in the list has priority 1, and the remaining ciphers are in priority order.

```
aws elbv2 describe-ssl-policies \
    --names ELBSecurityPolicy-TLS13-1-2-2021-06 \
    --query SslPolicies[*].Ciphers[*].Name
```

Output:

```
[
    "TLS_AES_128_GCM_SHA256",
    "TLS_AES_256_GCM_SHA384",
    "TLS_CHACHA20_POLY1305_SHA256",
    "ECDHE-ECDSA-AES128-GCM-SHA256",
    "ECDHE-RSA-AES128-GCM-SHA256",
    "ECDHE-ECDSA-AES128-SHA256",
    "ECDHE-RSA-AES128-SHA256",
    "ECDHE-ECDSA-AES256-GCM-SHA384",
    "ECDHE-RSA-AES256-GCM-SHA384",
    "ECDHE-ECDSA-AES256-SHA384",
    "ECDHE-RSA-AES256-SHA384"
]
```

For more information, see Security policies for your Application Load Balancer in the *Application Load Balancers Guide*.

- For API details, see DescribeSslPolicies in *AWS CLI Command Reference*.

`describe-tags`

The following code example shows how to use `describe-tags`.

AWS CLI

To describe the tags assigned to a load balancer

The following `describe-tags` example describes the tags assigned to the specified load balancer.

```
aws elbv2 describe-tags \
    --resource-arns arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```

Output:

```
{
    "TagDescriptions": [
        {
            "ResourceArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
            "Tags": [
                {
                    "Value": "lima",
                    "Key": "project"
                },
                {
                    "Value": "digital-media",
                    "Key": "department"
                }
            ]
        }
    ]
}
```

For more information, see Tag an Application Load Balancer in the *Application Load Balancers Guide*.

- For API details, see DescribeTags in *AWS CLI Command Reference*.

`describe-target-group-attributes`

The following code example shows how to use `describe-target-group-attributes`.

AWS CLI

To describe target group attributes

The following `describe-target-group-attributes` example displays the attributes of the specified target group.

```
aws elbv2 describe-target-group-attributes \
    --target-group-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

The output includes the attributes if the protocol is HTTP or HTTPS and the target type is `instance` or `ip`.

Output:

```
{
    "Attributes": [
        {
            "Value": "false",
            "Key": "stickiness.enabled"
        },
        {
            "Value": "300",
            "Key": "deregistration_delay.timeout_seconds"
        },
        {
            "Value": "lb_cookie",
            "Key": "stickiness.type"
        },
        {
            "Value": "86400",
            "Key": "stickiness.lb_cookie.duration_seconds"
        },
        {
            "Value": "0",
            "Key": "slow_start.duration_seconds"
        }
    ]
```

```
}
```

The following output includes the attributes if the protocol is HTTP or HTTPS and the target type is `lambda`.

Output:

```
{
    "Attributes": [
        {
            "Value": "false",
            "Key": "lambda.multi_value_headers.enabled"
        }
    ]
}
```

The following output includes the attributes if the protocol is TCP, TLS, UDP, or TCP_UDP.

Output:

```
{
    "Attributes": [
        {
            "Value": "false",
            "Key": "proxy_protocol_v2.enabled"
        },
        {
            "Value": "300",
            "Key": "deregistration_delay.timeout_seconds"
        }
    ]
}
```

For more information, see Edit target group attributes for your Application Load Balancer in the *Application Load Balancers Guide*.

- For API details, see DescribeTargetGroupAttributes in *AWS CLI Command Reference*.

`describe-target-groups`

The following code example shows how to use `describe-target-groups`.

AWS CLI

Example 1: To describe a target group

The following `describe-target-groups` example displays details for the specified target group.

```
aws elbv2 describe-target-groups \
    --target-group-arns arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

Output:

```
{
    "TargetGroups": [
        {
            "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
            "TargetGroupName": "my-targets",
            "Protocol": "HTTP",
            "Port": 80,
            "VpcId": "vpc-3ac0fb5f",
            "HealthCheckProtocol": "HTTP",
            "HealthCheckPort": "traffic-port",
            "HealthCheckEnabled": true,
            "HealthCheckIntervalSeconds": 30,
            "HealthCheckTimeoutSeconds": 5,
            "HealthyThresholdCount": 5,
            "UnhealthyThresholdCount": 2,
            "HealthCheckPath": "/",
            "Matcher": {
                "HttpCode": "200"
            },
            "LoadBalancerArns": [
                "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/
app/my-load-balancer/50dc6c495c0c9188"
            ],
            "TargetType": "instance",
            "ProtocolVersion": "HTTP1",
            "IpAddressType": "ipv4"
        }
    ]
}
```

Example 2: To describe all target groups for a load balancer

The following `describe-target-groups` example displays details for all target groups for the specified load balancer. The example uses the `--query` parameter to display only the target group names.

```
aws elbv2 describe-target-groups \
    --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
    --query TargetGroups[*].TargetGroupName
```

Output:

```
[
    "my-instance-targets",
    "my-ip-targets",
    "my-lambda-target"
]
```

For more information, see Target groups in the *Application Load Balancers Guide*.

- For API details, see DescribeTargetGroups in *AWS CLI Command Reference*.

`describe-target-health`

The following code example shows how to use `describe-target-health`.

AWS CLI

Example 1: To describe the health of the targets for a target group

The following `describe-target-health` example displays health details for the targets of the specified target group. These targets are healthy.

```
aws elbv2 describe-target-health \
    --target-group-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

Output:

```
{
    "TargetHealthDescriptions": [
```

```
        {
            "HealthCheckPort": "80",
            "Target": {
                "Id": "i-ceddcd4d",
                "Port": 80
            },
            "TargetHealth": {
                "State": "healthy"
            }
        },
        {
            "HealthCheckPort": "80",
            "Target": {
                "Id": "i-0f76fade",
                "Port": 80
            },
            "TargetHealth": {
                "State": "healthy"
            }
        }
    ]
}
```

For more information, see Check the health of your Application Load Balancer targets in the *Application Load Balancers Guide*.

Example 2: To describe the health of a target

The following `describe-target-health` example displays health details for the specified target. This target is healthy.

```
aws elbv2 describe-target-health \
    --targets Id=i-0f76fade,Port=80 \
    --target-group-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

Output:

```
{
    "TargetHealthDescriptions": [
        {
            "HealthCheckPort": "80",
            "Target": {
```

```
                "Id": "i-0f76fade",
                "Port": 80
            },
            "TargetHealth": {
                "State": "healthy"
            }
        }
    ]
}
```

The following example output is for a target whose target group is not specified in an action for a listener. This target can't receive traffic from the load balancer.

```
{
    "TargetHealthDescriptions": [
    {
        "HealthCheckPort": "80",
        "Target": {
            "Id": "i-0f76fade",
            "Port": 80
        },
            "TargetHealth": {
                "State": "unused",
                "Reason": "Target.NotInUse",
                "Description": "Target group is not configured to receive traffic
 from the load balancer"
            }
        }
    ]
}
```

The following example output is for a target whose target group was just specified in an action for a listener. The target is still being registered.

```
{
    "TargetHealthDescriptions": [
        {
            "HealthCheckPort": "80",
            "Target": {
                "Id": "i-0f76fade",
                "Port": 80
            },
            "TargetHealth": {
```

```
                "State": "initial",
                "Reason": "Elb.RegistrationInProgress",
                "Description": "Target registration is in progress"
            }
        }
    ]
}
```

The following example output is for an unhealthy target.

```
{
    "TargetHealthDescriptions": [
        {
            "HealthCheckPort": "80",
            "Target": {
                "Id": "i-0f76fade",
                "Port": 80
            },
            "TargetHealth": {
                "State": "unhealthy",
                "Reason": "Target.Timeout",
                "Description": "Connection to target timed out"
            }
        }
    ]
}
```

The following example output is for a target that is a Lambda function and health checks are disabled.

```
{
    "TargetHealthDescriptions": [
        {
            "Target": {
                "Id": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
                "AvailabilityZone": "all",
            },
            "TargetHealth": {
                "State": "unavailable",
                "Reason": "Target.HealthCheckDisabled",
                "Description": "Health checks are not enabled for this target"
            }
        }
```

```
    ]
}
```

For more information, see Check the health of your Application Load Balancer targets in the *Application Load Balancers Guide*.

- For API details, see DescribeTargetHealth in *AWS CLI Command Reference*.

`modify-listener`

The following code example shows how to use `modify-listener`.

AWS CLI

Example 1: To change the default action to a forward action

The following `modify-listener` example changes the default action to a `forward` action for the specified listener.

```
aws elbv2 modify-listener \
    --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \
    --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-new-targets/2453ed029918f21f
```

Output:

```
{
    "Listeners": [
        {
            "ListenerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2",
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
            "Protocol": "HTTP",
            "Port": 80,
            "DefaultActions": [
                {
                    "Type": "forward",
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-new-targets/2453ed029918f21f"
                }
```

```
            ]
        }
    ]
}
```

Example 2: To change the default action to a redirect action

The following `modify-listener` example changes the default action to a `redirect` action for the specified listener.

```
aws elbv2 modify-listener \
    --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/
my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \
    --default-actions
 'Type=redirect,RedirectConfig={Protocol=HTTPS,StatusCode=HTTP_302}'
```

Output:

```
{
    "Listeners": [
        {
            "ListenerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/
f2f7dc8efc522ab2",
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
            "Protocol": "HTTP",
            "Port": 80,
            "DefaultActions": [
                {
                    "Type": "redirect",
                    "RedirectConfig": {
                        "Protocol": "HTTPS",
                        "Port": "#{port}",
                        "Host": "#{host}",
                        "Path": "/#{path}",
                        "Query": "#{query}",
                        "StatusCode": "HTTP_302"
                    }
                }
            ]
        }
    ]
```

```
}
```

Example 3: To change the server certificate

The following `modify-listener` example changes the server certificate for the specified HTTPS listener.

```
aws elbv2 modify-listener \
    --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/0467ef3c8400ae65 \
    --certificates CertificateArn=arn:aws:iam::123456789012:server-certificate/my-new-server-cert
```

Output:

```
{
    "Listeners": [
        {
            "ListenerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener/app/my-load-
balancer/50dc6c495c0c9188/0467ef3c8400ae65",
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
            "Protocol": "HTTPS",
            "Port": 443,
            "DefaultActions": [
                {
                    "Type": "forward",
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067"
                }
            ],
            "SslPolicy": "ELBSecurityPolicy-2015-05",
            "Certificates": [
                {
                    "CertificateArn": "arn:aws:iam::123456789012:server-certificate/
my-new-server-cert"
                }
            ]
        }
    ]
}
```

For more information, see Listener rules in the *Application Load Balancers User Guide*.

- For API details, see ModifyListener in *AWS CLI Command Reference*.

`modify-load-balancer-attributes`

The following code example shows how to use `modify-load-balancer-attributes`.

AWS CLI

Example 1: To enable deletion protection

The following `modify-load-balancer-attributes` example enables deletion protection for the specified load balancer.

```
aws elbv2 modify-load-balancer-attributes \
    --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
    --attributes Key=deletion_protection.enabled,Value=true
```

Output:

```
{
    "Attributes": [
        {
            "Value": "true",
            "Key": "deletion_protection.enabled"
        },
        {
            "Value": "false",
            "Key": "access_logs.s3.enabled"
        },
        {
            "Value": "60",
            "Key": "idle_timeout.timeout_seconds"
        },
        {
            "Value": "",
            "Key": "access_logs.s3.prefix"
        },
        {
            "Value": "",
            "Key": "access_logs.s3.bucket"
```

```
        }
    ]
}
```

For more information, see Edit attributes for your Application Load Balancer in the *Application Load Balancers Guide*.

Example 2: To change the idle timeout

The following `modify-load-balancer-attributes` example changes the idle timeout value for the specified load balancer.

```
aws elbv2 modify-load-balancer-attributes \
    --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
    --attributes Key=idle_timeout.timeout_seconds,Value=30
```

Output:

```
{
    "Attributes": [
        {
            "Value": "30",
            "Key": "idle_timeout.timeout_seconds"
        },
        {
            "Value": "false",
            "Key": "access_logs.s3.enabled"
        },
        {
            "Value": "",
            "Key": "access_logs.s3.prefix"
        },
        {
            "Value": "true",
            "Key": "deletion_protection.enabled"
        },
        {
            "Value": "",
            "Key": "access_logs.s3.bucket"
        }
    ]
```

```
}
```

For more information, see Edit attributes for your Application Load Balancer in the *Application Load Balancers Guide*.

Example 3: To enable access logs

The following `modify-load-balancer-attributes` example enables access logs for the specified load balancer. Note that the S3 bucket must exist in the same region as the load balancer and must have a policy attached that grants access to the Elastic Load Balancing service.

```
aws elbv2 modify-load-balancer-attributes \
    --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
    --
attributes Key=access_logs.s3.enabled,Value=true Key=access_logs.s3.bucket,Value=my-
loadbalancer-logs Key=access_logs.s3.prefix,Value=myapp
```

Output:

```
{
    "Attributes": [
        {
            "Value": "true",
            "Key": "access_logs.s3.enabled"
        },
        {
            "Value": "my-load-balancer-logs",
            "Key": "access_logs.s3.bucket"
        },
        {
            "Value": "myapp",
            "Key": "access_logs.s3.prefix"
        },
        {
            "Value": "60",
            "Key": "idle_timeout.timeout_seconds"
        },
        {
            "Value": "false",
            "Key": "deletion_protection.enabled"
```

```
        }
    ]
}
```

For more information, see Access logs for your Application Load Balancer in the *Application Load Balancers Guide*.

- For API details, see ModifyLoadBalancerAttributes in *AWS CLI Command Reference*.

`modify-rule`

The following code example shows how to use `modify-rule`.

AWS CLI

To modify a rule

The following `modify-rule` example updates the actions and conditions for the specified rule.

```
aws elbv2 modify-rule \
    --actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067 \
    --conditions Field=path-pattern,Values='/images/*' \
    --rule-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/
app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/9683b2d02a6cabee
```

Output:

```
{
    "Rules": [
        {
            "Priority": "10",
            "Conditions": [
                {
                    "Field": "path-pattern",
                    "Values": [
                        "/images/*"
                    ]
                }
            ],
            "RuleArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/
f2f7dc8efc522ab2/9683b2d02a6cabee",
```

```
            "IsDefault": false,
            "Actions": [
                {
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                    "Type": "forward"
                }
            ]
        }
    ]
}
```

For more information, see Edit a listener rule for your Application Load Balancer in the *Application Load Balancers Guide*.

- For API details, see ModifyRule in *AWS CLI Command Reference*.

`modify-target-group-attributes`

The following code example shows how to use `modify-target-group-attributes`.

AWS CLI

To modify the deregistration delay timeout

The following `modify-target-group-attributes` example sets the deregistration delay timeout to the specified value for the specified target group.

```
aws elbv2 modify-target-group-attributes \
    --target-group-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067 \
    --attributes Key=deregistration_delay.timeout_seconds,Value=600
```

Output:

```
{
    "Attributes": [
        {
            "Value": "false",
            "Key": "stickiness.enabled"
        },
        {
```

```
            "Value": "600",
            "Key": "deregistration_delay.timeout_seconds"
        },
        {
            "Value": "lb_cookie",
            "Key": "stickiness.type"
        },
        {
            "Value": "86400",
            "Key": "stickiness.lb_cookie.duration_seconds"
        }
    ]
}
```

For more information, see Edit target group attributes for your Application Load Balancer in the *Application Load Balancers Guide*.

- For API details, see ModifyTargetGroupAttributes in *AWS CLI Command Reference*.

`modify-target-group`

The following code example shows how to use `modify-target-group`.

AWS CLI

To modify the health check configuration for a target group

The following `modify-target-group` example changes the configuration of the health checks used to evaluate the health of the targets for the specified target group. Because the range for the `--matcher` option contains a comma, put the range in double quotes and the whole value in single quotes.

```
aws elbv2 modify-target-group \
    --target-group-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-https-targets/2453ed029918f21f \
    --health-check-protocol HTTPS \
    --health-check-port 443 \
    --matcher 'HttpCode="200,299"'
```

Output:

```
{
```

```
    "TargetGroups": [
        {
            "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-https-targets/2453ed029918f21f",
            "TargetGroupName": "my-https-targets",
            "Protocol": "HTTPS",
            "Port": 443,
            "VpcId": "vpc-3ac0fb5f",
            "HealthCheckProtocol": "HTTPS",
            "HealthCheckPort": "443",
            "HealthCheckEnabled": true,
            "HealthCheckIntervalSeconds": 30,
            "HealthCheckTimeoutSeconds": 5,
            "HealthyThresholdCount": 5,
            "UnhealthyThresholdCount": 2,
            "Matcher": {
                "HttpCode": "200,299"
            },
            "LoadBalancerArns": [
                "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/
app/my-load-balancer/50dc6c495c0c9188"
            ],
            "TargetType": "instance",
            "ProtocolVersion": "HTTP1",
            "IpAddressType": "ipv4"
        }
    ]
}
```

For more information, see Target groups in the *Application Load Balancers Guide*.

- For API details, see ModifyTargetGroup in *AWS CLI Command Reference*.

`register-targets`

The following code example shows how to use `register-targets`.

AWS CLI

Example 1: To register targets with a target group by instance ID

The following `register-targets` example registers the specified instances with a target group. The target group must have a target type of `instance`.

```
aws elbv2 register-targets \
    --target-group-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067 \
    --targets Id=i-1234567890abcdef0 Id=i-0abcdef1234567890
```

This command produces no output.

For more information, see Register targets with your Application Load Balancer target group in the *Application Load Balancers Guide*.

Example 2: To register targets with a target group using port overrides

The following `register-targets` example registers the specified instance with a target group using multiple ports. This enables you to register containers on the same instance as targets in the target group.

```
aws elbv2 register-targets \
    --target-group-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-internal-targets/3bb63f11dfb0faf9 \
    --targets Id=i-0598c7d356eba48d7,Port=80 Id=i-0598c7d356eba48d7,Port=766
```

This command produces no output.

For more information, see Register targets with your Application Load Balancer target group in the *Application Load Balancers Guide*.

Example 3: To register targets with a target group by IP address

The following `register-targets` example registers the specified IP addresses with a target group. The target group must have a target type of `ip`.

```
aws elbv2 register-targets \
    --target-group-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-tcp-ip-targets/8518e899d173178f \
    --targets Id=10.0.1.15 Id=10.0.1.23
```

This command produces no output.

For more information, see Register targets for your Network Load Balancer in the *Network Load Balancers Guide*.

Example 4: To register a Lambda function as a target

The following `register-targets` example registers the specified IP addresses with a target group. The target group must have a target type of `lambda`. You must grant Elastic Load Balancing permission to invoke the Lambda function.

```
aws elbv2 register-targets \
    --target-group-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-tcp-ip-targets/8518e899d173178f \
    --targets Id=arn:aws:lambda:us-west-2:123456789012:function:my-function
```

This command produces no output.

For more information, see Use Lambda functions as targets of an Application Load Balancer in the *Application Load Balancers Guide*.

- For API details, see RegisterTargets in *AWS CLI Command Reference*.

`remove-listener-certificates`

The following code example shows how to use `remove-listener-certificates`.

AWS CLI

To remove a certificate from a secure listener

The following `remove-listener-certificates` example removes the specified certificate from the specified secure listener.

```
aws elbv2 remove-listener-certificates \
    --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/
my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \
    --certificates CertificateArn=arn:aws:acm:us-west-2:123456789012:certificate/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see SSL certificates for your Application Load Balancer in the *Application Load Balancers Guide*.

- For API details, see RemoveListenerCertificates in *AWS CLI Command Reference*.

`remove-tags`

The following code example shows how to use `remove-tags`.

AWS CLI

To remove tags from a load balancer

The following `remove-tags` example removes the `project` and `department` tags from the specified load balancer.

```
aws elbv2 remove-tags \
    --resource-arns arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
    --tag-keys project department
```

This command produces no output.

For more information, see Tag an Application Load Balancer in the *Application Load Balancers Guide*.

- For API details, see RemoveTags in *AWS CLI Command Reference*.

`set-ip-address-type`

The following code example shows how to use `set-ip-address-type`.

AWS CLI

To set the address type of a load balancer

The following `set-ip-address-type` example sets the address type of the specified load balancer to `dualstack`. The load balancer subnets must have associated IPv6 CIDR blocks.

```
aws elbv2 set-ip-address-type \
    --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
    --ip-address-type dualstack
```

Output:

```
{
```

```
    "IpAddressType": "dualstack"
}
```

For more information, see Update the IP address types for your Application Load Balancer in the *Application Load Balancers Guide*.

- For API details, see SetIpAddressType in *AWS CLI Command Reference*.

`set-rule-priorities`

The following code example shows how to use `set-rule-priorities`.

AWS CLI

To set the rule priority

The following `set-rule-priorities` example sets the priority of the specified rule.

```
aws elbv2 set-rule-priorities \
    --rule-priorities RuleArn=arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/
f2f7dc8efc522ab2/1291d13826f405c3,Priority=5
```

Output:

```
{
    "Rules": [
        {
            "Priority": "5",
            "Conditions": [
                {
                    "Field": "path-pattern",
                    "Values": [
                        "/img/*"
                    ]
                }
            ],
            "RuleArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/
f2f7dc8efc522ab2/1291d13826f405c3",
            "IsDefault": false,
            "Actions": [
                {
```

```
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                    "Type": "forward"
                }
            ]
        }
    ]
}
```

For more information, see Edit a listener rule for your Application Load Balancer in the *Application Load Balancers Guide*.

- For API details, see SetRulePriorities in *AWS CLI Command Reference*.

`set-security-groups`

The following code example shows how to use `set-security-groups`.

AWS CLI

To associate a security group with a load balancer

The following `set-security-groups` example associates the specified security group with the specified load balancer.

```
aws elbv2 set-security-groups \
    --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
    --security-groups sg-5943793c
```

Output:

```
{
    "SecurityGroupIds": [
        "sg-5943793c"
    ]
}
```

For more information, see Security groups for your Application Load Balancer in the *Application Load Balancers Guide*.

- For API details, see SetSecurityGroups in *AWS CLI Command Reference*.

`set-subnets`

The following code example shows how to use `set-subnets`.

AWS CLI

To enable Availability Zones for a load balancer

The following `set-subnets` example enables the Availability Zone for the specified subnet for the specified load balancer.

```
aws elbv2 set-subnets \
    --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
    --subnets subnet-8360a9e7 subnet-b7d581c0
```

Output:

```
{
    "AvailabilityZones": [
        {
            "SubnetId": "subnet-8360a9e7",
            "ZoneName": "us-west-2a"
        },
        {
            "SubnetId": "subnet-b7d581c0",
            "ZoneName": "us-west-2b"
        }
    ]
}
```

For more information, see Update the Availability Zones for your Application Load Balancer in the *Application Load Balancers Guide*.

- For API details, see SetSubnets in *AWS CLI Command Reference*.

ElastiCache examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with ElastiCache.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-tags-to-resource`

The following code example shows how to use `add-tags-to-resource`.

AWS CLI

To add tags to a resource

The following `add-tags-to-resource` example adds up to 10 tags, key-value pairs, to a cluster or snapshot resource.

```
aws elasticache add-tags-to-resource \
    --resource-name "arn:aws:elasticache:us-west-2:1234567890:cluster:my-mem-cluster" \
    --tags Key="APIVersion",Value="20150202" Key="Service",Value="ElastiCache"
```

Output:

```
{
    "TagList": [
        {
            "Value": "20150202",
            "Key": "APIVersion"
        },
        {
            "Value": "ElastiCache",
            "Key": "Service"
        }
    ]
}
```

For more information, see Monitoring Costs with Cost Allocation Tags in the *Elasticache User Guide*.

- For API details, see AddTagsToResource in *AWS CLI Command Reference*.

`authorize-cache-security-group-ingress`

The following code example shows how to use `authorize-cache-security-group-ingress`.

AWS CLI

To authorize cache security group for ingress

The following `authorize-cache-security-group-ingress` example allows network ingress to a cache security group.

```
aws elasticache authorize-cache-security-group-ingress \
    --cache-security-group-name "my-sec-grp" \
    --ec2-security-group-name "my-ec2-sec-grp" \
    --ec2-security-group-owner-id "1234567890"
```

Output:

```
{
    "CacheSecurityGroup": {
        "OwnerId": "123456789012",
        "CacheSecurityGroupName": "my-sec-grp",
        "Description": "My cache security group",
        "EC2SecurityGroups": [
            {
                "Status": "authorizing",
                "EC2SecurityGroupName": "my-ec2-sec-grp",
                "EC2SecurityGroupOwnerId": "1234567890"
            }
        ],
        "ARN": "arn:aws:elasticache:us-west-2:123456789012:securitygroup:my-sec-grp"
    }
}
```

For more information, see Self-Service Updates in Amazon ElastiCache in the *Elasticache User Guide*.

- For API details, see AuthorizeCacheSecurityGroupIngress in *AWS CLI Command Reference*.

`batch-apply-update-action`

The following code example shows how to use `batch-apply-update-action`.

AWS CLI

To apply a service update

The following `batch-apply-update-action` example applies a service update to a Redis cluster.

```
aws elasticache batch-apply-update-action \
    --service-update-name elc-xxxxx406-xxx \
    --replication-group-ids test-cluster
```

Output:

```
{
    "ProcessedUpdateActions": [
        {
            "ReplicationGroupId": "pat-cluster",
            "ServiceUpdateName": "elc-xxxxx406-xxx",
            "UpdateActionStatus": "waiting-to-start"
        }
    ],
    "UnprocessedUpdateActions": []
}
```

For more information, see Self-Service Updates in Amazon ElastiCache in the *Elasticache User Guide*.

- For API details, see BatchApplyUpdateAction in *AWS CLI Command Reference*.

`batch-stop-update-action`

The following code example shows how to use `batch-stop-update-action`.

AWS CLI

To stop a service update

The following `batch-stop-update-action` example applies a service update to a Redis cluster.

```
aws elasticache batch-stop-update-action \
    --service-update-name elc-xxxxx406-xxx \
    --replication-group-ids test-cluster
```

Output:

```
{
    "ProcessedUpdateActions": [
        {
            "ReplicationGroupId": "pat-cluster",
            "ServiceUpdateName": "elc-xxxxx406-xxx",
            "UpdateActionStatus": "stopping"
        }
    ],
    "UnprocessedUpdateActions": []
}
```

For more information, see Self-Service Updates in Amazon ElastiCache in the *Elasticache User Guide*.

- For API details, see BatchStopUpdateAction in *AWS CLI Command Reference*.

`copy-snapshot`

The following code example shows how to use `copy-snapshot`.

AWS CLI

To copy a snapshot

The following `copy-snapshot` example makes a copy of an existing snapshot.

```
aws elasticache copy-snapshot \
    --source-snapshot-name "my-snapshot" \
    --target-snapshot-name "my-snapshot-copy"
```

Output:

```
{
    "Snapshot":{
```

```
        "Engine": "redis",
        "CacheParameterGroupName": "default.redis3.2",
        "VpcId": "vpc-3820329f3",
        "CacheClusterId": "my-redis4",
        "SnapshotRetentionLimit": 7,
        "NumCacheNodes": 1,
        "SnapshotName": "my-snapshot-copy",
        "CacheClusterCreateTime": "2016-12-21T22:24:04.955Z",
        "AutoMinorVersionUpgrade": true,
        "PreferredAvailabilityZone": "us-west-2c",
        "SnapshotStatus": "creating",
        "SnapshotSource": "manual",
        "SnapshotWindow": "07:00-08:00",
        "EngineVersion": "3.2.4",
        "NodeSnapshots": [
            {
                "CacheSize": "3 MB",
                "SnapshotCreateTime": "2016-12-28T07:00:52Z",
                "CacheNodeId": "0001",
                "CacheNodeCreateTime": "2016-12-21T22:24:04.955Z"
            }
        ],
        "CacheSubnetGroupName": "default",
        "Port": 6379,
        "PreferredMaintenanceWindow": "tue:09:30-tue:10:30",
        "CacheNodeType": "cache.m3.large"
    }
}
```

For more information, see Exporting a Backup in the *Elasticache User Guide*.

- For API details, see CopySnapshot in *AWS CLI Command Reference*.

`create-cache-cluster`

The following code example shows how to use `create-cache-cluster`.

AWS CLI

To create a cache cluster

The following `create-cache-cluster` example creates a cache cluster using the Redis engine.

```
aws elasticache create-cache-cluster \
    --cache-cluster-id "cluster-test" \
    --engine redis \
    --cache-node-type cache.m5.large \
    --num-cache-nodes 1
```

Output:

```
{
    "CacheCluster": {
        "CacheClusterId": "cluster-test",
        "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/
home#client-download:",
        "CacheNodeType": "cache.m5.large",
        "Engine": "redis",
        "EngineVersion": "5.0.5",
        "CacheClusterStatus": "creating",
        "NumCacheNodes": 1,
        "PreferredMaintenanceWindow": "sat:13:00-sat:14:00",
        "PendingModifiedValues": {},
        "CacheSecurityGroups": [],
        "CacheParameterGroup": {
            "CacheParameterGroupName": "default.redis5.0",
            "ParameterApplyStatus": "in-sync",
            "CacheNodeIdsToReboot": []
        },
        "CacheSubnetGroupName": "default",
        "AutoMinorVersionUpgrade": true,
        "SnapshotRetentionLimit": 0,
        "SnapshotWindow": "06:30-07:30",
        "TransitEncryptionEnabled": false,
        "AtRestEncryptionEnabled": false
    }
}
```

For more information, see Creating a Cluster in the *Elasticache User Guide*.

- For API details, see CreateCacheCluster in *AWS CLI Command Reference*.

`create-cache-parameter-group`

The following code example shows how to use `create-cache-parameter-group`.

AWS CLI

To create a cache parameter group

The following `create-cache-parameter-group` example creates a new Amazon ElastiCache cache parameter group.

```
aws elasticache create-cache-parameter-group \
    --cache-parameter-group-family "redis5.0" \
    --cache-parameter-group-name "mygroup" \
    --description "mygroup"
```

Output:

```
{
    "CacheParameterGroup": {
        "CacheParameterGroupName": "mygroup",
        "CacheParameterGroupFamily": "redis5.0",
        "Description": "my group"
    }
}
```

For more information, see Creating a Parameter Group in the *Elasticache User Guide*.

- For API details, see CreateCacheParameterGroup in *AWS CLI Command Reference*.

`create-cache-subnet-group`

The following code example shows how to use `create-cache-subnet-group`.

AWS CLI

To create a cache subnet group

The following `create-cache-subnet-group` example creates a new cache subnet group.

```
aws elasticache create-cache-subnet-group \
    --cache-subnet-group-name "mygroup" \
    --cache-subnet-group-description "my subnet group" \
    --subnet-ids "subnet-xxxxec4f"
```

Output:

```
{
    "CacheSubnetGroup": {
        "CacheSubnetGroupName": "mygroup",
        "CacheSubnetGroupDescription": "my subnet group",
        "VpcId": "vpc-a3e97cdb",
        "Subnets": [
            {
                "SubnetIdentifier": "subnet-xxxxec4f",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2d"
                }
            }
        ]
    }
}
```

For more information, see Creating a subnet group in the *Elasticache User Guide*.

- For API details, see CreateCacheSubnetGroup in *AWS CLI Command Reference*.

`create-global-replication-group`

The following code example shows how to use `create-global-replication-group`.

AWS CLI

To create a global replication group

The following `create-global-replication-group` example creates a new global replication group.

```
aws elasticache create-global-replication-group \
    --global-replication-group-id-suffix my-global-replication-group \
    --primary-replication-group-id my-primary-cluster
```

Output:

```
{
    "GlobalReplicationGroup": {
```

```
        "GlobalReplicationGroupId": "sgaui-my-global-replication-group",
        "GlobalReplicationGroupDescription": " ",
        "Status": "creating",
        "CacheNodeType": "cache.r5.large",
        "Engine": "redis",
        "EngineVersion": "5.0.6",
        "Members": [
            {
                "ReplicationGroupId": "my-primary-cluster",
                "ReplicationGroupRegion": "us-west-2",
                "Role": "PRIMARY",
                "AutomaticFailover": "enabled",

            }
        ],
        "AuthTokenEnabled": false,
        "TransitEncryptionEnabled": false,
        "AtRestEncryptionEnabled": false
    }
}
```

For more information, see Replication across AWS Regions using global datastores in the *Amazon ElastiCache User Guide*.

- For API details, see CreateGlobalReplicationGroup in *AWS CLI Command Reference*.

`create-replication-group`

The following code example shows how to use `create-replication-group`.

AWS CLI

To create a replication group

The following `create-replication-group` example creates a Valkey (cluster mode disabled) replication group with in-transit encryption enabled. This operation is valid for Valkey and Redis

OSS. For Valkey, you must specify `--transit-encryption-enabled` or `--no-transit-encryption-enabled`.

```
aws elasticache create-replication-group \
    --replication-group-id "mygroup" \
    --replication-group-description "my group" \
    --engine "valkey" \
    --cache-node-type "cache.m7g.large" \
    --transit-encryption-enabled
```

Output:

```
{
    "ReplicationGroup": {
        "ReplicationGroupId": "mygroup",
        "Description": "my group",
        "GlobalReplicationGroupInfo": {},
        "Status": "creating",
        "PendingModifiedValues": {},
        "MemberClusters": [
            "mygroup-001"
        ],
        "AutomaticFailover": "disabled",
        "MultiAZ": "disabled",
        "SnapshotRetentionLimit": 0,
        "SnapshotWindow": "09:30-10:30",
        "ClusterEnabled": false,
        "CacheNodeType": "cache.m7g.large",
        "TransitEncryptionEnabled": true,
        "AtRestEncryptionEnabled": true,
        "ARN": "arn:aws:elasticache:us-
west-2:123456789012:replicationgroup:mygroup",
        "LogDeliveryConfigurations": [],
        "ReplicationGroupCreateTime": "2026-10-26T14:21:45.460000+00:00",
        "DataTiering": "disabled",
        "AutoMinorVersionUpgrade": true,
        "NetworkType": "ipv4",
        "IpDiscovery": "ipv4",
        "TransitEncryptionMode": "required",
        "ClusterMode": "disabled",
        "Engine": "valkey"
    }
```

```
}
```

For more information, see Creating a Valkey or Redis OSS replication group in the *Amazon ElastiCache User Guide*.

- For API details, see CreateReplicationGroup in *AWS CLI Command Reference*.

`create-serverless-cache`

The following code example shows how to use `create-serverless-cache`.

AWS CLI

To create a serverless cache

The following `create-serverless-cache` example creates a Valkey serverless cache using only the required parameters. The example omits `--subnet-ids` and `--security-group-ids`, so ElastiCache selects default subnets in your default VPC and uses the default security group of that VPC.

```
aws elasticache create-serverless-cache \
    --serverless-cache-name my-serverless-cache \
    --engine valkey
```

Output:

```
{
    "ServerlessCache": {
        "ServerlessCacheName": "my-serverless-cache",
        "Description": " ",
        "CreateTime": "2026-10-26T14:21:19.667000+00:00",
        "Status": "creating",
        "Engine": "valkey",
        "MajorEngineVersion": "9",
        "SecurityGroupIds": [
            "sg-xxxxxxxxxxxxc560"
        ],
        "ARN": "arn:aws:elasticache:us-west-2:123456789012:serverlesscache:my-
serverless-cache",
        "SubnetIds": [
            "subnet-xxxxxxxxxxxxb4b0",
```

```
            "subnet-xxxxxxxxxxxx2437",
            "subnet-xxxxxxxxxxxx5198"
        ],
        "SnapshotRetentionLimit": 0,
        "DailySnapshotTime": "08:30"
    }
}
```

For more information, see Create a Valkey serverless cache in a VPC in the *Amazon ElastiCache User Guide*.

- For API details, see CreateServerlessCache in *AWS CLI Command Reference*.

`create-snapshot`

The following code example shows how to use `create-snapshot`.

AWS CLI

To create a snapshot

The following `create-snapshot` example creates a snapshot using the Redis engine.

```
aws elasticache create-snapshot \
    --snapshot-name mysnapshot \
    --cache-cluster-id cluster-test
```

Output:

```
{
    "Snapshot": {
        "SnapshotName": "mysnapshot",
        "CacheClusterId": "cluster-test",
        "SnapshotStatus": "creating",
        "SnapshotSource": "manual",
        "CacheNodeType": "cache.m5.large",
        "Engine": "redis",
        "EngineVersion": "5.0.5",
        "NumCacheNodes": 1,
        "PreferredAvailabilityZone": "us-west-2b",
        "CacheClusterCreateTime": "2020-03-19T03:12:01.483Z",
        "PreferredMaintenanceWindow": "sat:13:00-sat:14:00",
```

```
        "Port": 6379,
        "CacheParameterGroupName": "default.redis5.0",
        "CacheSubnetGroupName": "default",
        "VpcId": "vpc-a3e97cdb",
        "AutoMinorVersionUpgrade": true,
        "SnapshotRetentionLimit": 0,
        "SnapshotWindow": "06:30-07:30",
        "NodeSnapshots": [
            {
                "CacheNodeId": "0001",
                "CacheSize": "",
                "CacheNodeCreateTime": "2020-03-19T03:12:01.483Z"
            }
        ]
    }
}
```

For more information, see Backup and Restore for ElastiCache for Redis in the *Elasticache User Guide*.

- For API details, see CreateSnapshot in *AWS CLI Command Reference*.

`create-user-group`

The following code example shows how to use `create-user-group`.

AWS CLI

To create a user group

The following `create-user-group` example creates a new user group.

```
aws elasticache create-user-group \
    --user-group-id myusergroup \
    --engine redis \
    --user-ids default
```

Output:

```
{
    "UserGroupId": "myusergroup",
    "Status": "creating",
```

```
    "Engine": "redis",
    "UserIds": [
        "default"
    ],
    "ReplicationGroups": [],
    "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:usergroup:myusergroup"
}
```

For more information, see Authenticating Users with Role-Based Access Control (RBAC) in the *Elasticache User Guide*.

- For API details, see CreateUserGroup in *AWS CLI Command Reference*.

`create-user`

The following code example shows how to use `create-user`.

AWS CLI

To create a user

The following `create-user` example creates a new user.

```
aws elasticache create-user \
    --user-id user1 \
    --user-name myUser \
    --passwords mYnuUzrpAxXw2rdzx \
    --engine redis \
    --access-string "on ~app::* -@all +@read"
```

Output:

```
{
    "UserId": "user2",
    "UserName": "myUser",
    "Status": "active",
    "Engine": "redis",
    "AccessString": "on ~app::* -@all +@read +@hash +@bitmap +@geo -setbit -bitfield
 -hset -hsetnx -hmset -hincrby -hincrbyfloat -hdel -bitop -geoadd -georadius -
georadiusbymember",
    "UserGroupIds": [],
    "Authentication": {
```

```
        "Type": "password",
        "PasswordCount": 1
    },
    "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user2"
}
```

For more information, see Authenticating Users with Role-Based Access Control (RBAC) in the *Elasticache User Guide*.

- For API details, see CreateUser in *AWS CLI Command Reference*.

`decrease-node-groups-in-global-replication-group`

The following code example shows how to use `decrease-node-groups-in-global-replication-group`.

AWS CLI

To decrease the number of node groups in a global replication group

The following `decrease-node-groups-in-global-replication-group` example decreases the node group count using the Redis engine.

```
aws elasticache decrease-node-groups-in-global-replication-group \
    --global-replication-group-id sgaui-test \
    --node-group-count 1 \
    --apply-immediately \
    --global-node-groups-to-retain sgaui-test-0003
```

Output:

```
{
    "GlobalReplicationGroup":
    {
        "GlobalReplicationGroupId": "sgaui-test",
        "GlobalReplicationGroupDescription": "test",
        "Status": "modifying",
        "CacheNodeType": "cache.r5.large",
        "Engine": "redis",
        "EngineVersion": "5.0.6",
        "Members": [
            {
```

```
                "ReplicationGroupId": "test-2",
                "ReplicationGroupRegion": "us-east-1",
                "Role": "SECONDARY",
                "AutomaticFailover": "enabled",
                "Status": "associated"
            },
            {
                "ReplicationGroupId": "test-1",
                "ReplicationGroupRegion": "us-west-2",
                "Role": "PRIMARY",
                "AutomaticFailover": "enabled",
                "Status": "associated"
            }
        ],
        "ClusterEnabled": true,
        "GlobalNodeGroups": [
            {
                "GlobalNodeGroupId": "sgaui-test-0001",
                "Slots": "0-449,1816-5461"
            },
            {
                "GlobalNodeGroupId": "sgaui-test-0002",
                "Slots": "6827-10922"
            },
            {
                "GlobalNodeGroupId": "sgaui-test-0003",
                "Slots": "10923-14052,15418-16383"
            },
            {
                "GlobalNodeGroupId": "sgaui-test-0004",
                "Slots": "450-1815,5462-6826,14053-15417"
            }
        ],
        "AuthTokenEnabled": false,
        "TransitEncryptionEnabled": false,
        "AtRestEncryptionEnabled": false
    }
}
```

For more information, see Replication Across AWS Regions Using Global Datastore in the *Elasticache User Guide*.

- For API details, see DecreaseNodeGroupsInGlobalReplicationGroup in *AWS CLI Command Reference*.

`decrease-replica-count`

The following code example shows how to use `decrease-replica-count`.

AWS CLI

To decrease replica count

The following `decrease-replica-count` example dynamically decreases the number of replicas in a Redis (cluster mode disabled) replication group or the number of replica nodes in one or more node groups (shards) of a Redis (cluster mode enabled) replication group. This operation is performed with no cluster downtime.

```
aws elasticache decrease-replica-count \
    --replication-group-id my-cluster \
    --apply-immediately  \
    --new-replica-count 2
```

Output:

```
{
    "ReplicationGroup": {
        "ReplicationGroupId": "my-cluster",
        "Description": " ",
        "Status": "modifying",
        "PendingModifiedValues": {},
        "MemberClusters": [
            "myrepliace",
            "my-cluster-001",
            "my-cluster-002",
            "my-cluster-003"
        ],
        "NodeGroups": [
            {
                "NodeGroupId": "0001",

```

For more information, see Changing the Number of Replicas in the *Elasticache User Guide*.

- For API details, see DecreaseReplicaCount in *AWS CLI Command Reference*.

`delete-cache-cluster`

The following code example shows how to use `delete-cache-cluster`.

AWS CLI

To delete a cache cluster

The following `delete-cache-cluster` example deletes the specified previously provisioned cluster. The command deletes all associated cache nodes, node endpoints. and the cluster itself. When you receive a successful response from this operation, Amazon ElastiCache immediately begins deleting the cluster; you can't cancel or revert this operation.

This operation is not valid for the following:

Redis (cluster mode enabled) clustersA cluster that is the last read replica of a replication groupA node group (shard) that has Multi-AZ mode enabledA cluster from a Redis (cluster mode enabled) replication groupA cluster that is not in the available state

The following command deletes the cluster `my-cluster-002`.

```
aws elasticache delete-cache-cluster \
```

```
    --cache-cluster-id "my-cluster-002"
```

Output:

```
{
    "CacheCluster": {
        "CacheClusterId": "my-cluster-002",
        "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/
home#client-download:",
        "CacheNodeType": "cache.r5.xlarge",
        "Engine": "redis",
        "EngineVersion": "5.0.5",
        "CacheClusterStatus": "deleting",
        "NumCacheNodes": 1,
        "PreferredAvailabilityZone": "us-west-2a",
        "CacheClusterCreateTime": "2019-11-26T03:35:04.546Z",
        "PreferredMaintenanceWindow": "mon:04:05-mon:05:05",
        "PendingModifiedValues": {},
        "NotificationConfiguration": {
            "TopicArn": "arn:aws:sns:us-west-x:xxxxxxx4152:My_Topic",
            "TopicStatus": "active"
        },
        "CacheSecurityGroups": [],
        "CacheParameterGroup": {
            "CacheParameterGroupName": "mygroup",
            "ParameterApplyStatus": "in-sync",
            "CacheNodeIdsToReboot": []
        },
        "CacheSubnetGroupName": "kxkxk",
        "AutoMinorVersionUpgrade": true,
        "SecurityGroups": [
            {
                "SecurityGroupId": "sg-xxxxxxxxxx9836",
                "Status": "active"
            },
            {
                "SecurityGroupId": "sg-xxxxxxxxxxxx7b",
                "Status": "active"
            }
        ],
        "ReplicationGroupId": "my-cluster",
        "SnapshotRetentionLimit": 0,
        "SnapshotWindow": "07:30-08:30",
```

```
        "TransitEncryptionEnabled": false,
        "AtRestEncryptionEnabled": false
    }
}
```

For more information, see Deleting a Cluster in the *Elasticache User Guide*.

- For API details, see DeleteCacheCluster in *AWS CLI Command Reference*.

`delete-cache-parameter-group`

The following code example shows how to use `delete-cache-parameter-group`.

AWS CLI

To delete a cache parameter group

The following `delete-cache-parameter-group` example deletes the specified cache parameter group. You can't delete a cache parameter group if it's associated with any cache clusters.

```
aws elasticache delete-cache-parameter-group \
    --cache-parameter-group-name myparamgroup
```

This command produces no output.

For more information, see Deleting a Parameter Group in the *Elasticache User Guide*.

- For API details, see DeleteCacheParameterGroup in *AWS CLI Command Reference*.

`delete-cache-subnet-group`

The following code example shows how to use `delete-cache-subnet-group`.

AWS CLI

To delete a cache subnet group

The following `delete-cache-subnet-group` example deletes the specified cache subnet group. You can't delete a cache subnet group if it's associated with any clusters.

```
aws elasticache delete-cache-subnet-group \
```

```
    --cache-subnet-group-name "mygroup"
```

This command produces no output.

For more information, see Deleting a Subnet Group in the *Elasticache User Guide*.

- For API details, see DeleteCacheSubnetGroup in *AWS CLI Command Reference*.

`delete-global-replication-group`

The following code example shows how to use `delete-global-replication-group`.

AWS CLI

To delete a global replication group

The following `delete-global-replication-group` example deletes a new global replication group.

```
aws elasticache delete-global-replication-group \
    --global-replication-group-id my-global-replication-group \
    --retain-primary-replication-group
```

Output:

```
{
    "GlobalReplicationGroup": {
        "GlobalReplicationGroupId": "sgaui-my-grg",

For more information, see Replication across AWS Regions using global datastores in the *Amazon ElastiCache User Guide*.

- For API details, see DeleteGlobalReplicationGroup in *AWS CLI Command Reference*.

`delete-replication-group`

The following code example shows how to use `delete-replication-group`.

AWS CLI

To delete a replication group

The following `delete-replication-group` example deletes an existing replication group. By default, this operation deletes the entire replication group, including the primary/primaries and all of the read replicas. If the replication group has only one primary, you can optionally delete only the read replicas, while retaining the primary by setting RetainPrimaryCluster=true .

When you receive a successful response from this operation, Amazon ElastiCache immediately begins deleting the selected resources; you cannot cancel or revert this operation. Valid for Redis only.

```
aws elasticache delete-replication-group \
    --replication-group-id "mygroup"
```

Output:

```
{
    "ReplicationGroup": {
        "ReplicationGroupId": "mygroup",
        "Description": "my group",
        "Status": "deleting",
        "PendingModifiedValues": {},
        "AutomaticFailover": "disabled",
        "SnapshotRetentionLimit": 0,
```

```
        "SnapshotWindow": "06:00-07:00",
        "TransitEncryptionEnabled": false,
        "AtRestEncryptionEnabled": false
    }
}
```

For more information, see Deleting a replication group in the *Amazon ElastiCache User Guide*.

- For API details, see DeleteReplicationGroup in *AWS CLI Command Reference*.

`delete-snapshot`

The following code example shows how to use `delete-snapshot`.

AWS CLI

To delete a snapshot

The following `delete-snapshot` example deleted a snapshot using the Redis engine.

```
aws elasticache delete-snapshot \
    --snapshot-name mysnapshot
```

Output:

```
{
    "Snapshot": {
        "SnapshotName": "my-cluster-snapshot",
        "ReplicationGroupId": "mycluster",
        "ReplicationGroupDescription": "mycluster",

`delete-user-group`

The following code example shows how to use `delete-user-group`.

AWS CLI

To delete a user group

The following `delete-user-group` example deletes a user group.

```
aws elasticache delete-user-group \
    --user-group-id myusergroup
```

Output:

```
{
    "UserGroupId": "myusergroup",
    "Status": "deleting",
    "Engine": "redis",
    "UserIds": [
        "default"
    ],
    "ReplicationGroups": [],
    "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:usergroup:myusergroup"
}
```

For more information, see Authenticating Users with Role-Based Access Control (RBAC) in the *Elasticache User Guide*.

- For API details, see DeleteUserGroup in *AWS CLI Command Reference*.

`delete-user`

The following code example shows how to use `delete-user`.

AWS CLI

To delete a user

The following `delete-user` example deletes a user.

```
aws elasticache delete-user \
    --user-id user2
```

Output:

```
{
    "UserId": "user1",
    "UserName": "myUser",
    "Status": "deleting",
    "Engine": "redis",
    "AccessString": "on ~* +@all",
    "UserGroupIds": [
        "myusergroup"
    ],
    "Authentication": {
        "Type": "password",
        "PasswordCount": 1
    },
    "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user1"
}
```

For more information, see Authenticating Users with Role-Based Access Control (RBAC) in the *Elasticache User Guide*.

- For API details, see DeleteUser in *AWS CLI Command Reference*.

`describe-cache-clusters`

The following code example shows how to use `describe-cache-clusters`.

AWS CLI

To describe a cache cluster

The following `describe-cache-clusters` example describes a cache cluster.

```
aws elasticache describe-cache-clusters
```

Output:

```
{
    "CacheClusters": [
    {
            "CacheClusterId": "my-cluster-003",
            "ClientDownloadLandingPage": "https://console.aws.amazon.com/
elasticache/home#client-download:",
```

        }
    ]
}
```

For more information, see Managing Clusters in the *Elasticache User Guide*.

- For API details, see DescribeCacheClusters in *AWS CLI Command Reference*.

`describe-cache-engine-versions`

The following code example shows how to use `describe-cache-engine-versions`.

AWS CLI

To describe a cache engine version

The following `describe-cache-engine-versions` example returns a list of the available cache engines and their versions.

```
aws elasticache describe-cache-engine-versions \
    --engine "Redis"
```

Output:

```
{
    "CacheEngineVersions": [
        {
            "Engine": "redis",
            "EngineVersion": "2.6.13",
            "CacheParameterGroupFamily": "redis2.6",
            "CacheEngineDescription": "Redis",
            "CacheEngineVersionDescription": "redis version 2.6.13"
        },
        {
            "Engine": "redis",
            "EngineVersion": "2.8.19",
            "CacheParameterGroupFamily": "redis2.8",
            "CacheEngineDescription": "Redis",
```

```
            "CacheEngineVersionDescription": "redis version 2.8.19"
        },
        {
            "Engine": "redis",

        }
    ]
}
```

For more information, see Engine versions and upgrading in ElastiCache in the *Amazon ElastiCache User Guide*.

- For API details, see DescribeCacheEngineVersions in *AWS CLI Command Reference*.

`describe-cache-parameter-groups`

The following code example shows how to use `describe-cache-parameter-groups`.

AWS CLI

To describe a cache parameter group

The following `describe-cache-parameter-groups` example returns a list of cache parameter group descriptions.

```
aws elasticache describe-cache-parameter-groups \
    --cache-parameter-group-name "mygroup"
```

Output:

```
{
    "CacheParameterGroups": [
        {
            "CacheParameterGroupName": "mygroup",
            "CacheParameterGroupFamily": "redis5.0",
            "Description": " "
        }
    ]
}
```

For more information, see Configuring Engine Parameters Using Parameter Groups in the *Elasticache User Guide*.

- For API details, see DescribeCacheParameterGroups in *AWS CLI Command Reference*.

describe-cache-parameters

The following code example shows how to use `describe-cache-parameters`.

AWS CLI

To describe cache parameters

The following `describe-cache-parameters` example returns the detailed parameter list for the specified cache parameter group.

```
aws elasticache describe-cache-parameters \
    --cache-parameter-group-name "myparamgroup"
```

Output:

```
{
    "Parameters": [
        {
            "ParameterName": "activedefrag",
            "ParameterValue": "yes",

`describe-cache-subnet-groups`

The following code example shows how to use `describe-cache-subnet-groups`.

AWS CLI

To describe cache subnet groups

The following `describe-cache-subnet-groups` example returns a list of subnet groups.

```
aws elasticache describe-cache-subnet-groups
```

Output:

```
{
    "CacheSubnetGroups": [
        {
            "CacheSubnetGroupName": "default",
            "CacheSubnetGroupDescription": "Default CacheSubnetGroup",
            "VpcId": "vpc-a3e97cdb",
            "Subnets": [
                {
                    "SubnetIdentifier": "subnet-8d4bacf5",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2b"
                    }
                },
                {
                    "SubnetIdentifier": "subnet-dde21380",
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2c"
                    }
                },

`describe-engine-default-parameters`

The following code example shows how to use `describe-engine-default-parameters`.

AWS CLI

To describe engine default parameters

The following `describe-engine-default-parameters` example returns the default engine and system parameter information for the specified cache engine.

```
aws elasticache describe-engine-default-parameters \
    --cache-parameter-group-family "redis5.0"
```

Output:

```
{
    "EngineDefaults": {
        "Parameters": [
```

```
            {
                "ParameterName": "activedefrag",

- For API details, see DescribeEngineDefaultParameters in *AWS CLI Command Reference*.

`describe-events`

The following code example shows how to use `describe-events`.

AWS CLI

To describe events of a replication group

The following `describe-events` example returns a list of events for a replication group.

```
aws elasticache describe-events \
    --source-identifier test-cluster \
    --source-type replication-group
```

Output:

```
{
    "Events": [
        {
            "SourceIdentifier": "test-cluster",
            "SourceType": "replication-group",
            "Message": "Automatic failover has been turned on for replication group
 test-cluster",
            "Date": "2020-03-18T23:51:34.457Z"
        },
        {
```

```
            "SourceIdentifier": "test-cluster",
            "SourceType": "replication-group",
            "Message": "Replication group test-cluster created",
            "Date": "2020-03-18T23:50:31.378Z"
        }
    ]
}
```

For more information, see Monitoring Events in the *Elasticache User Guide*.

- For API details, see DescribeEvents in *AWS CLI Command Reference*.

`describe-global-replication-groups`

The following code example shows how to use `describe-global-replication-groups`.

AWS CLI

To describe global replication groups

The following `describe-global-replication-groups` example returns details of a Global datastore.

```
aws elasticache describe-global-replication-groups \
    --global-replication-group-id my-grg
```

Output:

```
{
    "GlobalReplicationGroups": [
        {
            "GlobalReplicationGroupId": "my-grg",
            "GlobalReplicationGroupDescription": "my-grg",
            "Status": "creating",
            "CacheNodeType": "cache.r5.large",
            "Engine": "redis",
            "EngineVersion": "5.0.6",
            "ClusterEnabled": false,
            "AuthTokenEnabled": false,
            "TransitEncryptionEnabled": false,
            "AtRestEncryptionEnabled": false
        }
    ]
```

```
}
```

For more information, see Replication Across AWS Regions Using Global Datastore in the *Elasticache User Guide*.

- For API details, see DescribeGlobalReplicationGroups in *AWS CLI Command Reference*.

`describe-replication-groups`

The following code example shows how to use `describe-replication-groups`.

AWS CLI

To return a list of replication group details

The following `describe-replication-groups` example returns the replication groups.

```
aws elasticache describe-replication-groups
```

Output:

```
{
    "ReplicationGroups": [
        {
            "ReplicationGroupId": "my-cluster",

describe-reserved-cache-nodes-offerings

The following code example shows how to use `describe-reserved-cache-nodes-offerings`.

AWS CLI

To describe reserved-cache-nodes-offerings

The following `describe-reserved-cache-nodes-offerings` example returns details of a reserved-cache-node options.

```
aws elasticache describe-reserved-cache-nodes-offerings
```

Output:

```
{
    "ReservedCacheNodesOfferings": [
        {
            "ReservedCacheNodesOfferingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "CacheNodeType": "cache.t3.small",
            "Duration": 31536000,
            "FixedPrice": 97.0,
            "UsagePrice": 0.0,
            "ProductDescription": "memcached",
            "OfferingType": "Partial Upfront",
            "RecurringCharges": [
                {
                    "RecurringChargeAmount": 0.011,
                    "RecurringChargeFrequency": "Hourly"
                }
            ]
        },
        {
            "ReservedCacheNodesOfferingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "CacheNodeType": "cache.m3.2xlarge",
            "Duration": 31536000,
            "FixedPrice": 1772.0,
            "UsagePrice": 0.0,
            "ProductDescription": "redis",
            "OfferingType": "Heavy Utilization",
            "RecurringCharges": [
                {
                    "RecurringChargeAmount": 0.25,
```

```
                    "RecurringChargeFrequency": "Hourly"
                }
            ]
        }
    ]
}
```

For more information, see Reserved nodes in the *Elasticache User Guide*.

- For API details, see DescribeReservedCacheNodesOfferings in *AWS CLI Command Reference*.

`describe-reserved-cache-nodes`

The following code example shows how to use `describe-reserved-cache-nodes`.

AWS CLI

To describe reserved cache nodes

The following `describe-reserved-cache-nodes` example returns information about reserved cache nodes for this account, or about the specified reserved cache node.

aws elasticache describe-reserved-cache-nodes

Output:

```
{
    "ReservedCacheNodes": [
        {
            "ReservedCacheNodeId": "mynode",
            "ReservedCacheNodesOfferingId": "xxxxxxxxx-xxxxx-xxxxx-xxxx-xxxxxxxx71",
            "CacheNodeType": "cache.t3.small",
            "StartTime": "2019-12-06T02:50:44.003Z",
            "Duration": 31536000,
            "FixedPrice": 0.0,
            "UsagePrice": 0.0,
            "CacheNodeCount": 1,
            "ProductDescription": "redis",
            "OfferingType": "No Upfront",
            "State": "payment-pending",
            "RecurringCharges": [
                {
                    "RecurringChargeAmount": 0.023,
                    "RecurringChargeFrequency": "Hourly"
```

```
                }
            ],
            "ReservationARN": "arn:aws:elasticache:us-
west-2:xxxxxxxxxxx52:reserved-instance:mynode"
        }
    ]
}
```

For more information, see Reserved nodes in the *Elasticache User Guide*.

- For API details, see DescribeReservedCacheNodes in *AWS CLI Command Reference*.

`describe-service-updates`

The following code example shows how to use `describe-service-updates`.

AWS CLI

To describe service updates

The following `describe-service-updates` example returns details about service updates.

```
aws elasticache describe-service-updates
```

Output:

```
{
    "ServiceUpdates": [
        {
            "ServiceUpdateName": "elc-xxxxxxxx7-001",
            "ServiceUpdateReleaseDate": "2019-10-09T16:00:00Z",
            "ServiceUpdateEndDate": "2020-02-09T15:59:59Z",
            "ServiceUpdateSeverity": "important",
            "ServiceUpdateRecommendedApplyByDate": "2019-11-08T15:59:59Z",
            "ServiceUpdateStatus": "available",
            "ServiceUpdateDescription": "Upgrades to improve the security,
 reliability, and operational performance of your ElastiCache nodes",
            "ServiceUpdateType": "security-update",
            "Engine": "redis, memcached",
            "EngineVersion": "redis 2.6.13 and onwards, memcached 1.4.5 and
 onwards",
            "AutoUpdateAfterRecommendedApplyByDate": false,
            "EstimatedUpdateTime": "30 minutes per node"
```

```
        },
        {
            "ServiceUpdateName": "elc-xxxxxxxx4-001",
            "ServiceUpdateReleaseDate": "2019-06-11T15:00:00Z",
            "ServiceUpdateEndDate": "2019-10-01T09:24:00Z",
            "ServiceUpdateSeverity": "important",
            "ServiceUpdateRecommendedApplyByDate": "2019-07-11T14:59:59Z",
            "ServiceUpdateStatus": "expired",
            "ServiceUpdateDescription": "Upgrades to improve the security,
 reliability, and operational performance of your ElastiCache nodes",
            "ServiceUpdateType": "security-update",
            "Engine": "redis",
            "EngineVersion": "redis 3.2.6, redis 4.0 and onwards",
            "AutoUpdateAfterRecommendedApplyByDate": false,
            "EstimatedUpdateTime": "30 minutes per node"
        }
    ]
}
```

For more information, see Service updates in ElastiCache in the *Amazon ElastiCache User Guide*.

- For API details, see DescribeServiceUpdates in *AWS CLI Command Reference*.

`describe-snapshots`

The following code example shows how to use `describe-snapshots`.

AWS CLI

To describe snapshots

The following `describe-snapshots` example returns information about your cluster or replication group snapshots.

```
aws elasticache describe-snapshots
```

Output:

```
{
    "Snapshots": [
        {
            "SnapshotName": "automatic.my-cluster2-002-2019-12-05-06-38",
            "CacheClusterId": "my-cluster2-002",
```

```
            "SnapshotStatus": "available",
            "SnapshotSource": "automated",
            "CacheNodeType": "cache.r5.large",
            "Engine": "redis",
            "EngineVersion": "5.0.5",
            "NumCacheNodes": 1,
            "PreferredAvailabilityZone": "us-west-2a",
            "CacheClusterCreateTime": "2019-11-26T01:22:52.396Z",
            "PreferredMaintenanceWindow": "mon:17:30-mon:18:30",

                }
            ]
        }
    ]
}
```

For more information, see Backup and Restore for ElastiCache for Redis in the *Elasticache User Guide*.

- For API details, see DescribeSnapshots in *AWS CLI Command Reference*.

`describe-update-actions`

The following code example shows how to use `describe-update-actions`.

AWS CLI

To describe update actions

The following `describe-update-actions` example returns details of update actions.

```
aws elasticache describe-update-actions
```

Output:

```
{
    "UpdateActions": [
        {
            "ReplicationGroupId": "mycluster",
            "ServiceUpdateName": "elc-20191007-001",

        }
    ]
}
```

For more information, see Self-Service Updates in Amazon ElastiCache in the *Elasticache User Guide*.

- For API details, see DescribeUpdateActions in *AWS CLI Command Reference*.

`describe-user-groups`

The following code example shows how to use `describe-user-groups`.

AWS CLI

To describe user-groups

The following `describe-user-groups` example returns a list of user groups.

```
aws elasticache describe-user-groups
```

Output:

```
{
    "UserGroups": [
        {
            "UserGroupId": "myusergroup",
            "Status": "active",
            "Engine": "redis",
            "UserIds": [
                "default"
            ],
            "ReplicationGroups": [],
            "ARN": "arn:aws:elasticache:us-
west-2:xxxxxxxxxx52:usergroup:myusergroup"
        }
    ]
}
```

For more information, see Authenticating Users with Role-Based Access Control (RBAC) in the *Elasticache User Guide*.

- For API details, see DescribeUserGroups in *AWS CLI Command Reference*.

`describe-users`

The following code example shows how to use `describe-users`.

AWS CLI

To describe users

The following `describe-users` example returns a list of users.

```
aws elasticache describe-users
```

Output:

```
{
    "Users": [
        {
            "UserId": "default",
            "UserName": "default",
            "Status": "active",
            "Engine": "redis",
            "AccessString": "on ~* +@all",
            "UserGroupIds": [
                "myusergroup"
            ],
            "Authentication": {
                "Type": "no-password"
            },
            "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:default"
        },
        {
            "UserId": "user1",
            "UserName": "myUser",
            "Status": "active",
            "Engine": "redis",
            "AccessString": "on ~* +@all",
            "UserGroupIds": [],
            "Authentication": {
                "Type": "password",
                "PasswordCount": 1
            },
            "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user1"
        },
        {
            "UserId": "user2",
            "UserName": "myUser",
            "Status": "active",
```

```
            "Engine": "redis",
            "AccessString": "on ~app::* -@all +@read +@hash +@bitmap +@geo -setbit -
bitfield -hset -hsetnx -hmset -hincrby -hincrbyfloat -hdel -bitop -geoadd -georadius
 -georadiusbymember",
            "UserGroupIds": [],
            "Authentication": {
                "Type": "password",
                "PasswordCount": 1
            },
            "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user2"
        }
    ]
}
```

For more information, see Authenticating Users with Role-Based Access Control (RBAC) in the *Elasticache User Guide*.

- For API details, see DescribeUsers in *AWS CLI Command Reference*.

`disassociate-global-replication-group`

The following code example shows how to use `disassociate-global-replication-group`.

AWS CLI

To diassociate a secondary cluster from a global replication group

The following `disassociate-global-replication-group` example removes a secondary cluster from a Global datastore.

```
aws elasticache disassociate-global-replication-group \
    --global-replication-group-id my-grg \
    --replication-group-id my-cluster-grg-secondary \
    --replication-group-region us-east-1
```

Output:

```
{
    "GlobalReplicationGroup": {
        "GlobalReplicationGroupId": "my-grg",
        "GlobalReplicationGroupDescription": "my-grg",
```

```

`increase-node-groups-in-global-replication-group`

The following code example shows how to use `increase-node-groups-in-global-replication-group`.

AWS CLI

To increase the number of node groups in a global replication group

The following `increase-node-groups-in-global-replication-group` example increases the node group count using the Redis engine.

```
aws elasticache increase-node-groups-in-global-replication-group \
    --global-replication-group-id sgaui-pat-test-4 \
    --node-group-count 6 \
    --apply-immediately
```

Output:

```
{
    "GlobalReplicationGroup": {
        "GlobalReplicationGroupId": "sgaui-test-4",
        "GlobalReplicationGroupDescription": "test-4",
        "Status": "modifying",

`increase-replica-count`

The following code example shows how to use `increase-replica-count`.

AWS CLI

To increase replica count

The following `increase-replica-count` example does one of two things. It can dynamically increase the number of replicas in a Redis (cluster mode disabled) replication group. Or it can dynamically increase the number of replica nodes in one or more node groups (shards) of a Redis (cluster mode enabled) replication group. This operation is performed with no cluster downtime.

```
aws elasticache increase-replica-count \
    --replication-group-id "my-cluster" \
    --apply-immediately \
    --new-replica-count 3
```

Output:

```
{
    "ReplicationGroup": {
        "ReplicationGroupId": "my-cluster",
        "Description": " ",
        "Status": "modifying",
        "PendingModifiedValues": {},
        "MemberClusters": [
            "my-cluster-001",
            "my-cluster-002",
            "my-cluster-003",
            "my-cluster-004"
        ],
        "NodeGroups": [
            {
                "NodeGroupId": "0001",
                "Status": "modifying",
                "PrimaryEndpoint": {
                    "Address": "my-
cluster.xxxxxih.ng.0001.usw2.cache.amazonaws.com",
                    "Port": 6379
                },
                "ReaderEndpoint": {

                        "ReadEndpoint": {
```

```
                            "Address": "my-
cluster-003.xxxxxih.0001.usw2.cache.amazonaws.com",
                            "Port": 6379
                        },
                        "PreferredAvailabilityZone": "us-west-2a",
                        "CurrentRole": "replica"
                    }
                ]
            }
        ],
        "AutomaticFailover": "disabled",
        "SnapshotRetentionLimit": 0,
        "SnapshotWindow": "07:30-08:30",
        "ClusterEnabled": false,
        "CacheNodeType": "cache.r5.xlarge",
        "TransitEncryptionEnabled": false,
        "AtRestEncryptionEnabled": false
    }
}
```

For more information, see Increasing the number of replicas in a shard in the *Amazon ElastiCache User Guide*.

- For API details, see IncreaseReplicaCount in *AWS CLI Command Reference*.

`list-allowed-node-type-modifications`

The following code example shows how to use `list-allowed-node-type-modifications`.

AWS CLI

To list the allowed node modifications

The following `list-allowed-node-type-modifications` example lists all the available node types that you can scale your Redis cluster's or replication group's current node type to.

```
aws elasticache list-allowed-node-type-modifications \
    --replication-group-id "my-replication-group"
```

Output:

```
{
```

```
    "ScaleUpModifications": [
        "cache.m5.12xlarge",
        "cache.m5.24xlarge",
        "cache.m5.4xlarge",
        "cache.r5.12xlarge",
        "cache.r5.24xlarge",
        "cache.r5.2xlarge",
        "cache.r5.4xlarge"
    ],
    "ScaleDownModifications": [
        "cache.m3.large",
        "cache.m3.medium",
        "cache.m3.xlarge",
        "cache.m4.large",
        "cache.m4.xlarge",
        "cache.m5.2xlarge",
        "cache.m5.large",
        "cache.m5.xlarge",
        "cache.r3.large",
        "cache.r4.large",
        "cache.r4.xlarge",
        "cache.r5.large",
        "cache.t2.medium",
        "cache.t2.micro",
        "cache.t2.small",
        "cache.t3.medium",
        "cache.t3.micro",
        "cache.t3.small"
    ]
}
```

For more information, see Scaling ElastiCache for Redis Clusters in the *Elasticache User Guide*.

- For API details, see ListAllowedNodeTypeModifications in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a resource

The following `list-tags-for-resource` example lists tags for a resource.

```
aws elasticache list-tags-for-resource \
    --resource-name "arn:aws:elasticache:us-west-2:123456789012:cluster:my-cluster"
```

Output:

```
{
    "TagList": [
        {
            "Key": "Project",
            "Value": "querySpeedUp"
        },
        {
            "Key": "Environment",
            "Value": "PROD"
        }
    ]
}
```

For more information, see Listing Tags Using the AWS CLI in the *Elasticache User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`modify-cache-cluster`

The following code example shows how to use `modify-cache-cluster`.

AWS CLI

To modify cache clusters

The following `modify-cache-cluster` example modifies the settings for the specified cluster.

```
aws elasticache modify-cache-cluster \
    --cache-cluster-id "my-cluster" \
    --num-cache-nodes 1
```

Output:

```
{
    "CacheCluster": {
        "CacheClusterId": "my-cluster",
```

```
        "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/
home#client-download:",
        "CacheNodeType": "cache.m5.large",
        "Engine": "redis",
        "EngineVersion": "5.0.5",
        "CacheClusterStatus": "available",
        "NumCacheNodes": 1,
        "PreferredAvailabilityZone": "us-west-2c",
        "CacheClusterCreateTime": "2019-12-04T18:24:56.652Z",
        "PreferredMaintenanceWindow": "sat:10:00-sat:11:00",
        "PendingModifiedValues": {},
        "CacheSecurityGroups": [],
        "CacheParameterGroup": {
            "CacheParameterGroupName": "default.redis5.0",
            "ParameterApplyStatus": "in-sync",
            "CacheNodeIdsToReboot": []
        },
        "CacheSubnetGroupName": "default",
        "AutoMinorVersionUpgrade": true,
        "SnapshotRetentionLimit": 0,
        "SnapshotWindow": "07:00-08:00",
        "TransitEncryptionEnabled": false,
        "AtRestEncryptionEnabled": false
    }
}
```

For more information, see Modifying an ElastiCache Cluster in the *Elasticache User Guide*.

- For API details, see ModifyCacheCluster in *AWS CLI Command Reference*.

`modify-cache-parameter-group`

The following code example shows how to use `modify-cache-parameter-group`.

AWS CLI

To modify a cache parameter group

The following `modify-cache-parameter-group` example modifies the parameters of the specified cache parameter group.

```
aws elasticache modify-cache-parameter-group \
    --cache-parameter-group-name "mygroup" \
```

```
    --parameter-name-values "ParameterName=activedefrag, ParameterValue=no"
```

Output:

```
{
    "CacheParameterGroupName": "mygroup"
}
```

For more information, see Modifying a Parameter Group in the *Elasticache User Guide*.

- For API details, see ModifyCacheParameterGroup in *AWS CLI Command Reference*.

`modify-cache-subnet-group`

The following code example shows how to use `modify-cache-subnet-group`.

AWS CLI

To modify a cache subnet group

The following `modify-cache-subnet-group` example modifies the specified cache subnet group.

```
aws elasticache modify-cache-subnet-group \
    --cache-subnet-group-name kxkxk \
    --cache-subnet-group-description "mygroup"
```

Output:

```
{
    "CacheSubnetGroup": {
        "CacheSubnetGroupName": "kxkxk",
        "CacheSubnetGroupDescription": "mygroup",
        "VpcId": "vpc-xxxxcdb",
        "Subnets": [
            {
                "SubnetIdentifier": "subnet-xxxxbff",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2a"
                }
            }
        ]
```

```
    }
}
```

For more information, see Modifying a Subnet Group in the *Elasticache User Guide*.

- For API details, see ModifyCacheSubnetGroup in *AWS CLI Command Reference*.

`modify-global-replication-group`

The following code example shows how to use `modify-global-replication-group`.

AWS CLI

To modify a global replication group

The following `modify-global-replication-group` example modifies the properties of a global replication group, in this case disabling automatic failover, using the Redis engine.

```
aws elasticache modify-global-replication-group \
    --global-replication-group-id sgaui-pat-group \
    --apply-immediately \
    --no-automatic-failover-enabled
```

Output:

```
{
    "GlobalReplicationGroup": {
        "GlobalReplicationGroupId": "sgaui-test-group",
        "GlobalReplicationGroupDescription": " ",
        "Status": "modifying",
        "CacheNodeType": "cache.r5.large",
        "Engine": "redis",
        "EngineVersion": "5.0.6",
        "ClusterEnabled": false,
        "AuthTokenEnabled": false,
        "TransitEncryptionEnabled": false,
        "AtRestEncryptionEnabled": false
    }
}
```

For more information, see Replication Across AWS Regions Using Global Datastore in the *Elasticache User Guide*.

- For API details, see ModifyGlobalReplicationGroup in *AWS CLI Command Reference*.

`modify-replication-group-shard-configuration`

The following code example shows how to use `modify-replication-group-shard-configuration`.

AWS CLI

To modify a replication group shard configuration

The following `modify-replication-group-shard-configuration` example decreases the node group count using the Redis engine.

```
aws elasticache modify-replication-group-shard-configuration \
    --replication-group-id mycluster \
    --node-group-count 3 \
    --apply-immediately \
    --node-groups-to-remove 0002
```

Output:

```
{
    "ReplicationGroup": {
        "ReplicationGroupId": "mycluster",
        "Description": "mycluster",
        "GlobalReplicationGroupInfo": {},
        "Status": "modifying",
        "PendingModifiedValues": {},
        "MemberClusters": [
            "mycluster-0002-001",

`modify-replication-group`

The following code example shows how to use `modify-replication-group`.

AWS CLI

To modify a replication group

The following `modify-replication-group` example disables Multi-AZ using the Redis engine.

```
aws elasticache modify-replication-group \
    --replication-group-id test-cluster \
```

```
    --no-multi-az-enabled \
    --apply-immediately
```

Output:

```
{
    "ReplicationGroup": {
        "ReplicationGroupId": "test-cluster",
        "Description": "test-cluster",
        "GlobalReplicationGroupInfo": {
            "GlobalReplicationGroupId": "sgaui-pat-group",
            "GlobalReplicationGroupMemberRole": "PRIMARY"
        },
        "Status": "available",
        "PendingModifiedValues": {},
        "MemberClusters": [
            "test-cluster-001",
            "test-cluster-002",
            "test-cluster-003"
        ],
        "NodeGroups": [
            {
                "NodeGroupId": "0001",
                "Status": "available",
                "PrimaryEndpoint": {
                    "Address": "test-
cluster.g2xbih.ng.0001.usw2.cache.amazonaws.com",

        "SnapshotWindow": "08:00-09:00",
        "ClusterEnabled": false,
        "CacheNodeType": "cache.r5.large",
        "TransitEncryptionEnabled": false,
        "AtRestEncryptionEnabled": false
    }
}
```

For more information, see Modifying a Replication Group in the *Elasticache User Guide*.

- For API details, see ModifyReplicationGroup in *AWS CLI Command Reference*.

`modify-user-group`

The following code example shows how to use `modify-user-group`.

AWS CLI

To modify a user group

The following `modify-user-group` example adds a user to the user group.

```
aws elasticache modify-user-group \
    --user-group-id myusergroup \
    --user-ids-to-add user1
```

Output:

```
{
    "UserGroupId": "myusergroup",
    "Status": "modifying",
    "Engine": "redis",
    "UserIds": [
        "default"
    ],
    "PendingChanges": {
        "UserIdsToAdd": [
            "user1"
        ]
    },
    "ReplicationGroups": [],
    "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:usergroup:myusergroup"
}
```

For more information, see Authenticating Users with Role-Based Access Control (RBAC) in the *Elasticache User Guide*.

- For API details, see ModifyUserGroup in *AWS CLI Command Reference*.

`modify-user`

The following code example shows how to use `modify-user`.

AWS CLI

To modify a user

The following `modify-user` example modifies a user's access string.

```
aws elasticache modify-user \
    --user-id user2 \
    --append-access-string "on ~* +@all"
```

Output:

```
{
    "UserId": "user2",
    "UserName": "myUser",
    "Status": "modifying",
    "Engine": "redis",
    "AccessString": "on ~* +@all",
    "UserGroupIds": [],
    "Authentication": {
        "Type": "password",
        "PasswordCount": 1
    },
    "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user2"
}
```

For more information, see Authenticating Users with Role-Based Access Control (RBAC) in the *Elasticache User Guide*.

- For API details, see ModifyUser in *AWS CLI Command Reference*.

`purchase-reserved-cache-nodes-offering`

The following code example shows how to use `purchase-reserved-cache-nodes-offering`.

AWS CLI

To purchase a reserved-cache-node-offering

The following `purchase-reserved-cache-nodes-offering` example allows you to purchase a reserved cache node offering.

```
aws elasticache purchase-reserved-cache-nodes-offering \
```

```
    --reserved-cache-nodes-offering-id xxxxxxx-4da5-4b90-b92d-929fbd7abed2
```

Output:

```
{
    "ReservedCacheNode": {
        "ReservedCacheNodeId": "ri-2020-06-30-17-59-40-474",
        "ReservedCacheNodesOfferingId": "xxxxxxx-4da5-4b90-b92d-929fbd7abed2",
        "CacheNodeType": "cache.m3.2xlarge",
        "StartTime": "2020-06-30T17:59:40.474000+00:00",
        "Duration": 31536000,
        "FixedPrice": 1772.0,
        "UsagePrice": 0.0,
        "CacheNodeCount": 1,
        "ProductDescription": "redis",
        "OfferingType": "Heavy Utilization",
        "State": "payment-pending",
        "RecurringCharges": [
            {
                "RecurringChargeAmount": 0.25,
                "RecurringChargeFrequency": "Hourly"
            }
        ]
    }
}
```

For more information, see Reserved nodes in the *Elasticache User Guide*.

- For API details, see PurchaseReservedCacheNodesOffering in *AWS CLI Command Reference*.

`reboot-cache-cluster`

The following code example shows how to use `reboot-cache-cluster`.

AWS CLI

To reboot a cache cluster

The following `reboot-cache-cluster` example reboots some, or all, of the cache nodes within a provisioned cluster. This operation applies any modified cache parameter groups to the cluster. The reboot operation takes place as soon as possible, and results in a momentary outage to the cluster. During the reboot, the cluster status is set to `REBOOTING`.

```
aws elasticache reboot-cache-cluster \
    --cache-cluster-id "my-cluster-001" \
    --cache-node-ids-to-reboot "0001"
```

Output:

```
{
    "CacheCluster": {
        "CacheClusterId": "my-cluster-001",
        "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/
home#client-download:",
        "CacheNodeType": "cache.r5.xlarge",
        "Engine": "redis",
        "EngineVersion": "5.0.5",
        "CacheClusterStatus": "rebooting cache cluster nodes",
        "NumCacheNodes": 1,
        "PreferredAvailabilityZone": "us-west-2a",
        "CacheClusterCreateTime": "2019-11-26T03:35:04.546Z",
        "PreferredMaintenanceWindow": "mon:04:05-mon:05:05",
        "PendingModifiedValues": {},
        "NotificationConfiguration": {
            "TopicArn": "arn:aws:sns:us-west-2:xxxxxxxxxx152:My_Topic",
            "TopicStatus": "active"
        },
        "CacheSecurityGroups": [],
        "CacheParameterGroup": {
            "CacheParameterGroupName": "mygroup",
            "ParameterApplyStatus": "in-sync",
            "CacheNodeIdsToReboot": []
        },
        "CacheSubnetGroupName": "kxkxk",
        "AutoMinorVersionUpgrade": true,
        "SecurityGroups": [
            {
                "SecurityGroupId": "sg-xxxxxxxxxxxxx836",
                "Status": "active"
            },
            {
                "SecurityGroupId": "sg-xxxxxxxx7b",
                "Status": "active"
            }
        ],
        "ReplicationGroupId": "my-cluster",
```

```
        "SnapshotRetentionLimit": 0,
        "SnapshotWindow": "07:30-08:30",
        "TransitEncryptionEnabled": false,
        "AtRestEncryptionEnabled": false
    }
}
```

For more information, see Rebooting nodes in the *Amazon ElastiCache User Guide*.

- For API details, see RebootCacheCluster in *AWS CLI Command Reference*.

`reset-cache-parameter-group`

The following code example shows how to use `reset-cache-parameter-group`.

AWS CLI

To reset a cache parameter group

The following `reset-cache-parameter-group` example modifies the parameters of a cache parameter group to the engine or system default value. You can reset specific parameters by submitting a list of parameter names. To reset the entire cache parameter group, specify the `--reset-all-parameters` and `--cache-parameter-group-name` parameters.

```
aws elasticache reset-cache-parameter-group \
    --cache-parameter-group-name "mygroup" \
    --reset-all-parameters
```

Output:

```
{
    "CacheParameterGroupName": "mygroup"
}
```

For more information, see Configuring engine parameters using ElastiCache parameter groups in the *Amazon ElastiCache User Guide*.

- For API details, see ResetCacheParameterGroup in *AWS CLI Command Reference*.

`start-migration`

The following code example shows how to use `start-migration`.

AWS CLI

To start a migration

The following `start-migration` example migrates your data from self-hosted Redis on Amazon EC2 to Amazon ElastiCache, using the Redis engine.

```
aws elasticache start-migration \
    --replication-group-id test \
    --customer-node-endpoint-
list "Address='test.g2xbih.ng.0001.usw2.cache.amazonaws.com',Port=6379"
```

Output:

```
{
    "ReplicationGroup": {
        "ReplicationGroupId": "test",
        "Description": "test",
        "GlobalReplicationGroupInfo": {},
        "Status": "modifying",
        "PendingModifiedValues": {},
        "MemberClusters": [
            "test-001",
            "test-002",
            "test-003"
        ],
        "NodeGroups": [
            {
                "NodeGroupId": "0001",
                "Status": "available",
                "PrimaryEndpoint": {
                    "Address": "test.g2xbih.ng.0001.usw2.cache.amazonaws.com",
                    "Port": 6379
                },
                "ReaderEndpoint": {
                    "Address": "test-ro.g2xbih.ng.0001.usw2.cache.amazonaws.com",
                    "Port": 6379
                },
                "NodeGroupMembers": [
                    {
                        "CacheClusterId": "test-001",
                        "CacheNodeId": "0001",
                        "ReadEndpoint": {
```

```

        "AtRestEncryptionEnabled": false
    }
}
```

For more information, see Online Migration to ElastiCache in the *Elasticache User Guide*.

- For API details, see StartMigration in *AWS CLI Command Reference*.

`test-failover`

The following code example shows how to use `test-failover`.

AWS CLI

To test failover of a node group

The following `test-failover` example tests automatic failover on the specified node group (called a shard in the console) in a replication group (called a cluster in the console).

```
aws elasticache test-failover \
    --replication-group-id "mycluster" \
    --node-group-id "0001"
```

Output:

```
{
    "ReplicationGroup": {
        "ReplicationGroupId": "mycluster",
        "Description": "My Cluster",

MediaStore examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaStore.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-container`

The following code example shows how to use `create-container`.

AWS CLI

To create a container

The following `create-container` example creates a new, empty container.

```
aws mediastore create-container \
    --container-name ExampleContainer
```

Output:

```
{
    "Container": {
        "AccessLoggingEnabled": false,
        "CreationTime": 1563557265,
        "Name": "ExampleContainer",
        "Status": "CREATING",
        "ARN": "arn:aws:mediastore:us-west-2:123456789012:container/
ExampleContainer"
    }
}
```

- For API details, see CreateContainer in *AWS CLI Command Reference*.

`delete-container-policy`

The following code example shows how to use `delete-container-policy`.

AWS CLI

To delete a container policy

The following `delete-container-policy` example deletes the policy that is assigned to the specified container. When the policy is deleted, AWS Elemental MediaStore automatically assigns the default policy to the container.

```
aws mediastore delete-container-policy \
    --container-name LiveEvents
```

This command produces no output.

- For API details, see DeleteContainerPolicy in *AWS CLI Command Reference*.

`delete-container`

The following code example shows how to use `delete-container`.

AWS CLI

To delete a container

The following `delete-container` example deletes the specified container. You can delete a container only if it has no objects.

```
aws mediastore delete-container \
    --container-name=ExampleLiveDemo
```

This command produces no output.

- For API details, see DeleteContainer in *AWS CLI Command Reference*.

`delete-cors-policy`

The following code example shows how to use `delete-cors-policy`.

AWS CLI

To delete a CORS policy

The following `delete-cors-policy` example deletes the cross-origin resource sharing (CORS) policy that is assigned to the specified container.

```
aws mediastore delete-cors-policy \
    --container-name ExampleContainer
```

This command produces no output.

- For API details, see DeleteCorsPolicy in *AWS CLI Command Reference*.

`delete-lifecycle-policy`

The following code example shows how to use `delete-lifecycle-policy`.

AWS CLI

To delete an object lifecycle policy

The following `delete-lifecycle-policy` example deletes the object lifecycle policy attached to the specified container. This change can take up to 20 minutes to take effect.

```
aws mediastore delete-lifecycle-policy \
    --container-name LiveEvents
```

This command produces no output.

- For API details, see DeleteLifecyclePolicy in *AWS CLI Command Reference*.

`describe-container`

The following code example shows how to use `describe-container`.

AWS CLI

To view the details of a container

The following `describe-container` example displays the details of the specified container.

```
aws mediastore describe-container \
    --container-name ExampleContainer
```

Output:

```
{
    "Container": {
        "CreationTime": 1563558086,
        "AccessLoggingEnabled": false,
        "ARN": "arn:aws:mediastore:us-west-2:123456789012:container/
ExampleContainer",
        "Status": "ACTIVE",
        "Name": "ExampleContainer",
        "Endpoint": "https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com"
    }
}
```

- For API details, see DescribeContainer in *AWS CLI Command Reference*.

`get-container-policy`

The following code example shows how to use `get-container-policy`.

AWS CLI

To view a container policy

The following `get-container-policy` example displays the resource-based policy of the specified container.

```
aws mediastore get-container-policy \
    --container-name ExampleLiveDemo
```

Output:

```
{
    "Policy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":
\"PublicReadOverHttps\",\"Effect\":\"Allow\",\"Principal\":{\"AWS\":
\"arn:aws:iam::123456789012:root\"},\"Action\":[\"mediastore:GetObject
\",\"mediastore:DescribeObject\"],\"Resource\":\"arn:aws:mediastore:us-
```

```
west-2:123456789012:container/ExampleLiveDemo/\",\"Condition\":{\"Bool\":
{\"aws:SecureTransport\":\"true\"}}}]}"
}
```

- For API details, see GetContainerPolicy in *AWS CLI Command Reference*.

`get-cors-policy`

The following code example shows how to use `get-cors-policy`.

AWS CLI

To view a CORS policy

The following `get-cors-policy` example displays the cross-origin resource sharing (CORS) policy that is assigned to the specified container.

```
aws mediastore get-cors-policy \
    --container-name ExampleContainer
```

Output:

```
{
    "CorsPolicy": [
        {
            "AllowedMethods": [
                "GET",
                "HEAD"
            ],
            "MaxAgeSeconds": 3000,
            "AllowedOrigins": [
                ""
            ],
            "AllowedHeaders": [
                ""
            ]
        }
    ]
}
```

- For API details, see GetCorsPolicy in *AWS CLI Command Reference*.

`get-lifecycle-policy`

The following code example shows how to use `get-lifecycle-policy`.

AWS CLI

To view an object lifecycle policy

The following `get-lifecycle-policy` example displays the object lifecycle policy attached to the specified container.

```
aws mediastore get-lifecycle-policy \
    --container-name LiveEvents
```

Output:

```
{
    "LifecyclePolicy": "{\"rules\":[{\"definition\":{\"path\":[{\"prefix\":
\"Football/\"},{\"prefix\":\"Baseball/\"}],\"days_since_create\":[{\"numeric\":[\">
\",28]}]},\"action\":\"EXPIRE\"}]}"
}
```

- For API details, see GetLifecyclePolicy in *AWS CLI Command Reference*.

`list-containers`

The following code example shows how to use `list-containers`.

AWS CLI

To view a list of containers

The following `list-containers` example displays a list of all containers that are associated with your account.

```
aws mediastore list-containers
```

Output:

```
{
    "Containers": [
```

```
        {
            "CreationTime": 1505317931,
            "Endpoint": "https://aaabbbcccdddee.data.mediastore.us-
west-2.amazonaws.com",
            "Status": "ACTIVE",
            "ARN": "arn:aws:mediastore:us-west-2:123456789012:container/
ExampleLiveDemo",
            "AccessLoggingEnabled": false,
            "Name": "ExampleLiveDemo"
        },
        {
            "CreationTime": 1506528818,
            "Endpoint": "https://fffgggghhhiiijj.data.mediastore.us-
west-2.amazonaws.com",
            "Status": "ACTIVE",
            "ARN": "arn:aws:mediastore:us-west-2:123456789012:container/
ExampleContainer",
            "AccessLoggingEnabled": false,
            "Name": "ExampleContainer"
        }
    ]
}
```

- For API details, see ListContainers in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a container

The following `list-tags-for-resource` example displays the tag keys and values assigned to the specified container.

```
aws mediastore list-tags-for-resource \
    --resource arn:aws:mediastore:us-west-2:1213456789012:container/ExampleContainer
```

Output:

```
{
```

```
    "Tags": [
        {
            "Value": "Test",
            "Key": "Environment"
        },
        {
            "Value": "West",
            "Key": "Region"
        }
    ]
}
```

For more information, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`put-container-policy`

The following code example shows how to use `put-container-policy`.

AWS CLI

To edit a container policy

The following `put-container-policy` example assigns a different policy to the specified container. In this example, the updated policy is defined in a file named `LiveEventsContainerPolicy.json`.

```
aws mediastore put-container-policy \
    --container-name LiveEvents \
    --policy file://LiveEventsContainerPolicy.json
```

Contents of `LiveEventsContainerPolicy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "MediaStoreFullAccess",
            "Effect": "Allow",
            "Principal": {
```

```
                "AWS": "arn:aws:iam::123456789012:root"
            },
            "Action": "mediastore:*",
            "Resource": "arn:aws:mediastore:us-west-2:123456789012:container/
LiveEvents/*",
            "Condition": {
                "Bool": {
                    "aws:SecureTransport": "true"
                }
            }
        }
    ]
}
```

This command produces no output.

- For API details, see PutContainerPolicy in *AWS CLI Command Reference*.

`put-cors-policy`

The following code example shows how to use `put-cors-policy`.

AWS CLI

Example 1: To add a CORS policy

The following `put-cors-policy` example adds a cross-origin resource sharing (CORS) policy to the specified container. The contents of the CORS policy are in the file named `corsPolicy.json`.

```
aws mediastore put-cors-policy \
    --container-name ExampleContainer \
    --cors-policy file://corsPolicy.json
```

Contents of `corsPolicy.json`:

```
[
    {
        "AllowedOrigins": [
            "https://www.example.com"
        ],
        "AllowedMethods": [
```

```
            "GET",
            "HEAD"
        ],
        "AllowedHeaders": [
            "*"
        ],
        "MaxAgeSeconds": 3000
    }
]
```

This command produces no output.

Example 2: To edit a CORS policy

The following `put-cors-policy` example updates the cross-origin resource sharing (CORS) policy that is assigned to the specified container. The contents of the updated CORS policy are in the file named `corsPolicy2.json`.

- For API details, see PutCorsPolicy in *AWS CLI Command Reference*.

`put-lifecycle-policy`

The following code example shows how to use `put-lifecycle-policy`.

AWS CLI

To create an object lifecycle policy

The following `put-lifecycle-policy` example attaches an object lifecycle policy to the specified container. This enables you to specify how long the service should store objects in your container. MediaStore deletes objects in the container once they reach their expiration date, as indicated in the policy, which is in the file named `ExampleLifecyclePolicy.json`.

```
aws mediastore put-lifecycle-policy \
    --container-name ExampleContainer \
    --lifecycle-policy file://ExampleLifecyclePolicy.json
```

Contents of `ExampleLifecyclePolicy.json`:

```
{
    "rules": [
        {
```

```
            "definition": {
                "path": [
                    {"prefix": "Football/"},
                    {"prefix": "Baseball/"}
                ],
                "days_since_create": [
                    {"numeric": [">", 28]}
                ]
            },
            "action": "EXPIRE"
        }
    ]
}
```

This command produces no output.

- For API details, see PutLifecyclePolicy in *AWS CLI Command Reference*.

`start-access-logging`

The following code example shows how to use `start-access-logging`.

AWS CLI

To enable access logging on a container

The following `start-access-logging` example enable access logging on the specified container.

```
aws mediastore start-access-logging \
    --container-name LiveEvents
```

This command produces no output.

- For API details, see StartAccessLogging in *AWS CLI Command Reference*.

`stop-access-logging`

The following code example shows how to use `stop-access-logging`.

AWS CLI

To disable access logging on a container

The following `stop-access-logging` example disables access logging on the specified container.

```
aws mediastore stop-access-logging \
    --container-name LiveEvents
```

This command produces no output.

- For API details, see StopAccessLogging in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add tags to a container

The following `tag-resource` example adds tag keys and values to the specified container.

```
aws mediastore tag-resource \
    --resource arn:aws:mediastore:us-west-2:123456789012:container/ExampleContainer
 \
    --tags '[{"Key": "Region", "Value": "West"}, {"Key": "Environment", "Value":
 "Test"}]'
```

This command produces no output.

For more information, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a container

The following `untag-resource` example removes the specified tag key and its associated value from a container.

```
aws mediastore untag-resource \
    --resource arn:aws:mediastore:us-west-2:123456789012:container/ExampleContainer
 \
    --tag-keys Region
```

This command produces no output.

For more information, see Best practices and strategies in the *Tagging AWS Resources and Tag Editor User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

Amazon EMR examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EMR.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`add-instance-fleet`

The following code example shows how to use `add-instance-fleet`.

AWS CLI

To add a task instance fleet to a cluster

The following `add-instance-fleet` example adds a new task instance fleet to the cluster specified.

```
aws emr add-instance-fleet \
    --cluster-id 'j-12ABCDEFGHI34JK' \
```

```
    --instance-fleet
 InstanceFleetType=TASK,TargetSpotCapacity=1,LaunchSpecifications={SpotSpecification='{Timeo
```

Output:

```
{
    "ClusterId": "j-12ABCDEFGHI34JK",
    "InstanceFleetId": "if-23ABCDEFGHI45JJ"
}
```

For more information, see Planning and configuring instance fleets for your Amazon EMR cluster in the *Amazon EMR Management Guide*.

- For API details, see AddInstanceFleet in *AWS CLI Command Reference*.

`add-steps`

The following code example shows how to use `add-steps`.

AWS CLI

Example 1: To add Custom JAR steps to a cluster

The following `add-steps` example adds two Custom JAR steps to the specified cluster.

```
aws emr add-steps \
    --cluster-id j-XXXXXXXX \
    --steps Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s3://amzn-
s3-demo-bucket/
mytest.jar,Args=arg1,arg2,arg3 Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s
amzn-s3-demo-bucket/mytest.jar,MainClass=mymainclass,Args=arg1,arg2,arg3
```

Required parameters:

```
Jar
```

Optional parameters:

```
Type, Name, ActionOnFailure, Args
```

Output:

```
{
    "StepIds":[
        "s-XXXXXXXX",
        "s-YYYYYYYY"
    ]
}
```

Example 2: To add Streaming steps to a cluster

The following `add-steps` example adds a Streaming step to the specified cluster.

```
aws emr add-steps \
    --cluster-id j-XXXXXXXX \
    --steps Type=STREAMING,Name='Streaming Program',ActionOnFailure=CONTINUE,Args=[-
files,s3://elasticmapreduce/samples/wordcount/wordSplitter.py,-
mapper,wordSplitter.py,-reducer,aggregate,-input,s3://elasticmapreduce/samples/
wordcount/input,-output,s3://amzn-s3-demo-bucket/wordcount/output]
```

Required parameters:

```
Type, Args
```

Optional parameters:

```
Name, ActionOnFailure
```

The following `add-steps` example adds the Streaming step that is defined in the `step.json` file.

```
aws emr add-steps \
    --cluster-id j-XXXXXXXX \
    --steps file://./step.json
```

Contents of `step.json`:

```
[
    {
        "Name": "JSON Streaming Step",
        "Args": ["-files","s3://elasticmapreduce/samples/wordcount/
wordSplitter.py","-mapper","wordSplitter.py","-reducer","aggregate","-input","s3://
```

```
elasticmapreduce/samples/wordcount/input","-output","s3://amzn-s3-demo-bucket/
wordcount/output"],
        "ActionOnFailure": "CONTINUE",
        "Type": "STREAMING"
    }
]
```

NOTE: JSON arguments must include options and values as their own items in the list.

Output:

```
{
    "StepIds":[
        "s-XXXXXXXX",
        "s-YYYYYYYY"
    ]
}
```

Example 3: To add a Streaming step with multiple files to a cluster (JSON only)

The following `add-steps` example adds a Streaming step with multiple files to the specified cluster. The step is defined in the `multiplefiles.json` file.

The following command adds the step that is defined in the `multiplefiles.json` file.

```
aws emr add-steps \
    --cluster-id j-XXXXXXXX \
    --steps file://./multiplefiles.json
```

Contents of `multiplefiles.json`:

```
[
    {
        "Name": "JSON Streaming Step",
        "Type": "STREAMING",
        "ActionOnFailure": "CONTINUE",
        "Args": [
            "-files",
            "s3://amzn-s3-demo-bucket/mapper.py,s3://amzn-s3-demo-bucket/
reducer.py",
            "-mapper",
            "mapper.py",
```

```
            "-reducer",
            "reducer.py",
            "-input",
            "s3://amzn-s3-demo-bucket/input",
            "-output",
            "s3://amzn-s3-demo-bucket/output"
        ]
    }
]
```

Required parameters:

```
Type, Args
```

Optional parameters:

```
Name, ActionOnFailure
```

Output:

```
{
    "StepIds":[
        "s-XXXXXXXX"
    ]
}
```

Example 4: To add Hive steps to a cluster

The following `add-steps` example adds two Hive steps to the specified cluster.

```
aws emr add-steps \
    --cluster-id j-XXXXXXXX \
    --steps Type=HIVE,Name='Hive program',ActionOnFailure=CONTINUE,Args=[-f,s3://
amzn-s3-demo-bucket/myhivescript.q,-d,INPUT=s3://amzn-s3-demo-bucket/myhiveinput,-
d,OUTPUT=s3://amzn-s3-demo-bucket/myhiveoutput,arg1,arg2] Type=HIVE,Name='Hive
 steps',ActionOnFailure=TERMINATE_CLUSTER,Args=[-f,s3://elasticmapreduce/samples/
hive-ads/libs/model-build.q,-d,INPUT=s3://elasticmapreduce/samples/hive-ads/tables,-
d,OUTPUT=s3://amzn-s3-demo-bucket/hive-ads/output/2014-04-18/11-07-32,-d,LIBS=s3://
elasticmapreduce/samples/hive-ads/libs]
```

Required parameters:

```
Type, Args
```

Optional parameters:

```
Name, ActionOnFailure
```

Output:

```
{
    "StepIds":[
        "s-XXXXXXXX",
        "s-YYYYYYYY"
    ]
}
```

Example 5: To add Pig steps to a cluster

The following `add-steps` example adds two Pig steps to the specified cluster.

```
aws emr add-steps \
    --cluster-id j-XXXXXXXX \
    --steps Type=PIG,Name='Pig program',ActionOnFailure=CONTINUE,Args=[-f,s3://
amzn-s3-demo-bucket/mypigscript.pig,-p,INPUT=s3://amzn-s3-demo-bucket/mypiginput,-
p,OUTPUT=s3://amzn-s3-demo-bucket/mypigoutput,arg1,arg2] Type=PIG,Name='Pig
 program',Args=[-f,s3://elasticmapreduce/samples/pig-apache/do-reports2.pig,-
p,INPUT=s3://elasticmapreduce/samples/pig-apache/input,-p,OUTPUT=s3://amzn-s3-demo-
bucket/pig-apache/output,arg1,arg2]
```

Required parameters:

```
Type, Args
```

Optional parameters:

```
Name, ActionOnFailure
```

Output:

```
{
    "StepIds":[
```

```
        "s-XXXXXXXX",
        "s-YYYYYYYY"
    ]
}
```

Example 6: To add Impala steps to a cluster

The following `add-steps` example adds an Impala step to the specified cluster.

```
aws emr add-steps \
    --cluster-id j-XXXXXXXX \
    --steps Type=IMPALA,Name='Impala program',ActionOnFailure=CONTINUE,Args=--
impala-script,s3://amzn-s3-demo-bucket/input,--console-output-path,s3://amzn-s3-
demo-bucket/output
```

Required parameters:

```
Type, Args
```

Optional parameters:

```
Name, ActionOnFailure
```

Output:

```
{
    "StepIds":[
        "s-XXXXXXXX",
        "s-YYYYYYYY"
    ]
}
```

For more information, see Submit work to an Amazon EMR cluster in the *Amazon EMR Management Guide*.

- For API details, see AddSteps in *AWS CLI Command Reference*.

add-tags

The following code example shows how to use `add-tags`.

AWS CLI

To add tags to a cluster

The following `add-tags` example adds tags to the specified cluster.

```
aws emr add-tags \
    --resource-id j-xxxxxxx \
    --tags name="John Doe" age=29 sex=male address="123 East NW Seattle"
```

This command produces no output.

To list the tags of the cluster, run the following `describe-cluster` command.

```
aws emr describe-cluster \
    --cluster-id j-xxxxxxx \
    --query Cluster.Tags
```

Output:

```
[
    {
        "Value": "male",
        "Key": "sex"
    },
    {
        "Value": "123 East NW Seattle",
        "Key": "address"
    },
    {
        "Value": "John Doe",
        "Key": "name"
    },
    {
        "Value": "29",
        "Key": "age"
    }
]
```

For more information, see Tag and categorize Amazon EMR cluster resources in the *Amazon EMR Management Guide*.

- For API details, see AddTags in *AWS CLI Command Reference*.

`create-cluster`

The following code example shows how to use `create-cluster`.

AWS CLI

Example 1: To create a cluster

The following `create-cluster` example creates a simple EMR cluster.

```
aws emr create-cluster \
    --release-label emr-5.14.0 \
    --instance-type m4.large \
    --instance-count 2
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

This example and most of the following examples assume that you specified your Amazon EMR service role and Amazon EC2 instance profile. If you have not done this, you must specify each required IAM role or use the `--use-default-roles` parameter when creating your cluster. For more information about specifying IAM roles, see Configure IAM Roles for Amazon EMR Permissions to AWS Services in the *Amazon EMR Management Guide*.

Example 2: To create an Amazon EMR cluster with default ServiceRole and InstanceProfile roles

The following `create-cluster` example creates an Amazon EMR cluster that uses the `--instance-groups` configuration.

```
aws emr create-cluster \
    --release-label emr-5.14.0 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

Example 3: To create an Amazon EMR cluster that uses an instance fleet

The following `create-cluster` example creates an Amazon EMR cluster that uses the `--instance-fleets` configuration, specifying two instance types for each fleet and two EC2 Subnets.

```
aws emr create-cluster \
    --release-label emr-5.14.0 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole,SubnetIds=['subnet-
ab12345c','subnet-de67890f'] \
    --instance-fleets
 InstanceFleetType=MASTER,TargetOnDemandCapacity=1,InstanceTypeConfigs=['{InstanceType=m4.la
 InstanceFleetType=CORE,TargetSpotCapacity=11,InstanceTypeConfigs=['{InstanceType=m4.large,B
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

Example 4: To create a cluster with default roles

The following `create-cluster` example uses the `--use-default-roles` parameter to specify the default service role and instance profile.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --use-default-roles \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
```

```
    --auto-terminate
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

Example 5: To create a cluster and specify the applications to install

The following `create-cluster` example uses the `--applications` parameter to specify the applications that Amazon EMR installs. This example installs Hadoop, Hive and Pig.

```
aws emr create-cluster \
    --applications Name=Hadoop Name=Hive Name=Pig \
    --release-label emr-5.9.0 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
    --auto-terminate
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

Example 6: To create a cluster that includes Spark

The following `create-cluster` example installs Spark.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --applications Name=Spark \
    --ec2-attributes KeyName=myKey \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
```

```
    --auto-terminate
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

Example 7: To specify a custom AMI to use for cluster instances

The following `create-cluster` example creates a cluster instance based on the Amazon Linux AMI with ID `ami-a518e6df`.

```
aws emr create-cluster \
    --name "Cluster with My Custom AMI" \
    --custom-ami-id ami-a518e6df \
    --ebs-root-volume-size 20 \
    --release-label emr-5.9.0 \
    --use-default-roles \
    --instance-count 2 \
    --instance-type m4.large
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

Example 8: To customize application configurations

The following `create-cluster` examples use the `--configurations` parameter to specify a JSON configuration file that contains application customizations for Hadoop. For more information, see Configuring Applications in the *Amazon EMR Release Guide*.

Contents of `configurations.json`:

```
[
```

```
    {
        "Classification": "mapred-site",
        "Properties": {
            "mapred.tasktracker.map.tasks.maximum": 2
        }
    },
    {
        "Classification": "hadoop-env",
        "Properties": {},
        "Configurations": [
            {
                "Classification": "export",
                "Properties": {
                    "HADOOP_DATANODE_HEAPSIZE": 2048,
                    "HADOOP_NAMENODE_OPTS": "-XX:GCTimeRatio=19"
                }
            }
        ]
    }
]
```

The following example references `configurations.json` as a local file.

```
aws emr create-cluster \
    --configurations file://configurations.json \
    --release-label emr-5.9.0 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
    --auto-terminate
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

The following example references `configurations.json` as a file in Amazon S3.

```
aws emr create-cluster \
```

```
    --configurations https://s3.amazonaws.com/amzn-s3-demo-bucket/
configurations.json \
    --release-label emr-5.9.0 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
    --auto-terminate
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

Example 9: To create a cluster with master, core, and task instance groups

The following `create-cluster` example uses `--instance-groups` to specify the type and number of EC2 instances to use for master, core, and task instance groups.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --instance-
groups Name=Master,InstanceGroupType=MASTER,InstanceType=m4.large,InstanceCount=1 Name=Core,
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

Example 10: To specify that a cluster should terminate after completing all steps

The following `create-cluster` example uses `--auto-terminate` to specify that the cluster should shut down automatically after completing all steps.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
```

```
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
    --auto-terminate
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

Example 11: To specify cluster configuration details such as the Amazon EC2 key pair, network configuration, and security groups

The following `create-cluster` example creates a cluster with the Amazon EC2 key pair named `myKey` and a customized instance profile named `myProfile`. Key pairs are used to authorize SSH connections to cluster nodes, most often the master node. For more information, see Use an Amazon EC2 Key Pair for SSH Credentials in the *Amazon EMR Management Guide*.

```
aws emr create-cluster \
    --ec2-attributes KeyName=myKey,InstanceProfile=myProfile \
    --release-label emr-5.9.0 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
    --auto-terminate
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

The following example creates a cluster in an Amazon VPC subnet.

```
aws emr create-cluster \
    --ec2-attributes SubnetId=subnet-xxxxx \
    --release-label emr-5.9.0 \
```

```
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
    --auto-terminate
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

The following example creates a cluster in the `us-west-2b` availability zone.

```
aws emr create-cluster \
    --ec2-attributes AvailabilityZone=us-west-2b \
    --release-label emr-5.9.0 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

The following example creates a cluster and specifies only the Amazon EMR-managed security groups.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --service-role myServiceRole \
    --ec2-attributes InstanceProfile=myRole,EmrManagedMasterSecurityGroup=sg-
master1,EmrManagedSlaveSecurityGroup=sg-slave1 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

The following example creates a cluster and specifies only additional Amazon EC2 security groups.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --service-role myServiceRole \
    --ec2-attributes InstanceProfile=myRole,AdditionalMasterSecurityGroups=[sg-
addMaster1,sg-addMaster2,sg-addMaster3,sg-
addMaster4],AdditionalSlaveSecurityGroups=[sg-addSlave1,sg-addSlave2,sg-
addSlave3,sg-addSlave4] \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

The following example creates a cluster and specifies the EMR-Managed security groups, as well as additional security groups.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --service-role myServiceRole \
    --ec2-attributes InstanceProfile=myRole,EmrManagedMasterSecurityGroup=sg-
master1,EmrManagedSlaveSecurityGroup=sg-slave1,AdditionalMasterSecurityGroups=[sg-
addMaster1,sg-addMaster2,sg-addMaster3,sg-
addMaster4],AdditionalSlaveSecurityGroups=[sg-addSlave1,sg-addSlave2,sg-
addSlave3,sg-addSlave4] \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

The following example creates a cluster in a VPC private subnet and use a specific Amazon EC2 security group to enable Amazon EMR service access, which is required for clusters in private subnets.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --service-role myServiceRole \
    --ec2-attributes InstanceProfile=myRole,ServiceAccessSecurityGroup=sg-service-
access,EmrManagedMasterSecurityGroup=sg-master,EmrManagedSlaveSecurityGroup=sg-slave
 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

The following example specifies security group configuration parameters using a JSON file named `ec2_attributes.json` that is stored locally. NOTE: JSON arguments must include options and values as their own items in the list.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --service-role myServiceRole \
    --ec2-attributes file://ec2_attributes.json  \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

Contents of `ec2_attributes.json`:

```
[
    {
        "SubnetId": "subnet-xxxxx",
        "KeyName": "myKey",
        "InstanceProfile":"myRole",
        "EmrManagedMasterSecurityGroup": "sg-master1",
        "EmrManagedSlaveSecurityGroup": "sg-slave1",
        "ServiceAccessSecurityGroup": "sg-service-access",
        "AdditionalMasterSecurityGroups": ["sg-addMaster1","sg-addMaster2","sg-
addMaster3","sg-addMaster4"],
        "AdditionalSlaveSecurityGroups": ["sg-addSlave1","sg-addSlave2","sg-
addSlave3","sg-addSlave4"]
    }
]
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

Example 12: To enable debugging and specify a log URI

The following `create-cluster` example uses the `--enable-debugging` parameter, which allows you to view log files more easily using the debugging tool in the Amazon EMR console. The `--log-uri` parameter is required with `--enable-debugging`.

```
aws emr create-cluster \
    --enable-debugging \
    --log-uri s3://amzn-s3-demo-bucket/myLog \
    --release-label emr-5.9.0 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
    --auto-terminate
```

Output:

```
{
```

```
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

Example 13: To add tags when creating a cluster

The following `create-cluster` example uses the `--tags` parameter to create three tags for a cluster, one with the key name `name` and the value `Shirley Rodriguez`, a second with the key name `age` and the value 29, and a third tag with the key name `department` and the value `Analytics`. Tags are key-value pairs that help you identify and manage clusters.

```
aws emr create-cluster \
    --tags name="Shirley Rodriguez" age=29 department="Analytics" \
    --release-label emr-5.32.0 \
    --instance-type m5.xlarge \
    --instance-count 3 \
    --use-default-roles
```

Output:

```
{
    "ClusterId": "j-XXXXXXYY",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/j-
XXXXXXYY"
}
```

The following example lists the tags applied to a cluster.

```
aws emr describe-cluster \
    --cluster-id j-XXXXXXYY \
    --query Cluster.Tags
```

Output:

```
[
    {
        "Key": "name",
        "Value": "Shirley Rodriguez"
    },
```

```
    {
        "Key": "age",
        "Value": "29"
    },
    {
        "Key": "department",
        "Value": "Analytics"
    }
]
```

Example 14: To use a security configuration that enables encryption and other security features

The following `create-cluster` example uses the `--security-configuration` parameter to specify a security configuration for an EMR cluster. You can use security configurations with Amazon EMR version 4.8.0 or later.

```
aws emr create-cluster \
    --instance-type m4.large \
    --release-label emr-5.9.0 \
    --security-configuration mySecurityConfiguration
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

Example 15: To create a cluster with additional EBS storage volumes configured for the instance groups

The following `create-cluster` example creates a cluster with multiple EBS volumes attached to EC2 instances in the core instance group. When specifying additional EBS volumes, the following arguments are required: `VolumeType`, `SizeInGB` if `EbsBlockDeviceConfigs` is specified.

```
aws emr create-cluster \
    --release-label emr-5.9.0  \
    --use-default-roles \
```

```
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=d2.xlarge
 'InstanceGroupType=CORE,InstanceCount=2,InstanceType=d2.xlarge,EbsConfiguration={EbsOptimiz
{VolumeSpecification={VolumeType=io1,SizeInGB=100,Iops=100},VolumesPerInstance=4}]}'
 \
    --auto-terminate
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

The following example creates a cluster with multiple EBS volumes attached to EC2 instances in the master instance group.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --use-default-roles \
    --instance-groups 'InstanceGroupType=MASTER, InstanceCount=1,
 InstanceType=d2.xlarge, EbsConfiguration={EbsOptimized=true,
 EbsBlockDeviceConfigs=[{VolumeSpecification={VolumeType=io1, SizeInGB=100,
 Iops=100}},
{VolumeSpecification={VolumeType=standard,SizeInGB=50},VolumesPerInstance=3}]}' InstanceGrou
 \
    --auto-terminate
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

Example 16: To create a cluster with an automatic scaling policy

The following `create-cluster` example creates a cluster with an automatic scaling policy. You can attach automatic scaling policies to core and task instance groups using Amazon EMR

version 4.0 and later. The automatic scaling policy dynamically adds and removes EC2 instances in response to an Amazon CloudWatch metric. For more information, see Using Automatic Scaling in Amazon EMR <https://docs.aws.amazon.com/emr/latest/ManagementGuide/emr-automatic-scaling.html>`_ in the *Amazon EMR Management Guide*.

When attaching an automatic scaling policy, you must also specify the default role for automatic scaling using `--auto-scaling-role EMR_AutoScaling_DefaultRole`.

The following `create-cluster` example specifies the automatic scaling policy for the `CORE` instance group using the `AutoScalingPolicy` argument with an embedded JSON structure, which specifies the scaling policy configuration. Instance groups with an embedded JSON structure must have the entire collection of arguments enclosed in single quotes. Using single quotes is optional for instance groups without an embedded JSON structure.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --use-default-roles \
    --auto-scaling-role EMR_AutoScaling_DefaultRole \
    --instance-
groups InstanceGroupType=MASTER,InstanceType=d2.xlarge,InstanceCount=1
 'InstanceGroupType=CORE,InstanceType=d2.xlarge,InstanceCount=2,AutoScalingPolicy={Constrain
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

The following example uses a JSON file, `instancegroupconfig.json`, to specify the configuration of all instance groups in a cluster. The JSON file specifies the automatic scaling policy configuration for the core instance group.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
    --instance-groups file://myfolder/instancegroupconfig.json \
    --auto-scaling-role EMR_AutoScaling_DefaultRole
```

Contents of `instancegroupconfig.json`:

```
[
    {
        "InstanceCount": 1,
        "Name": "MyMasterIG",
        "InstanceGroupType": "MASTER",
        "InstanceType": "m4.large"
    },
    {
        "InstanceCount": 2,
        "Name": "MyCoreIG",
        "InstanceGroupType": "CORE",
        "InstanceType": "m4.large",
        "AutoScalingPolicy": {
            "Constraints": {
                "MinCapacity": 2,
                "MaxCapacity": 10
            },
            "Rules": [
                {
                    "Name": "Default-scale-out",
                    "Description": "Replicates the default scale-out rule in the
 console for YARN memory.",
                    "Action": {
                        "SimpleScalingPolicyConfiguration": {
                            "AdjustmentType": "CHANGE_IN_CAPACITY",
                            "ScalingAdjustment": 1,
                            "CoolDown": 300
                        }
                    },
                    "Trigger": {
                        "CloudWatchAlarmDefinition": {
                            "ComparisonOperator": "LESS_THAN",
                            "EvaluationPeriods": 1,
                            "MetricName": "YARNMemoryAvailablePercentage",
                            "Namespace": "AWS/ElasticMapReduce",
                            "Period": 300,
                            "Threshold": 15,
                            "Statistic": "AVERAGE",
                            "Unit": "PERCENT",
                            "Dimensions": [
                                {
                                    "Key": "JobFlowId",
```

```
                                    "Value": "${emr.clusterId}"
                                }
                            ]
                        }
                    }
                }
            ]
        }
    }
]
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

Example 17: To add custom JAR steps when creating a cluster

The following `create-cluster` example adds steps by specifying a JAR file stored in Amazon S3. Steps submit work to a cluster. The main function defined in the JAR file executes after EC2 instances are provisioned, any bootstrap actions have executed, and applications are installed. The steps are specified using `Type=CUSTOM_JAR`.

Custom JAR steps require the `Jar=` parameter, which specifies the path and file name of the JAR. Optional parameters are `Type`, `Name`, `ActionOnFailure`, `Args`, and `MainClass`. If main class is not specified, the JAR file should specify `Main-Class` in its manifest file.

```
aws emr create-cluster \
    --steps Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s3://amzn-
s3-demo-bucket/
mytest.jar,Args=arg1,arg2,arg3 Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s
amzn-s3-demo-bucket/mytest.jar,MainClass=mymainclass,Args=arg1,arg2,arg3  \
    --release-label emr-5.3.1 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
    --auto-terminate
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

Example 18: To add streaming steps when creating a cluster

The following `create-cluster` examples add a streaming step to a cluster that terminates after all steps run. Streaming steps require parameters `Type` and `Args`. Streaming steps optional parameters are `Name` and `ActionOnFailure`.

The following example specifies the step inline.

```
aws emr create-cluster \
    --steps Type=STREAMING,Name='Streaming Program',ActionOnFailure=CONTINUE,Args=[-
files,s3://elasticmapreduce/samples/wordcount/wordSplitter.py,-
mapper,wordSplitter.py,-reducer,aggregate,-input,s3://elasticmapreduce/samples/
wordcount/input,-output,s3://amzn-s3-demo-bucket/wordcount/output] \
    --release-label emr-5.3.1 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
    --auto-terminate
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

The following example uses a locally stored JSON configuration file named `multiplefiles.json`. The JSON configuration specifies multiple files. To specify multiple files within a step, you must use a JSON configuration file to specify the step. JSON arguments must include options and values as their own items in the list.

```
aws emr create-cluster \
    --steps file://./multiplefiles.json \
    --release-label emr-5.9.0  \
```

```
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
    --auto-terminate
```

Contents of `multiplefiles.json`:

```
[
    {
        "Name": "JSON Streaming Step",
        "Args": [
            "-files",
            "s3://elasticmapreduce/samples/wordcount/wordSplitter.py",
            "-mapper",
            "wordSplitter.py",
            "-reducer",
            "aggregate",
            "-input",
            "s3://elasticmapreduce/samples/wordcount/input",
            "-output",
            "s3://amzn-s3-demo-bucket/wordcount/output"
        ],
        "ActionOnFailure": "CONTINUE",
        "Type": "STREAMING"
    }
]
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

Example 19: To add Hive steps when creating a cluster

The following `create-cluster` example adds Hive steps when creating a cluster. Hive steps require parameters `Type` and `Args`. Hive steps optional parameters are `Name` and `ActionOnFailure`.

```
aws emr create-cluster \
```

```
    --steps Type=HIVE,Name='Hive
 program',ActionOnFailure=CONTINUE,ActionOnFailure=TERMINATE_CLUSTER,Args=[-
f,s3://elasticmapreduce/samples/hive-ads/libs/model-build.q,-d,INPUT=s3://
elasticmapreduce/samples/hive-ads/tables,-d,OUTPUT=s3://amzn-s3-demo-bucket/hive-
ads/output/2014-04-18/11-07-32,-d,LIBS=s3://elasticmapreduce/samples/hive-ads/libs]
 \
    --applications Name=Hive \
    --release-label emr-5.3.1 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

Example 20: To add Pig steps when creating a cluster

The following `create-cluster` example adds Pig steps when creating a cluster. Pig steps required parameters are `Type` and `Args`. Pig steps optional parameters are `Name` and `ActionOnFailure`.

```
aws emr create-cluster \
    --steps Type=PIG,Name='Pig program',ActionOnFailure=CONTINUE,Args=[-f,s3://
elasticmapreduce/samples/pig-apache/do-reports2.pig,-p,INPUT=s3://elasticmapreduce/
samples/pig-apache/input,-p,OUTPUT=s3://amzn-s3-demo-bucket/pig-apache/output] \
    --applications Name=Pig \
    --release-label emr-5.3.1 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

Example 21: To add bootstrap actions

The following `create-cluster` example runs two bootstrap actions defined as scripts that are stored in Amazon S3.

```
aws emr create-cluster \
    --bootstrap-actions Path=s3://amzn-s3-demo-bucket/
myscript1,Name=BootstrapAction1,Args=[arg1,arg2] Path=s3://amzn-s3-demo-bucket/
myscript2,Name=BootstrapAction2,Args=[arg1,arg2] \
    --release-label emr-5.3.1 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
    --auto-terminate
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

Example 22: To enable EMRFS consistent view and customize the RetryCount and RetryPeriod settings

The following `create-cluster` example specifies the retry count and retry period for EMRFS consistent view. The `Consistent=true` argument is required.

```
aws emr create-cluster \
    --instance-type m4.large \
    --release-label emr-5.9.0 \
    --emrfs Consistent=true,RetryCount=6,RetryPeriod=30
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

The following example specifies the same EMRFS configuration as the previous example, using a locally stored JSON configuration file named `emrfsconfig.json`.

```
aws emr create-cluster \
    --instance-type m4.large \
    --release-label emr-5.9.0 \
    --emrfs file://emrfsconfig.json
```

Contents of `emrfsconfig.json`:

```
{
    "Consistent": true,
    "RetryCount": 6,
    "RetryPeriod": 30
}
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

Example 23: To create a cluster with Kerberos configured

The following `create-cluster` examples create a cluster using a security configuration with Kerberos enabled, and establishes Kerberos parameters for the cluster using `--kerberos-attributes`.

The following command specifies Kerberos attributes for the cluster inline.

```
aws emr create-cluster \
    --instance-type m3.xlarge \
    --release-label emr-5.10.0 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
    --security-configuration mySecurityConfiguration \
    --kerberos-
attributes Realm=EC2.INTERNAL,KdcAdminPassword=123,CrossRealmTrustPrincipalPassword=123
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

The following command specifies the same attributes, but references a locally stored JSON file named `kerberos_attributes.json`. In this example, the file is saved in the same directory where you run the command. You can also reference a configuration file saved in Amazon S3.

```
aws emr create-cluster \
    --instance-type m3.xlarge \
    --release-label emr-5.10.0 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
    --security-configuration mySecurityConfiguration \
    --kerberos-attributes file://kerberos_attributes.json
```

Contents of `kerberos_attributes.json`:

```
{
    "Realm": "EC2.INTERNAL",
    "KdcAdminPassword": "123",
    "CrossRealmTrustPrincipalPassword": "123",
}
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the `--instance-groups` configuration and has a managed scaling policy.

```
aws emr create-cluster \
```

```
    --release-label emr-5.30.0 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
    --managed-scaling-policy
 ComputeLimits='{MinimumCapacityUnits=2,MaximumCapacityUnits=4,UnitType=Instances}'
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the "--log-encryption-kms-key-id" to define KMS key ID utilized for Log encryption.

```
aws emr create-cluster \
    --release-label emr-5.30.0 \
    --log-uri s3://amzn-s3-demo-bucket/myLog \
    --log-encryption-kms-key-id arn:aws:kms:us-west-2:123456789012:key/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the "--placement-group-configs" configuration to place master nodes in a high-availability (HA) cluster within an EC2 placement group using SPREAD placement strategy.

```
aws emr create-cluster \
```

```
    --release-label emr-5.30.0 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=3,InstanceType=m4.large InstanceGroupType=CORE
 \
    --placement-group-configs InstanceRole=MASTER
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the "--auto-termination-policy" configuration to place an automatic idle termination threshold for the cluster.

```
aws emr create-cluster \
    --release-label emr-5.34.0 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
 \
    --auto-termination-policy IdleTimeout=100
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the "--os-release-label" to define an Amazon Linux release for cluster launch.

```
aws emr create-cluster \
```

```
    --release-label emr-6.6.0 \
    --os-release-label 2.0.20220406.1 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
    --instance-
groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

Example 24: To specify an EBS root volume attributes: size, iops and throughput for cluster instances created with EMR releases 6.15.0 and later

The following `create-cluster` example creates an Amazon EMR cluster that uses root volume attributes to configure root volumes specifications for the EC2 instances.

```
aws emr create-cluster \
    --name "Cluster with My Custom AMI" \
    --custom-ami-id ami-a518e6df \
    --ebs-root-volume-size 20 \
    --ebs-root-volume-iops 3000 \
    --ebs-root-volume-throughput 125 \
    --release-label emr-6.15.0 \
    --use-default-roles \
    --instance-count 2 \
    --instance-type m4.large
```

Output:

```
{
    "ClusterId": "j-1K48XXXXXXHCB",
    "ClusterArn": "arn:aws:elasticmapreduce:us-west-2:123456789012:cluster/
j-1K48XXXXXXHCB"
}
```

- For API details, see CreateCluster in *AWS CLI Command Reference*.

create-default-roles

The following code example shows how to use `create-default-roles`.

AWS CLI

To create the default IAM role for EC2

The following `create-default-roles` example creates the default IAM role for EC2. If the role already exists, the command returns nothing.

```
aws emr create-default-roles
```

Output:

```
[
    {
        "RolePolicy": {
            "Version":"2012-10-17",
            "Statement": [
                {
                    "Action": [

```

For more information, see Configure IAM service roles for Amazon EMR permissions to AWS services and resources in the *Amazon EMR Management Guide*.

- For API details, see CreateDefaultRoles in *AWS CLI Command Reference*.

`create-security-configuration`

The following code example shows how to use `create-security-configuration`.

AWS CLI

Example 1: To create a security configuration with in-transit encryption enabled with PEM for certificate provider, and at-rest encryption enabled with SSE-S3 for S3 encryption and AWS-KMS for local disk key provider

The following `create-security-configuration` example creates a security configuration named `MySecurityConfig` with in-transit encryption enabled with PEM for certificate provider, and at-rest encryption enabled with SSE-S3 for S3 encryption and AWS-KMS for local disk key provider.

```
aws emr create-security-configuration \
    --name MySecurityConfig \
    --security-configuration '{
        "EncryptionConfiguration": {
            "EnableInTransitEncryption" : true,
            "EnableAtRestEncryption" : true,
            "InTransitEncryptionConfiguration" : {
                "TLSCertificateConfiguration" : {
```

```
                    "CertificateProviderType" : "PEM",
                    "S3Object" : "s3://amzn-s3-demo-bucket/artifacts/MyCerts.zip"
                }
            },
            "AtRestEncryptionConfiguration" : {
                "S3EncryptionConfiguration" : {
                    "EncryptionMode" : "SSE-S3"
                },
                "LocalDiskEncryptionConfiguration" : {
                    "EncryptionKeyProviderType" : "AwsKms",
                    "AwsKmsKey" : "arn:aws:kms:us-west-2:123456789012:key/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
                }
            }
        }
    }'
```

Output:

```
{
    "CreationDateTime": "2016-09-16T20:08:09.129000-0400",
    "Name": "MySecurityConfig"
}
```

The following `create-security-configuration` example creates the same security configuration by using the `security_configuration.json` file.

```
aws emr create-security-configuration \
    --name "MySecurityConfig" \
    --security-configuration file://./security_configuration.json
```

Contents of `security_configuration.json`:

```
{
    "EncryptionConfiguration": {
        "EnableInTransitEncryption": true,
        "EnableAtRestEncryption": true,
        "InTransitEncryptionConfiguration": {
            "TLSCertificateConfiguration": {
                "CertificateProviderType": "PEM",
                "S3Object": "s3://amzn-s3-demo-bucket/artifacts/MyCerts.zip"
            }
```

```
        },
        "AtRestEncryptionConfiguration": {
            "S3EncryptionConfiguration": {
                "EncryptionMode": "SSE-S3"
            },
            "LocalDiskEncryptionConfiguration": {
                "EncryptionKeyProviderType": "AwsKms",
                "AwsKmsKey": "arn:aws:kms:us-west-2:123456789012:key/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
            }
        }
    }
}
```

Output:

```
{
    "CreationDateTime": "2016-09-16T20:08:09.129000-0400",
    "Name": "MySecurityConfig"
}
```

Example 2: To create a security configuration with Kerberos enabled using cluster-dedicated KDC and cross-realm trust

The following `create-security-configuration` example creates a security configuration named `MySecurityConfig` with Kerberos enabled using cluster-dedicated KDC and cross-realm trust.

```
aws emr create-security-configuration \
    --name MySecurityConfig \
    --security-configuration '{
        "AuthenticationConfiguration": {
            "KerberosConfiguration": {
                "Provider": "ClusterDedicatedKdc",
                "ClusterDedicatedKdcConfiguration": {
                    "TicketLifetimeInHours": 24,
                    "CrossRealmTrustConfiguration": {
                        "Realm": "AD.DOMAIN.COM",
                        "Domain": "ad.domain.com",
                        "AdminServer": "ad.domain.com",
                        "KdcServer": "ad.domain.com"
                    }
```

```
                }
            }
        }
    }'
```

Output:

```
{
    "CreationDateTime": "2017-03-22T19:32:38.982000-0400",
    "Name": "MySecurityConfig"
}
```

The following `create-security-configuration` example creates the same security configuration by using the `security_configuration.json` file.

```
aws emr create-security-configuration \
    --name "MySecurityConfig" \
    --security-configuration file://./security_configuration.json
```

Contents of `security_configuration.json`:

```
{
    "AuthenticationConfiguration": {
        "KerberosConfiguration": {
            "Provider": "ClusterDedicatedKdc",
            "ClusterDedicatedKdcConfiguration": {
                "TicketLifetimeInHours": 24,
                "CrossRealmTrustConfiguration": {
                    "Realm": "AD.DOMAIN.COM",
                    "Domain": "ad.domain.com",
                    "AdminServer": "ad.domain.com",
                    "KdcServer": "ad.domain.com"
                }
            }
        }
    }
}
```

Output:

```
{
```

```
    "CreationDateTime": "2017-03-22T19:32:38.982000-0400",
    "Name": "MySecurityConfig"
}
```

For more information, see Create a security configuration with the Amazon EMR console or with the AWS CLI in the *Amazon EMR Management Guide*.

- For API details, see CreateSecurityConfiguration in *AWS CLI Command Reference*.

`delete-security-configuration`

The following code example shows how to use `delete-security-configuration`.

AWS CLI

To delete a security configuration in the current region

The following `delete-security-configuration` example deletes the security configuration named `MySecurityConfig` in the current region.

```
aws emr delete-security-configuration \
    --name MySecurityConfig
```

This command produces no output.

For more information, see Use security configurations to set up Amazon EMR cluster security in the *Amazon EMR Management Guide*.

- For API details, see DeleteSecurityConfiguration in *AWS CLI Command Reference*.

`describe-cluster`

The following code example shows how to use `describe-cluster`.

AWS CLI

To describe a cluster

The following `describe-cluster` example describes the specified cluster.

```
aws emr describe-cluster \
    --cluster-id j-XXXXXXXX
```

For a release-label based uniform instance groups cluster, the output looks like the following.

Output:

```
{
    "Cluster": {
        "Status": {
            "Timeline": {
                "ReadyDateTime": "2015-07-09T16:51:15.199000-0400",

                    },
                    "State": "RUNNING",
                    "StateChangeReason": {
                        "Message": ""
                    }
                },
                "Name": "MASTER",
                "InstanceGroupType": "MASTER",
                "Id": "ig-XXXXXXXXX",
                "Configurations": [],
                "InstanceType": "m3.large",
                "Market": "ON_DEMAND",
                "RunningInstanceCount": 1
            }
        ],
        "Applications": [
            {
                "Name": "Hadoop"
            }
        ],
        "VisibleToAllUsers": true,
        "BootstrapActions": [],
        "MasterPublicDnsName": "ec2-54-147-144-78.compute-1.amazonaws.com",
        "AutoTerminate": false,
        "Id": "j-XXXXXXXX",
        "Configurations": [
            {
                "Properties": {
```

```
                    "fs.s3.consistent.retryPeriodSeconds": "20",
                    "fs.s3.enableServerSideEncryption": "true",
                    "fs.s3.consistent": "false",
                    "fs.s3.consistent.retryCount": "2"
                },
                "Classification": "emrfs-site"
            }
        ]
    }
}
```

For a release-label based instance fleet cluster, the output looks like the following.

Output:

```
{
    "Cluster": {
        "Status": {
            "Timeline": {
                "ReadyDateTime": "2017-02-23T19:48:09.705000-0500",

}
```

For more information, see View Amazon EMR cluster status and details in the *Amazon EMR Management Guide*.

- For API details, see DescribeCluster in *AWS CLI Command Reference*.

`describe-step`

The following code example shows how to use `describe-step`.

AWS CLI

To describe a step

The following `describe-step` example describes a step with the step ID `s-3LZC0QUT43AM` in a cluster with the cluster ID `j-3SD91U2E1L2QX`.

```
aws emr describe-step \
    --cluster-id j-3SD91U2E1L2QX \
    --step-id s-3LZC0QUT43AM
```

Output:

```
{
    "Step": {
        "Status": {
            "Timeline": {
                "EndDateTime": "2015-06-01T19:14:30.481000-0400",
                "CreationDateTime": "2015-06-01T19:05:26.597000-0400",
                "StartDateTime": "2015-06-01T19:13:24.959000-0400"
            },
            "State": "COMPLETED",
            "StateChangeReason": {}
        },
        "Config": {
            "Args": [
                "s3://us-west-2.elasticmapreduce/libs/hive/hive-script",
                "--base-path",
                "s3://us-west-2.elasticmapreduce/libs/hive/",
                "--install-hive",
                "--hive-versions",
                "0.13.1"
            ],
            "Jar": "s3://us-west-2.elasticmapreduce/libs/script-runner/script-
runner.jar",
            "Properties": {}
```

```
        },
        "Id": "s-3LZC0QUT43AM",
        "ActionOnFailure": "TERMINATE_CLUSTER",
        "Name": "Setup hive"
    }
}
```

For more information, see Submit work to an Amazon EMR cluster in the *Amazon EMR Management Guide*.

- For API details, see DescribeStep in *AWS CLI Command Reference*.

`get`

The following code example shows how to use `get`.

AWS CLI

To download a file from the primary node of a cluster

The following `get` example downloads the `hadoop-examples.jar` archive from the master instance in a cluster with the cluster ID `j-3SD91U2E1L2QX`. The command displays the `scp` command that it runs, followed by any output from `scp`.

```
aws emr get \
    --cluster-id j-3SD91U2E1L2QX \
    --key-pair-file ~/.ssh/mykey.pem \
    --src /home/hadoop-examples.jar \
    --dest ~
```

Output:

```
scp -r -o StrictHostKeyChecking=accept-new -i /home/local/user/.ssh/mykey.pem
 hadoop@ec2-52-52-41-150.us-west-2.compute.amazonaws.com:/home/hadoop-examples.jar /
home/local/user
```

For more information, see Connect to the Amazon EMR cluster primary node using SSH in the *Amazon EMR Management Guide*.

- For API details, see Get in *AWS CLI Command Reference*.

`list-clusters`

The following code example shows how to use `list-clusters`.

AWS CLI

To list the active clusters

The following `list-clusters` example lists all active EMR clusters in the current region.

```
aws emr list-clusters \
    --active
```

Output:

```
{
    "Clusters": [
        {
            "Status": {
                "Timeline": {
                    "ReadyDateTime": "2025-10-28T11:11:52.228000-04:00",
                    "CreationDateTime": "2025-10-28T11:02:22.179000-04:00"
                },
                "State": "WAITING",
                "StateChangeReason": {
                    "Message": "Waiting after step completed"
                }
            },
            "NormalizedInstanceHours": 6,
            "Id": "j-3SD91U2E1L2QX",
            "Name": "my-cluster"
        }
    ]
}
```

For more information, see View Amazon EMR cluster status and details in the *Amazon EMR Management Guide*.

- For API details, see ListClusters in *AWS CLI Command Reference*.

`list-instance-fleets`

The following code example shows how to use `list-instance-fleets`.

AWS CLI

To get configuration details of instance fleets in a cluster

The following `list-instance-fleets` example lists the details of instance fleets in the cluster specified.

```
list-instance-fleets --cluster-id 'j-12ABCDEFGHI34JK'
```

Output:

```
{
    "InstanceFleets": [
        {
            "Status": {
                "Timeline": {
                    "ReadyDateTime": "2017-03-05T19:11:34.637000-0500",
                    "CreationDateTime": "2017-03-05T19:05:19.817000-0500"
                },
                "State": "RUNNING",
                "StateChangeReason": {
                    "Message": ""
                }
            },

                    "WeightedCapacity": 1
                }
            ],
            "Id": "if-2ABC4DEFGHIJ4"
        }
    ]
}
```

For more information, see Planning and configuring instance fleets for your Amazon EMR cluster in the *Amazon EMR Management Guide*.

- For API details, see ListInstanceFleets in *AWS CLI Command Reference*.

`list-instances`

The following code example shows how to use `list-instances`.

AWS CLI

To list the instances in a cluster

The following `list-instances` example lists all of the instances in a cluster with the cluster ID `j-3C6XNQ39VR9WL`.

```
aws emr list-instances \
    --cluster-id j-3C6XNQ39VR9WL
```

For a uniform instance group based cluster, the output looks like the following.

Output:

```
{
    "Instances": [
        {
            "Status": {
                "Timeline": {
                    "ReadyDateTime": "2015-06-01T19:13:20.431000-0400",
                    "CreationDateTime": "2015-06-01T19:05:49.263000-0400"
                },
                "State": "RUNNING",
                "StateChangeReason": {}
            },
            "Ec2InstanceId": "i-f19ecfee",
            "PublicDnsName": "ec2-52-52-41-150.us-west-2.compute.amazonaws.com",
            "PrivateDnsName": "ip-172-21-11-216.us-west-2.compute.internal",
            "PublicIpAddress": "52.52.41.150",
            "Id": "ci-3NNHQUQ2TWB6Y",
            "PrivateIpAddress": "172.21.11.216"
        },
        {
            "Status": {
                "Timeline": {
                    "ReadyDateTime": "2015-06-01T19:13:20.431000-0400",
                    "CreationDateTime": "2015-06-01T19:05:49.263000-0400"
                },
                "State": "RUNNING",
                "StateChangeReason": {}
            },
            "Ec2InstanceId": "i-1feee4c2",
            "PublicDnsName": "ec2-52-63-246-32.us-west-2.compute.amazonaws.com",
            "PrivateDnsName": "ip-172-31-24-130.us-west-2.compute.internal",
            "PublicIpAddress": "52.63.246.32",
            "Id": "ci-GAOCMKNKDCV7",
            "PrivateIpAddress": "172.21.11.215"
        },
        {
            "Status": {
```

```
                "Timeline": {
                    "ReadyDateTime": "2015-06-01T19:13:20.431000-0400",
                    "CreationDateTime": "2015-06-01T19:05:49.263000-0400"
                },
                "State": "RUNNING",
                "StateChangeReason": {}
            },
            "Ec2InstanceId": "i-15cfeee3",
            "PublicDnsName": "ec2-52-25-246-63.us-west-2.compute.amazonaws.com",
            "PrivateDnsName": "ip-172-31-24-129.us-west-2.compute.internal",
            "PublicIpAddress": "52.25.246.63",
            "Id": "ci-2W3TDFFB47UAD",
            "PrivateIpAddress": "172.21.11.214"
        }
    ]
}
```

For an instance fleet based cluster, the output looks like the following.

Output:

```
{
    "Instances": [
        {
            "Status": {
                "Timeline": {
                    "ReadyDateTime": "2017-02-22T19:46:50.878000-0500",

        }
    ]
}
```

For more information, see View Amazon EMR cluster status and details in the *Amazon EMR Management Guide*.

- For API details, see ListInstances in *AWS CLI Command Reference*.

`list-security-configurations`

The following code example shows how to use `list-security-configurations`.

AWS CLI

To list security configurations in the current region

The following `list-security-configurations` example lists the security configurations in the current region.

```
aws emr list-security-configurations
```

Output:

```
{
    "SecurityConfigurations": [
        {
            "CreationDateTime": "2025-10-28T10:15:36.207000-04:00",
            "Name": "MySecurityConfig-1"
        },
        {
            "CreationDateTime": "2025-10-28T10:15:36.207000-04:00",
            "Name": "MySecurityConfig-2"
        }
    ]
}
```

For more information, see Use security configurations to set up Amazon EMR cluster security in the *Amazon EMR Management Guide*.

- For API details, see ListSecurityConfigurations in *AWS CLI Command Reference*.

list-steps

The following code example shows how to use `list-steps`.

AWS CLI

To list the steps in a cluster

The following `list-steps` example lists all of the steps in a cluster with the cluster ID `j-3SD91U2E1L2QX`.

```
aws emr list-steps \
    --cluster-id j-3SD91U2E1L2QX
```

Output:

```
{
    "Steps": [
        {
            "Id": "s-2BRWVHXA3EXBT",
            "Name": "Custom JAR",
            "Config": {
                "Jar": "s3://amzn-s3-demo-bucket/mytest.jar",
                "Properties": {},
                "MainClass": "mymainclass",
                "Args": [
                    "arg1",
                    "arg2"
                ]
            },
            "ActionOnFailure": "CONTINUE",
            "Status": {
                "State": "COMPLETED",
                "StateChangeReason": {},
                "Timeline": {
                    "CreationDateTime": "2024-05-14T18:07:31.123000+00:00",

                    "EndDateTime": "2024-05-14T18:12:20.789000+00:00"
                }
            }
        },
        {
            "Id": "s-1AXF2SNQKPLZR",
```

```
            "Name": "Setup Hadoop Debugging",
            "Config": {
                "Jar": "command-runner.jar",
                "Properties": {},
                "Args": [
                    "state-pusher-script"
                ]
            },
            "ActionOnFailure": "TERMINATE_CLUSTER",
            "Status": {
                "State": "COMPLETED",
                "StateChangeReason": {},
                "Timeline": {
                    "CreationDateTime": "2024-05-14T18:01:02.345000+00:00",
                    "StartDateTime": "2024-05-14T18:09:30.678000+00:00",
                    "EndDateTime": "2024-05-14T18:10:40.901000+00:00"
                }
            }
        }
    ]
}
```

For more information, see Submit work to an Amazon EMR cluster in the *Amazon EMR Management Guide*.

- For API details, see ListSteps in *AWS CLI Command Reference*.

`list-studios`

The following code example shows how to use `list-studios`.

AWS CLI

To list available EMR Studios

The following `list-studios` example lists the EMR Studios in the AWS account.

```
aws emr list-studios
```

Output:

```
{
```

```
    "Studios": [
        {
            "StudioId": "es-XXXXXXX132E0X7R0W7GAS1MVB",
            "Name": "My_EMR_Studio",
            "Url": "https://es-XXXXXXX132E0X7R0W7GAS1MVB.emrstudio-prod.us-
west-2.amazonaws.com",
            "AuthMode": "IAM",
            "CreationTime": "2025-10-28T11:09:33.624000-04:00"
        }
    ]
}
```

For more information, see Monitor, update and delete Amazon EMR Studio resources in the *Amazon EMR Management Guide*.

- For API details, see ListStudios in *AWS CLI Command Reference*.

`modify-cluster-attributes`

The following code example shows how to use `modify-cluster-attributes`.

AWS CLI

To make a cluster visible to all users

The following `modify-cluster-attributes` example sets the visibility of an EMR cluster with the ID `j-301CDNY0J5XM4` to all users.

```
aws emr modify-cluster-attributes \
    --cluster-id j-301CDNY0J5XM4 \
    --visible-to-all-users
```

This command produces no output.

For more information, see AWS Identity and Access Management for Amazon EMR in the *Amazon EMR Management Guide*.

- For API details, see ModifyClusterAttributes in *AWS CLI Command Reference*.

`modify-instance-fleet`

The following code example shows how to use `modify-instance-fleet`.

AWS CLI

To change the target capacities of an instance fleet

The following `modify-instance-fleet` example changes the On-Demand and Spot target capacities to 1 for the specified instance fleet.

```
aws emr modify-instance-fleet \
    --cluster-id 'j-12ABCDEFGHI34JK' \
    --instance-fleet
 InstanceFleetId='if-2ABC4DEFGHIJ4',TargetOnDemandCapacity=1,TargetSpotCapacity=1
```

This command produces no output.

For more information, see Planning and configuring instance fleets for your Amazon EMR cluster in the *Amazon EMR Management Guide*.

- For API details, see ModifyInstanceFleet in *AWS CLI Command Reference*.

put

The following code example shows how to use `put`.

AWS CLI

To upload a file to the primary node of a cluster

The following `put` example uploads a file named `healthcheck.sh` to the master instance in a cluster with the cluster ID `j-3SD91U2E1L2QX`. The command displays the `scp` command that it runs, followed by any output from `scp`.

```
aws emr put \
    --cluster-id j-3SD91U2E1L2QX \
    --key-pair-file ~/.ssh/mykey.pem \
    --src ~/scripts/healthcheck.sh \
    --dest /home/hadoop/bin/healthcheck.sh
```

Output:

```
scp -r -o StrictHostKeyChecking=accept-new -i /home/local/user/.ssh/
mykey.pem /home/local/user/scripts/healthcheck.sh hadoop@ec2-52-52-41-150.us-
west-2.compute.amazonaws.com:/home/hadoop/bin/healthcheck.sh
```

For more information, see Connect to an Amazon EMR cluster in the *Amazon EMR Management Guide*.

- For API details, see Put in *AWS CLI Command Reference*.

`remove-tags`

The following code example shows how to use `remove-tags`.

AWS CLI

To remove a tag from a cluster

The following `remove-tags` example removes a tag with the key `prod` from a cluster with the cluster ID `j-3SD91U2E1L2QX`.

```
aws emr remove-tags \
    --resource-id j-3SD91U2E1L2QX \
    --tag-keys prod
```

This command produces no output.

For more information, see Tag and categorize Amazon EMR cluster resources in the *Amazon EMR Management Guide*.

- For API details, see RemoveTags in *AWS CLI Command Reference*.

`schedule-hbase-backup`

The following code example shows how to use `schedule-hbase-backup`.

AWS CLI

Example 1: To schedule a full HBase backup

The following `schedule-hbase-backup` example schedules a full, consistent HBase backup to Amazon S3 every 10 hours. This command can only be used with HBase on AMI version 2.x and 3.x. The command adds an HBase backup step to the cluster and returns the ID of the step.

```
aws emr schedule-hbase-backup \
    --cluster-id j-XXXXXXYY \
```

```
    --type full \
    --dir s3://amzn-s3-demo-bucket/backup \
    --interval 10 \
    --unit hours \
    --start-time 2014-04-21T05:26:10Z \
    --consistent
```

Output:

```
{
    "StepIds": [
        "s-1A2B3C4D5E6F7"
    ]
}
```

Example 2: To schedule an incremental HBase backup

The following `schedule-hbase-backup` example schedules an incremental, consistent HBase backup to Amazon S3 every 30 minutes. This command can only be used with HBase on AMI version 2.x and 3.x. The command adds an HBase backup step to the cluster and returns the ID of the step.

```
aws emr schedule-hbase-backup \
    --cluster-id j-XXXXXXYY \
    --type incremental \
    --dir s3://amzn-s3-demo-bucket/backup \
    --interval 30 \
    --unit minutes \
    --start-time 2014-04-21T05:26:10Z \
    --consistent
```

Output:

```
{
    "StepIds": [
        "s-2B3C4D5E6F7G8"
    ]
}
```

For more information, see HBase application specifics for earlier AMI versions of Amazon EMR in the *Amazon EMR Release Guide*.

- For API details, see ScheduleHbaseBackup in *AWS CLI Command Reference*.

socks

The following code example shows how to use `socks`.

AWS CLI

To open a SOCKS connection to the primary node of a cluster

The following `socks` example opens a socks connection with the master instance in a cluster with the cluster ID `j-3SD91U2E1L2QX`.

```
aws emr socks \
    --cluster-id j-3SD91U2E1L2QX \
    --key-pair-file ~/.ssh/mykey.pem
```

The key pair file option takes a local path to a private key file. The command displays the `ssh` command that it runs and keeps the tunnel open on local port 8157 until you press Ctrl+C.

Output:

```
ssh -o StrictHostKeyChecking=accept-new -o ServerAliveInterval=10 -ND 8157 -i /home/
local/user/.ssh/mykey.pem hadoop@ec2-52-52-41-150.us-west-2.compute.amazonaws.com
Disabling Socks Tunnel.
```

For more information, see Option 2, part 1: Set up an SSH tunnel to the primary node using dynamic port forwarding in the *Amazon EMR Management Guide*.

- For API details, see Socks in *AWS CLI Command Reference*.

ssh

The following code example shows how to use `ssh`.

AWS CLI

To open an SSH connection to the primary node of a cluster

The following `ssh` example opens an ssh connection with the master instance in a cluster with the cluster ID `j-3SD91U2E1L2QX`.

```
aws emr ssh \
    --cluster-id j-3SD91U2E1L2QX \
    --key-pair-file ~/.ssh/mykey.pem
```

The key pair file option takes a local path to a private key file.

Output:

```
ssh -o StrictHostKeyChecking=no -o ServerAliveInterval=10 -i /home/local/user/.ssh/
mykey.pem hadoop@ec2-52-52-41-150.us-west-2.compute.amazonaws.com
Warning: Permanently added 'ec2-52-52-41-150.us-
west-2.compute.amazonaws.com,52.52.41.150' (ECDSA) to the list of known hosts.

--------------------------------------------------------------------------------

Welcome to Amazon Elastic MapReduce running Hadoop and Amazon Linux.

Hadoop is installed in /home/hadoop. Log files are in /mnt/var/log/hadoop. Check
/mnt/var/log/hadoop/steps for diagnosing step failures.

The Hadoop UI can be accessed via the following commands:

  ResourceManager    lynx http://ip-172-21-11-216:9026/
  NameNode           lynx http://ip-172-21-11-216:9101/

--------------------------------------------------------------------------------

[hadoop@ip-172-31-16-216 ~]$
```

For more information, see Connect to the Amazon EMR cluster primary node using SSH in the *Amazon EMR Management Guide*.

- For API details, see Ssh in *AWS CLI Command Reference*.

Amazon EMR on EKS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EMR on EKS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-role-associations`

The following code example shows how to use `create-role-associations`.

AWS CLI

To create role associations of an IAM Role with EMR service accounts to be used with Amazon EMR on EKS

The following `create-role-associations` example creates EKS pod identity associations of a role named **example_iam_role** with EMR service accounts such that it can be used with Amazon EMR on EKS with **example_namespace** namespace from an EKS cluster named **example_cluster**.

```
aws emr-containers create-role-associations \
    --cluster-name example_cluster \
    --namespace example_namespace \
    --role-name example_iam_role
```

Output:

```
[
    {
        "clusterName": "example_cluster",
        "namespace": "example_namespace",
```

```
        "serviceAccount": "emr-spark-client-service-account-example",
        "roleArn": "arn:aws:iam::123456789012:role/example_iam_role",
        "associationArn": "arn:aws:eks:us-
west-2:123456789012:podidentityassociation/example_cluster/a-bgyr1umgdmrk1kdtq",
        "associationId": "a-bgyr1umgdmrk1kdtq",
        "tags": {},
        "createdAt": "2022-11-15T10:49:00+00:00",
        "modifiedAt": "2022-11-15T10:49:00+00:00"
    },
    {
        "clusterName": "example_cluster",
        "namespace": "example_namespace",
        "serviceAccount": "emr-spark-driver-service-account-example",
        "roleArn": "arn:aws:iam::123456789012:role/example_iam_role",
        "associationArn": "arn:aws:eks:us-
west-2:123456789012:podidentityassociation/example_cluster/b-bgyr1umgdmrk1kdtq",
        "associationId": "b-bgyr1umgdmrk1kdtq",
        "tags": {},
        "createdAt": "2022-11-15T10:49:00+00:00",
        "modifiedAt": "2022-11-15T10:49:00+00:00"
    },
    {
        "clusterName": "example_cluster",
        "namespace": "example_namespace",
        "serviceAccount": "emr-spark-executor-service-account-example",
        "roleArn": "arn:aws:iam::123456789012:role/example_iam_role",
        "associationArn": "arn:aws:eks:us-
west-2:123456789012:podidentityassociation/example_cluster/c-bgyr1umgdmrk1kdtq",
        "associationId": "c-bgyr1umgdmrk1kdtq",
        "tags": {},
        "createdAt": "2022-11-15T10:49:00+00:00",
        "modifiedAt": "2022-11-15T10:49:00+00:00"
    }
]
```

For more information, see Option 1: Enable EKS Pod Identity on the EKS Cluster in the *Amazon EMR on EKS Development Guide*.

- For API details, see CreateRoleAssociations in *AWS CLI Command Reference*.

`delete-role-associations`

The following code example shows how to use `delete-role-associations`.

AWS CLI

To delete role associations of an IAM Role with EMR service accounts

The following `delete-role-associations` example deletes EKS pod identity associations of a role named **example_iam_role** with EMR service accounts such that it can be removed from Amazon EMR on EKS with **example_namespace** namespace from an EKS cluster named **example_cluster**.

EKS allows associations with non existing resources (namespace, service account), so EMR on EKS suggest to delete the associations if the namespace is deleted or the role is not in use to release the space for other associations.

```
aws emr-containers delete-role-associations \
    --cluster-name example_cluster \
    --namespace example_namespace \
    --role-name example_iam_role
```

Output:

```
[
    {
        "clusterName": "example_cluster",
        "namespace": "example_namespace",
        "serviceAccount": "emr-spark-client-service-account-example",
        "roleArn": "arn:aws:iam::123456789012:role/example_iam_role",
        "associationArn": "arn:aws:eks:us-
west-2:123456789012:podidentityassociation/example_cluster/a-bgyr1umgdmrk1kdtq",
        "associationId": "a-bgyr1umgdmrk1kdtq",
        "tags": {},
        "createdAt": "2022-11-15T10:49:00+00:00",
        "modifiedAt": "2022-11-15T10:49:00+00:00"
    },
    {
        "clusterName": "example_cluster",
        "namespace": "example_namespace",
        "serviceAccount": "emr-spark-driver-service-account-example",
        "roleArn": "arn:aws:iam::123456789012:role/example_iam_role",
        "associationArn": "arn:aws:eks:us-
west-2:123456789012:podidentityassociation/example_cluster/b-bgyr1umgdmrk1kdtq",
        "associationId": "b-bgyr1umgdmrk1kdtq",
        "tags": {},
```

```
        "createdAt": "2022-11-15T10:49:00+00:00",
        "modifiedAt": "2022-11-15T10:49:00+00:00"
    },
    {
        "clusterName": "example_cluster",
        "namespace": "example_namespace",
        "serviceAccount": "emr-spark-executor-service-account-example",
        "roleArn": "arn:aws:iam::123456789012:role/example_iam_role",
        "associationArn": "arn:aws:eks:us-
west-2:123456789012:podidentityassociation/example_cluster/c-bgyr1umgdmrk1kdtq",
        "associationId": "c-bgyr1umgdmrk1kdtq",
        "tags": {},
        "createdAt": "2022-11-15T10:49:00+00:00",
        "modifiedAt": "2022-11-15T10:49:00+00:00"
    }
]
```

For more information, see Option 1: Enable EKS Pod Identity on the EKS Cluster in the *Amazon EMR on EKS Development Guide*.

- For API details, see DeleteRoleAssociations in *AWS CLI Command Reference*.

`update-role-trust-policy`

The following code example shows how to use `update-role-trust-policy`.

AWS CLI

To update the trust policy of an IAM Role to be used with Amazon EMR on EKS

The following `update-role-trust-policy` example updates the trust policy of a role named **example_iam_role** such that it can be used with Amazon EMR on EKS with **example_namespace** namespace from an EKS cluster named **example_cluster**.

```
aws emr-containers update-role-trust-policy \
    --cluster-name example_cluster \
    --namespace example_namespace \
    --role-name example_iam_role
```

If the trust policy has already been updated, the command displays the following output.

Output:

```
Trust policy statement already exists for role example_iam_role. No changes were
 made!
```

If the trust policy has not been updated yet, the command displays the following output.

Output:

```
Successfully updated trust policy of role example_iam_role.
```

For more information, see Update the trust policy of the job execution role in the *Amazon EMR on EKS Development Guide*.

- For API details, see UpdateRoleTrustPolicy in *AWS CLI Command Reference*.

EventBridge examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with EventBridge.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`delete-rule`

The following code example shows how to use `delete-rule`.

AWS CLI

To delete a CloudWatch Events rule

The following `delete-rule` example deletes the rule named `EC2InstanceStateChanges`.

```
aws events delete-rule \
    --name "EC2InstanceStateChanges"
```

This command produces no output.

For more information, see Disabling or deleting a rule in Amazon EventBridge in the *Amazon EventBridge User Guide*.

- For API details, see DeleteRule in *AWS CLI Command Reference*.

`describe-rule`

The following code example shows how to use `describe-rule`.

AWS CLI

To display information about a CloudWatch Events rule

The following `describe-rule` example displays information about the rule named `DailyLambdaFunction`.

```
aws events describe-rule \
    --name "DailyLambdaFunction"
```

Output:

```
{
    "Name": "DailyLambdaFunction",
    "Arn": "arn:aws:events:us-west-2:123456789012:rule/DailyLambdaFunction",
    "ScheduleExpression": "cron(0 9 * * ? *)",
    "State": "ENABLED",
    "EventBusName": "default",
    "CreatedBy": "123456789012"
}
```

For more information, see Rules in Amazon EventBridge in the *Amazon EventBridge User Guide*.

- For API details, see DescribeRule in *AWS CLI Command Reference*.

`disable-rule`

The following code example shows how to use `disable-rule`.

AWS CLI

To disable a CloudWatch Events rule

The following `disable-rule` example disables the rule named `DailyLambdaFunction`. The rule is not deleted.

```
aws events disable-rule \
    --name "DailyLambdaFunction"
```

This command produces no output.

For more information, see Disabling or deleting a rule in Amazon EventBridge in the *Amazon EventBridge User Guide*.

- For API details, see DisableRule in *AWS CLI Command Reference*.

`enable-rule`

The following code example shows how to use `enable-rule`.

AWS CLI

To enable a CloudWatch Events rule

The following `enable-rule` example enables the rule named `DailyLambdaFunction`, which had been previously disabled.

```
aws events enable-rule \
    --name "DailyLambdaFunction"
```

This command produces no output.

For more information, see Rules in Amazon EventBridge in the *Amazon EventBridge User Guide*.

- For API details, see EnableRule in *AWS CLI Command Reference*.

`list-rule-names-by-target`

The following code example shows how to use `list-rule-names-by-target`.

AWS CLI

To display all the rules that have a specified target

The following `list-rule-names-by-target` example displays all rules that have the Lambda function named `MyFunctionName` as the target.

```
aws events list-rule-names-by-target \
    --target-arn "arn:aws:lambda:us-west-2:123456789012:function:MyFunctionName"
```

Output:

```
{
    "RuleNames": [
        "DailyLambdaFunction"
    ]
}
```

For more information, see Event bus targets in Amazon EventBridge in the *Amazon EventBridge User Guide*.

- For API details, see ListRuleNamesByTarget in *AWS CLI Command Reference*.

`list-rules`

The following code example shows how to use `list-rules`.

AWS CLI

Example 1: To display a list of all CloudWatch Events rules

The following `list-rules` example displays all CloudWatch Events rules in the region.

```
aws events list-rules
```

Output:

```
{
    "Rules": [
        {
            "Name": "DailyLambdaFunction",
```

```
            "Arn": "arn:aws:events:us-west-2:123456789012:rule/DailyLambdaFunction",
            "State": "ENABLED",
            "ScheduleExpression": "cron(0 9 * * ? *)",
            "EventBusName": "default"
        },
        {
            "Name": "EC2InstanceStateChanges",
            "Arn": "arn:aws:events:us-west-2:123456789012:rule/
EC2InstanceStateChanges",
            "EventPattern": "{\"source\":[\"aws.ec2\"],\"detail-type\":[\"EC2
 Instance State-change Notification\"]}",
            "State": "ENABLED",
            "RoleArn": "arn:aws:iam::123456789012:role/MyRoleForThisRule",
            "EventBusName": "default"
        }
    ]
}
```

Example 2: To display a list of CloudWatch Events rules beginning with a certain string

The following `list-rules` example displays all CloudWatch Events rules in the region that have a name starting with `Daily`.

```
aws events list-rules \
    --name-prefix "Daily"
```

Output:

```
{
    "Rules": [
        {
            "Name": "DailyLambdaFunction",
            "Arn": "arn:aws:events:us-west-2:123456789012:rule/DailyLambdaFunction",
            "State": "ENABLED",
            "ScheduleExpression": "cron(0 9 * * ? *)",
            "EventBusName": "default"
        }
    ]
}
```

For more information, see Rules in Amazon EventBridge in the *Amazon EventBridge User Guide*.

- For API details, see ListRules in *AWS CLI Command Reference*.

`list-targets-by-rule`

The following code example shows how to use `list-targets-by-rule`.

AWS CLI

To display all the targets for a CloudWatch Events rule

The following `list-targets-by-rule` example displays all the targets of the rule named `DailyLambdaFunction`.

```
aws events list-targets-by-rule \
    --rule "DailyLambdaFunction"
```

Output:

```
{
    "Targets": [
        {
            "Id": "1",
            "Arn": "arn:aws:lambda:us-west-2:123456789012:function:MyFunctionName"
        }
    ]
}
```

For more information, see Event bus targets in Amazon EventBridge in the *Amazon EventBridge User Guide*.

- For API details, see ListTargetsByRule in *AWS CLI Command Reference*.

`put-events`

The following code example shows how to use `put-events`.

AWS CLI

To send a custom event to CloudWatch Events

The following `put-events` example sends a custom event to CloudWatch Events. The event is contained within the `putevents.json` file.

```
aws events put-events \
```

```
    --entries file://putevents.json
```

Contents of `putevents.json`:

```
[
    {
        "Source": "com.mycompany.myapp",
        "Detail": "{ \"key1\": \"value1\", \"key2\": \"value2\" }",
        "Resources": [
            "resource1",
            "resource2"
        ],
        "DetailType": "myDetailType"
    },
    {
        "Source": "com.mycompany.myapp",
        "Detail": "{ \"key1\": \"value3\", \"key2\": \"value4\" }",
        "Resources": [
            "resource1",
            "resource2"
        ],
        "DetailType": "myDetailType"
    }
]
```

Output:

```
{
    "FailedEntryCount": 0,
    "Entries": [
        {
            "EventId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        },
        {
            "EventId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        }
    ]
}
```

For more information, see Sending events with PutEvents in Amazon EventBridge in the *Amazon EventBridge User Guide*.

- For API details, see PutEvents in *AWS CLI Command Reference*.

put-rule

The following code example shows how to use `put-rule`.

AWS CLI

To create CloudWatch Events rules

The following `put-rule` example creates a rule that triggers every day at 9:00am (UTC). If you use `put-targets` to add a Lambda function as a target of this rule, you could run the Lambda function every day at the specified time.

```
aws events put-rule \
    --name "DailyLambdaFunction" \
    --schedule-expression "cron(0 9 * * ? *)"
```

Output:

```
{
    "RuleArn": "arn:aws:events:us-west-2:123456789012:rule/DailyLambdaFunction"
}
```

The following `put-rule` example creates a rule that triggers when any EC2 instance in the region changes state.

```
aws events put-rule \
    --name "EC2InstanceStateChanges" \
    --event-pattern "{\"source\":[\"aws.ec2\"],\"detail-type\":[\"EC2 Instance
 State-change Notification\"]}" \
    --role-arn "arn:aws:iam::123456789012:role/MyRoleForThisRule"
```

Output:

```
{
    "RuleArn": "arn:aws:events:us-west-2:123456789012:rule/EC2InstanceStateChanges"
}
```

The following `put-rule` example creates a rule that triggers when any EC2 instance in the region is stopped or terminated.

```
aws events put-rule \
```

```
    --name "EC2InstanceStateChangeStopOrTerminate" \
    --event-pattern "{\"source\":[\"aws.ec2\"],\"detail-type\":[\"EC2 Instance
 State-change Notification\"],\"detail\":{\"state\":[\"stopped\",\"terminated\"]}}"
 \
    --role-arn "arn:aws:iam::123456789012:role/MyRoleForThisRule"
```

Output:

```
{
    "RuleArn": "arn:aws:events:us-west-2:123456789012:rule/
EC2InstanceStateChangeStopOrTerminate"
}
```

For more information, see Rules in Amazon EventBridge in the *Amazon EventBridge User Guide*.

- For API details, see PutRule in *AWS CLI Command Reference*.

`put-targets`

The following code example shows how to use `put-targets`.

AWS CLI

To add targets for CloudWatch Events rules

The following `put-targets` example adds a Lambda function as the target of a rule.

```
aws events put-targets \
    --rule DailyLambdaFunction \
    --targets "Id"="1","Arn"="arn:aws:lambda:us-
west-2:123456789012:function:MyFunctionName"
```

Output:

```
{
    "FailedEntryCount": 0,
    "FailedEntries": []
}
```

The following `put-targets` example sets an Amazon Kinesis stream as the target, so that events caught by this rule are relayed to the stream.

```
aws events put-targets \
    --rule EC2InstanceStateChanges \
    --targets "Id"="1","Arn"="arn:aws:kinesis:us-west-2:123456789012:stream/
MyStream","RoleArn"="arn:aws:iam::123456789012:role/MyRoleForThisRule"
```

Output:

```
{
    "FailedEntryCount": 0,
    "FailedEntries": []
}
```

The following `put-targets` example sets two Amazon Kinesis streams as targets for one rule.

```
aws events put-targets \
    --rule DailyLambdaFunction \
    --targets "Id"="Target1","Arn"="arn:aws:kinesis:us-west-2:123456789012:stream/
MyStream1","RoleArn"="arn:aws:iam::123456789012:role/ MyRoleToAccessLambda"
 "Id"="Target2"," Arn"="arn:aws:kinesis:us-west-2:123456789012:stream/
MyStream2","RoleArn"="arn:aws:iam::123456789012:role/MyRoleToAccessLambda"
```

Output:

```
{
    "FailedEntryCount": 0,
    "FailedEntries": []
}
```

For more information, see Event bus targets in Amazon EventBridge in the *Amazon EventBridge User Guide*.

- For API details, see PutTargets in *AWS CLI Command Reference*.

`remove-targets`

The following code example shows how to use `remove-targets`.

AWS CLI

To remove a target for an event

The following `remove-targets` example removes the Amazon Kinesis stream named `MyStream1` from being a target of the rule `DailyLambdaFunction`. When `DailyLambdaFunction` was created, this stream was set as a target with an ID of `Target1`.

```
aws events remove-targets \
    --rule "DailyLambdaFunction" \
    --ids "Target1"
```

Output:

```
{
    "FailedEntryCount": 0,
    "FailedEntries": []
}
```

For more information, see Event bus targets in Amazon EventBridge in the *Amazon EventBridge User Guide*.

- For API details, see RemoveTargets in *AWS CLI Command Reference*.

`test-event-pattern`

The following code example shows how to use `test-event-pattern`.

AWS CLI

To check whether an event pattern matches a specified event

The following `test-event-pattern` example tests whether the pattern `source:com.mycompany.myapp` matches the specified event. In this example, the output would be `true`.

```
aws events test-event-pattern \
    --event-pattern "{\"source\":[\"com.mycompany.myapp\"]}" \
    --event "{\"id\":\"1\",\"source\":\"com.mycompany.myapp\",\"detail-type\":
\"myDetailType\",\"account\":\"123456789012\",\"region\":\"us-west-2\",\"time\":
\"2017-04-11T20:11:04Z\"}"
```

Output:

```
{
```

```
    "Result": true
}
```

For more information, see Amazon EventBridge event patterns in the *Amazon EventBridge User Guide*.

- For API details, see TestEventPattern in *AWS CLI Command Reference*.

EventBridge Pipes examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with EventBridge Pipes.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-pipe`

The following code example shows how to use `create-pipe`.

AWS CLI

To Create a pipe

The following `create-pipe` example creates a Pipe named `Demo_Pipe` with SQS as the source and CloudWatch Log Group as the target for the Pipe.

```
aws pipes create-pipe \
    --name Demo_Pipe \
    --desired-state RUNNING \
    --role-arn arn:aws:iam::123456789012:role/service-role/
Amazon_EventBridge_Pipe_Demo_Pipe_28b3aa4f \
```

```
    --source arn:aws:sqs:us-west-2:123456789012:Demo_Queue \
    --target arn:aws:logs:us-west-2:123456789012:log-group:/aws/pipes/Demo_LogGroup
```

Output:

```
{
    "Arn": "arn:aws:pipes:us-west-2:123456789012:pipe/Demo_Pipe",
    "Name": "Demo_Pipe",
    "DesiredState": "RUNNING",
    "CurrentState": "CREATING",
    "CreationTime": "2024-10-08T12:33:59-05:00",
    "LastModifiedTime": "2024-10-08T12:33:59.684839-05:00"
}
```

For more information, see Amazon EventBridge Pipes concepts in the *Amazon EventBridge User Guide*.

- For API details, see CreatePipe in *AWS CLI Command Reference*.

`delete-pipe`

The following code example shows how to use `delete-pipe`.

AWS CLI

To delete an existing pipe

The following `delete-pipe` example deletes a Pipe named `Demo_Pipe` in the specified account.

```
aws pipes delete-pipe \
    --name Demo_Pipe
```

Output:

```
{
    "Arn": "arn:aws:pipes:us-west-2:123456789012:pipe/Demo_Pipe",
    "Name": "Demo_Pipe",
    "DesiredState": "STOPPED",
    "CurrentState": "DELETING",
    "CreationTime": "2024-10-08T09:29:10-05:00",
```

```
    "LastModifiedTime": "2024-10-08T11:57:22-05:00"
}
```

For more information, see Amazon EventBridge Pipes concepts in the *Amazon EventBridge User Guide*.

- For API details, see DeletePipe in *AWS CLI Command Reference*.

`describe-pipe`

The following code example shows how to use `describe-pipe`.

AWS CLI

To retrieve information about a Pipe

The following `describe-pipe` example displays information about the Pipe `Demo_Pipe` in the specified account.

```
aws pipes describe-pipe \
    --name Demo_Pipe
```

Output:

```
{
    "Arn": "arn:aws:pipes:us-west-2:123456789012:pipe/Demo_Pipe",
    "Name": "Demo_Pipe",
    "DesiredState": "RUNNING",
    "CurrentState": "RUNNING",
    "StateReason": "User initiated",
    "Source": "arn:aws:sqs:us-west-2:123456789012:Demo_Queue",
    "SourceParameters": {
        "SqsQueueParameters": {
            "BatchSize": 1
        }
    },
    "EnrichmentParameters": {},
    "Target": "arn:aws:logs:us-west-2:123456789012:log-group:/aws/pipes/
Demo_LogGroup",
    "TargetParameters": {},
    "RoleArn": "arn:aws:iam::123456789012:role/service-role/
Amazon_EventBridge_Pipe_Demo_Pipe_28b3aa4f",
```

```
    "Tags": {},
    "CreationTime": "2024-10-08T09:29:10-05:00",
    "LastModifiedTime": "2024-10-08T10:23:47-05:00",
    "LogConfiguration": {
        "CloudwatchLogsLogDestination": {
            "LogGroupArn": "arn:aws:logs:us-west-2:123456789012:log-group:/aws/
vendedlogs/pipes/Demo_Pipe"
        },
        "Level": "ERROR"
    }
}
```

For more information, see Amazon EventBridge Pipes concepts in the *Amazon EventBridge User Guide*.

- For API details, see DescribePipe in *AWS CLI Command Reference*.

`list-pipes`

The following code example shows how to use `list-pipes`.

AWS CLI

To retrieve a list of Pipes

The following `list-pipes` example shows all the pipes in the specified account.

```
aws pipes list-pipes
```

Output:

```
{
    "Pipes": [
        {
            "Name": "Demo_Pipe",
            "Arn": "arn:aws:pipes:us-west-2:123456789012:pipe/Demo_Pipe",
            "DesiredState": "RUNNING",
            "CurrentState": "RUNNING",
            "StateReason": "User initiated",
            "CreationTime": "2024-10-08T09:29:10-05:00",
            "LastModifiedTime": "2024-10-08T10:23:47-05:00",
            "Source": "arn:aws:sqs:us-west-2:123456789012:Demo_Queue",
```

```
            "Target": "arn:aws:logs:us-west-2:123456789012:log-group:/aws/pipes/
Demo_LogGroup"
        }
    ]
}
```

For more information, see Amazon EventBridge Pipes concepts in the *Amazon EventBridge User Guide*.

- For API details, see ListPipes in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags associated with an existing pipe

The following `list-tags-for-resource` example lists all the tags associated with a pipe named `Demo_Pipe` in the specified account.

```
aws pipes list-tags-for-resource \
    --resource-arn arn:aws:pipes:us-west-2:123456789012:pipe/Demo_Pipe
```

Output:

```
{
    "tags": {
        "stack": "Production",
        "team": "DevOps"
    }
}
```

For more information, see Amazon EventBridge Pipes concepts in the *Amazon EventBridge User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`start-pipe`

The following code example shows how to use `start-pipe`.

AWS CLI

To start an existing pipe

The following `start-pipe` example starts a Pipe named `Demo_Pipe` in the specified account.

```
aws pipes start-pipe \
    --name Demo_Pipe
```

Output:

```
{
    "Arn": "arn:aws:pipes:us-west-2:123456789012:pipe/Demo_Pipe",
    "Name": "Demo_Pipe",
    "DesiredState": "RUNNING",
    "CurrentState": "STARTING",
    "CreationTime": "2024-10-08T09:29:10-05:00",
    "LastModifiedTime": "2024-10-08T10:17:24-05:00"
}
```

For more information, see Starting or stopping an Amazon EventBridge pipe in the *Amazon EventBridge User Guide*.

- For API details, see StartPipe in *AWS CLI Command Reference*.

`stop-pipe`

The following code example shows how to use `stop-pipe`.

AWS CLI

To stop an existing pipe

The following `stop-pipe` example stops a Pipe named `Demo_Pipe` in the specified account.

```
aws pipes stop-pipe \
    --name Demo_Pipe
```

Output:

```
{
    "Arn": "arn:aws:pipes:us-west-2:123456789012:pipe/Demo_Pipe",
```

```
    "Name": "Demo_Pipe",
    "DesiredState": "STOPPED",
    "CurrentState": "STOPPING",
    "CreationTime": "2024-10-08T09:29:10-05:00",
    "LastModifiedTime": "2024-10-08T09:29:49-05:00"
}
```

For more information, see Starting or stopping an Amazon EventBridge pipe in the *Amazon EventBridge User Guide*.

- For API details, see StopPipe in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To Tag an existing pipe

The following `tag-resource` example tags a Pipe named `Demo_Pipe`.

```
aws pipes tag-resource \
    --resource-arn arn:aws:pipes:us-west-2:123456789012:pipe/Demo_Pipe \
    --tags stack=Production
```

This command produces no output.

For more information, see Amazon EventBridge Pipes concepts in the *Amazon EventBridge User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a Tag from an existing pipe

The following `untag-resource` example removes a tag with the key `stack` from the Pipe named `Demo_Pipe`.

```
aws pipes untag-resource \
    --resource-arn arn:aws:pipes:us-west-2:123456789012:pipe/Demo_Pipe \
    --tag-keys stack
```

This command produces no output.

For more information, see Amazon EventBridge Pipes concepts in the *Amazon EventBridge User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-pipe`

The following code example shows how to use `update-pipe`.

AWS CLI

To update an existing pipe

The following `update-pipe` example updates the Pipe named `Demo_Pipe` by adding a CloudWatch Log configuration parameter, enure to update the execution role of the pipe so that it has the correct permissions for Log destination.

```
aws pipes update-pipe \
    --name Demo_Pipe \
    --desired-state RUNNING \
    --log-configuration CloudwatchLogsLogDestination={LogGroupArn=arn:aws:logs:us-west-2:123456789012:log-group:/aws/vendedlogs/pipes/Demo_Pipe},Level=TRACE \
    --role-arn arn:aws:iam::123456789012:role/service-role/Amazon_EventBridge_Pipe_Demo_Pipe_28b3aa4f
```

Output:

```
{
    "Arn": "arn:aws:pipes:us-west-2:123456789012:pipe/Demo_Pipe",
    "Name": "Demo_Pipe",
    "DesiredState": "RUNNING",
    "CurrentState": "UPDATING",
    "CreationTime": "2024-10-08T09:29:10-05:00",
    "LastModifiedTime": "2024-10-08T11:35:48-05:00"
}
```

For more information, see Amazon EventBridge Pipes concepts in the *Amazon EventBridge User Guide*.

- For API details, see UpdatePipe in *AWS CLI Command Reference*.

Firewall Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Firewall Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`associate-admin-account`

The following code example shows how to use `associate-admin-account`.

AWS CLI

To set the Firewall Manager administrator account

The following `associate-admin-account` example sets the administrator account for Firewall Manager.

```
aws fms associate-admin-account \
    --admin-account 123456789012
```

This command produces no output.

For more information, see Set the AWS Firewall Manager Administrator Account in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see AssociateAdminAccount in *AWS CLI Command Reference*.

`delete-notification-channel`

The following code example shows how to use `delete-notification-channel`.

AWS CLI

To remove the SNS topic information for Firewall Manager logs

The following `delete-notification-channel` example removes the SNS topic information.

```
aws fms delete-notification-channel
```

This command produces no output.

For more information, see Configure Amazon SNS Notifications and Amazon CloudWatch Alarms in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see DeleteNotificationChannel in *AWS CLI Command Reference*.

`delete-policy`

The following code example shows how to use `delete-policy`.

AWS CLI

To delete a Firewall Manager policy

The following `delete-policy` example removes the policy with the specified ID, along with all of its resources.

```
aws fms delete-policy \
    --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --delete-all-policy-resources
```

This command produces no output.

For more information, see Working with AWS Firewall Manager Policies in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see DeletePolicy in *AWS CLI Command Reference*.

`disassociate-admin-account`

The following code example shows how to use `disassociate-admin-account`.

AWS CLI

To remove the Firewall Manager administrator account

The following `disassociate-admin-account` example removes the current administrator account association from Firewall Manager.

```
aws fms disassociate-admin-account
```

This command produces no output.

For more information, see Set the AWS Firewall Manager Administrator Account in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see DisassociateAdminAccount in *AWS CLI Command Reference*.

`get-admin-account`

The following code example shows how to use `get-admin-account`.

AWS CLI

To retrieve the Firewall Manager administrator account

The following `get-admin-account` example retrieves the administrator account.

```
aws fms get-admin-account
```

Output:

```
{
    "AdminAccount": "123456789012",
    "RoleStatus": "READY"
}
```

For more information, see AWS Firewall Manager Prerequisites in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see GetAdminAccount in *AWS CLI Command Reference*.

`get-compliance-detail`

The following code example shows how to use `get-compliance-detail`.

AWS CLI

To retrieve the compliance information for an account

The following `get-compliance-detail` example retrieves compliance information for the specified policy and member account.

```
aws fms get-compliance-detail \
    --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --member-account 123456789012
```

Output:

```
{
    "PolicyComplianceDetail": {
        "EvaluationLimitExceeded": false,
        "IssueInfoMap": {},
        "MemberAccount": "123456789012",
        "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "PolicyOwner": "123456789012",
        "Violators": []
    }
}
```

For more information, see Viewing Resource Compliance with a Policy in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see GetComplianceDetail in *AWS CLI Command Reference*.

`get-notification-channel`

The following code example shows how to use `get-notification-channel`.

AWS CLI

To retrieve the SNS topic information for Firewall Manager logs

The following `get-notification-channel` example retrieves the SNS topic information.

```
aws fms get-notification-channel
```

Output:

```
{
    "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:us-west-2-fms",
    "SnsRoleName": "arn:aws:iam::123456789012:role/aws-service-role/
fms.amazonaws.com/AWSServiceRoleForFMS"
}
```

For more information, see Configure Amazon SNS Notifications and Amazon CloudWatch Alarms in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see GetNotificationChannel in *AWS CLI Command Reference*.

`get-policy`

The following code example shows how to use `get-policy`.

AWS CLI

To retrieve a Firewall Manager policy

The following `get-policy` example retrieves the policy with the specified ID.

```
aws fms get-policy \
    --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Policy": {
        "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "PolicyName": "test",
        "PolicyUpdateToken": "1:p+2RpKR4wPFx7mcrL1UOQQ==",
        "SecurityServicePolicyData": {
            "Type": "SECURITY_GROUPS_COMMON",
            "ManagedServiceData": "{\"type\":\"SECURITY_GROUPS_COMMON\",
\"revertManualSecurityGroupChanges\":true,\"exclusiveResourceSecurityGroupManagement
\":false,\"securityGroups\":[{\"id\":\"sg-045c43ccc9724e63e\"}]}"
```

```
        },
        "ResourceType": "AWS::EC2::Instance",
        "ResourceTags": [],
        "ExcludeResourceTags": false,
        "RemediationEnabled": false
    },
    "PolicyArn": "arn:aws:fms:us-west-2:123456789012:policy/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111"
}
```

For more information, see Working with AWS Firewall Manager Policies in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see GetPolicy in *AWS CLI Command Reference*.

`list-compliance-status`

The following code example shows how to use `list-compliance-status`.

AWS CLI

To retrieve the policy compliance information for member accounts

The following `list-compliance-status` example retrieves member account compliance information for the specified policy.

```
aws fms list-compliance-status \
    --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "PolicyComplianceStatusList": [
        {
            "PolicyOwner": "123456789012",
            "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "PolicyName": "test",
            "MemberAccount": "123456789012",
            "EvaluationResults": [
                {
                    "ComplianceStatus": "COMPLIANT",
                    "ViolatorCount": 0,
```

```
                    "EvaluationLimitExceeded": false
                },
                {
                    "ComplianceStatus": "NON_COMPLIANT",
                    "ViolatorCount": 2,
                    "EvaluationLimitExceeded": false
                }
            ],
            "LastUpdated": 1576283774.0,
            "IssueInfoMap": {}
        }
    ]
}
```

For more information, see Viewing Resource Compliance with a Policy in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see ListComplianceStatus in *AWS CLI Command Reference*.

`list-member-accounts`

The following code example shows how to use `list-member-accounts`.

AWS CLI

To retrieve the member accounts in the organization

The following `list-member-accounts` example lists all of the member accounts that are in the Firewall Manager administrator's organization.

```
aws fms list-member-accounts
```

Output:

```
{
    "MemberAccounts": [
        "123456789111",
        "123456789222",
        "123456789333"
    ]
}
```

For more information, see AWS Firewall Manager in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see ListMemberAccounts in *AWS CLI Command Reference*.

`list-policies`

The following code example shows how to use `list-policies`.

AWS CLI

To retrieve all Firewall Manager policies

The following `list-policies` example retrieves the list of policies for the account. In this example, the output is limited to two results per request. Each call returns a `NextToken` that can be used as the value for the `--starting-token` parameter in the next `list-policies` call to get the next set of results for the list.

```
aws fms list-policies \
    --max-items 2
```

Output:

```
{
    "PolicyList": [
        {
            "PolicyArn": "arn:aws:fms:us-west-2:123456789012:policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "PolicyName": "test",
            "ResourceType": "AWS::EC2::Instance",
            "SecurityServiceType": "SECURITY_GROUPS_COMMON",
            "RemediationEnabled": false
        },
        {
            "PolicyArn": "arn:aws:fms:us-west-2:123456789012:policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "PolicyName": "test",
            "ResourceType": "AWS::EC2::Instance",
            "SecurityServiceType": "SECURITY_GROUPS_COMMON",
            "RemediationEnabled": false
```

```
        }
    ],
    "NextToken": "eyJOZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAyfQ=="
}
```

For more information, see Working with AWS Firewall Manager Policies in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see ListPolicies in *AWS CLI Command Reference*.

`put-notification-channel`

The following code example shows how to use `put-notification-channel`.

AWS CLI

To set the SNS topic information for Firewall Manager logs

The following `put-notification-channel` example sets the SNS topic information.

```
aws fms put-notification-channel \
    --sns-topic-arn arn:aws:sns:us-west-2:123456789012:us-west-2-fms \
    --sns-role-name arn:aws:iam::123456789012:role/aws-service-role/
fms.amazonaws.com/AWSServiceRoleForFMS
```

This command produces no output.

For more information, see Configure Amazon SNS Notifications and Amazon CloudWatch Alarms in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see PutNotificationChannel in *AWS CLI Command Reference*.

`put-policy`

The following code example shows how to use `put-policy`.

AWS CLI

To create a Firewall Manager policy

The following `put-policy` example creates a Firewall Manager security group policy.

```
aws fms put-policy \
```

```
    --cli-input-json file://policy.json
```

Contents of `policy.json`:

```
{
    "Policy": {
        "PolicyName": "test",
        "SecurityServicePolicyData": {
            "Type": "SECURITY_GROUPS_USAGE_AUDIT",
            "ManagedServiceData": "{\"type\":\"SECURITY_GROUPS_USAGE_AUDIT\",
\"deleteUnusedSecurityGroups\":false,\"coalesceRedundantSecurityGroups\":true}"
        },
        "ResourceType": "AWS::EC2::SecurityGroup",
        "ResourceTags": [],
        "ExcludeResourceTags": false,
        "RemediationEnabled": false
    },
    "TagList": [
        {
            "Key": "foo",
            "Value": "foo"
        }
    ]
}
```

Output:

```
{
    "Policy": {
        "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "PolicyName": "test",
        "PolicyUpdateToken": "1:X9QGexP7HASDlsFp+G31Iw==",
        "SecurityServicePolicyData": {
            "Type": "SECURITY_GROUPS_USAGE_AUDIT",
            "ManagedServiceData": "{\"type\":\"SECURITY_GROUPS_USAGE_AUDIT\",
\"deleteUnusedSecurityGroups\":false,\"coalesceRedundantSecurityGroups\":true,
\"optionalDelayForUnusedInMinutes\":null}"
        },
        "ResourceType": "AWS::EC2::SecurityGroup",
        "ResourceTags": [],
        "ExcludeResourceTags": false,
        "RemediationEnabled": false
    },
```

```
    "PolicyArn": "arn:aws:fms:us-west-2:123456789012:policy/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111"
}
```

For more information, see Working with AWS Firewall Manager Policies in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see PutPolicy in *AWS CLI Command Reference*.

AWS FIS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS FIS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-experiment-template`

The following code example shows how to use `create-experiment-template`.

AWS CLI

To create an experiment template

The following `create-experiment-template` example creates an experiment template in your AWS FIS account.

```
aws fis create-experiment-template \
    --cli-input-json file://myfile.json
```

Contents of `myfile.json`:

```
{
    "description": "experimentTemplate",
    "stopConditions": [
        {
            "source": "aws:cloudwatch:alarm",
            "value": "arn:aws:cloudwatch:us-west-2:123456789012:alarm:alarmName"
        }
    ],
    "targets": {
        "Instances-Target-1": {
            "resourceType": "aws:ec2:instance",
            "resourceArns": [
                "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
            ],
            "selectionMode": "ALL"
        }
    },
    "actions": {
        "reboot": {
            "actionId": "aws:ec2:reboot-instances",
            "description": "reboot",
            "parameters": {},
            "targets": {
                "Instances": "Instances-Target-1"
            }
        }
    },
    "roleArn": "arn:aws:iam::123456789012:role/myRole"
}
```

Output:

```
{
    "experimentTemplate": {
        "id": "ABCDE1fgHIJkLmNop",
        "description": "experimentTemplate",
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/
i-12a3b4c56d78e9012"
                ],
```

```
                "selectionMode": "ALL"
            }
        },
        "actions": {
            "reboot": {
                "actionId": "aws:ec2:reboot-instances",
                "description": "reboot",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                }
            }
        },
        "stopConditions": [
            {
                "source": "aws:cloudwatch:alarm",
                "value": "arn:aws:cloudwatch:us-west-2:123456789012:alarm:alarmName"
            }
        ],
        "creationTime": 1616434850.659,
        "lastUpdateTime": 1616434850.659,
        "roleArn": "arn:aws:iam::123456789012:role/myRole",
        "tags": {}
    }
}
```

For more information, see Create an experiment template in the *AWS Fault Injection Simulator User Guide*.

- For API details, see CreateExperimentTemplate in *AWS CLI Command Reference*.

`delete-experiment-template`

The following code example shows how to use `delete-experiment-template`.

AWS CLI

To delete an experiment template

The following `delete-experiment-template` example deletes the specified experiment template.

```
aws fis delete-experiment-template \
```

```
    --id ABCDE1fgHIJkLmNop
```

Output:

```
{
    "experimentTemplate": {
        "id": "ABCDE1fgHIJkLmNop",
        "description": "myExperimentTemplate",
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/
i-12a3b4c56d78e9012"
                ],
                "selectionMode": "ALL"
            }
        },
        "actions": {
            "testaction": {
                "actionId": "aws:ec2:stop-instances",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                }
            }
        },
        "stopConditions": [
            {
                "source": "none"
            }
        ],
        "creationTime": 1616017191.124,
        "lastUpdateTime": 1616017859.607,
        "roleArn": "arn:aws:iam::123456789012:role/FISRole"
    }
}
```

For more information, see Delete an experiment template in the *AWS Fault Injection Simulator User Guide*.

- For API details, see DeleteExperimentTemplate in *AWS CLI Command Reference*.

`get-action`

The following code example shows how to use `get-action`.

AWS CLI

To get action details

The following `get-action` example gets the details of the specified action.

```
aws fis get-action \
    --id aws:ec2:stop-instances
```

Output:

```
{
    "action": {
        "id": "aws:ec2:stop-instances",
        "description": "Stop the specified EC2 instances.",
        "parameters": {
            "startInstancesAfterDuration": {
                "description": "The time to wait before restarting the instances
 (ISO 8601 duration).",
                "required": false
            }
        },
        "targets": {
            "Instances": {
                "resourceType": "aws:ec2:instance"
            }
        },
        "tags": {}
    }
}
```

For more information, see AWS FIS Actions reference in the *AWS Fault Injection Simulator User Guide*.

- For API details, see GetAction in *AWS CLI Command Reference*.

`get-experiment-template`

The following code example shows how to use `get-experiment-template`.

AWS CLI

To get experiment template details

The following `get-experiment-template` example gets the details of the specified experiment template.

```
aws fis get-experiment-template \
    --id ABCDE1fgHIJkLmNop
```

Output:

```
{
    "experimentTemplate": {
        "id": "ABCDE1fgHIJkLmNop",
        "description": "myExperimentTemplate",
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/
i-12a3b4c56d78e9012"
                ],
                "selectionMode": "ALL"
            }
        },
        "actions": {
            "testaction": {
                "actionId": "aws:ec2:stop-instances",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                }
            }
        },
        "stopConditions": [
            {
                "source": "none"
            }
        ],
        "creationTime": 1616017191.124,
        "lastUpdateTime": 1616017331.51,
        "roleArn": "arn:aws:iam::123456789012:role/FISRole",
```

```
        "tags": {
            "key": "value"
        }
    }
}
```

For more information, see Experiment templates in the *AWS Fault Injection Simulator User Guide*.

- For API details, see GetExperimentTemplate in *AWS CLI Command Reference*.

`get-experiment`

The following code example shows how to use `get-experiment`.

AWS CLI

To get experiment details

The following `get-experiment` example gets the details of the specified experiment.

```
aws fis get-experiment \
    --id ABC12DeFGhI3jKLMNOP
```

Output:

```
{
    "experiment": {
        "id": "ABC12DeFGhI3jKLMNOP",
        "experimentTemplateId": "ABCDE1fgHIJkLmNop",
        "roleArn": "arn:aws:iam::123456789012:role/myRole",
        "state": {
            "status": "completed",
            "reason": "Experiment completed."
        },
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/
i-12a3b4c56d78e9012"
                ],

```

For more information, see Experiments for AWS FIS in the *AWS Fault Injection Simulator User Guide*.

- For API details, see GetExperiment in *AWS CLI Command Reference*.

`list-actions`

The following code example shows how to use `list-actions`.

AWS CLI

To list actions

The following `list-actions` example lists the available actions.

```
aws fis list-actions
```

Output:

```
{
    "actions": [
        {
            "id": "aws:ec2:reboot-instances",
            "description": "Reboot the specified EC2 instances.",
            "targets": {
                "Instances": {
                    "resourceType": "aws:ec2:instance"
                }
            },
            "tags": {}
        },
        {
            "id": "aws:ec2:stop-instances",
            "description": "Stop the specified EC2 instances.",
            "targets": {
                "Instances": {
                    "resourceType": "aws:ec2:instance"
                }
            },
            "tags": {}
        },
        {
            "id": "aws:ec2:terminate-instances",
            "description": "Terminate the specified EC2 instances.",
            "targets": {
                "Instances": {
                    "resourceType": "aws:ec2:instance"
                }
            },
            "tags": {}
        },
        {

            "description": "Run the specified SSM document.",
            "targets": {
                "Instances": {
                    "resourceType": "aws:ec2:instance"
                }
            },
            "tags": {}
        }
    ]
}
```

For more information, see AWS FIS Actions reference in the *AWS Fault Injection Simulator User Guide*.

- For API details, see ListActions in *AWS CLI Command Reference*.

`list-experiment-templates`

The following code example shows how to use `list-experiment-templates`.

AWS CLI

To list experiment templates

The following `list-experiment-templates` example lists the experiment templates in your AWS account.

```
aws fis list-experiment-templates
```

Output:

```
{
    "experimentTemplates": [
        {
            "id": "ABCDE1fgHIJkLmNop",
            "description": "myExperimentTemplate",
            "creationTime": 1616017191.124,
            "lastUpdateTime": 1616017191.124,
            "tags": {
                "key": "value"
            }
        }
    ]
}
```

For more information, see Experiment templates in the *AWS Fault Injection Simulator User Guide*.

- For API details, see ListExperimentTemplates in *AWS CLI Command Reference*.

`list-experiments`

The following code example shows how to use `list-experiments`.

AWS CLI

To list experiments

The following `list-experiments` example lists the experiments in your AWS account.

```
aws fis list-experiments
```

Output:

```
{
    "experiments": [
        {
            "id": "ABCdeF1GHiJkLM23NO",
            "experimentTemplateId": "ABCDE1fgHIJkLmNop",
            "state": {
                "status": "running",
                "reason": "Experiment is running."
            },
            "creationTime": 1616017341.197,
            "tags": {
            "key": "value"
            }
        }
    ]
}
```

For more information, see Experiments in the *AWS Fault Injection Simulator User Guide*.

- For API details, see ListExperiments in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a resource

The following `list-tags-for-resource` example lists the tags for the specified resource.

```
aws fis list-tags-for-resource \
    --resource-arn arn:aws:fis:us-west-2:123456789012:experiment/ABC12DeFGhI3jKLMNOP
```

Output:

```
{
    "tags": {
```

```
        "key1": "value1",
        "key2": "value2"
    }
}
```

For more information, see Tag your AWS FIS resources in the *AWS Fault Injection Simulator User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`start-experiment`

The following code example shows how to use `start-experiment`.

AWS CLI

To start an experiment

The following `start-experiment` example starts the specified experiment.

```
aws fis start-experiment \
    --experiment-template-id ABCDE1fgHIJkLmNop
```

Output:

```
{
    "experiment": {
        "id": "ABC12DeFGhI3jKLMNOP",
        "experimentTemplateId": "ABCDE1fgHIJkLmNop",
        "roleArn": "arn:aws:iam::123456789012:role/myRole",
        "state": {
            "status": "initiating",
            "reason": "Experiment is initiating."
        },
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/
i-12a3b4c56d78e9012"
                ],
                "selectionMode": "ALL"
```

```
            }
        },
        "actions": {
            "reboot": {
                "actionId": "aws:ec2:reboot-instances",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                },
                "state": {
                    "status": "pending",
                    "reason": "Initial state"
                }
            }
        },
        "stopConditions": [
            {
                "source": "none"
            }
        ],
        "creationTime": 1616432464.025,
        "startTime": 1616432464.374,
        "tags": {}
    }
}
```

For more information, see Experiments for AWS FIS in the *AWS Fault Injection Simulator User Guide*.

- For API details, see StartExperiment in *AWS CLI Command Reference*.

`stop-experiment`

The following code example shows how to use `stop-experiment`.

AWS CLI

To stop an experiment

The following `stop-experiment` example stops the specified experiment from running.

```
aws fis stop-experiment \
    --id ABC12DeFGhI3jKLMNOP
```

Output:

```
{
    "experiment": {
        "id": "ABC12DeFGhI3jKLMNOP",
        "experimentTemplateId": "ABCDE1fgHIJkLmNop",
        "roleArn": "arn:aws:iam::123456789012:role/myRole",
        "state": {
            "status": "stopping",
            "reason": "Stopping Experiment."
        },
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/
i-12a3b4c56d78e9012"
                ],
                "selectionMode": "ALL"
            }
        },
        "actions": {
            "reboot": {
                "actionId": "aws:ec2:reboot-instances",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                },
                "startAfter": [
                    "wait"
                ],
                "state": {
                    "status": "pending",
                    "reason": "Initial state."
                }
            },
            "wait": {
                "actionId": "aws:fis:wait",
                "parameters": {
                    "duration": "PT5M"
                },
                "state": {
                    "status": "running",
                    "reason": ""
```

```
                }
            }
        },
        "stopConditions": [
            {
                "source": "none"
            }
        ],
        "creationTime": 1616432680.927,
        "startTime": 1616432681.177,
        "tags": {}
    }
}
```

For more information, see Experiments for AWS FIS in the *AWS Fault Injection Simulator User Guide*.

- For API details, see StopExperiment in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a resource

The following `tag-resource` example tags the specified resource.

```
aws fis tag-resource \
    --resource-arn arn:aws:fis:us-west-2:123456789012:experiment/ABC12DeFGhI3jKLMNOP
 \
    --tags key1=value1,key2=value2
```

This command produces no output.

For more information, see Tag your AWS FIS resources in the *AWS Fault Injection Simulator User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To untag a resource

The following `untag-resource` example removes the tags from the specified resource.

```
aws fis untag-resource \
    --resource-arn arn:aws:fis:us-west-2:123456789012:experiment/ABC12DeFGhI3jKLMNOP
```

This command produces no output.

For more information, see Tag your AWS FIS resources in the *AWS Fault Injection Simulator User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-experiment-template`

The following code example shows how to use `update-experiment-template`.

AWS CLI

To update an experiment template

The following `update-experiment-template` example updates the description of the specified experiment template.

```
aws fis update-experiment-template \
    --id ABCDE1fgHIJkLmNop \
    --description myExperimentTemplate
```

Output:

```
{
    "experimentTemplate": {
        "id": "ABCDE1fgHIJkLmNop",
        "description": "myExperimentTemplate",
        "targets": {
            "Instances-Target-1": {
```

```
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/
i-12a3b4c56d78e9012"
                ],
                "selectionMode": "ALL"
            }
        },
        "actions": {
            "testaction": {
                "actionId": "aws:ec2:stop-instances",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                }
            }
        },
        "stopConditions": [
            {
                "source": "none"
            }
        ],
        "creationTime": 1616017191.124,
        "lastUpdateTime": 1616017859.607,
        "roleArn": "arn:aws:iam::123456789012:role/FISRole",
        "tags": {
            "key": "value"
        }
    }
}
```

For more information, see Update an experiment template in the *AWS Fault Injection Simulator User Guide*.

- For API details, see UpdateExperimentTemplate in *AWS CLI Command Reference*.

Amazon GameLift Servers examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon GameLift Servers.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-build`

The following code example shows how to use `create-build`.

AWS CLI

Example 1: To create a game build from files in an S3 bucket

The following `create-build` example creates a custom game build resource. It uses zipped files that are stored in an S3 location in an AWS account that you control. This example assumes that you've already created an IAM role that gives Amazon GameLift permission to access the S3 location. Since the request does not specify an operating system, the new build resource defaults to WINDOWS_2012.

```
aws gamelift create-build \
    --storage-location file://storage-loc.json \
    --name MegaFrogRaceServer.NA \
    --build-version 12345.678
```

Contents of `storage-loc.json`:

```
{
    "Bucket":"MegaFrogRaceServer_NA_build_files",
    "Key":"MegaFrogRaceServer_build_123.zip",
    "RoleArn":"arn:aws:iam::123456789012:role/gamelift"
}
```

Output:

```
{
    "Build": {
        "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
```

```
        "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreationTime": 1496708916.18,
        "Name": "MegaFrogRaceServer.NA",
        "OperatingSystem": "WINDOWS_2012",
        "SizeOnDisk": 479303,
        "Status": "INITIALIZED",
        "Version": "12345.678"
    },
    "StorageLocation": {
        "Bucket": "MegaFrogRaceServer_NA_build_files",
        "Key": "MegaFrogRaceServer_build_123.zip"
    }
}
```

Example 2: To create a game build resource for manually uploading files to GameLift

The following `create-build` example creates a new build resource. It also gets a storage location and temporary credentials that allow you to manually upload your game build to the GameLift location in Amazon S3. Once you've successfully uploaded your build, the GameLift service validates the build and updates the new build's status.

```
aws gamelift create-build \
    --name MegaFrogRaceServer.NA \
    --build-version 12345.678 \
    --operating-system AMAZON_LINUX
```

Output:

```
{
    "Build": {

For more information, see Upload a Custom Server Build to GameLift in the *Amazon GameLift Developer Guide*.

- For API details, see CreateBuild in *AWS CLI Command Reference*.

`create-fleet`

The following code example shows how to use `create-fleet`.

AWS CLI

Example 1: To create a basic Linux fleet

The following `create-fleet` example creates a minimally configured fleet of on-demand Linux instances to host a custom server build. You can complete the configuration by using `update-fleet`.

```
aws gamelift create-fleet \
    --name MegaFrogRaceServer.NA.v2 \
    --description 'Hosts for v2 North America' \
    --build-id build-1111aaaa-22bb-33cc-44dd-5555eeee66ff \
    --certificate-configuration 'CertificateType=GENERATED' \
    --ec2-instance-type c4.large \
    --fleet-type ON_DEMAND \
    --runtime-configuration 'ServerProcesses=[{LaunchPath=/local/game/release-na/
MegaFrogRace_Server.exe,ConcurrentExecutions=1}]'
```

Output:

```
{
    "FleetAttributes": {
        "BuildId": "build-1111aaaa-22bb-33cc-44dd-5555eeee66ff",
        "CertificateConfiguration": {
```

```
            "CertificateType": "GENERATED"
        },
        "CreationTime": 1496365885.44,
        "Description": "Hosts for v2 North America",
        "FleetArn": "arn:aws:gamelift:us-west-2:123456789012:fleet/
fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "FleetType": "ON_DEMAND",
        "InstanceType": "c4.large",
        "MetricGroups": ["default"],
        "Name": "MegaFrogRace.NA.v2",
        "NewGameSessionProtectionPolicy": "NoProtection",
        "OperatingSystem": "AMAZON_LINUX",
        "ServerLaunchPath": "/local/game/release-na/MegaFrogRace_Server.exe",
        "Status": "NEW"
    }
}
```

For more information, see Create an Amazon GameLift Servers managed EC2 fleet in the *Amazon GameLift Servers Developer Guide*.

Example 2: To create a basic Windows fleet

The following `create-fleet` example creates a minimally configured fleet of spot Windows instances to host a custom server build. You can complete the configuration by using `update-fleet`.

```
aws gamelift create-fleet \
    --name MegaFrogRace.NA.v2 \
    --description 'Hosts for v2 North America' \
    --build-id build-2222aaaa-33bb-44cc-55dd-6666eeee77ff  \
    --certificate-configuration 'CertificateType=GENERATED' \
    --ec2-instance-type c4.large \
    --fleet-type SPOT \
    --runtime-configuration 'ServerProcesses=[{LaunchPath=C:\game
\Bin64.Release.Dedicated\MegaFrogRace_Server.exe,ConcurrentExecutions=1}]'
```

Output:

```
{
    "FleetAttributes": {
        "BuildId": "build-2222aaaa-33bb-44cc-55dd-6666eeee77ff",
```

```
        "CertificateConfiguration": {
            "CertificateType": "GENERATED"
        },
        "CreationTime": 1496365885.44,
        "Description": "Hosts for v2 North America",
        "FleetArn": "arn:aws:gamelift:us-west-2:123456789012:fleet/
fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "FleetType": "SPOT",
        "InstanceType": "c4.large",
        "MetricGroups": ["default"],
        "Name": "MegaFrogRace.NA.v2",
        "NewGameSessionProtectionPolicy": "NoProtection",
        "OperatingSystem": "WINDOWS_2012",
        "ServerLaunchPath": "C:\\game\\Bin64.Release.Dedicated\
\MegaFrogRace_Server.exe",
        "Status": "NEW"
    }
}
```

For more information, see Create an Amazon GameLift Servers managed EC2 fleet in the *Amazon GameLift Servers Developer Guide*.

Example 3: To create a fully configured fleet

The following `create-fleet` example creates a fleet of Spot Windows instances for a custom server build, with most commonly used configuration settings provided.

```
aws gamelift create-fleet \
    --name MegaFrogRace.NA.v2 \
    --description 'Hosts for v2 North America' \
    --build-id build-2222aaaa-33bb-44cc-55dd-6666eeee77ff \
    --certificate-configuration 'CertificateType=GENERATED' \
    --ec2-instance-type c4.large \
    --ec2-inbound-permissions
 'FromPort=33435,ToPort=33435,IpRange=10.24.34.0/23,Protocol=UDP' \
    --fleet-type SPOT \
    --new-game-session-protection-policy FullProtection \
    --runtime-configuration file://runtime-config.json \
    --metric-groups default \
    --instance-role-arn 'arn:aws:iam::123456789012:role/GameLiftS3Access'
```

Contents of `runtime-config.json`:

```
{
    "GameSessionActivationTimeoutSeconds": 300,
    "MaxConcurrentGameSessionActivations": 2,
    "ServerProcesses": [
        {"LaunchPath": "C:\\game\\Bin64.Release.Dedicated\\MegaFrogRace_Server.exe",
 "Parameters": "-debug", "ConcurrentExecutions": 1},
        {"LaunchPath": "C:\\game\\Bin64.Release.Dedicated\\MegaFrogRace_Server.exe",
 "ConcurrentExecutions": 1}
    ]
}
```

Output:

```
{
    "FleetAttributes": {
        "InstanceRoleArn": "arn:aws:iam::123456789012:role/GameLiftS3Access",
        "Status": "NEW",
        "InstanceType": "c4.large",
        "FleetArn": "arn:aws:gamelift:us-west-2:123456789012:fleet/
fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "Description": "Hosts for v2 North America",
        "FleetType": "SPOT",
        "OperatingSystem": "WINDOWS_2012",
        "Name": "MegaFrogRace.NA.v2",
        "CreationTime": 1569309011.11,
        "MetricGroups": [
            "default"
        ],
        "BuildId": "build-2222aaaa-33bb-44cc-55dd-6666eeee77ff",
        "ServerLaunchParameters": "abc",
        "ServerLaunchPath": "C:\\game\\Bin64.Release.Dedicated\
\MegaFrogRace_Server.exe",
        "NewGameSessionProtectionPolicy": "FullProtection",
        "CertificateConfiguration": {
            "CertificateType": "GENERATED"
        }
    }
}
```

For more information, see Create an Amazon GameLift Servers managed EC2 fleet in the *Amazon GameLift Servers Developer Guide*.

Example 4: To create a Realtime Servers fleet

The following `create-fleet` example creates a fleet of Spot instances with a Realtime configuration script that has been uploaded to Amazon GameLift. All Realtime servers are deployed onto Linux machines. For the purposes of this example, assume that the uploaded Realtime script includes multiple script files, with the `Init()` function located in the script file called `MainScript.js`. As shown, this file is identified as the launch script in the runtime configuration.

```
aws gamelift create-fleet \
    --name MegaFrogRace.NA.realtime \
    --description 'Mega Frog Race Realtime fleet' \
    --script-id script-1111aaaa-22bb-33cc-44dd-5555eeee66ff \
    --ec2-instance-type c4.large \
    --fleet-type SPOT \
    --certificate-configuration 'CertificateType=GENERATED' \
    --runtime-configuration 'ServerProcesses=[{LaunchPath=/local/game/
MainScript.js,Parameters=+map Winter444,ConcurrentExecutions=5}]'
```

Output:

```
{
    "FleetAttributes": {
        "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "Status": "NEW",
        "CreationTime": 1569310745.212,
        "InstanceType": "c4.large",
        "NewGameSessionProtectionPolicy": "NoProtection",
        "CertificateConfiguration": {
            "CertificateType": "GENERATED"
        },
        "Name": "MegaFrogRace.NA.realtime",
        "ScriptId": "script-1111aaaa-22bb-33cc-44dd-5555eeee66ff",
        "FleetArn": "arn:aws:gamelift:us-west-2:123456789012:fleet/
fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "FleetType": "SPOT",
        "MetricGroups": [
            "default"
        ],
        "Description": "Mega Frog Race Realtime fleet",
        "OperatingSystem": "AMAZON_LINUX"
    }
```

```
}
```

For more information, see Create an Amazon GameLift Servers managed EC2 fleet in the *Amazon GameLift Servers Developer Guide*.

- For API details, see CreateFleet in *AWS CLI Command Reference*.

`create-game-session-queue`

The following code example shows how to use `create-game-session-queue`.

AWS CLI

Example 1: To set up an ordered game session queue

The following `create-game-session-queue` example creates a new game session queue with destinations in two regions. It also configures the queue so that game session requests time out after waiting 10 minutes for placement. Since no latency policies are defined, GameLift attempts to place all game sessions with the first destination listed.

```
aws gamelift create-game-session-queue \
    --name MegaFrogRaceServer-NA \
    --destinations file://destinations.json \
    --timeout-in-seconds 600
```

Contents of `destinations.json`:

```
[
    {"DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" },
    {"DestinationArn": "arn:aws:gamelift:us-west-1::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222" }
]
```

Output:

```
{
    "GameSessionQueue": {
        "Name": "MegaFrogRaceServer-NA",
        "GameSessionQueueArn": "arn:aws:gamelift:us-west-2:123456789012:gamesessionqueue/MegaFrogRaceServer-NA",
```

```
        "TimeoutInSeconds": 600,
        "Destinations": [
            {"DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"},
            {"DestinationArn": "arn:aws:gamelift:us-west-1::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"}
        ]
    }
}
```

Example 2: To set up a game session queue with player latency policies

The following `create-game-session-queue` example creates a new game session queue with two player latency policies. The first policy sets a 100ms latency cap that is enforced during the first minute of a game session placement attempt. The second policy raises the latency cap to 200ms until the placement request times out at 3 minutes.

```
aws gamelift create-game-session-queue \
    --name MegaFrogRaceServer-NA \
    --destinations file://destinations.json \
    --player-latency-policies file://latency-policies.json \
    --timeout-in-seconds 180
```

Contents of `destinations.json`:

```
[
    { "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111" },
    { "DestinationArn": "arn:aws:gamelift:us-east-1::fleet/fleet-a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222" }
]
```

Contents of `latency-policies.json`:

```
[
    {"MaximumIndividualPlayerLatencyMilliseconds": 200},
    {"MaximumIndividualPlayerLatencyMilliseconds": 100, "PolicyDurationSeconds": 60}
]
```

Output:

```
{
    "GameSessionQueue": {
        "Name": "MegaFrogRaceServer-NA",
        "GameSessionQueueArn": "arn:aws:gamelift:us-
west-2:123456789012:gamesessionqueue/MegaFrogRaceServer-NA",
        "TimeoutInSeconds": 180,
        "PlayerLatencyPolicies": [
            {
                "MaximumIndividualPlayerLatencyMilliseconds": 100,
                "PolicyDurationSeconds": 60
            },
            {
                "MaximumIndividualPlayerLatencyMilliseconds": 200
            }
        ],
        "Destinations": [
            {"DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"},
            {"DestinationArn": "arn:aws:gamelift:us-east-1::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"}
        ]
    }
}
```

For more information, see Create a Queue in the *Amazon GameLift Developer Guide*.

- For API details, see CreateGameSessionQueue in *AWS CLI Command Reference*.

`delete-build`

The following code example shows how to use `delete-build`.

AWS CLI

To delete a custom game build

The following `delete-build` example removes a build from your Amazon GameLift account. After the build is deleted, you cannot use it to create new fleets. This operation cannot be undone.

```
aws gamelift delete-build \
    --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Create a game server build for Amazon GameLift Servers in the *Amazon GameLift Servers Developer Guide*.

- For API details, see DeleteBuild in *AWS CLI Command Reference*.

`delete-fleet`

The following code example shows how to use `delete-fleet`.

AWS CLI

To delete a fleet that is no longer in use

The following `delete-fleet` example removes a fleet that has been scaled down to zero instances. If the fleet capacity is greater than zero, the request fails with an HTTP 400 error.

```
aws gamelift delete-fleet \
    --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Manage GameLift Fleets in the *Amazon GameLift Developer Guide*.

- For API details, see DeleteFleet in *AWS CLI Command Reference*.

`delete-game-session-queue`

The following code example shows how to use `delete-game-session-queue`.

AWS CLI

To delete a game session queue

The following `delete-game-session-queue` example deletes a specified game session queue.

```
aws gamelift delete-game-session-queue \
    --name MegaFrogRace-NA
```

This command produces no output.

For more information, see Configure game session placement in the *Amazon GameLift Servers Developer Guide*.

- For API details, see DeleteGameSessionQueue in *AWS CLI Command Reference*.

`describe-build`

The following code example shows how to use `describe-build`.

AWS CLI

To get information on a custom game build

The following `describe-build` example retrieves properties for a game server build resource.

```
aws gamelift describe-build \
    --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Build": {
        "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
        "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreationTime": 1496708916.18,
        "Name": "My_Game_Server_Build_One",
        "OperatingSystem": "AMAZON_LINUX",
        "SizeOnDisk": 1304924,
        "Status": "READY",
        "Version": "12345.678"
    }
}
```

For more information, see Upload a Custom Server Build to GameLift in the *Amazon GameLift Developer Guide*.

- For API details, see DescribeBuild in *AWS CLI Command Reference*.

`describe-ec2-instance-limits`

The following code example shows how to use `describe-ec2-instance-limits`.

AWS CLI

To retrieve service limits for an EC2 instance type

The following `describe-ec2-instance-limits` example displays the maximum allowed instances and current instances in use for the specified EC2 instance type in the current Region. The result indicates that only five of the allowed twenty instances are being used.

```
aws gamelift describe-ec2-instance-limits \
    --ec2-instance-type m5.large
```

Output:

```
{
    "EC2InstanceLimits": [
        {
            "EC2InstanceType": "m5.large",
            "CurrentInstances": 5,
            "InstanceLimit": 20
        }
    ]
}
```

For more information, see Choose compute resources for a managed fleet in the *Amazon GameLift Developer Guide*.

- For API details, see DescribeEc2InstanceLimits in *AWS CLI Command Reference*.

`describe-fleet-attributes`

The following code example shows how to use `describe-fleet-attributes`.

AWS CLI

Example 1: To view attributes for a list of fleets

The following `describe-fleet-attributes` example retrieves fleet attributes for two specified fleets. As shown, the requested fleets are deployed with the same build, one for On-Demand instances and one for Spot instances, with some minor configuration differences.

```
aws gamelift describe-fleet-attributes \
```

```
    --fleet-ids arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111 fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "FleetAttributes": [
        {
            "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "FleetArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
            "FleetType": "ON_DEMAND",
            "InstanceType": "c4.large",
            "Description": "On-demand hosts for v2 North America",
            "Name": "MegaFrogRaceServer.NA.v2-od",
            "CreationTime": 1568836191.995,
            "Status": "ACTIVE",
            "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE33333",
            "ServerLaunchPath": "C:\\game\\MegaFrogRace_Server.exe",
            "ServerLaunchParameters": "+gamelift_start_server",
            "NewGameSessionProtectionPolicy": "NoProtection",
            "OperatingSystem": "WINDOWS_2012",
            "MetricGroups": [
                "default"
            ],
            "CertificateConfiguration": {
                "CertificateType": "DISABLED"
            }
        },
        {
            "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "FleetArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222",
            "FleetType": "SPOT",
            "InstanceType": "c4.large",
            "Description": "On-demand hosts for v2 North America",
            "Name": "MegaFrogRaceServer.NA.v2-spot",
            "CreationTime": 1568838275.379,
            "Status": "ACTIVATING",
            "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
```

```
            "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE33333",
            "ServerLaunchPath": "C:\\game\\MegaFrogRace_Server.exe",
            "NewGameSessionProtectionPolicy": "NoProtection",
            "OperatingSystem": "WINDOWS_2012",
            "MetricGroups": [
                "default"
            ],
            "CertificateConfiguration": {
                "CertificateType": "GENERATED"
            }
        }
    ]
}
```

Example 2: To request attributes for all fleets

The following `describe-fleet-attributes` example returns fleet attributes for all fleets with any status. This example illustrates the use of pagination parameters to return one fleet at a time.

```
aws gamelift describe-fleet-attributes \
    --limit 1
```

Output:

```
{
    "FleetAttributes": [
        {
            "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "FleetArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222",
            "FleetType": "SPOT",
            "InstanceType": "c4.large",
            "Description": "On-demand hosts for v2 North America",
            "Name": "MegaFrogRaceServer.NA.v2-spot",
            "CreationTime": 1568838275.379,
            "Status": "ACTIVATING",
            "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE33333",
            "ServerLaunchPath": "C:\\game\\MegaFrogRace_Server.exe",
            "NewGameSessionProtectionPolicy": "NoProtection",
```

```
            "OperatingSystem": "WINDOWS_2012",
            "MetricGroups": [
                "default"
            ],
            "CertificateConfiguration": {
                "CertificateType": "GENERATED"
            }
        }
    ],
    "NextToken":
 "eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmMS
}
```

The output includes a `NextToken` value that you can use when you call the command a second time. Pass the value to the `--next-token` parameter to specify where to pick up the output. The following command returns the second result in the output.

```
aws gamelift describe-fleet-attributes \
    --limit 1 \
    --next-
token eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZT
```

Repeat until the response doesn't include a `NextToken` value.

For more information, see Setting Up GameLift Fleets in the *Amazon GameLift Developer Guide*.

- For API details, see DescribeFleetAttributes in *AWS CLI Command Reference*.

`describe-fleet-capacity`

The following code example shows how to use `describe-fleet-capacity`.

AWS CLI

To view capacity status for a list of fleets

The following `describe-fleet-capacity` example retrieves current capacity for two specified fleets.

```
aws gamelift describe-fleet-capacity \
    --fleet-ids arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111 fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "FleetCapacity": [
        {
            "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "InstanceType": "c5.large",
            "InstanceCounts": {
                "DESIRED": 10,
                "MINIMUM": 1,
                "MAXIMUM": 20,
                "PENDING": 0,
                "ACTIVE": 10,
                "IDLE": 3,
                "TERMINATING": 0
            }
        },
        {
            "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "InstanceType": "c5.large",
            "InstanceCounts": {
                "DESIRED": 13,
                "MINIMUM": 1,
                "MAXIMUM": 20,
                "PENDING": 0,
                "ACTIVE": 15,
                "IDLE": 2,
                "TERMINATING": 2
            }
        }

    ]
}
```

For more information, see GameLift Metrics for Fleets in the *Amazon GameLift Developer Guide*.

- For API details, see DescribeFleetCapacity in *AWS CLI Command Reference*.

`describe-fleet-events`

The following code example shows how to use `describe-fleet-events`.

AWS CLI

To request events for a specified time span

The following `describe-fleet-events` example displays details of all fleet-related events that occurred during the specified time span.

```
aws gamelift describe-fleet-events \
    --fleet-id arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --start-time 1579647600 \
    --end-time 1579649400 \
    --limit 5
```

Output:

```
{
    "Events": [
        {
            "EventId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "ResourceId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "EventCode": "FLEET_STATE_ACTIVE",
            "Message": "Fleet fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 changed
 state to ACTIVE",
            "EventTime": 1579649342.191
        },
        {
            "EventId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "ResourceId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "EventCode": "FLEET_STATE_ACTIVATING",
            "Message": "Fleet fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 changed
 state to ACTIVATING",
            "EventTime": 1579649321.427
        },
        {
            "EventId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",

For more information, see Debug GameLift Fleet Issues in the *Amazon GameLift Developer Guide*.

- For API details, see DescribeFleetEvents in *AWS CLI Command Reference*.

`describe-fleet-port-settings`

The following code example shows how to use `describe-fleet-port-settings`.

AWS CLI

To view inbound connection permissions for a fleet

The following `describe-fleet-port-settings` example retrieves connection settings for a specified fleet.

```
aws gamelift describe-fleet-port-settings \
    --fleet-id arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "InboundPermissions": [
        {
            "FromPort": 33400,
            "ToPort": 33500,
            "IpRange": "0.0.0.0/0",
            "Protocol": "UDP"
        },
        {
            "FromPort": 1900,
            "ToPort": 2000,
            "IpRange": "0.0.0.0/0",
            "Protocol": "TCP"
        }
    ]
}
```

For more information, see Setting Up GameLift Fleets in the *Amazon GameLift Developer Guide*.

- For API details, see DescribeFleetPortSettings in *AWS CLI Command Reference*.

describe-fleet-utilization

The following code example shows how to use `describe-fleet-utilization`.

AWS CLI

Example 1: To view usage data for a list of fleets

The following `describe-fleet-utilization` example retrieves current usage information for one specified fleet.

```
aws gamelift describe-fleet-utilization \
    --fleet-ids arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "FleetUtilization": [
        {
            "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ActiveServerProcessCount": 100,
            "ActiveGameSessionCount": 62,
            "CurrentPlayerSessionCount": 329,
            "MaximumPlayerSessionCount": 1000
        }
    ]
}
```

Example 2: To request usage data for all fleets

The following `describe-fleet-utilization` example returns fleet usage data for all fleets with any status. This example uses pagination parameters to return data for two fleets at a time.

```
aws gamelift describe-fleet-utilization \
    --limit 2
```

Output:

```
{
    "FleetUtilization": [
```

```
        {
            "FleetId": "fleet-1111aaaa-22bb-33cc-44dd-5555eeee66ff",
            "ActiveServerProcessCount": 100,
            "ActiveGameSessionCount": 13,
            "CurrentPlayerSessionCount": 98,
            "MaximumPlayerSessionCount": 1000
        },
        {
            "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
            "ActiveServerProcessCount": 100,
            "ActiveGameSessionCount": 62,
            "CurrentPlayerSessionCount": 329,
            "MaximumPlayerSessionCount": 1000
        }
    ],
    "NextToken":
 "eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmMS
}
```

Call the command a second time, passing the `NextToken` value as the argument to the `--next-token` parameter to see the next two results.

```
aws gamelift describe-fleet-utilization \
    --limit 2 \
    --next-
token eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZT
```

Repeat until the response no longer includes a `NextToken` value in the output.

For more information, see GameLift Metrics for Fleets in the *Amazon GameLift Developer Guide*.

- For API details, see DescribeFleetUtilization in *AWS CLI Command Reference*.

`describe-game-session-queues`

The following code example shows how to use `describe-game-session-queues`.

AWS CLI

To view game session queues

The following `describe-game-session-queues` example retrieves properties for two specified queues.

```
aws gamelift describe-game-session-queues \
    --names MegaFrogRace-NA MegaFrogRace-EU
```

Output:

```
{
    "GameSessionQueues": [{
            "Destinations": [{
                    "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
                },
                {
                    "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
                }
            ],
            "Name": "MegaFrogRace-NA",
            "TimeoutInSeconds": 600,
            "GameSessionQueueArn": "arn:aws:gamelift:us-west-2::gamesessionqueue/
MegaFrogRace-NA",
            "PlayerLatencyPolicies": [{
                    "MaximumIndividualPlayerLatencyMilliseconds": 200
                },
                {
                    "MaximumIndividualPlayerLatencyMilliseconds": 100,
                    "PolicyDurationSeconds": 60
                }
            ],
            "FilterConfiguration": {
                "AllowedLocations": ["us-west-2", "ap-south-1", "us-east-1"]
            },
            "PriorityConfiguration": {
                "PriorityOrder": ["LOCATION", "FLEET_TYPE", "DESTINATION"],
                "LocationOrder": ["us-west-2", "ap-south-1", "us-east-1"]
            }
        },
        {
            "Destinations": [{
                "DestinationArn": "arn:aws:gamelift:eu-west-3::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
            }],
            "Name": "MegaFrogRace-EU",
            "TimeoutInSeconds": 600,
```

```
            "GameSessionQueueArn": "arn:aws:gamelift:us-west-2::gamesessionqueue/
MegaFrogRace-EU"
        }
    ]
}
```

For more information, see Using Multi-Region Queues in the *Amazon GameLift Developer Guide*.

- For API details, see DescribeGameSessionQueues in *AWS CLI Command Reference*.

`describe-runtime-configuration`

The following code example shows how to use `describe-runtime-configuration`.

AWS CLI

To request the runtime configuration for a fleet

The following `describe-runtime-configuration` example retrieves details about the current runtime configuration for a specified fleet.

```
aws gamelift describe-runtime-configuration \
    --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "RuntimeConfiguration": {
        "ServerProcesses": [
            {
                "LaunchPath": "C:\\game\\Bin64.Release.Dedicated\
\MegaFrogRace_Server.exe",
                "Parameters": "+gamelift_start_server",
                "ConcurrentExecutions": 3
            },
            {
                "LaunchPath": "C:\\game\\Bin64.Release.Dedicated\
\MegaFrogRace_Server.exe",
                "Parameters": "+gamelift_start_server +debug",
                "ConcurrentExecutions": 1
            }
        ],
```

```
        "MaxConcurrentGameSessionActivations": 2147483647,
        "GameSessionActivationTimeoutSeconds": 300
    }
}
```

For more information, see Run Multiple Processes on a Fleet in the *Amazon GameLift Developer Guide*.

- For API details, see DescribeRuntimeConfiguration in *AWS CLI Command Reference*.

`list-builds`

The following code example shows how to use `list-builds`.

AWS CLI

Example 1: To get a list of custom game builds

The following `list-builds` example retrieves properties for all game server builds in the current Region. The sample request illustrates how to use the pagination parameters, `Limit` and `NextToken`, to retrieve the results in sequential sets. The first command retrieves the first two builds. Because there are more than two available, the response includes a `NextToken` to indicate that more results are available.

```
aws gamelift list-builds \
    --limit 2
```

Output:

```
{
    "Builds": [
        {
            "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
            "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "CreationTime": 1495664528.723,
            "Name": "My_Game_Server_Build_One",
            "OperatingSystem": "WINDOWS_2012",
            "SizeOnDisk": 8567781,
            "Status": "READY",
            "Version": "12345.678"
```

```
        },
        {
            "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222",
            "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "CreationTime": 1495528748.555,
            "Name": "My_Game_Server_Build_Two",
            "OperatingSystem": "AMAZON_LINUX_2",
            "SizeOnDisk": 8567781,
            "Status": "FAILED",
            "Version": "23456.789"
        }
    ],
    "NextToken":
 "eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmMS
}
```

You can then call the command again with the `--next-token` parameter as follows to see the next two builds.

```
aws gamelift list-builds \
    --limit 2 \
    --next-
token eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZT
```

Repeat until the response doesn't include a `NextToken` value.

For more information, see Create a game server build for Amazon GameLift Servers in the *Amazon GameLift Servers Developer Guide*.

Example 2: To get a list of custom game builds in failure status

The following `list-builds` example retrieves properties for all game server builds in the current region that currently have status FAILED.

```
aws gamelift list-builds \
    --status FAILED
```

Output:

```
{
```

```
    "Builds": [
        {
            "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222",
            "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "CreationTime": 1495528748.555,
            "Name": "My_Game_Server_Build_Two",
            "OperatingSystem": "AMAZON_LINUX_2",
            "SizeOnDisk": 8567781,
            "Status": "FAILED",
            "Version": "23456.789"
        }
    ]
}
```

For more information, see Create a game server build for Amazon GameLift Servers in the *Amazon GameLift Servers Developer Guide*.

- For API details, see ListBuilds in *AWS CLI Command Reference*.

`list-fleets`

The following code example shows how to use `list-fleets`.

AWS CLI

Example 1: To get a list of all fleets in a Region

The following `list-fleets` example displays the fleet IDs of all fleets in the current Region. This example uses pagination parameters to retrieve two fleet IDs at a time. The response includes a `next-token` attribute, which indicates that there are more results to retrieve.

```
aws gamelift list-fleets \
    --limit 2
```

Output:

```
{
    "FleetIds": [
        "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

```
    ],
    "NextToken":
 "eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmMS
}
```

You can pass the `NextToken` value from the previous response in the next command, as shown here to get the next two results.

```
aws gamelift list-fleets \
    --limit 2 \
    --next-
token eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC00NDRlZj
```

For more information, see Deploy hosting fleets for Amazon GameLift Servers in the *Amazon GameLift Servers Developer Guide*.

Example 2: To get a list of all fleets in a Region with a specific build or script

The following `list-fleets` example retrieves the IDs of fleets that are deployed with the specified game build. If you're working with Realtime Servers, you can provide a script ID in place of a build ID. Because this example does not specify the limit parameter, the results can include up to 16 fleet IDs.

```
aws gamelift list-fleets \
    --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "FleetIds": [
        "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
        "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE44444"
    ]
}
```

For more information, see Deploy hosting fleets for Amazon GameLift Servers in the *Amazon GameLift Servers Developer Guide*.

- For API details, see ListFleets in *AWS CLI Command Reference*.

`request-upload-credentials`

The following code example shows how to use `request-upload-credentials`.

AWS CLI

To refresh access credentials for uploading a build

The following `request-upload-credentials` example obtains new, valid access credentials for uploading a GameLift build file to an Amazon S3 location. Credentials have a limited life span. You get the build ID from the response to the original `CreateBuild` request.

```
aws gamelift request-upload-credentials \
    --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "StorageLocation": {
        "Bucket": "gamelift-builds-us-west-2",
        "Key": "123456789012/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    },
    "UploadCredentials": {
        "AccessKeyId": "AKIAIOSFODNN7EXAMPLE",
        "SecretAccessKey": "wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY",
        "SessionToken": "AgoGb3JpZ2luENz...EXAMPLETOKEN=="
    }
}
```

For more information, see Upload a Custom Server Build to GameLift in the *Amazon GameLift Developer Guide*.

- For API details, see RequestUploadCredentials in *AWS CLI Command Reference*.

`start-fleet-actions`

The following code example shows how to use `start-fleet-actions`.

AWS CLI

To restart fleet automatic scaling activity

The following `start-fleet-actions` example resumes the use of all scaling policies that are defined for the specified fleet but were stopped by calling ``stop-fleet-actions``. After starting, the scaling policies immediately begin tracking their respective metrics.

```
aws gamelift start-fleet-actions \
    --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --actions AUTO_SCALING
```

This command produces no output.

For more information, see Auto-scale fleet capacity with Amazon GameLift Servers in the *Amazon GameLift Servers Developer Guide*.

- For API details, see StartFleetActions in *AWS CLI Command Reference*.

`stop-fleet-actions`

The following code example shows how to use `stop-fleet-actions`.

AWS CLI

To stop a fleet's automatic scaling activity

The following `stop-fleet-actions` example stops the use of all scaling policies that are defined for the specified fleet. After the policies are suspended, fleet capacity remains at the same active instance count unless you adjust it manually.

```
aws gamelift stop-fleet-actions \
    --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --actions AUTO_SCALING
```

This command produces no output.

For more information, see Auto-scale fleet capacity with Amazon GameLift Servers in the *Amazon GameLift Servers Developer Guide*.

- For API details, see StopFleetActions in *AWS CLI Command Reference*.

`update-build`

The following code example shows how to use `update-build`.

AWS CLI

To update a custom game build

The following `update-build` example changes the name and version information that is associated with a specified build resource. The returned build object verifies that the changes were made successfully.

```
aws gamelift update-build \
    --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --name MegaFrogRaceServer.NA.east \
    --build-version 12345.east
```

Output:

```
{
    "Build": {
        "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
        "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreationTime": 1496708916.18,
        "Name": "MegaFrogRaceServer.NA.east",
        "OperatingSystem": "AMAZON_LINUX_2",
        "SizeOnDisk": 1304924,
        "Status": "READY",
        "Version": "12345.east"
    }
}
```

For more information, see Update Your Build Files in the *Amazon GameLift Developer Guide*.

- For API details, see UpdateBuild in *AWS CLI Command Reference*.

`update-game-session-queue`

The following code example shows how to use `update-game-session-queue`.

AWS CLI

To update a game session queue configuration

The following `update-game-session-queue` example adds a new destination and updates the player latency policies for an existing game session queue.

```
aws gamelift update-game-session-queue \
    --name MegaFrogRace-NA \
    --destinations file://destinations.json \
    --player-latency-policies file://latency-policies.json
```

Contents of `destinations.json`:

```
[
    {"DestinationArn": "arn:aws:gamelift:us-west-2::fleet/
fleet-1a2b3c4d-5e6f-7a8b-9c0d-1e2f3a4b5c6d"},
    {"DestinationArn": "arn:aws:gamelift:us-east-1::fleet/
fleet-5c6d3c4d-5e6f-7a8b-9c0d-1e2f3a4b5a2b"},
    {"DestinationArn": "arn:aws:gamelift:us-east-1::alias/
alias-11aa22bb-3c4d-5e6f-000a-1111aaaa22bb"}
]
```

Contents of `latency-policies.json`:

```
[
    {"MaximumIndividualPlayerLatencyMilliseconds": 200},
    {"MaximumIndividualPlayerLatencyMilliseconds": 150, "PolicyDurationSeconds":
 120},
    {"MaximumIndividualPlayerLatencyMilliseconds": 100, "PolicyDurationSeconds":
 120}
]
```

Output:

```
{
    "GameSessionQueue": {
        "Destinations": [
            {"DestinationArn": "arn:aws:gamelift:us-west-2::fleet/
fleet-1a2b3c4d-5e6f-7a8b-9c0d-1e2f3a4b5c6d"},
            {"DestinationArn": "arn:aws:gamelift:us-east-1::fleet/
fleet-5c6d3c4d-5e6f-7a8b-9c0d-1e2f3a4b5a2b"},
            {"DestinationArn": "arn:aws:gamelift:us-east-1::alias/
alias-11aa22bb-3c4d-5e6f-000a-1111aaaa22bb"}
        ],
        "GameSessionQueueArn": "arn:aws:gamelift:us-
west-2:123456789012:gamesessionqueue/MegaFrogRace-NA",
        "Name": "MegaFrogRace-NA",
```

```
        "TimeoutInSeconds": 600,
        "PlayerLatencyPolicies": [
            {"MaximumIndividualPlayerLatencyMilliseconds": 200},
            {"MaximumIndividualPlayerLatencyMilliseconds": 150,
 "PolicyDurationSeconds": 120},
            {"MaximumIndividualPlayerLatencyMilliseconds": 100,
 "PolicyDurationSeconds": 120}
        ]
    }
}
```

For more information, see Using Multi-Region Queues in the *Amazon GameLift Developer Guide*.

- For API details, see UpdateGameSessionQueue in *AWS CLI Command Reference*.

`upload-build`

The following code example shows how to use `upload-build`.

AWS CLI

Example 1: To upload a Linux game server build

The following `upload-build` example uploads Linux game server build files from a file directory to the GameLift service and creates a build resource.

```
aws gamelift upload-build \
    --name MegaFrogRaceServer.NA \
    --build-version 2.0.1 \
    --build-root ~/MegaFrogRace_Server/release-na \
    --operating-system AMAZON_LINUX_2 \
    --server-sdk-version 4.0.2
```

Output:

```
Uploading ~/MegaFrogRace_Server/release-na:  16.0 KiB / 74.6 KiB (21.45%)
Uploading ~/MegaFrogRace_Server/release-na:  32.0 KiB / 74.6 KiB (42.89%)
Uploading ~/MegaFrogRace_Server/release-na:  48.0 KiB / 74.6 KiB (64.34%)
Uploading ~/MegaFrogRace_Server/release-na:  64.0 KiB / 74.6 KiB (85.79%)
Uploading ~/MegaFrogRace_Server/release-na:  74.6 KiB / 74.6 KiB (100.00%)
Successfully uploaded ~/MegaFrogRace_Server/release-na to AWS GameLift
Build ID: build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Example 2: To upload a Windows game server build

The following `upload-build` example uploads Windows game server build files from a directory to the GameLift service and creates a build record.

```
aws gamelift upload-build \
    --name MegaFrogRaceServer.NA \
    --build-version 2.0.1 \
    --build-root C:\MegaFrogRace_Server\release-na \
    --operating-system WINDOWS_2012 \
    --server-sdk-version 4.0.2
```

Output:

```
Uploading C:\MegaFrogRace_Server\release-na:  16.0 KiB / 74.6 KiB (21.45%)
Uploading C:\MegaFrogRace_Server\release-na:  32.0 KiB / 74.6 KiB (42.89%)
Uploading C:\MegaFrogRace_Server\release-na:  48.0 KiB / 74.6 KiB (64.34%)
Uploading C:\MegaFrogRace_Server\release-na:  64.0 KiB / 74.6 KiB (85.79%)
Uploading C:\MegaFrogRace_Server\release-na:  74.6 KiB / 74.6 KiB (100.00%)
Successfully uploaded C:\MegaFrogRace_Server\release-na to AWS GameLift
Build ID: build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

For more information, see Upload a Custom Server Build to GameLift in the *Amazon GameLift Developer Guide*.

- For API details, see UploadBuild in *AWS CLI Command Reference*.

Amazon Glacier examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Glacier.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`abort-multipart-upload`

The following code example shows how to use `abort-multipart-upload`.

AWS CLI

To abort a multipart upload

The following `abort-multipart-upload` example deletes an in-progress multipart upload to a vault named `my-vault`.

```
aws glacier abort-multipart-upload \
    --account-id - \
    --vault-name my-vault \
    --upload-id 19gaRezEXAMPLES6Ry5YYdqthHOC_kGRCT03L9yetr220UmPtBYKk-OssZtLqyFu7sY1_lR7vgFuJV6NtcV5zpsJ
```

This command produces no output. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account. The upload ID is returned by the `aws glacier initiate-multipart-upload` command and can also be obtained by using `aws glacier list-multipart-uploads`.

For more information on multipart uploads to Amazon Glacier using the AWS CLI, see Using Amazon Glacier in the AWS CLI in the *AWS CLI User Guide*.

For more information, see Uploading Large Archives in Parts (Multipart Upload) in the *Amazon Glacier Developer Guide*.

- For API details, see AbortMultipartUpload in *AWS CLI Command Reference*.

`abort-vault-lock`

The following code example shows how to use `abort-vault-lock`.

AWS CLI

To abort an in-progress vault lock process

The following `abort-vault-lock` example deletes a vault lock policy from the specified vault and resets the lock state of the vault lock to unlocked.

```
aws glacier abort-vault-lock \
    --account-id - \
    --vault-name MyVaultName
```

This command produces no output.

For more information, see Abort Vault Lock (DELETE lock-policy) in the *Amazon Glacier API Developer Guide*.

- For API details, see AbortVaultLock in *AWS CLI Command Reference*.

`add-tags-to-vault`

The following code example shows how to use `add-tags-to-vault`.

AWS CLI

To add tags to a vault

The following `add-tags-to-vault` example adds two tags to a vault named `my-vault`.

```
aws glacier add-tags-to-vault \
    --account-id - \
    --vault-name my-vault \
    --tags id=1234,date=july2015
```

This command produces no output.

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

For more information, see Tagging Amazon Glacier Resources in the *Amazon Glacier Developer Guide*.

- For API details, see AddTagsToVault in *AWS CLI Command Reference*.

`complete-multipart-upload`

The following code example shows how to use `complete-multipart-upload`.

AWS CLI

To complete a multipart upload

The following `complete-multipart-upload` example completes multipart upload for a 3 MiB archive.

```
aws glacier complete-multipart-upload \
    --archive-size 3145728 \
    --checksum 9628195fcdbcbbe76cdde456d4646fa7de5f219fb39823836d81f0cc0e18aa67 \
    --upload-id 19gaRezEXAMPLES6Ry5YYdqthHOC_kGRCT03L9yetr220UmPtBYKk-
OssZtLqyFu7sY1_lR7vgFuJV6NtcV5zpsJ \
    --account-id - \
    --vault-name my-vault
```

Output:

```
{
    "location": "/123456789012/vaults/my-vault/archives/
kKB7ymWJVpPSwhGP6ycSOAekp9ZYe_--zM_mw6k76ZFGEIWQX-ybtRDvc2VkPSDtfKmQrj0IRQLSGsNuDp-
AJVlu2ccmDSyDUmZwKbwbpAdGATGDiB3hHO0bjbGehXTcApVud_wyDw",
    "checksum": "9628195fcdbcbbe76cdde456d4646fa7de5f219fb39823836d81f0cc0e18aa67",
    "archiveId": "kKB7ymWJVpPSwhGP6ycSOAekp9ZYe_--zM_mw6k76ZFGEIWQX-
ybtRDvc2VkPSDtfKmQrj0IRQLSGsNuDp-
AJVlu2ccmDSyDUmZwKbwbpAdGATGDiB3hHO0bjbGehXTcApVud_wyDw"
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

The upload ID is returned by the `aws glacier initiate-multipart-upload` command and can also be obtained by using `aws glacier list-multipart-uploads`. The checksum parameter takes a SHA-256 tree hash of the archive in hexadecimal.

For more information on multipart uploads to Amazon Glacier using the AWS CLI, including instructions on calculating a tree hash, see Using Amazon Glacier in the AWS CLI in the *AWS CLI User Guide*.

For more information, see Uploading Large Archives in Parts (Multipart Upload) in the *Amazon Glacier Developer Guide*.

- For API details, see CompleteMultipartUpload in *AWS CLI Command Reference*.

`complete-vault-lock`

The following code example shows how to use `complete-vault-lock`.

AWS CLI

To complete an in-progress vault lock process

The following `complete-vault-lock` example completes the in-progress locking progress for the specified vault and sets the lock state of the vault lock to `Locked`. You get the value for the `lock-id` parameter when you run `initiate-lock-process`.

```
aws glacier complete-vault-lock \
    --account-id - \
    --vault-name MyVaultName \
    --lock-id 9QZgEXAMPLEPhvL6xEXAMPLE
```

This command produces no output.

For more information, see Complete Vault Lock (POST lockId) in the *Amazon Glacier API Developer Guide*.

- For API details, see CompleteVaultLock in *AWS CLI Command Reference*.

`create-vault`

The following code example shows how to use `create-vault`.

AWS CLI

To create a vault

The following `create-vault` example creates a new vault named `my-vault`.

```
aws glacier create-vault \
    --vault-name my-vault \
    --account-id -
```

Output:

```
{
    "location": "/123456789012/vaults/my-vault"
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

For more information, see Creating a Vault in Amazon Glacier Using the AWS Command Line Interface in the *Amazon Glacier Developer Guide*.

- For API details, see CreateVault in *AWS CLI Command Reference*.

`delete-archive`

The following code example shows how to use `delete-archive`.

AWS CLI

To delete an archive from a vault

The following `delete-archive` example removes the specified archive from `example_vault`.

```
aws glacier delete-archive \
    --account-id 123456789012  \
    --vault-name example_vault \
    --archive-id Sc0u9ZP8yaWkmh-XGlIvAVprtLhaLCGnNwNl5I5x9HqPIkX5mjc0DrId3Ln-
Gi_k2HzmlIDZUz117KSdVMdMXLuFWi9PJUitxWO73edQ43eTlMWkH0pd9zVSAuV_XXZBVhKhyGhJ7w
```

This command produces no output.

For more information, see Deleting an Archive in Amazon Glacier in the *Amazon Glacier Developer Guide*.

- For API details, see DeleteArchive in *AWS CLI Command Reference*.

`delete-vault-access-policy`

The following code example shows how to use `delete-vault-access-policy`.

AWS CLI

To remove the access policy of a vault

The following `delete-vault-access-policy` example removes the access policy for the specified vault.

```
aws glacier delete-vault-access-policy \
    --account-id 123456789012 \
```

```
    --vault-name example_vault
```

This command produces no output.

For more information, see Vault Access Policies in the *Amazon Glacier Developer Guide*.

- For API details, see DeleteVaultAccessPolicy in *AWS CLI Command Reference*.

`delete-vault-notifications`

The following code example shows how to use `delete-vault-notifications`.

AWS CLI

To remove the SNS notifications for a vault

The following `delete-vault-notifications` example removes notifications sent by Amazon Simple Notification Service (Amazon SNS) for the specified vault.

```
aws glacier delete-vault-notifications \
    --account-id 123456789012 \
    --vault-name example_vault
```

This command produces no output.

For more information, see Configuring Vault Notifications in Amazon Glacier in the *Amazon Glacier Developer Guide*.

- For API details, see DeleteVaultNotifications in *AWS CLI Command Reference*.

`delete-vault`

The following code example shows how to use `delete-vault`.

AWS CLI

To delete a vault

The following `delete-vault` example deletes a vault named `my-vault`.

```
aws glacier delete-vault \
    --vault-name my-vault \
```

```
    --account-id -
```

This command produces no output. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

For more information, see Deleting a Vault in Amazon Glacier Using the AWS Command Line Interface in the *Amazon Glacier Developer Guide*.

- For API details, see DeleteVault in *AWS CLI Command Reference*.

`describe-job`

The following code example shows how to use `describe-job`.

AWS CLI

To describe a job

The following `describe-job` example retrieves information about an inventory retrieval job on a vault named `my-vault`.

```
aws glacier describe-job \
    --account-id - \
    --vault-name my-vault \
    --job-id zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-
RO47Yc6FxsdGBgf_Q2DK5Ejh18CnTS5XW4_XqlNHS61dsO4CnMW
```

Output:

```
{
    "InventoryRetrievalParameters": {
        "Format": "JSON"
    },
    "VaultARN": "arn:aws:glacier:us-west-2:0123456789012:vaults/my-vault",
    "Completed": false,
    "JobId": "zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-
RO47Yc6FxsdGBgf_Q2DK5Ejh18CnTS5XW4_XqlNHS61dsO4CnMW",
    "Action": "InventoryRetrieval",
    "CreationDate": "2015-07-17T20:23:41.616Z",
    "StatusCode": "InProgress"
}
```

The job ID can be found in the output of `aws glacier initiate-job` and `aws glacier list-jobs`. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

For more information, see Downloading a Vault Inventory in Amazon Glacier in the *Amazon Glacier Developer Guide*.

- For API details, see DescribeJob in *AWS CLI Command Reference*.

`describe-vault`

The following code example shows how to use `describe-vault`.

AWS CLI

To describe a vault

The following `describe-vault` example retrieves data about a vault named `my-vault`.

```
aws glacier describe-vault \
    --vault-name my-vault \
    --account-id -
```

Output:

```
{
    "VaultARN": "arn:aws:glacier:us-west-2:123456789012:vaults/my-vault",
    "VaultName": "my-vault",
    "CreationDate": "2015-07-17T19:22:31.123Z",
    "LastInventoryDate": "2015-07-18T03:41:12.456Z",
    "NumberOfArchives": 1,
    "SizeInBytes": 3178496
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

For more information, see Retrieving Vault Metadata in Amazon Glacier Using the AWS Command Line Interface in the *Amazon Glacier Developer Guide*.

- For API details, see DescribeVault in *AWS CLI Command Reference*.

`get-data-retrieval-policy`

The following code example shows how to use `get-data-retrieval-policy`.

AWS CLI

To get the data retrieval policy for an account

The following `get-data-retrieval-policy` example gets the data retrieval policy for the in-use account.

```
aws glacier get-data-retrieval-policy \
    --account-id -
```

Output:

```
{
    "Policy": {
        "Rules": [
            {
                "BytesPerHour": 10737418240,
                "Strategy": "BytesPerHour"
            }
        ]
    }
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

For more information, see Amazon Glacier Data Retrieval Policies in the *Amazon Glacier Developer Guide*.

- For API details, see GetDataRetrievalPolicy in *AWS CLI Command Reference*.

`get-job-output`

The following code example shows how to use `get-job-output`.

AWS CLI

To get the output of a job

The following `get-job-output` example saves the output from a vault inventory job to a file in the current directory named `output.json`.

```
aws glacier get-job-output output.json \
    --account-id - \
    --vault-name my-vault \
    --job-id zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-
R047Yc6FxsdGBgf_Q2DK5Ejh18CnTS5XW4_XqlNHS61ds04CnMW
```

The `job-id` is available in the output of `aws glacier list-jobs`. Note that the output file name is a positional argument that is not prefixed by an option name. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

Output:

```
{
    "status": 200,
    "acceptRanges": "bytes",
    "contentType": "application/json"
}
```

`output.json`:

```
{"VaultARN":"arn:aws:glacier:us-west-2:0123456789012:vaults/
my-vault","InventoryDate":"2015-04-07T00:26:18Z","ArchiveList":
[{"ArchiveId":"kKB7ymWJVpPSwhGP6ycSOAekp9ZYe_--zM_mw6k76ZFGEIWQX-
ybtRDvc2VkPSDtfKmQrj0IRQLSGsNuDp-
AJVlu2ccmDSyDUmZwKbwbpAdGATGDiB3hHO0bjbGehXTcApVud_wyDw","ArchiveDescription":"multipart
 upload
 test","CreationDate":"2015-04-06T22:24:34Z","Size":3145728,"SHA256TreeHash":"9628195fcdbcbb
```

For more information, see Downloading a Vault Inventory in Amazon Glacier in the *Amazon Glacier Developer Guide*.

- For API details, see GetJobOutput in *AWS CLI Command Reference*.

`get-vault-access-policy`

The following code example shows how to use `get-vault-access-policy`.

AWS CLI

To retrieve the access policy of a vault

The following `get-vault-access-policy` example retrieves the access policy for the specified vault.

```
aws glacier get-vault-access-policy \
    --account-id 123456789111 \
    --vault-name example_vault
```

Output:

```
{
    "policy": {
        "Policy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Principal\":{\"AWS\":\"arn:aws:iam::123456789222:root
\"},\"Action\":\"glacier:ListJobs\",\"Resource\":\"arn:aws:glacier:us-
west-2:123456789111:vaults/example_vault\"},{\"Effect\":\"Allow\",\"Principal\":
{\"AWS\":\"arn:aws:iam::123456789222:root\"},\"Action\":\"glacier:UploadArchive\",
\"Resource\":\"arn:aws:glacier:us-west-2:123456789111:vaults/example_vault\"}]}"
    }
}
```

For more information, see Vault Access Policies in the *Amazon Glacier Developer Guide*.

- For API details, see GetVaultAccessPolicy in *AWS CLI Command Reference*.

`get-vault-lock`

The following code example shows how to use `get-vault-lock`.

AWS CLI

To get the details of a vault lock

The following `get-vault-lock` example retrieved the details about the lock for the specified vault.

```
aws glacier get-vault-lock \
    --account-id - \
```

```
    --vault-name MyVaultName
```

Output:

```
{
    "Policy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":\"Define-vault-
lock\",\"Effect\":\"Deny\",\"Principal\":{\"AWS\":\"arn:aws:iam::123456789012:root
\"},\"Action\":\"glacier:DeleteArchive\",\"Resource\":\"arn:aws:glacier:us-
west-2:99999999999:vaults/MyVaultName\",\"Condition\":{\"NumericLessThanEquals\":
{\"glacier:ArchiveAgeinDays\":\"365\"}}}]}",
    "State": "Locked",
    "CreationDate": "2019-07-29T22:25:28.640Z"
}
```

For more information, see Get Vault Lock (GET lock-policy) in the *Amazon Glacier API Developer Guide*.

- For API details, see GetVaultLock in *AWS CLI Command Reference*.

`get-vault-notifications`

The following code example shows how to use `get-vault-notifications`.

AWS CLI

To get the notification configuration for a vault

The following `get-vault-notifications` example gets a description of the notification configuration for a vault named `my-vault`.

```
aws glacier get-vault-notifications \
    --account-id - \
    --vault-name my-vault
```

Output:

```
{
    "vaultNotificationConfig": {
        "Events": [
            "InventoryRetrievalCompleted",
            "ArchiveRetrievalCompleted"
        ],
```

```
        "SNSTopic": "arn:aws:sns:us-west-2:0123456789012:my-vault"
    }
}
```

If no notifications have been configured for the vault, an error is returned. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

For more information, see Configuring Vault Notifications in Amazon Glacier in the *Amazon Glacier Developer Guide*.

- For API details, see GetVaultNotifications in *AWS CLI Command Reference*.

`initiate-job`

The following code example shows how to use `initiate-job`.

AWS CLI

To start an inventory retrieval job

The following `initiate-job` example initiates a job to get an inventory of the vault `my-vault`.

```
aws glacier initiate-job \
    --account-id - \
    --vault-name my-vault \
    --job-parameters '{"Type": "inventory-retrieval"}'
```

Output:

```
{
    "location": "/0123456789012/vaults/my-vault/jobs/
zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-
RO47Yc6FxsdGBgf_Q2DK5Ejh18CnTS5XW4_XqlNHS61dsO4CnMW",
    "jobId": "zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-
RO47Yc6FxsdGBgf_Q2DK5Ejh18CnTS5XW4_XqlNHS61dsO4CnMW"
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

For more information, see Downloading a Vault Inventory in Amazon Glacier in the *Amazon Glacier Developer Guide*.

The following `initiate-job` example initiates a job to retrieve an archive from the vault `my-vault`.

```
aws glacier initiate-job \
    --account-id - \
    --vault-name my-vault \
    --job-parameters file://job-archive-retrieval.json
```

`job-archive-retrieval.json` is a JSON file in the local folder that specifies the type of job, archive ID, and some optional parameters.

Contents of `job-archive-retrieval.json`:

```
{
    "Type": "archive-retrieval",
    "ArchiveId": "kKB7ymWJVpPSwhGP6ycSOAekp9ZYe_--zM_mw6k76ZFGEIWQX-
ybtRDvc2VkPSDtfKmQrj0IRQLSGsNuDp-
AJVlu2ccmDSyDUmZwKbwbpAdGATGDiB3hHO0bjbGehXTcApVud_wyDw",
    "Description": "Retrieve archive on 2015-07-17",
    "SNSTopic": "arn:aws:sns:us-west-2:0123456789012:my-topic"
}
```

Archive IDs are available in the output of `aws glacier upload-archive` and `aws glacier get-job-output`.

Output:

```
{
    "location": "/123456789012/vaults/mwunderl/jobs/l7IL5-
EkXyEY9Ws95fClzIbk2O5uLYaFdAYOi-
azsX_Z8V6NH4yERHzars8wTKYQMX6nBDI9cMNHzyZJO59-8N9aHWav",
    "jobId": "l7IL5-EkXy2O5uLYaFdAYOiEY9Ws95fClzIbk-
azsX_Z8V6NH4yERHzars8wTKYQMX6nBDI9cMNHzyZJO59-8N9aHWav"
}
```

For more information, see Retrieving Amazon Glacier Archives in the *Amazon Glacier Developer Guide*.

- For API details, see InitiateJob in *AWS CLI Command Reference*.

`initiate-multipart-upload`

The following code example shows how to use `initiate-multipart-upload`.

AWS CLI

To start a multipart upload

The following `initiate-multipart-upload` example initiates a multipart upload to a vault named `my-vault` with a part size of 1 MiB (1024 x 1024 bytes) per file.

```
aws glacier initiate-multipart-upload \
    --account-id - \
    --part-size 1048576 \
    --vault-name my-vault \
    --archive-description "multipart upload test"
```

Output:

```
{
    "location": "/123456789012/vaults/my-vault/multipart-
uploads/19gaRezEXAMPLES6Ry5YYdqthHOC_kGRCT03L9yetr220UmPtBYKk-
OssZtLqyFu7sY1_lR7vgFuJV6NtcV5zpsJ",
    "uploadId": "19gaRezEXAMPLES6Ry5YYdqthHOC_kGRCT03L9yetr220UmPtBYKk-
OssZtLqyFu7sY1_lR7vgFuJV6NtcV5zpsJ"
}
```

The archive description parameter is optional. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

This command outputs an upload ID when successful. Use the upload ID when uploading each part of your archive with `aws glacier upload-multipart-part`. For more information on multipart uploads to Amazon Glacier using the AWS CLI, see Using Amazon Glacier in the AWS CLI in the *AWS CLI User Guide*.

- For API details, see InitiateMultipartUpload in *AWS CLI Command Reference*.

`initiate-vault-lock`

The following code example shows how to use `initiate-vault-lock`.

AWS CLI

To initiate the vault locking process

The following `initiate-vault-lock` example installs a vault lock policy on the specified vault and sets the lock state of the vault lock to `InProgress`. You must complete the process by calling `complete-vault-lock` within 24 hours to set the state of the vault lock to `Locked`.

```
aws glacier initiate-vault-lock \
    --account-id - \
    --vault-name MyVaultName \
    --policy file://vault_lock_policy.json
```

Contents of `vault_lock_policy.json`:

```
{"Policy":"{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":\"Define-vault-
lock\",\"Effect\":\"Deny\",\"Principal\":{\"AWS\":\"arn:aws:iam::123456789012:root
\"},\"Action\":\"glacier:DeleteArchive\",\"Resource\":\"arn:aws:glacier:us-
west-2:123456789012:vaults/examplevault\",\"Condition\":{\"NumericLessThanEquals\":
{\"glacier:ArchiveAgeinDays\":\"365\"}}}]}"}
```

Output:

```
{
    "lockId": "9QZgEXAMPLEPhvL6xEXAMPLE"
}
```

The output is the vault lock ID that you can use to complete the vault lock process.

For more information, see Initiate Vault Lock (POST lock-policy) in the *Amazon Glacier API Developer Guide*.

- For API details, see InitiateVaultLock in *AWS CLI Command Reference*.

`list-jobs`

The following code example shows how to use `list-jobs`.

AWS CLI

To list the jobs for a vault

The following `list-jobs` example lists in-progress and recently completed jobs for a vault named `my-vault`.

```
aws glacier list-jobs \
    --account-id - \
    --vault-name my-vault
```

Output:

```
{
    "JobList": [
        {
            "VaultARN": "arn:aws:glacier:us-west-2:0123456789012:vaults/my-vault",
            "RetrievalByteRange": "0-3145727",
            "SNSTopic": "arn:aws:sns:us-west-2:0123456789012:my-vault",
            "Completed": false,
            "SHA256TreeHash":
 "9628195fcdbcbbe76cdde932d4646fa7de5f219fb39823836d81f0cc0e18aa67",
            "JobId": "l7IL5-EkXyEY9Ws95fClzIbk2O5uLYaFdAYOi-
azsX_Z8V6NH4yERHzars8wTKYQMX6nBDI9cMNHzyZJO59-8N9aHWav",
            "ArchiveId": "kKB7ymWJVpPSwhGP6ycSOAekp9ZYe_--zM_mw6k76ZFGEIWQX-
ybtRDvc2VkPSDtfKmQrj0IRQLSGsNuDp-
AJVlu2ccmDSyDUmZwKbwbpAdGATGDiB3hHO0bjbGehXTcApVud_wyDw",
            "JobDescription": "Retrieve archive on 2015-07-17",
            "ArchiveSizeInBytes": 3145728,
            "Action": "ArchiveRetrieval",
            "ArchiveSHA256TreeHash":
 "9628195fcdbcbbe76cdde932d4646fa7de5f219fb39823836d81f0cc0e18aa67",
            "CreationDate": "2015-07-17T21:16:13.840Z",
            "StatusCode": "InProgress"
        },
        {
            "InventoryRetrievalParameters": {
                "Format": "JSON"
            },
            "VaultARN": "arn:aws:glacier:us-west-2:0123456789012:vaults/my-vault",
            "Completed": false,
            "JobId": "zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-
RO47Yc6FxsdGBgf_Q2DK5Ejh18CnTS5XW4_XqlNHS61dsO4CnMW",
            "Action": "InventoryRetrieval",
            "CreationDate": "2015-07-17T20:23:41.616Z",
            "StatusCode": "InProgress"
        }
```

```
    ]
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

For more information, see Retrieving Amazon Glacier Archives in the *Amazon Glacier Developer Guide*.

- For API details, see ListJobs in *AWS CLI Command Reference*.

`list-multipart-uploads`

The following code example shows how to use `list-multipart-uploads`.

AWS CLI

To list the in-progress multipart uploads for a vault

The following `list-multipart-uploads` example shows all of the in-progress multipart uploads for a vault named `my-vault`.

```
aws glacier list-multipart-uploads \
    --account-id - \
    --vault-name my-vault
```

Output:

```
{
    "UploadsList": [
        {
            "MultipartUploadId":
 "19gaRezEXAMPLES6Ry5YYdqthHOC_kGRCT03L9yetr220UmPtBYKk-
OssZtLqyFu7sY1_lR7vgFuJV6NtcV5zpsJ",
            "VaultARN": "arn:aws:glacier:us-west-2:123456789012:vaults/my-vault",
            "ArchiveDescription": "multipart upload test",
            "PartSizeInBytes": 1048576,
            "CreationDate": "2015-07-18T00:05:23.830Z"
        }
    ]
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

For more information on multipart uploads to Amazon Glacier using the AWS CLI, see Using Amazon Glacier in the AWS CLI in the *AWS CLI User Guide*.

- For API details, see ListMultipartUploads in *AWS CLI Command Reference*.

`list-parts`

The following code example shows how to use `list-parts`.

AWS CLI

To list the uploaded parts of a multipart upload

The following `list-parts` example lists the uploaded parts for a multipart upload to a vault named `my-vault`.

```
aws glacier list-parts \
    --account-id - \
    --vault-name my-vault \
    --upload-id "SYZi7qnL-YGqGwAm8Kn3BLP2ElNCvnB-5961R09CSaPmPwkYGHOqeN_nX3-Vhnd2yF0KfB5FkmbnBU9GubbdrCs8ut-D"
```

Output:

```
{
    "MultipartUploadId": "SYZi7qnL-YGqGwAm8Kn3BLP2ElNCvnB-5961R09CSaPmPwkYGHOqeN_nX3-Vhnd2yF0KfB5FkmbnBU9GubbdrCs8ut-D",
    "Parts": [
        {
            "RangeInBytes": "0-1048575",
            "SHA256TreeHash": "e1f2a7cd6e047350f69b9f8cfa60fa606fe2f02802097a9a026360a7edc1f553"
        },
        {
            "RangeInBytes": "1048576-2097151",
            "SHA256TreeHash": "43cf3061fb95796aed99a11a6aa3cd8f839eed15e655ab0a597126210c36aee6"
        }
    ],
```

```
    "VaultARN": "arn:aws:glacier:us-west-2:0123456789012:vaults/my-vault",
    "CreationDate": "2015-07-18T00:05:23.830Z",
    "PartSizeInBytes": 1048576
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

For more information on multipart uploads to Amazon Glacier using the AWS CLI, see Using Amazon Glacier in the AWS CLI in the *AWS CLI User Guide*.

- For API details, see ListParts in *AWS CLI Command Reference*.

`list-provisioned-capacity`

The following code example shows how to use `list-provisioned-capacity`.

AWS CLI

To retrieve the provisioned capacity units

The following `list-provisioned-capacity` example retrieves details for any provisioned capacity units for the specified account.

```
aws glacier list-provisioned-capacity \
    --account-id 123456789012
```

Output:

```
{
    "ProvisionedCapacityList": [
        {
            "CapacityId": "HpASAuvfRFiVDbOjMfEIcr8K",
            "ExpirationDate": "2020-03-18T19:59:24.000Z",
            "StartDate": "2020-02-18T19:59:24.912Z"
        }
    ]
}
```

For more information, see Retrieving Amazon Glacier Archives in the *Amazon Glacier Developer Guide*.

- For API details, see ListProvisionedCapacity in *AWS CLI Command Reference*.

`list-tags-for-vault`

The following code example shows how to use `list-tags-for-vault`.

AWS CLI

To list the tags for a vault

The following `list-tags-for-vault` example lists the tags applied to a vault named `my-vault`.

```
aws glacier list-tags-for-vault \
    --account-id - \
    --vault-name my-vault
```

Output:

```
{
    "Tags": {
        "date": "july2015",
        "id": "1234"
    }
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

For more information, see Tagging Amazon Glacier Resources in the *Amazon Glacier Developer Guide*.

- For API details, see ListTagsForVault in *AWS CLI Command Reference*.

`list-vaults`

The following code example shows how to use `list-vaults`.

AWS CLI

To list the vaults

The following `list-vaults` example lists the vaults in the default account and region.

```
aws glacier list-vaults \
    --account-id -
```

Output:

```
{
    "VaultList": [
        {
            "SizeInBytes": 3178496,
            "VaultARN": "arn:aws:glacier:us-west-2:0123456789012:vaults/my-vault",
            "LastInventoryDate": "2015-04-07T00:26:19.028Z",
            "VaultName": "my-vault",
            "NumberOfArchives": 1,
            "CreationDate": "2015-04-06T21:23:45.708Z"
        }
    ]
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

For more information, see Retrieving Vault Metadata in Amazon Glacier in the *Amazon Glacier Developer Guide*.

- For API details, see ListVaults in *AWS CLI Command Reference*.

`purchase-provisioned-capacity`

The following code example shows how to use `purchase-provisioned-capacity`.

AWS CLI

To purchase a provisioned capacity unit

The following `purchase-provisioned-capacity` example purchases a provisioned capacity unit.

```
aws glacier purchase-provisioned-capacity \
    --account-id 123456789012
```

Output:

```
{
    "capacityId": "HpASAuvfRFiVDbOjMfEIcr8K"
}
```

For more information, see Retrieving Amazon Glacier Archives in the *Amazon Glacier Developer Guide*.

- For API details, see PurchaseProvisionedCapacity in *AWS CLI Command Reference*.

`remove-tags-from-vault`

The following code example shows how to use `remove-tags-from-vault`.

AWS CLI

To remove a tag from a vault

The following `remove-tags-from-vault` example removes a tag with the key `date` from a vault named `my-vault`.

```
aws glacier remove-tags-from-vault \
    --account-id - \
    --vault-name my-vault \
    --tag-keys date
```

This command produces no output.

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

For more information, see Tagging Amazon Glacier Resources in the *Amazon Glacier Developer Guide*.

- For API details, see RemoveTagsFromVault in *AWS CLI Command Reference*.

`set-data-retrieval-policy`

The following code example shows how to use `set-data-retrieval-policy`.

AWS CLI

To set the data retrieval policy for an account

The following `set-data-retrieval-policy` example configures a data retrieval policy for the in-use account.

```
aws glacier set-data-retrieval-policy \
    --account-id - \
    --policy file://data-retrieval-policy.json
```

This command produces no output.

`data-retrieval-policy.json` is a JSON file in the current folder that specifies a data retrieval policy.

Contents of `data-retrieval-policy.json`:

```
{
    "Rules": [
        {
            "Strategy": "BytesPerHour",
            "BytesPerHour": 10737418240
        }
    ]
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

The following `set-data-retrieval-policy` example sets the data retrieval policy to `FreeTier` using inline JSON.

```
aws glacier set-data-retrieval-policy \
    --account-id - \
    --policy '{"Rules":[{"Strategy":"FreeTier"}]}'
```

For more information, see Amazon Glacier Data Retrieval Policies in the *Amazon Glacier Developer Guide*.

- For API details, see SetDataRetrievalPolicy in *AWS CLI Command Reference*.

`set-vault-access-policy`

The following code example shows how to use `set-vault-access-policy`.

AWS CLI

To set the access policy of a vault

The following `set-vault-access-policy` example attaches a permission policy to the specified vault.

```
aws glacier set-vault-access-policy \
    --account-id 123456789111 \
    --vault-name example_vault \
    --policy '{"Policy": "{\"Version\":\"2012-10-17\",\"Statement\":
[{\"Effect\":\"Allow\",\"Principal\":{\"AWS\":\"arn:aws:iam::123456789222:root
\"},\"Action\":\"glacier:ListJobs\",\"Resource\":\"arn:aws:glacier:us-
west-2:123456789111:vaults/example_vault\"},{\"Effect\":\"Allow\",\"Principal\":
{\"AWS\":\"arn:aws:iam::123456789222:root\"},\"Action\":\"glacier:UploadArchive\",
\"Resource\":\"arn:aws:glacier:us-west-2:123456789111:vaults/example_vault\"}]}"}'
```

This command produces no output.

For more information, see Vault Access Policies in the *Amazon Glacier Developer Guide*.

- For API details, see SetVaultAccessPolicy in *AWS CLI Command Reference*.

`set-vault-notifications`

The following code example shows how to use `set-vault-notifications`.

AWS CLI

To configure SNS notifications for a vault

The following `set-vault-notifications` example configures SNS notifications for a vault named `my-vault`.

```
aws glacier set-vault-notifications \
    --account-id - \
    --vault-name my-vault \
    --vault-notification-config file://notificationconfig.json
```

This command produces no output.

`notificationconfig.json` is a JSON file in the current folder that specifies an SNS topic and the events to publish.

Contents of `notificationconfig.json`:

```
{
    "SNSTopic": "arn:aws:sns:us-west-2:0123456789012:my-vault",
    "Events": ["ArchiveRetrievalCompleted", "InventoryRetrievalCompleted"]
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

For more information, see Configuring Vault Notifications Using the AWS Command Line Interface in the *Amazon Glacier Developer Guide*.

- For API details, see SetVaultNotifications in *AWS CLI Command Reference*.

`upload-archive`

The following code example shows how to use `upload-archive`.

AWS CLI

To upload an archive to a vault

The following `upload-archive` example uploads an archive in the current folder named `archive.zip` to a vault named `my-vault`.

```
aws glacier upload-archive \
    --account-id - \
    --vault-name my-vault \
    --body archive.zip
```

Output:

```
{
    "archiveId": "kKB7ymWJVpPSwhGP6ycSOAekp9ZYe_--zM_mw6k76ZFGEIWQX-
ybtRDvc2VkPSDtfKmQrj0IRQLSGsNuDp-
AJVlu2ccmDSyDUmZwKbwbpAdGATGDiB3hHO0bjbGehXTcApVud_wyDw",
    "checksum": "969fb39823836d81f0cc028195fcdbcbbe76cdde932d4646fa7de5f21e18aa67",
    "location": "/0123456789012/vaults/my-vault/archives/
kKB7ymWJVpPSwhGP6ycSOAekp9ZYe_--zM_mw6k76ZFGEIWQX-ybtRDvc2VkPSDtfKmQrj0IRQLSGsNuDp-
AJVlu2ccmDSyDUmZwKbwbpAdGATGDiB3hHO0bjbGehXTcApVud_wyDw"
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

To retrieve an uploaded archive, initiate a retrieval job with the aws glacier initiate-job command.

For more information, see Uploading an Archive in Amazon Glacier in the *Amazon Glacier Developer Guide*.

- For API details, see UploadArchive in *AWS CLI Command Reference*.

`upload-multipart-part`

The following code example shows how to use `upload-multipart-part`.

AWS CLI

To upload a part of an archive

The following `upload-multipart-part` example uploads the first 1 MiB (1024 x 1024 bytes) part of an archive.

```
aws glacier upload-multipart-part \
    --body part1 \
    --range 'bytes 0-1048575/*' \
    --account-id - \
    --vault-name my-vault \
    --upload-id 19gaRezEXAMPLES6Ry5YYdqthHOC_kGRCT03L9yetr220UmPtBYKk-OssZtLqyFu7sY1_lR7vgFuJV6NtcV5zpsJ
```

Output:

```
{
    "checksum": "e1f2a7cd6e047fa606fe2f0280350f69b9f8cfa602097a9a026360a7edc1f553"
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

The body parameter takes a path to a part file on the local filesystem. The range parameter takes an HTTP content range indicating the bytes that the part occupies in the completed

archive. The upload ID is returned by the `aws glacier initiate-multipart-upload` command and can also be obtained by using `aws glacier list-multipart-uploads`.

For more information on multipart uploads to Amazon Glacier using the AWS CLI, see Using Amazon Glacier in the AWS CLI in the *AWS CLI User Guide*.

- For API details, see UploadMultipartPart in *AWS CLI Command Reference*.

Global Accelerator examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Global Accelerator.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-custom-routing-endpoints`

The following code example shows how to use `add-custom-routing-endpoints`.

AWS CLI

To add a VPC subnet endpoint to an endpoint group for a custom routing accelerator

The following `add-custom-routing-endpoints` example adds a VPC subnet endpoint to an endpoint group for a custom routing accelerator.

```
aws globalaccelerator add-custom-routing-endpoints \
    --endpoint-group-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/0123vxyz/endpoint-group/4321abcd \
    --endpoint-configurations "EndpointId=subnet-1234567890abcdef0"
```

Output:

```
{
    "EndpointDescriptions": [
        {
            "EndpointId": "subnet-1234567890abcdef0"
        }
    ],
    "EndpointGroupArn":"arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/0123vxyz/endpoint-group/4321abcd"
}
```

For more information, see VPC subnet endpoints for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see AddCustomRoutingEndpoints in *AWS CLI Command Reference*.

`advertise-byoip-cidr`

The following code example shows how to use `advertise-byoip-cidr`.

AWS CLI

To advertise an address range

The following `advertise-byoip-cidr` example requests AWS to advertise an address range that you've provisioned for use with your AWS resources.

```
aws globalaccelerator advertise-byoip-cidr \
    --cidr 198.51.100.0/24
```

Output:

```
{
    "ByoipCidr": {
        "Cidr": "198.51.100.0/24",
        "State": "PENDING_ADVERTISING"
    }
}
```

For more information, see Bring Your Own IP Address in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see AdvertiseByoipCidr in *AWS CLI Command Reference*.

`allow-custom-routing-traffic`

The following code example shows how to use `allow-custom-routing-traffic`.

AWS CLI

To allow traffic to specific Amazon EC2 instance destinations in a VPC subnet for a custom routing accelerator

The following `allow-custom-routing-traffic` example specifies that traffic is allowed to certain Amazon EC2 instance (destination) IP addresses and ports for a VPC subnet endpoint in a custom routing accelerator can receive traffic.

```
aws globalaccelerator allow-custom-routing-traffic \
    --endpoint-group-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/0123vxyz/endpoint-group/ab88888example
 \
    --endpoint-id subnet-abcd123example \
    --destination-addresses "172.31.200.6" "172.31.200.7" \
    --destination-ports 80 81
```

This command produces no output.

For more information, see VPC subnet endpoints for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see AllowCustomRoutingTraffic in *AWS CLI Command Reference*.

`create-accelerator`

The following code example shows how to use `create-accelerator`.

AWS CLI

To create an accelerator

The following `create-accelerator` example creates an accelerator with two tags with two BYOIP static IP addresses. You must specify the US-West-2 (Oregon) Region to create or update an accelerator.

```
aws globalaccelerator create-accelerator \
    --name ExampleAccelerator \
```

```
    --tags Key="Name",Value="Example Name" Key="Project",Value="Example Project" \
    --ip-addresses 192.0.2.250 198.51.100.52
```

Output:

```
{
    "Accelerator": {
        "AcceleratorArn": "arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "IpAddressType": "IPV4",
        "Name": "ExampleAccelerator",
        "Enabled": true,
        "Status": "IN_PROGRESS",
        "IpSets": [
            {
                "IpAddresses": [
                    "192.0.2.250",
                    "198.51.100.52"
                ],
                "IpFamily": "IPv4"
            }
        ],
        "DnsName":"a1234567890abcdef.awsglobalaccelerator.com",
        "CreatedTime": 1542394847.0,
        "LastModifiedTime": 1542394847.0
    }
}
```

For more information, see Accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see CreateAccelerator in *AWS CLI Command Reference*.

`create-custom-routing-accelerator`

The following code example shows how to use `create-custom-routing-accelerator`.

AWS CLI

To create a custom routing accelerator

The following `create-custom-routing-accelerator` example creates a custom routing accelerator with the tags `Name` and `Project`.

```
aws globalaccelerator create-custom-routing-accelerator \
    --name ExampleCustomRoutingAccelerator \
    --tags Key="Name",Value="Example Name" Key="Project",Value="Example Project" \
    --ip-addresses 192.0.2.250 198.51.100.52
```

Output:

```
{
    "Accelerator": {
        "AcceleratorArn": "arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "IpAddressType": "IPV4",
        "Name": "ExampleCustomRoutingAccelerator",
        "Enabled": true,
        "Status": "IN_PROGRESS",
        "IpSets": [
            {
                "IpAddresses": [
                    "192.0.2.250",
                    "198.51.100.52"
                ],
                "IpFamily": "IPv4"
            }
        ],
        "DnsName":"a1234567890abcdef.awsglobalaccelerator.com",
        "CreatedTime": 1542394847.0,
        "LastModifiedTime": 1542394847.0
    }
}
```

For more information, see Custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see CreateCustomRoutingAccelerator in *AWS CLI Command Reference*.

`create-custom-routing-endpoint-group`

The following code example shows how to use `create-custom-routing-endpoint-group`.

AWS CLI

To create an endpoint group for a custom routing accelerator

The following `create-custom-routing-endpoint-group` example creates an endpoint group for a custom routing accelerator.

```
aws globalaccelerator create-custom-routing-endpoint-group \
    --listener-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/0123vxyz \
    --endpoint-group-region us-west-2 \
    --destination-configurations "FromPort=80,ToPort=81,Protocols=TCP,UDP"
```

Output:

```
{
    "EndpointGroup": {
        "EndpointGroupArn": "arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/0123vxyz/endpoint-group/4321abcd",
        "EndpointGroupRegion": "us-west-2",
        "DestinationDescriptions": [
            {
                "FromPort": 80,
                "ToPort": 81,
                "Protocols": [
                    "TCP",
                    "UDP"
                ]
            }
        ],
        "EndpointDescriptions": []
    }
}
```

For more information, see Endpoint groups for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see CreateCustomRoutingEndpointGroup in *AWS CLI Command Reference*.

`create-custom-routing-listener`

The following code example shows how to use `create-custom-routing-listener`.

AWS CLI

To create a listener for a custom routing accelerator

The following `create-custom-routing-listener` example creates a listener with a port range from 5000 to 10000 for a custom routing accelerator.

```
aws globalaccelerator create-custom-routing-listener \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --port-ranges FromPort=5000,ToPort=10000
```

Output:

```
{
    "Listener": {
        "PortRanges": [
            {
                "FromPort": 5000,
                "ToPort": 10000
            }
        ],
        "ListenerArn": "arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/0123vxyz"
    }
}
```

For more information, see Listeners for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see CreateCustomRoutingListener in *AWS CLI Command Reference*.

`create-endpoint-group`

The following code example shows how to use `create-endpoint-group`.

AWS CLI

To create an endpoint group

The following `create-endpoint-group` example creates an endpoint group with one endpoint.

```
aws globalaccelerator create-endpoint-group \
    --listener-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/0123vxyz \
```

```
    --endpoint-group-region us-west-2 \
    --endpoint-configurations EndpointId=i-1234567890abcdef0,Weight=128
```

Output:

```
{
    "EndpointGroup": {
        "TrafficDialPercentage": 100.0,
        "EndpointDescriptions": [
            {
                "Weight": 128,
                "EndpointId": "i-1234567890abcdef0"
            }
        ],
        "EndpointGroupArn": "arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/0123vxyz/endpoint-group/098765zyxwvu",
        "EndpointGroupRegion": "us-west-2"
    }
}
```

For more information, see Endpoint groups in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see CreateEndpointGroup in *AWS CLI Command Reference*.

`create-listener`

The following code example shows how to use `create-listener`.

AWS CLI

To create a listener

The following `create-listener` example creates a listener with two ports.

```
aws globalaccelerator create-listener \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --port-ranges FromPort=80,ToPort=80 FromPort=81,ToPort=81 \
    --protocol TCP
```

Output:

```
{
    "Listener": {
        "PortRanges": [
            {
                "ToPort": 80,
                "FromPort": 80
            },
            {
                "ToPort": 81,
                "FromPort": 81
            }
        ],
        "ClientAffinity": "NONE",
        "Protocol": "TCP",
        "ListenerArn": "arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/0123vxyz"
    }
}
```

For more information, see Listeners in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see CreateListener in *AWS CLI Command Reference*.

`deny-custom-routing-traffic`

The following code example shows how to use `deny-custom-routing-traffic`.

AWS CLI

To specify a destination address that cannot receive traffic in a custom routing accelerator

The following `deny-custom-routing-traffic` example specifies destination address or addresses in a subnet endpoint that cannot receive traffic for a custom routing accelerator. To specify more than one destination address, separate the addresses with a space. There's no response for a successful deny-custom-routing-traffic call.

```
aws globalaccelerator deny-custom-routing-traffic \
    --endpoint-group-arn "arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/0123vxyz/endpoint-group/
ab88888example" \
    --endpoint-id "subnet-abcd123example" \
```

```
    --destination-addresses "198.51.100.52"
```

This command produces no output.

For more information, see VPC subnet endpoints for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DenyCustomRoutingTraffic in *AWS CLI Command Reference*.

`deprovision-byoip-cidr`

The following code example shows how to use `deprovision-byoip-cidr`.

AWS CLI

To deprovision an address range

The following `deprovision-byoip-cidr` example releases the specified address range that you provisioned to use with your AWS resources.

```
aws globalaccelerator deprovision-byoip-cidr \
    --cidr "198.51.100.0/24"
```

Output:

```
{
    "ByoipCidr": {
        "Cidr": "198.51.100.0/24",
        "State": "PENDING_DEPROVISIONING"
    }
}
```

For more information, see Bring your own IP address in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DeprovisionByoipCidr in *AWS CLI Command Reference*.

`describe-accelerator-attributes`

The following code example shows how to use `describe-accelerator-attributes`.

AWS CLI

To describe an accelerator's attributes

The following `describe-accelerator-attributes` example retrieves the attribute details for an accelerator.

```
aws globalaccelerator describe-accelerator-attributes \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "AcceleratorAttributes": {
        "FlowLogsEnabled": true,
        "FlowLogsS3Bucket": "flowlogs-abc",
        "FlowLogsS3Prefix": "bucketprefix-abc"
    }
}
```

For more information, see Accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DescribeAcceleratorAttributes in *AWS CLI Command Reference*.

`describe-accelerator`

The following code example shows how to use `describe-accelerator`.

AWS CLI

To describe an accelerator

The following `describe-accelerator` example retrieves the details about the specified accelerator.

```
aws globalaccelerator describe-accelerator \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Accelerator": {
        "AcceleratorArn": "arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "IpAddressType": "IPV4",
        "Name": "ExampleAccelerator",
        "Enabled": true,
        "Status": "IN_PROGRESS",
        "IpSets": [
            {
                "IpAddresses": [
                    "192.0.2.250",
                    "198.51.100.52"
                ],
                "IpFamily": "IPv4"
            }
        ],
        "DnsName":"a1234567890abcdef.awsglobalaccelerator.com",
        "CreatedTime": 1542394847,
        "LastModifiedTime": 1542395013
    }
}
```

For more information, see Accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DescribeAccelerator in *AWS CLI Command Reference*.

`describe-custom-routing-accelerator-attributes`

The following code example shows how to use `describe-custom-routing-accelerator-attributes`.

AWS CLI

To describe a custom routing accelerator's attributes

The following `describe-custom-routing-accelerator-attributes` example describes the attributes for a custom routing accelerator.

```
aws globalaccelerator describe-custom-routing-accelerator-attributes \
```

```
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "AcceleratorAttributes": {
    "FlowLogsEnabled": false
    }
}
```

For more information, see Custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DescribeCustomRoutingAcceleratorAttributes in *AWS CLI Command Reference*.

`describe-custom-routing-accelerator`

The following code example shows how to use `describe-custom-routing-accelerator`.

AWS CLI

To describe a custom routing accelerator

The following `describe-custom-routing-accelerator` example retrieves the details about the specified custom routing accelerator.

```
aws globalaccelerator describe-custom-routing-accelerator \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Accelerator": {
        "AcceleratorArn": "arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "IpAddressType": "IPV4",
        "Name": "ExampleCustomRoutingAccelerator",
        "Enabled": true,
        "Status": "IN_PROGRESS",
```

```
        "IpSets": [
            {
                "IpAddresses": [
                    "192.0.2.250",
                    "198.51.100.52"
                ],
                "IpFamily": "IPv4"
            }
        ],
        "DnsName":"a1234567890abcdef.awsglobalaccelerator.com",
        "CreatedTime": 1542394847,
        "LastModifiedTime": 1542395013
    }
}
```

For more information, see Custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DescribeCustomRoutingAccelerator in *AWS CLI Command Reference*.

`describe-custom-routing-endpoint-group`

The following code example shows how to use `describe-custom-routing-endpoint-group`.

AWS CLI

To describe an endpoint group for a custom routing accelerator

The following `describe-custom-routing-endpoint-group` example describes an endpoint group for a custom routing accelerator.

```
aws globalaccelerator describe-custom-routing-endpoint-group \
    --endpoint-group-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/6789vxyz/endpoint-group/ab88888example
```

Output:

```
{
    "EndpointGroup": {
        "EndpointGroupArn": "arn:aws:globalaccelerator::123456789012:accelerator/

            }
        ]
    }
}
```

For more information, see Endpoint groups for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DescribeCustomRoutingEndpointGroup in *AWS CLI Command Reference*.

`describe-custom-routing-listener`

The following code example shows how to use `describe-custom-routing-listener`.

AWS CLI

To describe a listener for a custom routing accelerator

The following `describe-custom-routing-listener` example describes a listener for a custom routing accelerator.

```
aws globalaccelerator describe-custom-routing-listener \
    --listener-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/abcdef1234
```

Output:

```
{
    "Listener": {
```

```
        "PortRanges": [
            {
                "FromPort": 5000,
                "ToPort": 10000
            }
        ],
        "ListenerArn": "arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/abcdef1234"
    }
}
```

For more information, see Listeners for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DescribeCustomRoutingListener in *AWS CLI Command Reference*.

`describe-endpoint-group`

The following code example shows how to use `describe-endpoint-group`.

AWS CLI

To describe an endpoint group

The following `describe-endpoint-group` example retrieves details about an endpoint group with the following endpoints: an Amazon EC2 instance, an ALB, and an NLB.

```
aws globalaccelerator describe-endpoint-group \
    --endpoint-group-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222/
endpoint-group/ab88888example
```

Output:

```
{
    "EndpointGroup": {
        "TrafficDialPercentage": 100.0,
        "EndpointDescriptions": [
        {
            "Weight": 128,
            "EndpointId": "i-1234567890abcdef0"
        },
```

```
        {
            "Weight": 128,
            "EndpointId": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/ALBTesting/alb01234567890xyz"
        },
        {
            "Weight": 128,
            "EndpointId": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/net/NLBTesting/alb01234567890qrs"
        }
        ],
        "EndpointGroupArn": "arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222/
endpoint-group/4321abcd-abcd-4321-abcd-4321abcdefg",
        "EndpointGroupRegion": "us-west-2"
    }
}
```

For more information, see Endpoint groups in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DescribeEndpointGroup in *AWS CLI Command Reference*.

`describe-listener`

The following code example shows how to use `describe-listener`.

AWS CLI

To describe a listener

The following `describe-listener` example describes a listener.

```
aws globalaccelerator describe-listener \
    --listener-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/abcdef1234
```

Output:

```
{
    "Listener": {
        "ListenerArn": "arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/abcdef1234",
```

```
        "PortRanges": [
            {
                "FromPort": 80,
                "ToPort": 80
            }
        ],
        "Protocol": "TCP",
        "ClientAffinity": "NONE"
    }
}
```

For more information, see Listeners in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DescribeListener in *AWS CLI Command Reference*.

`list-accelerators`

The following code example shows how to use `list-accelerators`.

AWS CLI

To list your accelerators

The following `list-accelerators` example lists the accelerators in your AWS account. This account has two accelerators.

```
aws globalaccelerator list-accelerators
```

Output:

```
{
    "Accelerators": [
        {
            "AcceleratorArn": "arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Name": "TestAccelerator",
            "IpAddressType": "IPV4",
            "Enabled": true,
            "IpSets": [
                {
```

```
                    "IpFamily": "IPv4",
                    "IpAddresses": [
                        "192.0.2.250",
                        "198.51.100.52"
                    ]
                }
            ],
            "DnsName": "5a5a5a5a5a5a5a5a.awsglobalaccelerator.com",
            "Status": "DEPLOYED",
            "CreatedTime": 1552424416.0,
            "LastModifiedTime": 1569375641.0
        },
        {
            "AcceleratorArn": "arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Name": "ExampleAccelerator",
            "IpAddressType": "IPV4",
            "Enabled": true,
            "IpSets": [
                {
                    "IpFamily": "IPv4",
                    "IpAddresses": [
                        "192.0.2.100",
                        "198.51.100.10"
                    ]
                }
            ],
            "DnsName": "6a6a6a6a6a6a6a6a.awsglobalaccelerator.com",
            "Status": "DEPLOYED",
            "CreatedTime": 1575585564.0,
            "LastModifiedTime": 1579809243.0
        }
    ]
}
```

For more information, see Accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListAccelerators in *AWS CLI Command Reference*.

`list-byoip-cidrs`

The following code example shows how to use `list-byoip-cidrs`.

AWS CLI

To list your address ranges

The following `list-byoip-cidrs` example list the bring your own IP address (BYOIP) address ranges that you've provisioned for use with Global Accelerator.

```
aws globalaccelerator list-byoip-cidrs
```

Output:

```
{
    "ByoipCidrs": [
        {
            "Cidr": "198.51.100.0/24",
            "State": "READY"
        },
        {
            "Cidr": "203.0.113.25/24",
            "State": "READY"
        }
    ]
}
```

For more information, see Bring your own IP address in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListByoipCidrs in *AWS CLI Command Reference*.

`list-custom-routing-accelerators`

The following code example shows how to use `list-custom-routing-accelerators`.

AWS CLI

To list your custom routing accelerators

The following `list-custom-routing-accelerators` example lists the custom routing accelerators in an AWS account.

```
aws globalaccelerator list-custom-routing-accelerators
```

Output:

```
{
    "Accelerators": [
        {
            "AcceleratorArn": "arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Name": "TestCustomRoutingAccelerator",
            "IpAddressType": "IPV4",
            "Enabled": true,
            "IpSets": [
                {
                    "IpFamily": "IPv4",
                    "IpAddresses": [
                        "192.0.2.250",
                        "198.51.100.52"
                    ]
                }
            ],
            "DnsName": "5a5a5a5a5a5a5a5a.awsglobalaccelerator.com",
            "Status": "DEPLOYED",
            "CreatedTime": 1552424416.0,
            "LastModifiedTime": 1569375641.0
        },
        {
            "AcceleratorArn": "arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Name": "ExampleCustomRoutingAccelerator",
            "IpAddressType": "IPV4",
            "Enabled": true,
            "IpSets": [
                {
                    "IpFamily": "IPv4",
                    "IpAddresses": [
                        "192.0.2.100",
                        "198.51.100.10"
                    ]
                }
            ],
            "DnsName": "6a6a6a6a6a6a6a6a.awsglobalaccelerator.com",
            "Status": "DEPLOYED",
            "CreatedTime": 1575585564.0,
            "LastModifiedTime": 1579809243.0
        }
```

```
    ]
}
```

For more information, see Custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListCustomRoutingAccelerators in *AWS CLI Command Reference*.

`list-custom-routing-endpoint-groups`

The following code example shows how to use `list-custom-routing-endpoint-groups`.

AWS CLI

To list endpoint groups for a listener in a custom routing accelerator

The following `list-custom-routing-endpoint-groups` example lists the endpoint groups for a listener in a custom routing accelerator.

```
aws globalaccelerator list-custom-routing-endpoint-groups \
    --listener-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/abcdef1234
```

Output:

```
{
    "EndpointGroups": [
        {
            "EndpointGroupArn":
 "arn:aws:globalaccelerator::123456789012:accelerator/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111/listener/abcdef1234/endpoint-group/ab88888example",
            "EndpointGroupRegion": "us-west-2",
            "DestinationDescriptions": [
                {
                    "FromPort": 80,
                    "ToPort": 80,
                    "Protocols": [
                        "TCP",
                        "UDP"
                    ]
                }
            ],
```

```
            "EndpointDescriptions": [
                {
                    "EndpointId": "subnet-abcd123example"
                }
            ]
        }
    ]
}
```

For more information, see Endpoint groups for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListCustomRoutingEndpointGroups in *AWS CLI Command Reference*.

`list-custom-routing-listeners`

The following code example shows how to use `list-custom-routing-listeners`.

AWS CLI

To list listeners for custom routing accelerators

The following `list-custom-routing-listeners` example lists the listeners for a custom routing accelerator.

```
aws globalaccelerator list-custom-routing-listeners \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Listeners": [
        {
            "ListenerArn": "arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/abcdef1234",
            "PortRanges": [
                {
                    "FromPort": 5000,
                    "ToPort": 10000
                }
            ]
```

```
        }
    ]
}
```

For more information, see Listeners for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListCustomRoutingListeners in *AWS CLI Command Reference*.

`list-custom-routing-port-mappings-by-destination`

The following code example shows how to use `list-custom-routing-port-mappings-by-destination`.

AWS CLI

To list the port mappings for a specific custom routing accelerator destination

The following `list-custom-routing-port-mappings-by-destination` example provides the port mappings for a specific destination EC2 server (at the destination address) for a custom routing accelerator.

```
aws globalaccelerator list-custom-routing-port-mappings-by-destination \
    --endpoint-id subnet-abcd123example \
    --destination-address 198.51.100.52
```

Output:

```
{
    "DestinationPortMappings": [
        {
            "AcceleratorArn": "arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
                "AcceleratorSocketAddresses": [
                    {
                        "IpAddress": "192.0.2.250",
                        "Port": 65514
                    },
                    {
                        "IpAddress": "192.10.100.99",
                        "Port": 65514
```

```
                    }
                ],
                "EndpointGroupArn":
 "arn:aws:globalaccelerator::123456789012:accelerator/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111/listener/0123vxyz/endpoint-group/ab88888example",
                "EndpointId": "subnet-abcd123example",
                "EndpointGroupRegion": "us-west-2",
                "DestinationSocketAddress": {
                    "IpAddress": "198.51.100.52",
                    "Port": 80
                },
                "IpAddressType": "IPv4",
                "DestinationTrafficState": "ALLOW"
        }
    ]
}
```

For more information, see How custom routing accelerators work in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListCustomRoutingPortMappingsByDestination in *AWS CLI Command Reference*.

`list-custom-routing-port-mappings`

The following code example shows how to use `list-custom-routing-port-mappings`.

AWS CLI

To list the port mappings in a custom routing accelerator

The following `list-custom-routing-port-mappings` example provides a partial list of the port mappings in a custom routing accelerator.

```
aws globalaccelerator list-custom-routing-port-mappings \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "PortMappings": [
```

```
        {
            "AcceleratorPort": 40480,
            "EndpointGroupArn":
 "arn:aws:globalaccelerator::123456789012:accelerator/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111/listener/0123vxyz/endpoint-group/098765zyxwvu",
            "EndpointId": "subnet-1234567890abcdef0",
            "DestinationSocketAddress": {
                "IpAddress": "192.0.2.250",
                "Port": 80
            },
            "Protocols": [
                "TCP",
                "UDP"
            ],
            "DestinationTrafficState": "ALLOW"
        },
        {
            "AcceleratorPort": 40481,
            "EndpointGroupArn":
 "arn:aws:globalaccelerator::123456789012:accelerator/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111/listener/0123vxyz/endpoint-group/098765zyxwvu",
            "EndpointId": "subnet-1234567890abcdef0",
            "DestinationSocketAddress": {
                "IpAddress": "192.0.2.251",
                "Port": 80
            },
            "Protocols": [
                "TCP",
                "UDP"
            ],
            "DestinationTrafficState": "ALLOW"
        }
    ]
}
```

For more information, see How custom routing accelerators work in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListCustomRoutingPortMappings in *AWS CLI Command Reference*.

`list-endpoint-groups`

The following code example shows how to use `list-endpoint-groups`.

AWS CLI

To list endpoint groups

The following `list-endpoint-groups` example lists the endpoint groups for a listener. This listener has two endpoint groups.

```
aws globalaccelerator list-endpoint-groups \
    --listener-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/abcdef1234
```

Output:

```
{
    "EndpointGroups": [
        {
            "EndpointGroupArn":
 "arn:aws:globalaccelerator::123456789012:accelerator/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111/listener/abcdef1234/endpoint-group/ab88888example",
            "EndpointGroupRegion": "eu-central-1",
            "EndpointDescriptions": [],
            "TrafficDialPercentage": 100.0,
            "HealthCheckPort": 80,
            "HealthCheckProtocol": "TCP",
            "HealthCheckIntervalSeconds": 30,
            "ThresholdCount": 3
        },
        {
            "EndpointGroupArn":
 "arn:aws:globalaccelerator::123456789012:accelerator/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111/listener/abcdef1234/endpoint-group/ab99999example",

            "ThresholdCount": 3
        }
    ]
}
```

For more information, see Endpoint Groups in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListEndpointGroups in *AWS CLI Command Reference*.

`list-listeners`

The following code example shows how to use `list-listeners`.

AWS CLI

To list listeners

The following `list-listeners` example lists the listeners for an accelerator.

```
aws globalaccelerator list-listeners \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Listeners": [
        {
            "ListenerArn": "arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/abcdef1234",
            "PortRanges": [
                {
                    "FromPort": 80,
                    "ToPort": 80
                }
            ],
            "Protocol": "TCP",
            "ClientAffinity": "NONE"
        }
    ]
}
```

For more information, see Listeners in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListListeners in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for an accelerator

The following `list-tags-for-resource` example lists the tags for a specific accelerator.

```
aws globalaccelerator list-tags-for-resource \
    --resource-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Tags": [
        {
            "Key": "Project",
            "Value": "A123456"
        }
    ]
}
```

For more information, see Tagging in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`provision-byoip-cidr`

The following code example shows how to use `provision-byoip-cidr`.

AWS CLI

To provision an address range

The following `provision-byoip-cidr` example provisions the specified address range to use with your AWS resources.

```
aws globalaccelerator provision-byoip-cidr \
    --cidr 192.0.2.250/24 \
```

```
    --cidr-authorization-context Message="$text_message",Signature="$signed_message"
```

Output:

```
{
    "ByoipCidr": {
        "Cidr": "192.0.2.250/24",
        "State": "PENDING_PROVISIONING"
    }
}
```

For more information, see Bring your own IP address in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ProvisionByoipCidr in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag an accelerator

The following `tag-resource` example adds tags Name and Project to an accelerator, along with corresponding values for each.

```
aws globalaccelerator tag-resource \
    --resource-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --tags Key="Name",Value="Example Name" Key="Project",Value="Example Project"
```

This command produces no output.

For more information, see Tagging in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from an accelerator

The following `untag-resource` example removes the tags Name and Project from an accelerator.

```
aws globalaccelerator untag-resource \
    --resource-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --tag-keys Key="Name" Key="Project"
```

This command produces no output.

For more information, see Tagging in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-accelerator-attributes`

The following code example shows how to use `update-accelerator-attributes`.

AWS CLI

To update an accelerator's attributes

The following `update-accelerator-attributes` example updates an accelerator to enable flow logs. You must specify the `US-West-2 (Oregon)` Region to create or update accelerator attributes.

```
aws globalaccelerator update-accelerator-attributes \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --flow-logs-enabled \
    --flow-logs-s3-bucket flowlogs-abc \
    --flow-logs-s3-prefix bucketprefix-abc
```

Output:

```
{
    "AcceleratorAttributes": {
```

```
        "FlowLogsEnabled": true,
        "FlowLogsS3Bucket": "flowlogs-abc",
        "FlowLogsS3Prefix": "bucketprefix-abc"
    }
}
```

For more information, see Accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see UpdateAcceleratorAttributes in *AWS CLI Command Reference*.

`update-accelerator`

The following code example shows how to use `update-accelerator`.

AWS CLI

To update an accelerator

The following `update-accelerator` example modifies an accelerator to change the accelerator name to `ExampleAcceleratorNew`. You must specify the `US-West-2 (Oregon)` Region to create or update accelerators.

```
aws globalaccelerator update-accelerator \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --name ExampleAcceleratorNew
```

Output:

```
{
    "Accelerator": {
        "AcceleratorArn": "arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "IpAddressType": "IPV4",
        "Name": "ExampleAcceleratorNew",
        "Enabled": true,
        "Status": "IN_PROGRESS",
        "IpSets": [
            {
                "IpAddresses": [
                    "192.0.2.250",
```

```
                    "198.51.100.52"
                ],
                "IpFamily": "IPv4"
            }
        ],
        "DnsName":"a1234567890abcdef.awsglobalaccelerator.com",
        "CreatedTime": 1232394847,
        "LastModifiedTime": 1232395654
    }
}
```

For more information, see Accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see UpdateAccelerator in *AWS CLI Command Reference*.

`update-custom-routing-accelerator-attributes`

The following code example shows how to use `update-custom-routing-accelerator-attributes`.

AWS CLI

To update a custom routing accelerator's attributes

The following `update-custom-routing-accelerator-attributes` example updates a custom routing accelerator to enable flow logs.

```
aws globalaccelerator update-custom-routing-accelerator-attributes \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --flow-logs-enabled \
    --flow-logs-s3-bucket flowlogs-abc \
    --flow-logs-s3-prefix bucketprefix-abc
```

Output:

```
{
    "AcceleratorAttributes": {
        "FlowLogsEnabled": true,
        "FlowLogsS3Bucket": "flowlogs-abc",
        "FlowLogsS3Prefix": "bucketprefix-abc"
```

```
    }
}
```

For more information, see Custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see UpdateCustomRoutingAcceleratorAttributes in *AWS CLI Command Reference*.

`update-custom-routing-accelerator`

The following code example shows how to use `update-custom-routing-accelerator`.

AWS CLI

To update a custom routing accelerator

The following `update-custom-routing-accelerator` example modifies a custom routing accelerator to change the accelerator name.

```
aws globalaccelerator update-custom-routing-accelerator \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --name ExampleCustomRoutingAcceleratorNew
```

Output:

```
{
    "Accelerator": {
        "AcceleratorArn": "arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "IpAddressType": "IPV4",
        "Name": "ExampleCustomRoutingAcceleratorNew",
        "Enabled": true,
        "Status": "IN_PROGRESS",
        "IpSets": [
            {
                "IpAddresses": [
                    "192.0.2.250",
                    "198.51.100.52"
                ],
                "IpFamily": "IPv4"
```

```
            }
        ],
        "DnsName":"a1234567890abcdef.awsglobalaccelerator.com",
        "CreatedTime": 1232394847,
        "LastModifiedTime": 1232395654
    }
}
```

For more information, see Custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see UpdateCustomRoutingAccelerator in *AWS CLI Command Reference*.

`update-custom-routing-listener`

The following code example shows how to use `update-custom-routing-listener`.

AWS CLI

To update a listener for a custom routing accelerator

The following `update-custom-routing-listener` example updates a listener to change the port range.

```
aws globalaccelerator update-custom-routing-listener \
    --listener-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/0123vxyz \
    --port-ranges FromPort=10000,ToPort=20000
```

Output:

```
{
    "Listener": {
        "ListenerArn": "arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/0123vxyz",
        "PortRanges": [
            {
                "FromPort": 10000,
                "ToPort": 20000
            }
        ]
    }
```

```
}
```

For more information, see Listeners for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see UpdateCustomRoutingListener in *AWS CLI Command Reference*.

`update-endpoint-group`

The following code example shows how to use `update-endpoint-group`.

AWS CLI

To update an endpoint group

The following `update-endpoint-group` example adds three endpoints to an endpoint group: an Elastic IP address, an ALB, and an NLB.

```
aws globalaccelerator update-endpoint-group \
    --endpoint-group-arn arn:aws:globalaccelerator::123456789012:accelerator/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222/endpoint-group/ab88888example \
    --endpoint-configurations EndpointId=eipalloc-eip01234567890abc,Weight=128 EndpointId=arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/ALBTesting/alb01234567890xyz,Weight=128 EndpointId=arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/net/NLBTesting/alb01234567890qrs,Weight=128
```

Output:

```
{
    "EndpointGroup": {
        "TrafficDialPercentage": 100,
        "EndpointDescriptions": [
            {
                "Weight": 128,
                "EndpointId": "eip01234567890abc"
            },
            {
                "Weight": 128,
                "EndpointId": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/ALBTesting/alb01234567890xyz"
```

```
            },
            {
                "Weight": 128,
                "EndpointId": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/net/NLBTesting/alb01234567890qrs"
            }
        ],
        "EndpointGroupArn": "arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222/
endpoint-group/4321abcd-abcd-4321-abcd-4321abcdefg",
        "EndpointGroupRegion": "us-west-2"
    }
}
```

For more information, see Endpoint groups in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see UpdateEndpointGroup in *AWS CLI Command Reference*.

`update-listener`

The following code example shows how to use `update-listener`.

AWS CLI

To update a listener

The following `update-listener` example updates a listener to change the port to 100.

```
aws globalaccelerator update-listener \
    --listener-arn arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/0123vxyz \
    --port-ranges FromPort=100,ToPort=100
```

Output:

```
{
    "Listener": {
        "ListenerArn": "arn:aws:globalaccelerator::123456789012:accelerator/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111/listener/0123vxyz",
        "PortRanges": [
            {
```

```
                "FromPort": 100,
                "ToPort": 100
            }
        ],
        "Protocol": "TCP",
        "ClientAffinity": "NONE"
    }
}
```

For more information, see Listeners in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see UpdateListener in *AWS CLI Command Reference*.

`withdraw-byoip-cidr`

The following code example shows how to use `withdraw-byoip-cidr`.

AWS CLI

To withdraw an address range

The following `withdraw-byoip-cidr` example withdraws an address range from AWS Global Accelerator that you previously advertised for use with your AWS resources.

```
aws globalaccelerator withdraw-byoip-cidr \
    --cidr 192.0.2.250/24
```

Output:

```
{
    "ByoipCidr": {
        "Cidr": "192.0.2.250/24",
        "State": "PENDING_WITHDRAWING"
    }
}
```

For more information, see Bring your own IP address in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see WithdrawByoipCidr in *AWS CLI Command Reference*.

AWS Glue examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Glue.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`batch-stop-job-run`

The following code example shows how to use `batch-stop-job-run`.

AWS CLI

To stop job runs

The following `batch-stop-job-run` example stops a job runs.

```
aws glue batch-stop-job-run \
    --job-name "my-testing-job" \
    --job-run-
ids jr_852f1de1f29fb62e0ba4166c33970803935d87f14f96cfdee5089d5274a61d3f
```

Output:

```
{
    "SuccessfulSubmissions": [
        {
            "JobName": "my-testing-job",
            "JobRunId":
 "jr_852f1de1f29fb62e0ba4166c33970803935d87f14f96cfdee5089d5274a61d3f"
        }
    ],
    "Errors": []
```

```
}
```

For more information, see Job Runs in the *AWS Glue Developer Guide*.

- For API details, see BatchStopJobRun in *AWS CLI Command Reference*.

`create-connection`

The following code example shows how to use `create-connection`.

AWS CLI

To create a connection for AWS Glue data stores

The following `create-connection` example creates a connection in the AWS Glue Data Catalog that provides connection information for a Kafka data store.

```
aws glue create-connection \
    --connection-input '{
        "Name":"conn-kafka-custom",
        "Description":"kafka connection with ssl to custom kafka",
        "ConnectionType":"KAFKA",
        "ConnectionProperties":{
            "KAFKA_BOOTSTRAP_SERVERS":"<Kafka-broker-server-url>:<SSL-Port>",
            "KAFKA_SSL_ENABLED":"true",
            "KAFKA_CUSTOM_CERT": "s3://amzn-s3-demo-bucket/prefix/cert-file.pem"
        },
        "PhysicalConnectionRequirements":{
            "SubnetId":"subnet-1234",
            "SecurityGroupIdList":["sg-1234"],
            "AvailabilityZone":"us-west-2a"}
    }'
```

This command produces no output.

For more information, see Defining Connections in the AWS Glue Data Catalog in the *AWS Glue Developer Guide*.

- For API details, see CreateConnection in *AWS CLI Command Reference*.

`create-database`

The following code example shows how to use `create-database`.

AWS CLI

To create a database

The following `create-database` example creates a database in the AWS Glue Data Catalog.

```
aws glue create-database \
    --database-input "{\"Name\":\"tempdb\"}" \
    --profile my_profile \
    --endpoint-url https://glue.us-west-2.amazonaws.com
```

This command produces no output.

For more information, see Defining a Database in Your Data Catalog in the *AWS Glue Developer Guide*.

- For API details, see CreateDatabase in *AWS CLI Command Reference*.

`create-job`

The following code example shows how to use `create-job`.

AWS CLI

To create a job to transform data

The following `create-job` example creates a streaming job that runs a script stored in S3.

```
aws glue create-job \
    --name my-testing-job \
    --role AWSGlueServiceRoleDefault \
    --command '{
        "Name": "gluestreaming",
        "ScriptLocation": "s3://amzn-s3-demo-bucket/folder/"
    }' \
    --default-arguments '{
        "--job-language":"scala",
        "--class":"GlueApp"
    }' \
    --profile my-profile
```

Contents of `test_script.scala`:

```

 Some("my-s3-sink"), transformationContext = "resolvechoice3")
        // @type: DataSink
        // @args: [database = "tempdb", table_name = "my-s3-sink",
 transformation_ctx = "datasink4"]
        // @return: datasink4
        // @inputs: [frame = resolvechoice3]
        val datasink4 = glueContext.getCatalogSink(database = "tempdb",
 tableName = "my-s3-sink", redshiftTmpDir = "", transformationContext =
 "datasink4").writeDynamicFrame(resolvechoice3)
        Job.commit()
    }
}
```

Output:

```
{
    "Name": "my-testing-job"
}
```

For more information, see Working with jobs in AWS Glue in the *AWS Glue Developer Guide*.

- For API details, see CreateJob in *AWS CLI Command Reference*.

`create-table`

The following code example shows how to use `create-table`.

AWS CLI

Example 1: To create a table for a Kinesis data stream

The following `create-table` example creates a table in the AWS Glue Data Catalog that describes a Kinesis data stream.

```
aws glue create-table \
    --database-name tempdb \
    --table-input  '{"Name":"test-kinesis-input", "StorageDescriptor":{
            "Columns":[
                {"Name":"sensorid", "Type":"int"},
                {"Name":"currenttemperature", "Type":"int"},
                {"Name":"status", "Type":"string"}
            ],
            "Location":"my-testing-stream",
            "Parameters":{
                "typeOfData":"kinesis","streamName":"my-testing-stream",
                "kinesisUrl":"https://kinesis.us-west-2.amazonaws.com"
            },
            "SerdeInfo":{
                "SerializationLibrary":"org.openx.data.jsonserde.JsonSerDe"}
        },
        "Parameters":{
            "classification":"json"}
        }' \
    --profile my-profile \
    --endpoint-url https://glue.us-west-2.amazonaws.com
```

This command produces no output.

For more information, see Defining Tables in the AWS Glue Data Catalog in the *AWS Glue Developer Guide*.

Example 2: To create a table for a Kafka data store

The following `create-table` example creates a table in the AWS Glue Data Catalog that describes a Kafka data store.

```
aws glue create-table \
    --database-name tempdb \
    --table-input  '{"Name":"test-kafka-input", "StorageDescriptor":{
            "Columns":[
                {"Name":"sensorid", "Type":"int"},
                {"Name":"currenttemperature", "Type":"int"},
                {"Name":"status", "Type":"string"}
            ],
            "Location":"glue-topic",
            "Parameters":{
                "typeOfData":"kafka","topicName":"glue-topic",
```

```
                "connectionName":"my-kafka-connection"
            },
            "SerdeInfo":{
                "SerializationLibrary":"org.apache.hadoop.hive.serde2.OpenCSVSerde"}
        },
        "Parameters":{
            "separatorChar":","}
        }' \
    --profile my-profile \
    --endpoint-url https://glue.us-west-2.amazonaws.com
```

This command produces no output.

For more information, see Defining Tables in the AWS Glue Data Catalog in the *AWS Glue Developer Guide*.

Example 3: To create a table for a AWS S3 data store

The following `create-table` example creates a table in the AWS Glue Data Catalog that describes a AWS Simple Storage Service (AWS S3) data store.

```
aws glue create-table \
    --database-name tempdb \
    --table-input  '{"Name":"s3-output", "StorageDescriptor":{
            "Columns":[
                {"Name":"s1", "Type":"string"},
                {"Name":"s2", "Type":"int"},
                {"Name":"s3", "Type":"string"}
            ],
            "Location":"s3://amzn-s3-demo-bucket/",
            "SerdeInfo":{
                "SerializationLibrary":"org.openx.data.jsonserde.JsonSerDe"}
        },
        "Parameters":{
            "classification":"json"}
        }' \
    --profile my-profile \
    --endpoint-url https://glue.us-west-2.amazonaws.com
```

This command produces no output.

For more information, see Defining Tables in the AWS Glue Data Catalog in the *AWS Glue Developer Guide*.

- For API details, see CreateTable in *AWS CLI Command Reference*.

`delete-job`

The following code example shows how to use `delete-job`.

AWS CLI

To delete a job

The following `delete-job` example deletes a job that is no longer needed.

```
aws glue delete-job \
    --job-name my-testing-job
```

Output:

```
{
    "JobName": "my-testing-job"
}
```

For more information, see Managing ETL jobs with AWS Glue Studio in the *AWS Glue Developer Guide*.

- For API details, see DeleteJob in *AWS CLI Command Reference*.

`get-databases`

The following code example shows how to use `get-databases`.

AWS CLI

To list the definitions of some or all of the databases in the AWS Glue Data Catalog

The following `get-databases` example returns information about the databases in the Data Catalog.

```
aws glue get-databases
```

Output:

```
{
```

```
    "DatabaseList": [
        {
            "Name": "default",
            "Description": "Default Hive database",
            "LocationUri": "file:/spark-warehouse",
            "CreateTime": 1602084052.0,
            "CreateTableDefaultPermissions": [
                {
                    "Principal": {

                    "Permissions": [
                        "ALL"
                    ]
                }
            ],
            "CatalogId": "123456789012"
        }
    ]
}
```

For more information, see Defining a Database in Your Data Catalog in the *AWS Glue Developer Guide*.

- For API details, see GetDatabases in *AWS CLI Command Reference*.

`get-job-run`

The following code example shows how to use `get-job-run`.

AWS CLI

To get information about a job run

The following `get-job-run` example retrieves information about a job run.

```
aws glue get-job-run \
    --job-name "Combine legistators data" \
    --run-id jr_012e1765065050a4d94d761755e5c62538ee1aad6f17d39f527e9140cf0c9a5e
```

Output:

```
{
    "JobRun": {
        "Id": "jr_012e1765065050a4d94d761755e5c62538ee1aad6f17d39f527e9140cf0c9a5e",

    }
}
```

For more information, see Job Runs in the *AWS Glue Developer Guide*.

- For API details, see GetJobRun in *AWS CLI Command Reference*.

`get-job-runs`

The following code example shows how to use `get-job-runs`.

AWS CLI

To get information about all job runs for a job

The following `get-job-runs` example retrieves information about job runs for a job.

```
aws glue get-job-runs \
```

```
    --job-name "my-testing-job"
```

Output:

```
{
    "JobRuns": [
        {
            "Id":

- For API details, see GetJobRuns in *AWS CLI Command Reference*.

`get-job`

The following code example shows how to use `get-job`.

AWS CLI

To retrieve information about a job

The following `get-job` example retrieves information about a job.

```
aws glue get-job \
    --job-name my-testing-job
```

Output:

```
{
    "Job": {
        "Name": "my-testing-job",
        "Role": "Glue_DefaultRole",
        "CreatedOn": 1602805698.167,
        "LastModifiedOn": 1602805698.167,

            "PythonVersion": "2"
        },
        "DefaultArguments": {
            "--class": "GlueApp",
            "--job-language": "scala"
        },
        "MaxRetries": 0,
        "AllocatedCapacity": 10,
        "MaxCapacity": 10.0,
        "GlueVersion": "1.0"
    }
}
```

For more information, see Jobs in the *AWS Glue Developer Guide*.

- For API details, see GetJob in *AWS CLI Command Reference*.

`get-plan`

The following code example shows how to use `get-plan`.

AWS CLI

To get the generated code for mapping data from source tables to target tables

The following `get-plan` example retrieves the generated code for mapping columns from the data source to the data target.

```
aws glue get-plan \
    --mapping '[
        {
            "SourcePath":"sensorid",
            "SourceTable":"anything",
            "SourceType":"int",
            "TargetPath":"sensorid",
            "TargetTable":"anything",
            "TargetType":"int"
        },
        {
            "SourcePath":"currenttemperature",
            "SourceTable":"anything",
            "SourceType":"int",
            "TargetPath":"currenttemperature",
            "TargetTable":"anything",
            "TargetType":"int"
        },
        {
            "SourcePath":"status",
            "SourceTable":"anything",
            "SourceType":"string",
            "TargetPath":"status",
            "TargetTable":"anything",
            "TargetType":"string"
        }]' \
    --source '{
        "DatabaseName":"tempdb",
```

```
        "TableName":"s3-source"
    }' \
    --sinks '[
        {
            "DatabaseName":"tempdb",
            "TableName":"my-s3-sink"
        }]' \
    --language "scala" \
    --output "text"
```

Output:

```

    // @args: [choice = "MATCH_CATALOG", database = "tempdb", table_name = "my-s3-
sink", transformation_ctx = "resolvechoice3"]
    // @return: resolvechoice3
    // @inputs: [frame = selectfields2]
    val resolvechoice3 = selectfields2.resolveChoice(choiceOption =
 Some(ChoiceOption("MATCH_CATALOG")), database = Some("tempdb"), tableName =
 Some("my-s3-sink"), transformationContext = "resolvechoice3")
    // @type: DataSink
    // @args: [database = "tempdb", table_name = "my-s3-sink", transformation_ctx =
 "datasink4"]
    // @return: datasink4
    // @inputs: [frame = resolvechoice3]
    val datasink4 = glueContext.getCatalogSink(database = "tempdb",
 tableName = "my-s3-sink", redshiftTmpDir = "", transformationContext =
 "datasink4").writeDynamicFrame(resolvechoice3)
    Job.commit()
  }
}
```

For more information, see Editing Scripts in AWS Glue in the *AWS Glue Developer Guide*.

- For API details, see GetPlan in *AWS CLI Command Reference*.

`get-tables`

The following code example shows how to use `get-tables`.

AWS CLI

To list the definitions of some or all of the tables in the specified database

The following `get-tables` example returns information about the tables in the specified database.

```
aws glue get-tables \
    --database-name 'tempdb'
```

Output:

```
{
    "TableList": [
        {
            "Name": "my-s3-sink",
            "DatabaseName": "tempdb",
            "CreateTime": 1602730539.0,

            "CatalogId": "123456789012"
        }
    ]
}
```

For more information, see Defining Tables in the AWS Glue Data Catalog in the *AWS Glue Developer Guide*.

- For API details, see GetTables in *AWS CLI Command Reference*.

`start-crawler`

The following code example shows how to use `start-crawler`.

AWS CLI

To start a crawler

The following `start-crawler` example starts a crawler.

```
aws glue start-crawler \
    --name my-crawler
```

This command produces no output.

For more information, see Defining Crawlers in the *AWS Glue Developer Guide*.

- For API details, see StartCrawler in *AWS CLI Command Reference*.

`start-job-run`

The following code example shows how to use `start-job-run`.

AWS CLI

To start running a job

The following `start-job-run` example starts a job.

```
aws glue start-job-run \
    --job-name my-job
```

Output:

```
{
    "JobRunId":
 "jr_22208b1f44eb5376a60569d4b21dd20fcb8621e1a366b4e7b2494af764b82ded"
}
```

For more information, see Working with jobs in AWS Glue in the *AWS Glue Developer Guide*.

- For API details, see StartJobRun in *AWS CLI Command Reference*.

GuardDuty examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with GuardDuty.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`accept-invitation`

The following code example shows how to use `accept-invitation`.

AWS CLI

To accept an invitation to become a GuardDuty member account in the current region

The following `accept-invitation` example shows how to accept an invitation to become a GuardDuty member account in the current region.

```
aws guardduty accept-invitation \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --master-id 123456789111 \
    --invitation-id d6b94fb03a66ff665f7db8764example
```

This command produces no output.

For more information, see Managing GuardDuty accounts by invitation in the *Amazon GuardDuty User Guide*.

- For API details, see AcceptInvitation in *AWS CLI Command Reference*.

`archive-findings`

The following code example shows how to use `archive-findings`.

AWS CLI

To archive findings in the current region

The following `archive-findings` example archives findings in the current region.

```
aws guardduty archive-findings \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --finding-ids d6b94fb03a66ff665f7db8764example 3eb970e0de00c16ec14e6910fexample
```

This command produces no output.

For more information, see Creating suppression rules in GuardDuty in the *GuardDuty User Guide*.

- For API details, see ArchiveFindings in *AWS CLI Command Reference*.

`create-detector`

The following code example shows how to use `create-detector`.

AWS CLI

To enable GuardDuty in the current region

The following `create-detector` example creates a new detector, which enables GuardDuty, in the current region.

```
aws guardduty create-detector \
    --enable
```

Output:

```
{
    "DetectorId": "b6b992d6d2f48e64bc59180bfexample"
}
```

For more information, see Enable Amazon GuardDuty in the *GuardDuty User Guide*.

- For API details, see CreateDetector in *AWS CLI Command Reference*.

`create-filter`

The following code example shows how to use `create-filter`.

AWS CLI

Example 1: To create a new filter in the current region

The following `create-filter` example creates a filter that matches all Portscan findings for instance created from a specific image. This does not suppress those findings.

```
aws guardduty create-filter \
    --detector-id b6b992d6d2f48e64bc59180bfexample \
    --name myFilterExample \
    --finding-criteria '{"Criterion": {"type": {"Eq": ["Recon:EC2/
Portscan"]},"resource.instanceDetails.imageId": {"Eq": ["ami-0a7a207083example"]}}}'
```

Output:

```
{
    "Name": "myFilterExample"
}
```

For more information, see Filtering GuardDuty findings in the *GuardDuty User Guide*.

Example 2: To create a new filter and suppress findings in the current region

The following `create-filter` example creates a filter that matches all Portscan findings for instance created from a specific image. This filter archives those findings so that they do not appear in your current findings.

```
aws guardduty create-filter \
    --detector-id b6b992d6d2f48e64bc59180bfexample \
    --action ARCHIVE \
    --name myFilterSecondExample \
    --finding-criteria '{"Criterion": {"type": {"Eq": ["Recon:EC2/
Portscan"]},"resource.instanceDetails.imageId": {"Eq": ["ami-0a7a207083example"]}}}'
```

Output:

```
{
    "Name": "myFilterSecondExample"
```

```
}
```

For more information, see Filtering GuardDuty findings in the *GuardDuty User Guide*.

- For API details, see CreateFilter in *AWS CLI Command Reference*.

`create-ip-set`

The following code example shows how to use `create-ip-set`.

AWS CLI

To create and activate a trusted IP set

The following `create-ip-set` example creates and activates a trusted IP set in the current Region.

```
aws guardduty create-ip-set \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --name new-ip-set-example \
    --format TXT \
    --location s3://amzn-s3-demo-bucket/customtrustlist.csv \
    --activate
```

Output:

```
{
    "IpSetId": "d4b94fc952d6912b8f3060768example"
}
```

For more information, see Working with Trusted IP Lists and Threat Lists in the *GuardDuty User Guide*.

- For API details, see CreateIpSet in *AWS CLI Command Reference*.

`create-members`

The following code example shows how to use `create-members`.

AWS CLI

To associate a new member with your GuardDuty master account in the current region.

The following `create-members` example associates member accounts to be managed by the current account as the GuardDuty master.

```
aws guardduty create-members \
    --detector-id b6b992d6d2f48e64bc59180bfexample \
    --account-details AccountId=123456789111,Email=first
+member@example.com AccountId=123456789222,Email=another+member@example.com
```

Output:

```
{
    "UnprocessedAccounts": []
}
```

For more information, see Managing multiple accounts in Amazon GuardDuty in the *Amazon GuardDuty User Guide*.

- For API details, see CreateMembers in *AWS CLI Command Reference*.

`create-publishing-destination`

The following code example shows how to use `create-publishing-destination`.

AWS CLI

To create a publishing destination to export GuardDuty findings in the current region to.

The following `create-publishing-destination` example shows how to set up a publishing destination to export current (not archived) GuardDuty findings to keep track of historical findings data.

```
aws guardduty create-publishing-destination \
    --detector-id b6b992d6d2f48e64bc59180bfexample \
    --destination-type S3 \
    --destination-properties 'DestinationArn=arn:aws:s3:::amzn-s3-demo-
bucket,KmsKeyArn=arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111'
```

Output:

```
{
```

```
    "DestinationId": "46b99823849e1bbc242dfbe3cexample"
}
```

For more information, see Exporting generated GuardDuty findings to Amazon S3 buckets in the *GuardDuty User Guide*.

- For API details, see CreatePublishingDestination in *AWS CLI Command Reference*.

`create-sample-findings`

The following code example shows how to use `create-sample-findings`.

AWS CLI

To create sample GuardDuty findings in the current region.

The following `create-sample-findings` example creates a sample finding of the provided types.

```
aws guardduty create-sample-findings \
    --detector-id b6b992d6d2f48e64bc59180bfexample \
    --finding-types UnauthorizedAccess:EC2/TorClient UnauthorizedAccess:EC2/TorRelay
```

This command produces no output.

For more information, see Sample findings in the *GuardDuty User Guide*.

- For API details, see CreateSampleFindings in *AWS CLI Command Reference*.

`create-threat-intel-set`

The following code example shows how to use `create-threat-intel-set`.

AWS CLI

To create and activate a new threat intel set

The following `create-threat-intel-set` example creates and activates a threat intel set in the current Region.

```
aws guardduty create-threat-intel-set \
```

```
    --detector-id b6b992d6d2f48e64bc59180bfexample \
    --name myThreatSet-example \
    --format TXT \
    --location s3://amzn-s3-demo-bucket/threatlist.csv \
    --activate
```

Output:

```
{
    "ThreatIntelSetId": "20b9a4691aeb33506b808878cexample"
}
```

For more information, see Working with Trusted IP Lists and Threat Lists in the *GuardDuty User Guide*.

- For API details, see CreateThreatIntelSet in *AWS CLI Command Reference*.

`decline-invitations`

The following code example shows how to use `decline-invitations`.

AWS CLI

To decline an invitation to have Guardduty managed by another account in the current region.

The following `decline-invitations` example declines a membership invitation.

```
aws guardduty decline-invitations \
    --account-ids 123456789012
```

Output:

```
{
    "UnprocessedAccounts": []
}
```

For more information, see Managing GuardDuty accounts by invitation in the *Amazon GuardDuty User Guide*.

- For API details, see DeclineInvitations in *AWS CLI Command Reference*.

`delete-detector`

The following code example shows how to use `delete-detector`.

AWS CLI

To delete a detector, and disable GuardDuty, in the current region.

The following `delete-detector` example deletes a detector. If successful, this disables GuardDuty in the region associated with that detector.

```
aws guardduty delete-detector \
    --detector-id b6b992d6d2f48e64bc59180bfexample
```

This command produces no output.

For more information, see Suspending or disabling GuardDuty in the *GuardDuty User Guide*.

- For API details, see DeleteDetector in *AWS CLI Command Reference*.

`delete-filter`

The following code example shows how to use `delete-filter`.

AWS CLI

To delete an existing filter in the current region

The following `delete-filter` example deletes a filter.

```
aws guardduty delete-filter \
    --detector-id b6b992d6d2f48e64bc59180bfexample \
    --filter-name byebyeFilter
```

This command produces no output.

For more information, see Filtering findings in GuardDuty in the *Amazon GuardDuty User Guide*.

- For API details, see DeleteFilter in *AWS CLI Command Reference*.

`disable-organization-admin-account`

The following code example shows how to use `disable-organization-admin-account`.

AWS CLI

To remove an account as the delegated administrator for GuardDuty within your organization

The following `disable-organization-admin-account` example removes an account as the delegated administrator for GuardDuty.

```
aws guardduty disable-organization-admin-account \
    --admin-account-id 123456789012
```

This command produces no output.

For more information, see Managing accounts with AWS organizations in the *GuardDuty User Guide*.

- For API details, see DisableOrganizationAdminAccount in *AWS CLI Command Reference*.

`disassociate-from-master-account`

The following code example shows how to use `disassociate-from-master-account`.

AWS CLI

To disassociate from your current administrator account in the current region

The following `disassociate-from-master-account` example disassociates your account from the current GuardDuty administrator account in the current AWS region.

```
aws guardduty disassociate-from-master-account \
    --detector-id d4b040365221be2b54a6264dcexample
```

This command produces no output.

For more information, see Understanding the relationship between GuardDuty administrator account and member accounts in the *GuardDuty User Guide*.

- For API details, see DisassociateFromMasterAccount in *AWS CLI Command Reference*.

`get-detector`

The following code example shows how to use `get-detector`.

AWS CLI

To retrieve details of a specific detector

The following `get-detector` example displays the configurations details of the specified detector.

```
aws guardduty get-detector \
    --detector-id 12abc34d567e8fa901bc2d34eexample
```

Output:

```
{
    "Status": "ENABLED",
    "ServiceRole": "arn:aws:iam::123456789012:role/aws-service-role/
guardduty.amazonaws.com/AWSServiceRoleForAmazonGuardDuty",
    "Tags": {},
    "FindingPublishingFrequency": "SIX_HOURS",
    "UpdatedAt": "2018-11-07T03:24:22.938Z",
    "CreatedAt": "2017-12-22T22:51:31.940Z"
}
```

For more information, see Concepts and key terms in Amazon GuardDuty in the *Amazon GuardDuty User Guide*.

- For API details, see GetDetector in *AWS CLI Command Reference*.

`get-findings`

The following code example shows how to use `get-findings`.

AWS CLI

Example 1: To retrieve the details of a specific finding

The following `get-findings` example retrieves the full JSON finding details of the specified finding.

```
aws guardduty get-findings \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --finding-ids 1ab92989eaf0e742df4a014d5example
```

Output:

```
{
    "Findings": [
        {
            "Resource": {
                "ResourceType": "AccessKey",
                "AccessKeyDetails": {
                    "UserName": "testuser",

    ]
}
```

For more information, see Understanding and generating Amazon GuardDuty findings in the *Amazon GuardDuty User Guide*.

- For API details, see GetFindings in *AWS CLI Command Reference*.

`get-ip-set`

The following code example shows how to use `get-ip-set`.

AWS CLI

To list get details on a specified trusted IP set

The following `get-ip-set` example shows the status and details of the specified trusted IP set.

```
aws guardduty get-ip-set \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --ip-set-id d4b94fc952d6912b8f3060768example
```

Output:

```
{
    "Status": "ACTIVE",
    "Location": "s3://amzn-s3-demo-bucket/customlist.csv",
    "Tags": {},
    "Format": "TXT",
    "Name": "test-ip-set-example"
}
```

For more information, see Working with Trusted IP Lists and Threat Lists in the *GuardDuty User Guide*.

- For API details, see GetIpSet in *AWS CLI Command Reference*.

`get-master-account`

The following code example shows how to use `get-master-account`.

AWS CLI

To retrieve details about your master account in the current region

The following `get-master-account` example displays the status and details of the master account associated with your detector in the current region.

```
aws guardduty get-master-account \
    --detector-id 12abc34d567e8fa901bc2d34eexample
```

Output:

```
{
    "Master": {
        "InvitationId": "04b94d9704854a73f94e061e8example",
        "InvitedAt": "2020-06-09T22:23:04.970Z",
        "RelationshipStatus": "Enabled",
        "AccountId": "123456789012"
    }
}
```

For more information, see Understanding the relationship between GuardDuty administrator account and member account in the *GuardDuty User Guide*.

- For API details, see GetMasterAccount in *AWS CLI Command Reference*.

`list-detectors`

The following code example shows how to use `list-detectors`.

AWS CLI

To list the available detectors in the current region

The following `list-detectors` example lists the available detectors in your current AWS region.

```
aws guardduty list-detectors
```

Output:

```
{
    "DetectorIds": [
        "12abc34d567e8fa901bc2d34eexample"
    ]
}
```

For more information, see Concepts and key terms in Amazon GuardDuty in the *Amazon GuardDuty User Guide*.

- For API details, see ListDetectors in *AWS CLI Command Reference*.

`list-findings`

The following code example shows how to use `list-findings`.

AWS CLI

Example 1: To list all findings for the current region

The following `list-findings` example displays a list of all findingIds for the current region sorted by severity from highest to lowest.

```
aws guardduty list-findings \
```

```
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --sort-criteria '{"AttributeName": "severity","OrderBy":"DESC"}'
```

Output:

```
{
    "FindingIds": [
        "04b8ab50fd29c64fc771b232dexample",
        "5ab8ab50fd21373735c826d3aexample",
        "90b93de7aba69107f05bbe60bexample"
    ]
}
```

For more information, see Understanding and generating Amazon GuardDuty findings in the *Amazon GuardDuty User Guide*.

Example 2: To list findings for the current region matching a specific finding criteria

The following `list-findings` example displays a list of all findingIds that match a specified finding type.

```
aws guardduty list-findings \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --finding-criteria '{"Criterion":{"type": {"Eq":["UnauthorizedAccess:EC2/
SSHBruteForce"]}}}'
```

Output:

```
{
    "FindingIds": [
        "90b93de7aba69107f05bbe60bexample",
        "6eb9430d7023d30774d6f05e3example",
        "2eb91a2d060ac9a21963a5848example",
        "44b8ab50fd2b0039a9e48f570example",
        "9eb8ab4cd2b7e5b66ba4f5e96example",
        "e0b8ab3a38e9b0312cc390ceeexample"
    ]
}
```

For more information, see Understanding and generating Amazon GuardDuty findings in the *Amazon GuardDuty User Guide*.

Example 3: To list findings for the current region matching a specific set of finding criteria defined within a JSON file

The following `list-findings` example displays a list of all findingIds that are not archived, and involve the IAM user named "testuser", as specified in a JSON file.

```
aws guardduty list-findings \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --finding-criteria file://myfile.json
```

Contents of `myfile.json`:

```
{"Criterion": {
    "resource.accessKeyDetails.userName":{
                "Eq":[
                    "testuser"
                    ]
                },
    "service.archived": {
                "Eq": [
                    "false"
                ]
            }
        }
}
```

Output:

```
{
    "FindingIds": [
        "1ab92989eaf0e742df4a014d5example"
    ]
}
```

For more information, see Understanding and generating Amazon GuardDuty findings in the *Amazon GuardDuty User Guide*.

- For API details, see ListFindings in *AWS CLI Command Reference*.

`list-invitations`

The following code example shows how to use `list-invitations`.

AWS CLI

To list details on your invitations to become a member account in the current region

The following `list-invitations` example lists details and statuses on your invitations to become a GuardDuty member account in the current region.

```
aws guardduty list-invitations
```

Output:

```
{
    "Invitations": [
        {
            "InvitationId": "d6b94fb03a66ff665f7db8764example",
            "InvitedAt": "2020-06-10T17:56:38.221Z",
            "RelationshipStatus": "Invited",
            "AccountId": "123456789111"
        }
    ]
}
```

For more information, see Managing GuardDuty accounts by invitation in the *Amazon GuardDuty User Guide*.

- For API details, see ListInvitations in *AWS CLI Command Reference*.

`list-ip-sets`

The following code example shows how to use `list-ip-sets`.

AWS CLI

To list trusted IP sets in the current region

The following `list-ip-sets` example lists the trusted IP sets in your current AWS region.

```
aws guardduty list-ip-sets \
    --detector-id 12abc34d567e8fa901bc2d34eexample
```

Output:

```
{
    "IpSetIds": [
        "d4b94fc952d6912b8f3060768example"
    ]
}
```

For more information, see Customizing threat detection with entity lists and IP address lists in the *Amazon GuardDuty User Guide*.

- For API details, see ListIpSets in *AWS CLI Command Reference*.

`list-members`

The following code example shows how to use `list-members`.

AWS CLI

Example 1: To list only current members in the current Region

The following `list-members` example lists and provides details of only current member accounts associated with the GuardDuty administrator account, in the current region.

```
aws guardduty list-members \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --only-associated="true"
```

Output:

```
{
    "Members": [
        {
            "RelationshipStatus": "Enabled",
            "InvitedAt": "2020-06-09T22:49:00.910Z",
            "MasterId": "123456789111",
            "DetectorId": "7ab8b2f61b256c87f793f6a86example",
            "UpdatedAt": "2020-06-09T23:08:22.512Z",
            "Email": "your+member@example.com",
            "AccountId": "123456789012"
        }
    ]
}
```

For more information, see Understanding the relationship between GuardDuty administrator account and member accounts in the *GuardDuty User Guide*.

Example 2: To list all the members in the current Region

The following `list-members` example lists and provides details of all the member accounts, including those who have been disassociated or have not yet accepted the invite from the GuardDuty administrator, in the current region.

```
aws guardduty list-members \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --only-associated="false"
```

Output:

```
{
    "Members": [
        {
            "RelationshipStatus": "Enabled",
            "InvitedAt": "2020-06-09T22:49:00.910Z",
            "MasterId": "123456789111",
            "DetectorId": "7ab8b2f61b256c87f793f6a86example",
            "UpdatedAt": "2020-06-09T23:08:22.512Z",
            "Email": "your+other+member@example.com",
            "AccountId": "123456789222"
        }
    ]
}
```

For more information, see Understanding the relationship between GuardDuty administrator account and member accounts in the *GuardDuty User Guide*.

- For API details, see ListMembers in *AWS CLI Command Reference*.

`update-detector`

The following code example shows how to use `update-detector`.

AWS CLI

Example 1: To enable runtime monitoring in GuardDuty

The following `update-detector` example enables runtime monitoring without additional configuration.

```
aws guardduty update-detector \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --features 'Name=RUNTIME_MONITORING,Status=ENABLED'
```

This command produces no output.

For more information, see Runtime monitoring in the *GuardDuty User Guide*.

Example 2: To enable runtime monitoring with additional configuration

The following `update-detector` example enables runtime monitoring with additional configuration for EC2, ECS Fargate, and EKS.

```
aws guardduty update-detector \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --features
 'Name=RUNTIME_MONITORING,Status=ENABLED,AdditionalConfiguration=[{Name=EC2_AGENT_MANAGEMENT
{Name=ECS_FARGATE_AGENT_MANAGEMENT,Status=ENABLED},
{Name=EKS_ADDON_MANAGEMENT,Status=ENABLED}]'
```

This command produces no output.

For more information, see Runtime monitoring in the *GuardDuty User Guide*.

- For API details, see UpdateDetector in *AWS CLI Command Reference*.

update-ip-set

The following code example shows how to use `update-ip-set`.

AWS CLI

To update a trusted IP set

The following `update-ip-set` example shows how to update the details of a trusted IP set.

```
aws guardduty update-ip-set \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --ip-set-id d4b94fc952d6912b8f3060768example \
```

```
    --location https://amzn-s3-demo-bucket.s3-us-west-2.amazonaws.com/
customtrustlist2.csv
```

This command produces no output.

For more information, see Working with Trusted IP Lists and Threat Lists in the *GuardDuty User Guide*.

- For API details, see UpdateIpSet in *AWS CLI Command Reference*.

AWS Health examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Health.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`describe-affected-entities`

The following code example shows how to use `describe-affected-entities`.

AWS CLI

To list the entities that are affected by a specified AWS Health event

The following `describe-affected-entities` example lists the entities that are affected by the specified AWS Health event. This event is a billing notification for the AWS account.

```
aws health describe-affected-entities \
    --filter "eventArns=arn:aws:health:global::event/BILLING/
AWS_BILLING_NOTIFICATION/AWS_BILLING_NOTIFICATION_6ce1d874-e995-40e2-99cd-
EXAMPLE11145" \
```

```
    --region us-east-1
```

Output:

```
{
    "entities": [
        {
            "entityArn": "arn:aws:health:global:123456789012:entity/
EXAMPLEimSMoULmWHpb",
            "eventArn": "arn:aws:health:global::event/BILLING/
AWS_BILLING_NOTIFICATION/AWS_BILLING_NOTIFICATION_6ce1d874-e995-40e2-99cd-
EXAMPLE11145",
            "entityValue": "AWS_ACCOUNT",
            "awsAccountId": "123456789012",
            "lastUpdatedTime": 1588356454.08
        }
    ]
}
```

For more information, see Event log in the *AWS Health User Guide*.

- For API details, see DescribeAffectedEntities in *AWS CLI Command Reference*.

`describe-event-details`

The following code example shows how to use `describe-event-details`.

AWS CLI

To list information about an AWS Health event

The following `describe-event-details` example lists information about the specified AWS Health event.

```
aws health describe-event-details \
    --event-arns "arn:aws:health:us-east-1::event/EC2/AWS_EC2_OPERATIONAL_ISSUE/
AWS_EC2_OPERATIONAL_ISSUE_VKTXI_EXAMPLE111" \
    --region us-east-1
```

Output:

```
{
```

```
    "successfulSet": [
        {
            "event": {
                "arn": "arn:aws:health:us-east-1::event/EC2/
AWS_EC2_OPERATIONAL_ISSUE/AWS_EC2_OPERATIONAL_ISSUE_VKTXI_EXAMPLE111",
                "service": "EC2",
                "eventTypeCode": "AWS_EC2_OPERATIONAL_ISSUE",
                "eventTypeCategory": "issue",
                "region": "us-east-1",
                "startTime": 1587462325.096,
                "endTime": 1587464204.774,
                "lastUpdatedTime": 1587464204.865,
                "statusCode": "closed"
            },
            "eventDescription": {
                "latestDescription": "[RESOLVED] Increased API Error Rates and
 Latencies\n\n[02:45 AM PDT] We are investigating increased API error rates and
 latencies in the US-EAST-1 Region.\n\n[03:16 AM PDT] Between 2:10 AM and 2:59 AM
 PDT we experienced increased API error rates and latencies in the US-EAST-1 Region.
 The issue has been resolved and the service is operating normally."
            }
        }
    ],
    "failedSet": []
}
```

For more information, see Event details pane in the *AWS Health User Guide*.

- For API details, see DescribeEventDetails in *AWS CLI Command Reference*.

`describe-events`

The following code example shows how to use `describe-events`.

AWS CLI

Example 1: To list AWS Health events

The following `describe-events` example lists recent AWS Health events.

```
aws health describe-events \
    --region us-east-1
```

Output:

```
{
    "events": [
        {
            "arn": "arn:aws:health:us-west-1::event/ECS/AWS_ECS_OPERATIONAL_ISSUE/

Example 2: To list AWS Health events by service and event status code

The following `describe-events` example lists AWS Health events for Amazon Elastic Compute Cloud (Amazon EC2) where the event status is closed.

```
aws health describe-events \
    --filter "services=EC2,eventStatusCodes=closed"
```

Output:

```
{
    "events": [
        {
            "arn": "arn:aws:health:us-east-1::event/EC2/AWS_EC2_OPERATIONAL_ISSUE/
AWS_EC2_OPERATIONAL_ISSUE_VKTXI_EXAMPLE111",

            "lastUpdatedTime": 1583885057.052,
            "statusCode": "closed",
            "eventScopeCode": "PUBLIC"
        }
    ]
}
```

For more information, see Getting started with the AWS Personal Health Dashboard in the *AWS Health User Guide*.

- For API details, see DescribeEvents in *AWS CLI Command Reference*.

HealthImaging examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with HealthImaging.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`copy-image-set`

The following code example shows how to use `copy-image-set`.

AWS CLI

Example 1: To copy an image set without a destination.

The following `copy-image-set` example makes a duplicate copy of an image set without a destination.

```
aws medical-imaging copy-image-set \
    --datastore-id 12345678901234567890123456789012 \
    --source-image-set-id ea92b0d8838c72a3f25d00d13616f87e \
    --copy-image-set-information '{"sourceImageSet": {"latestVersionId": "1" } }'
```

Output:

```
{
    "destinationImageSetProperties": {
        "latestVersionId": "2",
        "imageSetWorkflowStatus": "COPYING",
        "updatedAt": 1680042357.432,
        "imageSetId": "b9a06fef182a5f992842f77f8e0868e5",
        "imageSetState": "LOCKED",
        "createdAt": 1680042357.432
    },
    "sourceImageSetProperties": {
        "latestVersionId": "1",
        "imageSetWorkflowStatus": "COPYING_WITH_READ_ONLY_ACCESS",
        "updatedAt": 1680042357.432,
        "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
        "imageSetState": "LOCKED",
        "createdAt": 1680027126.436
    },
    "datastoreId": "12345678901234567890123456789012"
}
```

Example 2: To copy an image set with a destination.

The following `copy-image-set` example makes a duplicate copy of an image set with a destination.

```
aws medical-imaging copy-image-set \
    --datastore-id 12345678901234567890123456789012 \
    --source-image-set-id ea92b0d8838c72a3f25d00d13616f87e \
    --copy-image-set-information '{"sourceImageSet": {"latestVersionId": "1" },
 "destinationImageSet": { "imageSetId": "b9a06fef182a5f992842f77f8e0868e5",
 "latestVersionId": "1"} }'
```

Output:

```
{
    "destinationImageSetProperties": {
        "latestVersionId": "2",
        "imageSetWorkflowStatus": "COPYING",
        "updatedAt": 1680042505.135,
        "imageSetId": "b9a06fef182a5f992842f77f8e0868e5",
        "imageSetState": "LOCKED",
        "createdAt": 1680042357.432
    },
    "sourceImageSetProperties": {
        "latestVersionId": "1",
        "imageSetWorkflowStatus": "COPYING_WITH_READ_ONLY_ACCESS",
        "updatedAt": 1680042505.135,
        "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
        "imageSetState": "LOCKED",
        "createdAt": 1680027126.436
    },
    "datastoreId": "12345678901234567890123456789012"
}
```

Example 3: To copy a subset of instances from a source image set to a destination image set.

The following `copy-image-set` example copies one DICOM instance from the source image set to the destination image set. The force parameter is provided to override inconsistencies in the Patient, Study, and Series level attributes.

```
aws medical-imaging copy-image-set \
    --datastore-id 12345678901234567890123456789012 \
    --source-image-set-id ea92b0d8838c72a3f25d00d13616f87e \
```

```
    --copy-image-set-information '{"sourceImageSet": {"latestVersionId":
 "1","DICOMCopies": {"copiableAttributes": "{\"SchemaVersion\":\"1.1\",\"Study\":
{\"Series\":{\"1.3.6.1.4.1.5962.99.1.3673257865.2104868982.1369432891697.3666.0\":
{\"Instances\":
{\"1.3.6.1.4.1.5962.99.1.3673257865.2104868982.1369432891697.3669.0\":
{}}}}}}"}},"destinationImageSet": {"imageSetId":
 "b9eb50d8ee682eb9fcf4acbf92f62bb7","latestVersionId": "1"}}' \
    --force
```

Output:

```
{
    "destinationImageSetProperties": {
        "latestVersionId": "2",
        "imageSetWorkflowStatus": "COPYING",
        "updatedAt": 1680042505.135,
        "imageSetId": "b9eb50d8ee682eb9fcf4acbf92f62bb7",
        "imageSetState": "LOCKED",
        "createdAt": 1680042357.432
    },
    "sourceImageSetProperties": {
        "latestVersionId": "1",
        "imageSetWorkflowStatus": "COPYING_WITH_READ_ONLY_ACCESS",
        "updatedAt": 1680042505.135,
        "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
        "imageSetState": "LOCKED",
        "createdAt": 1680027126.436
    },
    "datastoreId": "12345678901234567890123456789012"
}
```

For more information, see Copying an image set in the *AWS HealthImaging Developer Guide*.

- For API details, see CopyImageSet in *AWS CLI Command Reference*.

`create-datastore`

The following code example shows how to use `create-datastore`.

AWS CLI

Example 1: To create a data store

The following `create-datastore` example creates a data store with the name `my-datastore`. When you create a datastore without specifying a `--lossless-storage-format`, AWS HealthImaging defaults to HTJ2K (High Throughput JPEG 2000).

```
aws medical-imaging create-datastore \
    --datastore-name "my-datastore"
```

Output:

```
{
    "datastoreId": "12345678901234567890123456789012",
    "datastoreStatus": "CREATING"
}
```

Example 2: To create a data store with JPEG 2000 Lossless storage format

The following `create-datastore` example creates a data store configured for JPEG 2000 Lossless storage format with the name `my-datastore`. A data store configured with JPEG 2000 Lossless storage format will transcode and persist lossless image frames in JPEG 2000 format. Image frames can then be retrieved in JPEG 2000 Lossless without transcoding.

```
aws medical-imaging create-datastore \
    --datastore-name "my-datastore" \
    --lossless-storage-format JPEG_2000_LOSSLESS
```

Output:

```
{
    "datastoreId": "12345678901234567890123456789012",
    "datastoreStatus": "CREATING"
}
```

For more information, see Creating a data store in the *AWS HealthImaging Developer Guide*.

- For API details, see CreateDatastore in *AWS CLI Command Reference*.

`delete-datastore`

The following code example shows how to use `delete-datastore`.

AWS CLI

To delete a data store

The following `delete-datastore` example deletes a data store.

```
aws medical-imaging delete-datastore \
    --datastore-id "12345678901234567890123456789012"
```

Output:

```
{
    "datastoreId": "12345678901234567890123456789012",
    "datastoreStatus": "DELETING"
}
```

For more information, see Deleting a data store in the *AWS HealthImaging Developer Guide*.

- For API details, see DeleteDatastore in *AWS CLI Command Reference*.

`delete-image-set`

The following code example shows how to use `delete-image-set`.

AWS CLI

To delete an image set

The following `delete-image-set` example deletes an image set.

```
aws medical-imaging delete-image-set \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id ea92b0d8838c72a3f25d00d13616f87e
```

Output:

```
{
    "imageSetWorkflowStatus": "DELETING",
    "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
    "imageSetState": "LOCKED",
```

```
    "datastoreId": "12345678901234567890123456789012"
}
```

For more information, see Deleting an image set in the *AWS HealthImaging Developer Guide*.

- For API details, see DeleteImageSet in *AWS CLI Command Reference*.

`get-datastore`

The following code example shows how to use `get-datastore`.

AWS CLI

Example 1: To get a data store's properties

The following `get-datastore` example gets a data store's properties.

```
aws medical-imaging get-datastore \
    --datastore-id 12345678901234567890123456789012
```

Output:

```
{
    "datastoreProperties": {
        "datastoreId": "12345678901234567890123456789012",
        "datastoreName": "TestDatastore123",
        "datastoreStatus": "ACTIVE",
        "losslessStorageFormat": "HTJ2K",
        "datastoreArn": "arn:aws:medical-imaging:us-
west-2:123456789012:datastore/12345678901234567890123456789012",
        "createdAt": "2022-11-15T23:33:09.643000+00:00",
        "updatedAt": "2022-11-15T23:33:09.643000+00:00"
    }
}
```

Example 2: To get data store's properties configured for JPEG2000

The following `get-datastore` example gets a data store's properties for a data store configured for JPEG 2000 Lossless storage format.

```
aws medical-imaging get-datastore \
```

```
    --datastore-id 12345678901234567890123456789012
```

Output:

```
{
    "datastoreProperties": {
        "datastoreId": "12345678901234567890123456789012",
        "datastoreName": "TestDatastore123",
        "datastoreStatus": "ACTIVE",
        "losslessStorageFormat": "JPEG_2000_LOSSLESS",
        "datastoreArn": "arn:aws:medical-imaging:us-
west-2:123456789012:datastore/12345678901234567890123456789012",
        "createdAt": "2022-11-15T23:33:09.643000+00:00",
        "updatedAt": "2022-11-15T23:33:09.643000+00:00"
    }
}
```

For more information, see Getting data store properties in the *AWS HealthImaging Developer Guide*.

- For API details, see GetDatastore in *AWS CLI Command Reference*.

`get-dicom-import-job`

The following code example shows how to use `get-dicom-import-job`.

AWS CLI

To get a dicom import job's properties

The following `get-dicom-import-job` example gets a dicom import job's properties.

```
aws medical-imaging get-dicom-import-job \
    --datastore-id "12345678901234567890123456789012" \
    --job-id "09876543210987654321098765432109"
```

Output:

```
{
    "jobProperties": {
        "jobId": "09876543210987654321098765432109",
```

```
        "jobName": "my-job",
        "jobStatus": "COMPLETED",
        "datastoreId": "12345678901234567890123456789012",
        "dataAccessRoleArn": "arn:aws:iam::123456789012:role/
ImportJobDataAccessRole",
        "endedAt": "2022-08-12T11:29:42.285000+00:00",
        "submittedAt": "2022-08-12T11:28:11.152000+00:00",
        "inputS3Uri": "s3://amzn-s3-demo-bucket1/dicom_input/",
        "outputS3Uri": "s3://amzn-s3-demo-bucket2/
job_output/12345678901234567890123456789012-
DicomImport-09876543210987654321098765432109/"
    }
}
```

For more information, see Getting import job properties in the *AWS HealthImaging Developer Guide*.

- For API details, see GetDICOMImportJob in *AWS CLI Command Reference*.

`get-image-frame`

The following code example shows how to use `get-image-frame`.

AWS CLI

To get image set pixel data

The following `get-image-frame` example gets an image frame.

```
aws medical-imaging get-image-frame imageframe.jph \
    --datastore-id "12345678901234567890123456789012" \
    --image-set-id "98765412345612345678907890789012" \
    --image-frame-information imageFrameId=3abf5d5d7ae72f80a0ec81b2c0de3ef4
```

Output:

```
{
    "contentType": "application/octet-stream"
}
```

The `GetImageFrame` action writes the stream of pixel data to the `imageframe.jph` file. For information about decoding and viewing image frames, see HTJ2K decoding libraries.

For more information, see Getting image set pixel data in the *AWS HealthImaging Developer Guide*.

- For API details, see GetImageFrame in *AWS CLI Command Reference*.

`get-image-set-metadata`

The following code example shows how to use `get-image-set-metadata`.

AWS CLI

Example 1: To get image set metadata without version

The following `get-image-set-metadata` example gets metadata for an image set without specifying a version.

Note: `outfile` is a required parameter.

```
aws medical-imaging get-image-set-metadata studymetadata.json.gz \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id ea92b0d8838c72a3f25d00d13616f87e
```

The returned metadata is compressed with gzip and stored in the studymetadata.json.gz file. To view the contents of the returned JSON object, you must first decompress it.

Output:

```
{
    "contentType": "application/json",
    "contentEncoding": "gzip"
}
```

Example 2: To get image set metadata with version

The following `get-image-set-metadata` example gets metadata for an image set with a specified version.

Note: `outfile` is a required parameter.

```
aws medical-imaging get-image-set-metadata studymetadata.json.gz \
```

```
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
    --version-id 1
```

The returned metadata is compressed with gzip and stored in the studymetadata.json.gz file. To view the contents of the returned JSON object, you must first decompress it.

Output:

```
{
    "contentType": "application/json",
    "contentEncoding": "gzip"
}
```

For more information, see Getting image set metadata in the *AWS HealthImaging Developer Guide*.

- For API details, see GetImageSetMetadata in *AWS CLI Command Reference*.

`get-image-set`

The following code example shows how to use `get-image-set`.

AWS CLI

To get image set properties

The following `get-image-set` example gets the properties for an image set.

```
aws medical-imaging get-image-set \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id 18f88ac7870584f58d56256646b4d92b \
    --version-id 1
```

Output:

```
{
    "versionId": "1",
    "imageSetWorkflowStatus": "COPIED",
    "updatedAt": 1680027253.471,
```

```
    "imageSetId": "18f88ac7870584f58d56256646b4d92b",
    "imageSetState": "ACTIVE",
    "createdAt": 1679592510.753,
    "datastoreId": "12345678901234567890123456789012"
}
```

For more information, see Getting image set properties in the *AWS HealthImaging Developer Guide*.

- For API details, see GetImageSet in *AWS CLI Command Reference*.

`list-datastores`

The following code example shows how to use `list-datastores`.

AWS CLI

To list data stores

The following `list-datastores` example lists available data stores.

```
aws medical-imaging list-datastores
```

Output:

```
{
    "datastoreSummaries": [
        {
            "datastoreId": "12345678901234567890123456789012",
            "datastoreName": "TestDatastore123",
            "datastoreStatus": "ACTIVE",
            "datastoreArn": "arn:aws:medical-imaging:us-
west-2:123456789012:datastore/12345678901234567890123456789012",
            "createdAt": "2022-11-15T23:33:09.643000+00:00",
            "updatedAt": "2022-11-15T23:33:09.643000+00:00"
        }
    ]
}
```

For more information, see Listing data stores in the *AWS HealthImaging Developer Guide*.

- For API details, see ListDatastores in *AWS CLI Command Reference*.

`list-dicom-import-jobs`

The following code example shows how to use `list-dicom-import-jobs`.

AWS CLI

To list dicom import jobs

The following `list-dicom-import-jobs` example lists dicom import jobs.

```
aws medical-imaging list-dicom-import-jobs \
    --datastore-id "12345678901234567890123456789012"
```

Output:

```
{
    "jobSummaries": [
        {
            "jobId": "09876543210987654321098765432109",
            "jobName": "my-job",
            "jobStatus": "COMPLETED",
            "datastoreId": "12345678901234567890123456789012",
            "dataAccessRoleArn": "arn:aws:iam::123456789012:role/
ImportJobDataAccessRole",
            "endedAt": "2022-08-12T11:21:56.504000+00:00",
            "submittedAt": "2022-08-12T11:20:21.734000+00:00"
        }
    ]
}
```

For more information, see Listing import jobs in the *AWS HealthImaging Developer Guide*.

- For API details, see ListDICOMImportJobs in *AWS CLI Command Reference*.

`list-image-set-versions`

The following code example shows how to use `list-image-set-versions`.

AWS CLI

To list image set versions

The following `list-image-set-versions` example lists the version history for an image set.

```
aws medical-imaging list-image-set-versions \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id ea92b0d8838c72a3f25d00d13616f87e
```

Output:

```
{
    "imageSetPropertiesList": [
        {
            "ImageSetWorkflowStatus": "UPDATED",
            "versionId": "4",
            "updatedAt": 1680029436.304,
            "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
            "imageSetState": "ACTIVE",
            "createdAt": 1680027126.436
        },
        {
            "ImageSetWorkflowStatus": "UPDATED",
            "versionId": "3",
            "updatedAt": 1680029163.325,
            "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
            "imageSetState": "ACTIVE",
            "createdAt": 1680027126.436
        },
        {
            "ImageSetWorkflowStatus": "COPY_FAILED",
            "versionId": "2",
            "updatedAt": 1680027455.944,
            "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
            "imageSetState": "ACTIVE",
            "message": "INVALID_REQUEST:  Series of SourceImageSet and
 DestinationImageSet don't match.",
            "createdAt": 1680027126.436
        },
        {
            "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
            "imageSetState": "ACTIVE",
            "versionId": "1",
            "ImageSetWorkflowStatus": "COPIED",
            "createdAt": 1680027126.436
        }
```

```
    ]
}
```

For more information, see Listing image set versions in the *AWS HealthImaging Developer Guide*.

- For API details, see ListImageSetVersions in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

Example 1: To list resource tags for a data store

The following `list-tags-for-resource` example lists tags for a data store.

```
aws medical-imaging list-tags-for-resource \
    --resource-arn "arn:aws:medical-imaging:us-
west-2:123456789012:datastore/12345678901234567890123456789012"
```

Output:

```
{
    "tags":{
        "Deployment":"Development"
    }
}
```

Example 2: To list resource tags for an image set

The following `list-tags-for-resource` example lists tags for an image set.

```
aws medical-imaging list-tags-for-resource \
    --resource-arn "arn:aws:medical-imaging:us-
west-2:123456789012:datastore/12345678901234567890123456789012/
imageset/18f88ac7870584f58d56256646b4d92b"
```

Output:

```
{
    "tags":{
```

```
        "Deployment":"Development"
    }
}
```

For more information, see Tagging resources with AWS HealthImaging in the *AWS HealthImaging Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`search-image-sets`

The following code example shows how to use `search-image-sets`.

AWS CLI

Example 1: To search image sets with an EQUAL operator

The following `search-image-sets` example uses the EQUAL operator to search image sets based on a specific value.

```
aws medical-imaging search-image-sets \
    --datastore-id 12345678901234567890123456789012 \
    --search-criteria file://search-criteria.json
```

Contents of `search-criteria.json`:

```
{
    "filters": [{
        "values": [{"DICOMPatientId" : "SUBJECT08701"}],
        "operator": "EQUAL"
    }]
}
```

Output:

```
{
    "imageSetsMetadataSummaries": [{
        "imageSetId": "09876543210987654321098765432109",
        "createdAt": "2022-12-06T21:40:59.429000+00:00",
        "version": 1,
        "DICOMTags": {
            "DICOMStudyId": "2011201407",
```

```
            "DICOMStudyDate": "19991122",
            "DICOMPatientSex": "F",
            "DICOMStudyInstanceUID": "1.2.840.99999999.84710745.943275268089",
            "DICOMPatientBirthDate": "19201120",
            "DICOMStudyDescription": "UNKNOWN",
            "DICOMPatientId": "SUBJECT08701",
            "DICOMPatientName": "Melissa844 Huel628",
            "DICOMNumberOfStudyRelatedInstances": 1,
            "DICOMStudyTime": "140728",
            "DICOMNumberOfStudyRelatedSeries": 1
        },
        "updatedAt": "2022-12-06T21:40:59.429000+00:00"
    }]
}
```

Example 2: To search image sets with a BETWEEN operator using DICOMStudyDate and DICOMStudyTime

The following `search-image-sets` example searches for image sets with DICOM Studies generated between January 1, 1990 (12:00 AM) and January 1, 2023 (12:00 AM).

Note: DICOMStudyTime is optional. If it is not present, 12:00 AM (start of the day) is the time value for the dates provided for filtering.

```
aws medical-imaging search-image-sets \
    --datastore-id 12345678901234567890123456789012 \
    --search-criteria file://search-criteria.json
```

Contents of `search-criteria.json`:

```
{
    "filters": [{
        "values": [{
            "DICOMStudyDateAndTime": {
                "DICOMStudyDate": "19900101",
                "DICOMStudyTime": "000000"
            }
        },
        {
            "DICOMStudyDateAndTime": {
                "DICOMStudyDate": "20230101",
                "DICOMStudyTime": "000000"
            }
```

```
        }],
        "operator": "BETWEEN"
    }]
}
```

Output:

```
{
    "imageSetsMetadataSummaries": [{
        "imageSetId": "09876543210987654321098765432109",
        "createdAt": "2022-12-06T21:40:59.429000+00:00",
        "version": 1,
        "DICOMTags": {
            "DICOMStudyId": "2011201407",
            "DICOMStudyDate": "19991122",
            "DICOMPatientSex": "F",
            "DICOMStudyInstanceUID": "1.2.840.99999999.84710745.943275268089",
            "DICOMPatientBirthDate": "19201120",
            "DICOMStudyDescription": "UNKNOWN",
            "DICOMPatientId": "SUBJECT08701",
            "DICOMPatientName": "Melissa844 Huel628",
            "DICOMNumberOfStudyRelatedInstances": 1,
            "DICOMStudyTime": "140728",
            "DICOMNumberOfStudyRelatedSeries": 1
        },
        "updatedAt": "2022-12-06T21:40:59.429000+00:00"
    }]
}
```

Example 3: To search image sets with a BETWEEN operator using createdAt (time studies were previously persisted)

The following `search-image-sets` example searches for image sets with DICOM Studies persisted in HealthImaging between the time ranges in UTC time zone.

Note: Provide createdAt in example format ("1985-04-12T23:20:50.52Z").

```
aws medical-imaging search-image-sets \
    --datastore-id 12345678901234567890123456789012 \
    --search-criteria  file://search-criteria.json
```

Contents of `search-criteria.json`:

```
{
    "filters": [{
        "values": [{
            "createdAt": "1985-04-12T23:20:50.52Z"
        },
        {
            "createdAt": "2022-04-12T23:20:50.52Z"
        }],
        "operator": "BETWEEN"
    }]
}
```

Output:

```
{
    "imageSetsMetadataSummaries": [{
        "imageSetId": "09876543210987654321098765432109",
        "createdAt": "2022-12-06T21:40:59.429000+00:00",
        "version": 1,
        "DICOMTags": {
            "DICOMStudyId": "2011201407",
            "DICOMStudyDate": "19991122",
            "DICOMPatientSex": "F",
            "DICOMStudyInstanceUID": "1.2.840.99999999.84710745.943275268089",
            "DICOMPatientBirthDate": "19201120",
            "DICOMStudyDescription": "UNKNOWN",
            "DICOMPatientId": "SUBJECT08701",
            "DICOMPatientName": "Melissa844 Huel628",
            "DICOMNumberOfStudyRelatedInstances": 1,
            "DICOMStudyTime": "140728",
            "DICOMNumberOfStudyRelatedSeries": 1
        },
        "updatedAt": "2022-12-06T21:40:59.429000+00:00"
    }]
}
```

Example 4: To search image sets with an EQUAL operator on DICOMSeriesInstanceUID and BETWEEN on updatedAt and sort response in ASC order on updatedAt field

The following `search-image-sets` example searches for image sets with an EQUAL operator on DICOMSeriesInstanceUID and BETWEEN on updatedAt and sorts the response in ASC order on the updatedAt field.

Note: Provide updatedAt in example format ("1985-04-12T23:20:50.52Z").

```
aws medical-imaging search-image-sets \
    --datastore-id 12345678901234567890123456789012 \
    --search-criteria  file://search-criteria.json
```

Contents of `search-criteria.json`:

```
{
    "filters": [{
        "values": [{
            "updatedAt": "2024-03-11T15:00:05.074000-07:00"
        }, {
            "updatedAt": "2024-03-11T16:00:05.074000-07:00"
        }],
        "operator": "BETWEEN"
    }, {
        "values": [{
            "DICOMSeriesInstanceUID": "1.2.840.99999999.84710745.943275268089"
        }],
        "operator": "EQUAL"
    }],
    "sort": {
        "sortField": "updatedAt",
        "sortOrder": "ASC"
    }
}
```

Output:

```
{
    "imageSetsMetadataSummaries": [{
        "imageSetId": "09876543210987654321098765432109",
        "createdAt": "2022-12-06T21:40:59.429000+00:00",
        "version": 1,
        "DICOMTags": {
            "DICOMStudyId": "2011201407",
            "DICOMStudyDate": "19991122",
            "DICOMPatientSex": "F",
            "DICOMStudyInstanceUID": "1.2.840.99999999.84710745.943275268089",
            "DICOMPatientBirthDate": "19201120",
            "DICOMStudyDescription": "UNKNOWN",
```

```
            "DICOMPatientId": "SUBJECT08701",
            "DICOMPatientName": "Melissa844 Huel628",
            "DICOMNumberOfStudyRelatedInstances": 1,
            "DICOMStudyTime": "140728",
            "DICOMNumberOfStudyRelatedSeries": 1
        },
        "updatedAt": "2022-12-06T21:40:59.429000+00:00"
    }]
}
```

For more information, see Searching image sets in the *AWS HealthImaging Developer Guide*.

- For API details, see SearchImageSets in *AWS CLI Command Reference*.

`start-dicom-import-job`

The following code example shows how to use `start-dicom-import-job`.

AWS CLI

To start a dicom import job

The following `start-dicom-import-job` example starts a dicom import job.

```
aws medical-imaging start-dicom-import-job \
    --job-name "my-job" \
    --datastore-id "12345678901234567890123456789012" \
    --input-s3-uri "s3://amzn-s3-demo-bucket1/dicom_input/" \
    --output-s3-uri "s3://amzn-s3-demo-bucket2/job_output/" \
    --data-access-role-arn "arn:aws:iam::123456789012:role/ImportJobDataAccessRole"
```

Output:

```
{
    "datastoreId": "12345678901234567890123456789012",
    "jobId": "09876543210987654321098765432109",
    "jobStatus": "SUBMITTED",
    "submittedAt": "2022-08-12T11:28:11.152000+00:00"
}
```

For more information, see Starting an import job in the *AWS HealthImaging Developer Guide*.

- For API details, see StartDICOMImportJob in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

Example 1: To tag a data store

The following `tag-resource` example tags a data store.

```
aws medical-imaging tag-resource \
    --resource-arn "arn:aws:medical-imaging:us-
west-2:123456789012:datastore/12345678901234567890123456789012" \
    --tags '{"Deployment":"Development"}'
```

This command produces no output.

Example 2: To tag an image set

The following `tag-resource` example tags an image set.

```
aws medical-imaging tag-resource \
    --resource-arn "arn:aws:medical-imaging:us-
west-2:123456789012:datastore/12345678901234567890123456789012/
imageset/18f88ac7870584f58d56256646b4d92b" \
    --tags '{"Deployment":"Development"}'
```

This command produces no output.

For more information, see Tagging resources with AWS HealthImaging in the *AWS HealthImaging Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

Example 1: To untag a data store

The following `untag-resource` example untags a data store.

```
aws medical-imaging untag-resource \
    --resource-arn "arn:aws:medical-imaging:us-
west-2:123456789012:datastore/12345678901234567890123456789012" \
    --tag-keys '["Deployment"]'
```

This command produces no output.

Example 2: To untag an image set

The following `untag-resource` example untags an image set.

```
aws medical-imaging untag-resource \
    --resource-arn "arn:aws:medical-imaging:us-
west-2:123456789012:datastore/12345678901234567890123456789012/
imageset/18f88ac7870584f58d56256646b4d92b" \
    --tag-keys '["Deployment"]'
```

This command produces no output.

For more information, see Tagging resources with AWS HealthImaging in the *AWS HealthImaging Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-image-set-metadata`

The following code example shows how to use `update-image-set-metadata`.

AWS CLI

Example 1: To insert or update an attribute in image set metadata

The following `update-image-set-metadata` example inserts or updates an attribute in image set metadata.

```
aws medical-imaging update-image-set-metadata \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
    --latest-version-id 1 \
    --cli-binary-format raw-in-base64-out \
    --update-image-set-metadata-updates file://metadata-updates.json
```

Contents of `metadata-updates.json`:

```
{
    "DICOMUpdates": {
        "updatableAttributes": "{\"SchemaVersion\":1.1,\"Patient\":{\"DICOM\":
{\"PatientName\":\"MX^MX\"}}}"
    }
}
```

Output:

```
{
    "latestVersionId": "2",
    "imageSetWorkflowStatus": "UPDATING",
    "updatedAt": 1680042257.908,
    "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
    "imageSetState": "LOCKED",
    "createdAt": 1680027126.436,
    "datastoreId": "12345678901234567890123456789012"
}
```

Example 2: To remove an attribute from image set metadata

The following `update-image-set-metadata` example removes an attribute from image set metadata.

```
aws medical-imaging update-image-set-metadata \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
    --latest-version-id 1 \
    --cli-binary-format raw-in-base64-out \
    --update-image-set-metadata-updates file://metadata-updates.json
```

Contents of `metadata-updates.json`:

```
{
    "DICOMUpdates": {
        "removableAttributes": "{\"SchemaVersion\":1.1,\"Study\":{\"DICOM\":
{\"StudyDescription\":\"CHEST\"}}}"
    }
}
```

Output:

```
{
    "latestVersionId": "2",
    "imageSetWorkflowStatus": "UPDATING",
    "updatedAt": 1680042257.908,
    "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
    "imageSetState": "LOCKED",
    "createdAt": 1680027126.436,
    "datastoreId": "12345678901234567890123456789012"
}
```

Example 3: To remove an instance from image set metadata

The following `update-image-set-metadata` example removes an instance from image set metadata.

```
aws medical-imaging update-image-set-metadata \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
    --latest-version-id 1 \
    --cli-binary-format raw-in-base64-out \
    --update-image-set-metadata-updates file://metadata-updates.json \
    --force
```

Contents of `metadata-updates.json`:

```
{
    "DICOMUpdates": {
        "removableAttributes": "{\"SchemaVersion\": 1.1,\"Study\": {\"Series
\": {\"1.1.1.1.1.1.12345.123456789012.123.12345678901234.1\": {\"Instances\":
 {\"1.1.1.1.1.1.12345.123456789012.123.12345678901234.1\": {}}}}}}"
    }
}
```

Output:

```
{
    "latestVersionId": "2",
    "imageSetWorkflowStatus": "UPDATING",
    "updatedAt": 1680042257.908,
    "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
```

```
    "imageSetState": "LOCKED",
    "createdAt": 1680027126.436,
    "datastoreId": "12345678901234567890123456789012"
}
```

Example 4: To revert an image set to a previous version

The following `update-image-set-metadata` example shows how to revert an image set to a prior version. CopyImageSet and UpdateImageSetMetadata actions create new versions of image sets.

```
aws medical-imaging update-image-set-metadata \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id 53d5fdb05ca4d46ac7ca64b06545c66e \
    --latest-version-id 3 \
    --cli-binary-format raw-in-base64-out \
    --update-image-set-metadata-updates '{"revertToVersionId": "1"}'
```

Output:

```
{
    "datastoreId": "12345678901234567890123456789012",
    "imageSetId": "53d5fdb05ca4d46ac7ca64b06545c66e",
    "latestVersionId": "4",
    "imageSetState": "LOCKED",
    "imageSetWorkflowStatus": "UPDATING",
    "createdAt": 1680027126.436,
    "updatedAt": 1680042257.908
}
```

Example 5: To add a private DICOM data element to an instance

The following `update-image-set-metadata` example shows how to add a private element to a specified instance within an image set. The DICOM standard permits private data elements for communication of information that cannot be contained in standard data elements. You can create, update, and delete private data elements with the UpdateImageSetMetadata action.

```
aws medical-imaging update-image-set-metadata \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id 53d5fdb05ca4d46ac7ca64b06545c66e \
    --latest-version-id 1 \
```

```
    --cli-binary-format raw-in-base64-out \
    --force \
    --update-image-set-metadata-updates file://metadata-updates.json
```

Contents of `metadata-updates.json`:

```
{
    "DICOMUpdates": {
        "updatableAttributes": "{\"SchemaVersion\": 1.1,\"Study\": {\"Series
\": {\"1.1.1.1.1.1.12345.123456789012.123.12345678901234.1\": {\"Instances
\": {\"1.1.1.1.1.1.12345.123456789012.123.12345678901234.1\": {\"DICOM\":
 {\"001910F9\": \"97\"},\"DICOMVRs\": {\"001910F9\": \"DS\"}}}}}}"
    }
}
```

Output:

```
{
    "latestVersionId": "2",
    "imageSetWorkflowStatus": "UPDATING",
    "updatedAt": 1680042257.908,
    "imageSetId": "53d5fdb05ca4d46ac7ca64b06545c66e",
    "imageSetState": "LOCKED",
    "createdAt": 1680027126.436,
    "datastoreId": "12345678901234567890123456789012"
}
```

Example 6: To update a private DICOM data element to an instance

The following `update-image-set-metadata` example shows how to update the value of a private data element belonging to an instance within an image set.

```
aws medical-imaging update-image-set-metadata \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id 53d5fdb05ca4d46ac7ca64b06545c66e \
    --latest-version-id 1 \
    --cli-binary-format raw-in-base64-out \
    --force \
    --update-image-set-metadata-updates file://metadata-updates.json
```

Contents of `metadata-updates.json`:

```
{
    "DICOMUpdates": {
        "updatableAttributes": "{\"SchemaVersion\": 1.1,\"Study\": {\"Series
\": {\"1.1.1.1.1.1.12345.123456789012.123.12345678901234.1\": {\"Instances
\": {\"1.1.1.1.1.1.12345.123456789012.123.12345678901234.1\": {\"DICOM\":
 {\"00091001\": \"GE_GENESIS_DD\"}}}}}}"
    }
}
```

Output:

```
{
    "latestVersionId": "2",
    "imageSetWorkflowStatus": "UPDATING",
    "updatedAt": 1680042257.908,
    "imageSetId": "53d5fdb05ca4d46ac7ca64b06545c66e",
    "imageSetState": "LOCKED",
    "createdAt": 1680027126.436,
    "datastoreId": "12345678901234567890123456789012"
}
```

Example 7: To update a SOPInstanceUID with the force parameter

The following `update-image-set-metadata` example shows how to update a SOPInstanceUID, using the force parameter to override the DICOM metadata constraints.

```
aws medical-imaging update-image-set-metadata \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id 53d5fdb05ca4d46ac7ca64b06545c66e \
    --latest-version-id 1 \
    --cli-binary-format raw-in-base64-out \
    --force \
    --update-image-set-metadata-updates file://metadata-updates.json
```

Contents of `metadata-updates.json`:

```
{
    "DICOMUpdates": {
        "updatableAttributes": "{\"SchemaVersion\":1.1,\"Study\":{\"Series\":
{\"1.3.6.1.4.1.5962.99.1.3633258862.2104868982.1369432891697.3656.0\":{\"Instances
\":{\"1.3.6.1.4.1.5962.99.1.3633258862.2104868982.1369432891697.3659.0\":{\"DICOM\":
```

```
{\"SOPInstanceUID\":
\"1.3.6.1.4.1.5962.99.1.3633258862.2104868982.1369432891697.3659.9\"}}}}}}"
    }
}
```

Output:

```
{
    "latestVersionId": "2",
    "imageSetWorkflowStatus": "UPDATING",
    "updatedAt": 1680042257.908,
    "imageSetId": "53d5fdb05ca4d46ac7ca64b06545c66e",
    "imageSetState": "LOCKED",
    "createdAt": 1680027126.436,
    "datastoreId": "12345678901234567890123456789012"
}
```

For more information, see Updating image set metadata in the *AWS HealthImaging Developer Guide*.

- For API details, see UpdateImageSetMetadata in *AWS CLI Command Reference*.

HealthLake examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with HealthLake.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-fhir-datastore`

The following code example shows how to use `create-fhir-datastore`.

AWS CLI

Example 1: To create a SigV4-enabled HealthLake data store

The following `create-fhir-datastore` example demonstrates how to create a new data store in AWS HealthLake.

```
aws healthlake create-fhir-datastore \
    --datastore-type-version R4 \
    --datastore-name "FhirTestDatastore"
```

Output:

```
{
    "DatastoreEndpoint": "https://healthlake.us-west-2.amazonaws.com/datastore/
a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6/r4/",
    "DatastoreArn": "arn:aws:healthlake:us-west-2:123456789012:datastore/
a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6",
    "DatastoreStatus": "CREATING",
    "DatastoreId": "a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6"
}
```

Example 2: To create a SMART on FHIR-enabled HealthLake data store

The following `create-fhir-datastore` example demonstrates how to create a new SMART on FHIR-enabled data store in AWS HealthLake.

```
aws healthlake create-fhir-datastore \
    --datastore-name "your-data-store-name" \
    --datastore-type-version R4 \
    --preload-data-config PreloadDataType="SYNTHEA" \
    --sse-configuration '{ "KmsEncryptionConfig": {  "CmkType":
 "CUSTOMER_MANAGED_KMS_KEY", "KmsKeyId": "arn:aws:kms:us-west-2:your-account-id:key/
your-key-id" } }' \
    --identity-provider-configuration  file://identity_provider_configuration.json
```

Contents of `identity_provider_configuration.json`:

```
{
    "AuthorizationStrategy": "SMART_ON_FHIR_V1",
    "FineGrainedAuthorizationEnabled": true,
```

```
    "IdpLambdaArn": "arn:aws:lambda:your-region:your-account-id:function:your-
lambda-name",
    "Metadata": "{\"issuer\":\"https://ehr.example.com\", \"jwks_uri\":\"https://
ehr.example.com/.well-known/jwks.json\",\"authorization_endpoint\":\"https://
ehr.example.com/auth/authorize\",\"token_endpoint\":\"https://ehr.token.com/auth/
token\",\"token_endpoint_auth_methods_supported\":[\"client_secret_basic\",\"foo\"],
\"grant_types_supported\":[\"client_credential\",\"foo\"],\"registration_endpoint\":
\"https://ehr.example.com/auth/register\",\"scopes_supported\":[\"openId\",\"profile
\",\"launch\"],\"response_types_supported\":[\"code\"],\"management_endpoint\":
\"https://ehr.example.com/user/manage\",\"introspection_endpoint\":\"https://
ehr.example.com/user/introspect\",\"revocation_endpoint\":\"https://ehr.example.com/
user/revoke\",\"code_challenge_methods_supported\":[\"S256\"],\"capabilities\":
[\"launch-ehr\",\"sso-openid-connect\",\"client-public\"]}"
}
```

Output:

```
{
    "DatastoreEndpoint": "https://healthlake.us-west-2.amazonaws.com/datastore/
a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6/r4/",
    "DatastoreArn": "arn:aws:healthlake:us-west-2:123456789012:datastore/
a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6",
    "DatastoreStatus": "CREATING",
    "DatastoreId": "a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6"
}
```

For more information, see Creating a HealthLake data store in the *AWS HealthLake Developer Guide*.

- For API details, see CreateFHIRDatastore in *AWS CLI Command Reference*.

`delete-fhir-datastore`

The following code example shows how to use `delete-fhir-datastore`.

AWS CLI

To delete a FHIR data store

The following `delete-fhir-datastore` example demonstrates how to delete a data store and all of its contents in AWS HealthLake.

```
aws healthlake delete-fhir-datastore \
```

```
    --datastore-id a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6
```

Output:

```
{
    "DatastoreEndpoint": "https://healthlake.us-west-2.amazonaws.com/datastore/
a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6/r4/",
    "DatastoreArn": "arn:aws:healthlake:us-west-2:123456789012:datastore/
a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6",
    "DatastoreStatus": "DELETING",
    "DatastoreId": "a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6"
}
```

For more information, see Deleting a HealthLake data store in the *AWS HealthLake Developer Guide*.

- For API details, see DeleteFHIRDatastore in *AWS CLI Command Reference*.

`describe-fhir-datastore`

The following code example shows how to use `describe-fhir-datastore`.

AWS CLI

To describe a FHIR data store

The following `describe-fhir-datastore` example demonstrates how to find the properties of a data store in AWS HealthLake.

```
aws healthlake describe-fhir-datastore \
    --datastore-id "1f2f459836ac6c513ce899f9e4f66a59"
```

Output:

```
{
    "DatastoreProperties": {
        "PreloadDataConfig": {
            "PreloadDataType": "SYNTHEA"
        },
        "SseConfiguration": {
            "KmsEncryptionConfig": {
                "CmkType": "CUSTOMER_MANAGED_KMS_KEY",
```

```
                "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
            }
        },
        "DatastoreName": "Demo",
        "DatastoreArn": "arn:aws:healthlake:us-west-2:123456789012:datastore/
a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6",
        "DatastoreEndpoint": "https://healthlake.us-west-2.amazonaws.com/datastore/
a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6/r4/",
        "DatastoreStatus": "ACTIVE",
        "DatastoreTypeVersion": "R4",
        "CreatedAt": 1603761064.881,
        "DatastoreId": "a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6",
        "IdentityProviderConfiguration": {
            "AuthorizationStrategy": "AWS_AUTH",
            "FineGrainedAuthorizationEnabled": false
        }
    }
}
```

For more information, see Getting HealthLake data store properties in the *AWS HealthLake Developer Guide*.

- For API details, see DescribeFHIRDatastore in *AWS CLI Command Reference*.

`describe-fhir-export-job`

The following code example shows how to use `describe-fhir-export-job`.

AWS CLI

To describe a FHIR export job

The following `describe-fhir-export-job` example shows how to find the properties of a FHIR export job in AWS HealthLake.

```
aws healthlake describe-fhir-export-job \
    --datastore-id a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6 \
    --job-id 9b9a51943afaedd0a8c0c26c49135a31
```

Output:

```
{
```

```
    "ExportJobProperties": {
        "DataAccessRoleArn": "arn:aws:iam::123456789012:role/
HealthLakeDataAccessRole",
        "JobStatus": "IN_PROGRESS",
        "JobId": "9009813e9d69ba7cf79bcb3468780f16",
        "SubmitTime": "2024-11-20T11:31:46.672000-05:00",
        "EndTime": "2024-11-20T11:34:01.636000-05:00",
        "OutputDataConfig": {
            "S3Configuration": {
            "S3Uri": "s3://amzn-s3-demo-bucket/healthlake/",
            "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111"
        }

        },
        "DatastoreId": "a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6"
    }
}
```

For more information, see Exporting files from a FHIR data store in the *AWS HealthLake Developer Guide*.

- For API details, see DescribeFHIRExportJob in *AWS CLI Command Reference*.

`describe-fhir-import-job`

The following code example shows how to use `describe-fhir-import-job`.

AWS CLI

To describe a FHIR import job

The following `describe-fhir-import-job` example shows how to learn the properties of a FHIR import job using AWS HealthLake.

```
aws healthlake describe-fhir-import-job \
    --datastore-id a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6 \
    --job-id c145fbb27b192af392f8ce6e7838e34f
```

Output:

```
{
```

```
    "ImportJobProperties": {
    "InputDataConfig": {
        "S3Uri": "s3://amzn-s3-demo-bucket/healthlake/"
    },
    "DataAccessRoleArn": "arn:aws:iam::123456789012:role/HealthLakeDataAccessRole",
    "JobStatus": "COMPLETED",
    "JobId": "c145fbb27b192af392f8ce6e7838e34f",
    "SubmitTime": 1606272542.161,
    "EndTime": 1606272609.497,
    "DatastoreId": "a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6"
    }
}
```

For more information, see Importing files to a FHIR data store in the *AWS HealthLake Developer Guide*.

- For API details, see DescribeFHIRImportJob in *AWS CLI Command Reference*.

`list-fhir-datastores`

The following code example shows how to use `list-fhir-datastores`.

AWS CLI

To list FHIR data stores

The following `list-fhir-datastores` example shows to how to use the command and how users can filter results based on data store status in AWS HealthLake.

```
aws healthlake list-fhir-datastores \
    --filter DatastoreStatus=ACTIVE
```

Output:

```
{
    "DatastorePropertiesList": [
    {
        "PreloadDataConfig": {
            "PreloadDataType": "SYNTHEA"
        },
        "SseConfiguration": {
            "KmsEncryptionConfig": {
                "CmkType": "CUSTOMER_MANAGED_KMS_KEY",
```

```
                "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
            }
        },
        "DatastoreName": "Demo",
        "DatastoreArn": "arn:aws:healthlake:us-west-2:123456789012:datastore/
a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6",
        "DatastoreEndpoint": "https://healthlake.us-west-2.amazonaws.com/datastore/
a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6/r4/",
        "DatastoreStatus": "ACTIVE",

    ]
}
```

For more information, see Listing HealthLake data stores in the *AWS HealthLake Developer Guide*.

- For API details, see ListFHIRDatastores in *AWS CLI Command Reference*.

`list-fhir-export-jobs`

The following code example shows how to use `list-fhir-export-jobs`.

AWS CLI

To list all FHIR export jobs

The following `list-fhir-export-jobs` example shows how to use the command to view a list of export jobs associated with an account.

```
aws healthlake list-fhir-export-jobs \
    --datastore-id a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6 \
    --submitted-before 2024-10-13T19:00:00Z \
    --submitted-after 2020-10-13T19:00:00Z \
    --job-name "FHIR-EXPORT" \
    --job-status SUBMITTED \
```

```
    --max-results 50
```

Output:

```
{
    "ExportJobPropertiesList": [
        {
            "OutputDataConfig": {
                "S3Configuration": {
                    "S3Uri": "s3://amzn-s3-demo-bucket/healthlake/",
                    "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
                }
            },
            "DataAccessRoleArn": "arn:aws:iam::123456789012:role/
HealthLakeDataAccessRole",
            "JobStatus": "COMPLETED",

            "JobName": "FHIR-EXPORT",
            "SubmitTime": "2024-11-20T11:31:46.672000-05:00",
            "EndTime": "2024-11-20T11:34:01.636000-05:00",
            "DatastoreId": "a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6"
        }
    ]
}
```

For more information, see Listing FHIR export jobs in the *AWS HealthLake Developer Guide*.

- For API details, see ListFHIRExportJobs in *AWS CLI Command Reference*.

`list-fhir-import-jobs`

The following code example shows how to use `list-fhir-import-jobs`.

AWS CLI

To list all FHIR import jobs

The following `list-fhir-import-jobs` example shows how to use the command to view a list of all import jobs associated with an account.

```
aws healthlake list-fhir-import-jobs \
    --datastore-id a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6 \
```

```
    --submitted-before 2024-10-13T19:00:00Z \
    --submitted-after 2020-10-13T19:00:00Z \
    --job-name "FHIR-IMPORT" \
    --job-status SUBMITTED \
    --max-results 50
```

Output:

```
{
    "ImportJobPropertiesList": [
        {
            "JobId": "c0fddbf76f238297632d4aebdbfc9ddf",

                "TotalNumberOfFilesReadWithCustomerError": 0,
                "Throughput": 0.0
            },
            "DataAccessRoleArn": "arn:aws:iam::123456789012:role/
HealthLakeDataAccessRole"
        }
    ]
}
```

For more information, see Listing FHIR import jobs in the *AWS HealthLake Developer Guide*.

- For API details, see ListFHIRImportJobs in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a data store

The following `list-tags-for-resource` example lists the tags associated with the specified data store.

```
aws healthlake list-tags-for-resource \
    --resource-arn "arn:aws:healthlake:us-west-2:123456789012:datastore/fhir/0725c83f4307f263e16fd56b6d8ebdbe"
```

Output:

```
{
    "Tags": [
        {
            "Key": "key",
            "Value": "value"
        },
        {
            "Key": "key1",
            "Value": "value1"
        }
    ]
}
```

For more information, see Tagging HealthLake data stores in the *AWS HealthLake Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`start-fhir-export-job`

The following code example shows how to use `start-fhir-export-job`.

AWS CLI

To start a FHIR export job

The following `start-fhir-export-job` example shows how to start a FHIR export job using AWS HealthLake.

```
aws healthlake start-fhir-export-job \
    --output-data-config '{"S3Configuration": {"S3Uri":"s3://amzn-s3-demo-bucket/
healthlake/","KmsKeyId":"arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111"}}' \
    --datastore-id a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6 \
    --data-access-role-arn arn:aws:iam::123456789012:role/HealthLakeDataAccessRole
```

Output:

```
{
    "DatastoreId": "a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6",
    "JobStatus": "SUBMITTED",
    "JobId": "9b9a51943afaedd0a8c0c26c49135a31"
}
```

For more information, see Exporting files from a FHIR data store in the *AWS HealthLake Developer Guide*.

- For API details, see StartFHIRExportJob in *AWS CLI Command Reference*.

`start-fhir-import-job`

The following code example shows how to use `start-fhir-import-job`.

AWS CLI

To start a FHIR import job

The following `start-fhir-import-job` example shows how to start a FHIR import job using AWS HealthLake.

```
aws healthlake start-fhir-import-job \
    --input-data-config S3Uri="s3://amzn-s3-demo-bucket/healthlake/" \
    --job-output-data-config '{"S3Configuration": {"S3Uri":"s3://amzn-s3-
demo-bucket/healthlake/","KmsKeyId":"arn:aws:kms:us-west-2:123456789012:key/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"}}' \
```

```
    --datastore-id a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6 \
    --data-access-role-arn "arn:aws:iam::123456789012:role/HealthLakeDataAccessRole"
```

Output:

```
{
    "DatastoreId": "a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6",
    "JobStatus": "SUBMITTED",
    "JobId": "c145fbb27b192af392f8ce6e7838e34f"
}
```

For more information, see Importing files to a FHIR data store in the *AWS HealthLake Developer Guide*.

- For API details, see StartFHIRImportJob in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to data store

The following `tag-resource` example shows how to add a tag to a data store.

```
aws healthlake tag-resource \
    --resource-arn "arn:aws:healthlake:us-west-2:123456789012:datastore/
fhir/0725c83f4307f263e16fd56b6d8ebdbe" \
    --tags '[{"Key": "key1", "Value": "value1"}]'
```

This command produces no output.

For more information, see Tagging HealthLake data stores in the *AWS HealthLake Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a data store.

The following `untag-resource` example shows how to remove tags from a data store.

```
aws healthlake untag-resource \
    --resource-arn "arn:aws:healthlake:us-west-2:123456789012:datastore/fhir/
b91723d65c6fdeb1d26543a49d2ed1fa" \
    --tag-keys '["key1"]'
```

This command produces no output.

For more information, see Removing tags from a data store in the *AWS HealthLake Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

HealthOmics examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with HealthOmics.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`abort-multipart-read-set-upload`

The following code example shows how to use `abort-multipart-read-set-upload`.

AWS CLI

To stop a multipart read set upload

The following `abort-multipart-read-set-upload` example stops a multipart read set upload into your HealthOmics sequence store.

```
aws omics abort-multipart-read-set-upload \
    --sequence-store-id 0123456789 \
    --upload-id 1122334455
```

This command produces no output.

For more information, see Direct upload to a sequence store in the *AWS HealthOmics User Guide*.

- For API details, see AbortMultipartReadSetUpload in *AWS CLI Command Reference*.

`accept-share`

The following code example shows how to use `accept-share`.

AWS CLI

To accept a share of analytics store data

The following `accept-share` example accepts a share of HealthOmics analytics store data.

```
aws omics accept-share \
    --share-id "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a"
```

Output:

```
{
    "status": "ACTIVATING"
}
```

For more information, see Cross-account sharing in the *AWS HealthOmics User Guide*.

- For API details, see AcceptShare in *AWS CLI Command Reference*.

`batch-delete-read-set`

The following code example shows how to use `batch-delete-read-set`.

AWS CLI

To delete multiple read sets

The following `batch-delete-read-set` example deletes two read sets.

```
aws omics batch-delete-read-set \
    --sequence-store-id 1234567890 \
    --ids 1234567890 0123456789
```

If there is an error deleting any of the specified read sets, the service returns an error list.

Output:

```
{
    "errors": [
        {
            "code": "",
            "id": "0123456789",
            "message": "The specified readset does not exist."
        }
    ]
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see BatchDeleteReadSet in *AWS CLI Command Reference*.

`cancel-annotation-import-job`

The following code example shows how to use `cancel-annotation-import-job`.

AWS CLI

To cancel an annotation import job

The following `cancel-annotation-import-job` example cancels an annotation import job with ID `a1b2c3d4-5678-90ab-cdef-EXAMPLE11111`.

```
aws omics cancel-annotation-import-job \
    --job-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see CancelAnnotationImportJob in *AWS CLI Command Reference*.

`cancel-run`

The following code example shows how to use `cancel-run`.

AWS CLI

To cancel a run

The following `cancel-run` example cancels a run with ID `1234567`.

```
aws omics cancel-run \
    --id 1234567
```

This command produces no output.

For more information, see Run lifecycle in a workflow in the *AWS HealthOmics User Guide*.

- For API details, see CancelRun in *AWS CLI Command Reference*.

`cancel-variant-import-job`

The following code example shows how to use `cancel-variant-import-job`.

AWS CLI

To cancel a variant import job

The following `cancel-variant-import-job` example cancels a variant import job with ID `a1b2c3d4-5678-90ab-cdef-EXAMPLE11111`.

```
aws omics cancel-variant-import-job \
    --job-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see CancelVariantImportJob in *AWS CLI Command Reference*.

`complete-multipart-read-set-upload`

The following code example shows how to use `complete-multipart-read-set-upload`.

AWS CLI

To conclude a multipart upload once you have uploaded all of the components.

The following `complete-multipart-read-set-upload` example concludes a multipart upload into a sequence store once all of the components have been uploaded.

```
aws omics complete-multipart-read-set-upload \
    --sequence-store-id 0123456789 \
    --upload-id 1122334455 \
    --parts '[{"checksum":"gaCBQMe+rpCFZxLpoP6gydBoXaKKDA/
Vobh5zBDb4W4=","partNumber":1,"partSource":"SOURCE1"}]'
```

Output:

```
{
    "readSetId": "0000000001"
}
```

For more information, see Direct upload to a sequence store in the *AWS HealthOmics User Guide*.

- For API details, see CompleteMultipartReadSetUpload in *AWS CLI Command Reference*.

`create-annotation-store-version`

The following code example shows how to use `create-annotation-store-version`.

AWS CLI

To create a new version of an annotation store

The following `create-annotation-store-version` example creates a new version of an annotation store.

```
aws omics create-annotation-store-version \
    --name my_annotation_store \
```

```
    --version-name my_version
```

Output:

```
{
    "creationTime": "2023-07-21T17:15:49.251040+00:00",
    "id": "3b93cdef69d2",
    "name": "my_annotation_store",
    "status": "CREATING",
    "versionName": "my_version"
}
```

For more information, see Creating new versions of annotation stores in the *AWS HealthOmics User Guide*.

- For API details, see CreateAnnotationStoreVersion in *AWS CLI Command Reference*.

`create-annotation-store`

The following code example shows how to use `create-annotation-store`.

AWS CLI

Example 1: To create a VCF annotation store

The following `create-annotation-store` example creates a VCF format annotation store.

```
aws omics create-annotation-store \
    --name my_ann_store \
    --store-format VCF \
    --reference referenceArn=arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890
```

Output:

```
{
    "creationTime": "2022-11-23T22:48:39.226492Z",
    "id": "0a91xmplc71f",
    "name": "my_ann_store",
    "reference": {
        "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
```

```
    },
    "status": "CREATING",
    "storeFormat": "VCF"
}
```

For more information, see Creating HealthOmics annotation stores in the *AWS HealthOmics User Guide*.

Example 2: To create a TSV annotation store

The following `create-annotation-store` example creates a TSV format annotation store.

```
aws omics create-annotation-store \
    --name tsv_ann_store \
    --store-format TSV \
    --reference referenceArn=arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890 \
    --store-options file://tsv-store-options.json
```

The `tsv-store-options.json` file configures format options for annotations.

Contents of `tsv-store-options.json`:

```
{
    "tsvStoreOptions": {
        "annotationType": "CHR_START_END_ZERO_BASE",
        "formatToHeader": {
            "CHR": "chromosome",
            "START": "start",
            "END": "end"
        },
        "schema": [
            {
                "chromosome": "STRING"
            },
            {
                "start": "LONG"
            },
            {
                "end": "LONG"
            },
            {
```

```
                "name": "STRING"
            }
        ]
    }
}
```

Output:

```
{
    "creationTime": "2022-11-30T01:28:08.525586Z",
    "id": "861cxmpl96b0",
    "name": "tsv_ann_store",
    "reference": {
        "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
    },
    "status": "CREATING",
    "storeFormat": "TSV",
    "storeOptions": {
        "tsvStoreOptions": {
            "annotationType": "CHR_START_END_ZERO_BASE",
            "formatToHeader": {
                "CHR": "chromosome",
                "END": "end",
                "START": "start"
            },
            "schema": [
                {
                    "chromosome": "STRING"
                },
                {
                    "start": "LONG"
                },
                {
                    "end": "LONG"
                },
                {
                    "name": "STRING"
                }
            ]
        }
    }
}
```

For more information, see Creating HealthOmics annotation stores in the *AWS HealthOmics User Guide*.

- For API details, see CreateAnnotationStore in *AWS CLI Command Reference*.

`create-multipart-read-set-upload`

The following code example shows how to use `create-multipart-read-set-upload`.

AWS CLI

To begin a multipart read set upload.

The following `create-multipart-read-set-upload` example initiates a multipart read set upload.

```
aws omics create-multipart-read-set-upload \
    --sequence-store-id 0123456789 \
    --name HG00146 \
    --source-file-type FASTQ \
    --subject-id mySubject \
    --sample-id mySample \
    --description "FASTQ for HG00146" \
    --generated-from "1000 Genomes"
```

Output:

```
{
    "creationTime": "2022-07-13T23:25:20Z",
    "description": "FASTQ for HG00146",
    "generatedFrom": "1000 Genomes",
    "name": "HG00146",
    "sampleId": "mySample",
    "sequenceStoreId": "0123456789",
    "sourceFileType": "FASTQ",
    "subjectId": "mySubject",
    "uploadId": "1122334455"
}
```

For more information, see Direct upload to a sequence store in the *AWS HealthOmics User Guide*.

- For API details, see CreateMultipartReadSetUpload in *AWS CLI Command Reference*.

`create-reference-store`

The following code example shows how to use `create-reference-store`.

AWS CLI

To create a reference store

The following `create-reference-store` example creates a reference store `my-ref-store`.

```
aws omics create-reference-store \
    --name my-ref-store
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:referenceStore/1234567890",
    "creationTime": "2022-11-22T22:13:25.947Z",
    "id": "1234567890",
    "name": "my-ref-store"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see CreateReferenceStore in *AWS CLI Command Reference*.

`create-run-group`

The following code example shows how to use `create-run-group`.

AWS CLI

To create a run group

The following `create-run-group` example creates a run group named `cram-converter`.

```
aws omics create-run-group \
    --name cram-converter \
    --max-cpus 20 \
    --max-gpus 10 \
    --max-duration 600 \
    --max-runs 5
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:runGroup/1234567",
    "id": "1234567",
    "tags": {}
}
```

For more information, see Creating run groups in the *AWS HealthOmics User Guide*.

- For API details, see CreateRunGroup in *AWS CLI Command Reference*.

`create-sequence-store`

The following code example shows how to use `create-sequence-store`.

AWS CLI

To create a sequence store

The following `create-sequence-store` example creates a sequence store.

```
aws omics create-sequence-store \
    --name my-seq-store
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:sequenceStore/1234567890",
    "creationTime": "2022-11-23T01:24:33.629Z",
    "id": "1234567890",
    "name": "my-seq-store"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see CreateSequenceStore in *AWS CLI Command Reference*.

`create-share`

The following code example shows how to use `create-share`.

AWS CLI

To create a share of a HealthOmics analytics store

The following `create-share` example shows how to create a share of a HealthOmics analytics store that can be accepted by a subscriber outside the account.

```
aws omics create-share \
    --resource-arn "arn:aws:omics:us-west-2:123456789111:variantStore/
omics_dev_var_store" \
    --principal-subscriber "123456789012" \
    --share-name "my_Share-123"
```

Output:

```
{
    "shareId": "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a",
    "shareName": "my_Share-123",
    "status": "PENDING"
}
```

For more information, see Cross-acount sharing in the *AWS HealthOmics User Guide*.

- For API details, see CreateShare in *AWS CLI Command Reference*.

`create-variant-store`

The following code example shows how to use `create-variant-store`.

AWS CLI

To create a variant store

The following `create-variant-store` example creates a variant store named `my_var_store`.

```
aws omics create-variant-store \
    --name my_var_store \
    --reference referenceArn=arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890
```

Output:

```
{
    "creationTime": "2022-11-23T22:09:07.534499Z",
    "id": "02dexmplcfdd",
    "name": "my_var_store",
    "reference": {
        "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
    },
    "status": "CREATING"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see CreateVariantStore in *AWS CLI Command Reference*.

`create-workflow`

The following code example shows how to use `create-workflow`.

AWS CLI

To create a workflow

The following `create-workflow` example creates a WDL workflow.

```
aws omics create-workflow \
    --name cram-converter \
    --engine WDL \
    --definition-zip fileb://workflow-crambam.zip \
    --parameter-template file://workflow-params.json
```

`workflow-crambam.zip` is a ZIP archive containing a workflow definition. `workflow-params.json` defines runtime parameters for the workflow.

Contents of `workflow-params.json`:

```
{
    "ref_fasta": {
        "description": "Reference genome fasta file",
        "optional": false
    },
    "ref_fasta_index": {
```

```
        "description": "Index of the reference genome fasta file",
        "optional": false
    },
    "ref_dict": {
        "description": "dictionary file for 'ref_fasta'",
        "optional": false
    },
    "input_cram": {
        "description": "The Cram file to convert to BAM",
        "optional": false
    },
    "sample_name": {
        "description": "The name of the input sample, used to name the output BAM",
        "optional": false
    }
}
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:workflow/1234567",
    "id": "1234567",
    "status": "CREATING",
    "tags": {}
}
```

For more information, see Creating private workflows in the *AWS HealthOmics User Guide*.

- For API details, see CreateWorkflow in *AWS CLI Command Reference*.

`delete-annotation-store-versions`

The following code example shows how to use `delete-annotation-store-versions`.

AWS CLI

To delete an annotation store version

The following `delete-annotation-store-versions` example deletes an annotation store version.

```
aws omics delete-annotation-store-versions \
```

```
    --name my_annotation_store \
    --versions my_version
```

Output:

```
{
    "errors": []
}
```

For more information, see Creating new versions of annotation stores in the *AWS HealthOmics User Guide*.

- For API details, see DeleteAnnotationStoreVersions in *AWS CLI Command Reference*.

`delete-annotation-store`

The following code example shows how to use `delete-annotation-store`.

AWS CLI

To delete an annotation store

The following `delete-annotation-store` example deletes an annotation store named `my_vcf_store`.

```
aws omics delete-annotation-store \
    --name my_vcf_store
```

Output:

```
{
    "status": "DELETING"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see DeleteAnnotationStore in *AWS CLI Command Reference*.

`delete-reference-store`

The following code example shows how to use `delete-reference-store`.

AWS CLI

To delete a reference store

The following `delete-reference-store` example deletes a reference store with ID `1234567890`.

```
aws omics delete-reference-store \
    --id 1234567890
```

This command produces no output.

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see DeleteReferenceStore in *AWS CLI Command Reference*.

`delete-reference`

The following code example shows how to use `delete-reference`.

AWS CLI

To delete a reference

The following `delete-reference` example deletes a reference.

```
aws omics delete-reference \
    --reference-store-id 1234567890 \
    --id 1234567890
```

This command produces no output.

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see DeleteReference in *AWS CLI Command Reference*.

`delete-run-group`

The following code example shows how to use `delete-run-group`.

AWS CLI

To delete a run group

The following `delete-run-group` example deletes a run group with ID `1234567`.

```
aws omics delete-run-group \
    --id 1234567
```

This command produces no output.

For more information, see Using HealthOmics run groups in the *AWS HealthOmics User Guide*.

- For API details, see DeleteRunGroup in *AWS CLI Command Reference*.

`delete-run`

The following code example shows how to use `delete-run`.

AWS CLI

To delete a workflow run

The following `delete-run` example deletes a run with ID `1234567`.

```
aws omics delete-run \
    --id 1234567
```

This command produces no output.

For more information, see Delete a run in HealthOmics in the *AWS HealthOmics User Guide*.

- For API details, see DeleteRun in *AWS CLI Command Reference*.

`delete-sequence-store`

The following code example shows how to use `delete-sequence-store`.

AWS CLI

To delete a sequence store

The following `delete-sequence-store` example deletes a sequence store with ID `1234567890`.

```
aws omics delete-sequence-store \
    --id 1234567890
```

This command produces no output.

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see DeleteSequenceStore in *AWS CLI Command Reference*.

`delete-share`

The following code example shows how to use `delete-share`.

AWS CLI

To delete a share of HealthOmics analytics data

The following `delete-share` example deletes a cross-account share of analytics data.

```
aws omics delete-share \
    --share-id "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a"
```

Output:

```
{
    "status": "DELETING"
}
```

For more information, see Cross-account sharing in the *AWS HealthOmics User Guide*.

- For API details, see DeleteShare in *AWS CLI Command Reference*.

`delete-variant-store`

The following code example shows how to use `delete-variant-store`.

AWS CLI

To delete a variant store

The following `delete-variant-store` example deletes a variant store named `my_var_store`.

```
aws omics delete-variant-store \
    --name my_var_store
```

Output:

```
{
    "status": "DELETING"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see DeleteVariantStore in *AWS CLI Command Reference*.

`delete-workflow`

The following code example shows how to use `delete-workflow`.

AWS CLI

To delete a workflow

The following `delete-workflow` example deletes a workflow with ID `1234567`.

```
aws omics delete-workflow \
    --id 1234567
```

This command produces no output.

For more information, see Delete a private workflow in the *AWS HealthOmics User Guide*.

- For API details, see DeleteWorkflow in *AWS CLI Command Reference*.

`get-annotation-import-job`

The following code example shows how to use `get-annotation-import-job`.

AWS CLI

To view an annotation import job

The following `get-annotation-import-job` example gets details about an annotation import job.

```
aws omics get-annotation-import-job \
    --job-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "creationTime": "2022-11-30T01:40:11.017746Z",
    "destinationName": "tsv_ann_store",
    "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "items": [
        {
            "jobStatus": "COMPLETED",
            "source": "s3://amzn-s3-demo-bucket/targetedregions.bed.gz"
        }
    ],
    "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W8O1XMPL7QZ",
    "runLeftNormalization": false,
    "status": "COMPLETED",
    "updateTime": "2022-11-30T01:42:39.134009Z"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see GetAnnotationImportJob in *AWS CLI Command Reference*.

`get-annotation-store-version`

The following code example shows how to use `get-annotation-store-version`.

AWS CLI

To retrieve the metadata for an annotation store version

The following `get-annotation-store-version` example retrieves the metadata for the requested annotation store version.

```
aws omics get-annotation-store-version \
    --name my_annotation_store \
    --version-name my_version
```

Output:

```
{
    "storeId": "4934045d1c6d",
```

```
    "id": "2a3f4a44aa7b",
    "status": "ACTIVE",
    "versionArn": "arn:aws:omics:us-west-2:123456789012:annotationStore/
my_annotation_store/version/my_version",
    "name": "my_annotation_store",
    "versionName": "my_version",
    "creationTime": "2023-07-21T17:15:49.251040+00:00",
    "updateTime": "2023-07-21T17:15:56.434223+00:00",
    "statusMessage": "",
    "versionSizeBytes": 0
}
```

For more information, see Creating new versions of annotation stores in the *AWS HealthOmics User Guide*.

- For API details, see GetAnnotationStoreVersion in *AWS CLI Command Reference*.

`get-annotation-store`

The following code example shows how to use `get-annotation-store`.

AWS CLI

To view an annotation store

The following `get-annotation-store` example gets details about an annotation store named `my_ann_store`.

```
aws omics get-annotation-store \
    --name my_ann_store
```

Output:

```
{
    "creationTime": "2022-11-23T22:48:39.226492Z",
    "id": "0a91xmplc71f",
    "name": "my_ann_store",
    "reference": {
        "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
    },
    "status": "CREATING",
```

```
    "storeArn": "arn:aws:omics:us-west-2:123456789012:annotationStore/my_ann_store",
    "storeFormat": "VCF",
    "storeSizeBytes": 0,
    "tags": {}
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see GetAnnotationStore in *AWS CLI Command Reference*.

`get-read-set-activation-job`

The following code example shows how to use `get-read-set-activation-job`.

AWS CLI

To view a read set activation job

The following `get-read-set-activation-job` example gets details about a read set activation job.

```
aws omics get-read-set-activation-job \
    --sequence-store-id 1234567890 \
    --id 1234567890
```

Output:

```
{
    "completionTime": "2022-12-06T22:33:42.828Z",
    "creationTime": "2022-12-06T22:32:45.213Z",
    "id": "1234567890",
    "sequenceStoreId": "1234567890",
    "sources": [
        {
            "readSetId": "1234567890",
            "status": "FINISHED",
            "statusMessage": "No activation needed as read set is already in
 ACTIVATING or ACTIVE state."
        }
    ],
    "status": "COMPLETED",
    "statusMessage": "The job completed successfully."
```

```
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReadSetActivationJob in *AWS CLI Command Reference*.

`get-read-set-export-job`

The following code example shows how to use `get-read-set-export-job`.

AWS CLI

To view a read set export job

The following `get-read-set-export-job` example gets details about a read set export job.

```
aws omics get-read-set-export-job \
    --sequence-store-id 1234567890 \
    --id 1234567890
```

Output:

```
{
    "completionTime": "2022-12-06T22:39:14.491Z",
    "creationTime": "2022-12-06T22:37:18.612Z",
    "destination": "s3://amzn-s3-demo-bucket/read-set-export/",
    "id": "1234567890",
    "sequenceStoreId": "1234567890",
    "status": "COMPLETED",
    "statusMessage": "The job is submitted and will start soon."
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReadSetExportJob in *AWS CLI Command Reference*.

`get-read-set-import-job`

The following code example shows how to use `get-read-set-import-job`.

AWS CLI

To view a read set import job

The following `get-read-set-import-job` example gets details about a read set import job.

```
aws omics get-read-set-import-job \
    --sequence-store-id 1234567890 \
    --id 1234567890
```

Output:

```
{
    "creationTime": "2022-11-23T01:36:38.158Z",
    "id": "1234567890",

            }
        }
    ],
    "status": "IN_PROGRESS",
    "statusMessage": "The job is currently in progress."
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReadSetImportJob in *AWS CLI Command Reference*.

`get-read-set-metadata`

The following code example shows how to use `get-read-set-metadata`.

AWS CLI

To view a read set

The following `get-read-set-metadata` example gets details about a read set's files.

```
aws omics get-read-set-metadata \
    --sequence-store-id 1234567890 \
    --id 1234567890
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:sequenceStore/1234567890/
readSet/1234567890",
    "creationTime": "2022-11-23T21:55:00.515Z",
    "fileType": "FASTQ",
    "files": {
        "source1": {
            "contentLength": 310054739,
            "partSize": 104857600,
            "totalParts": 3
        },
        "source2": {
            "contentLength": 307846621,
            "partSize": 104857600,
            "totalParts": 3
        }
    },
    "id": "1234567890",
    "name": "HG00146",
    "referenceArn": "arn:aws:omics:us-west-2:123456789012:referenceStore/1234567890/
reference/1234567890",
    "sampleId": "fastq-sample",
    "sequenceInformation": {
        "alignment": "UNALIGNED",
        "totalBaseCount": 677717384,
        "totalReadCount": 8917334
    },
    "sequenceStoreId": "1234567890",
    "status": "ACTIVE",
    "subjectId": "fastq-subject"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReadSetMetadata in *AWS CLI Command Reference*.

`get-read-set`

The following code example shows how to use `get-read-set`.

AWS CLI

To download a read set

The following `get-read-set` example downloads part 3 of a read set as `1234567890.3.bam`.

```
aws omics get-read-set \
    --sequence-store-id 1234567890 \
    --id 1234567890 \
    --part-number 3  1234567890.3.bam
```

This command produces no output.

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReadSet in *AWS CLI Command Reference*.

`get-reference-import-job`

The following code example shows how to use `get-reference-import-job`.

AWS CLI

To view a reference import job

The following `get-reference-import-job` example example gets details about a reference import job.

```
aws omics get-reference-import-job \
    --reference-store-id 1234567890 \
    --id 1234567890
```

Output:

```
{
    "creationTime": "2022-11-22T22:25:41.124Z",
    "id": "1234567890",
    "referenceStoreId": "1234567890",
```

```
    "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W8O1XMPL7QZ",
    "sources": [
        {
            "name": "assembly-38",
            "sourceFile": "s3://amzn-s3-demo-bucket/Homo_sapiens_assembly38.fasta",
            "status": "IN_PROGRESS",
            "statusMessage": "The source job is currently in progress."
        }
    ],
    "status": "IN_PROGRESS",
    "statusMessage": "The job is currently in progress."
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReferenceImportJob in *AWS CLI Command Reference*.

`get-reference-metadata`

The following code example shows how to use `get-reference-metadata`.

AWS CLI

To view a reference

The following `get-reference-metadata` example gets details about a reference.

```
aws omics get-reference-metadata \
    --reference-store-id 1234567890 \
    --id 1234567890
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:referenceStore/1234567890/
reference/1234567890",
    "creationTime": "2022-11-22T22:27:09.033Z",
    "files": {
        "index": {
            "contentLength": 160928,
            "partSize": 104857600,
            "totalParts": 1
```

```
        },
        "source": {
            "contentLength": 3249912778,
            "partSize": 104857600,
            "totalParts": 31
        }
    },
    "id": "1234567890",
    "md5": "7ff134953dcca8c8997453bbb80b6b5e",
    "name": "assembly-38",
    "referenceStoreId": "1234567890",
    "status": "ACTIVE",
    "updateTime": "2022-11-22T22:27:09.033Z"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReferenceMetadata in *AWS CLI Command Reference*.

`get-reference-store`

The following code example shows how to use `get-reference-store`.

AWS CLI

To view a reference store

The following `get-reference-store` example gets details about a reference store.

```
aws omics get-reference-store \
    --id 1234567890
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:referenceStore/1234567890",
    "creationTime": "2022-09-23T23:27:20.364Z",
    "id": "1234567890",
    "name": "my-rstore-0"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReferenceStore in *AWS CLI Command Reference*.

`get-reference`

The following code example shows how to use `get-reference`.

AWS CLI

To download a genome reference

The following `get-reference` example downloads part 1 of a genome as `hg38.1.fa`.

```
aws omics get-reference \
    --reference-store-id 1234567890 \
    --id 1234567890 \
    --part-number 1 hg38.1.fa
```

This command produces no output.

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReference in *AWS CLI Command Reference*.

`get-run-group`

The following code example shows how to use `get-run-group`.

AWS CLI

To view a run group

The following `get-run-group` example gets details about a run group.

```
aws omics get-run-group \
    --id 1234567
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:runGroup/1234567",
    "creationTime": "2022-12-01T00:58:42.915219Z",
    "id": "1234567",
```

```
    "maxCpus": 20,
    "maxDuration": 600,
    "name": "cram-convert",
    "tags": {}
}
```

For more information, see Creating run groups in the *AWS HealthOmics User Guide*.

- For API details, see GetRunGroup in *AWS CLI Command Reference*.

`get-run-task`

The following code example shows how to use `get-run-task`.

AWS CLI

To view a task

The following `get-run-task` example gets details about a workflow task.

```
aws omics get-run-task \
    --id 1234567 \
    --task-id 1234567
```

Output:

```
{
    "cpus": 1,
    "creationTime": "2022-11-30T23:13:00.718651Z",
    "logStream": "arn:aws:logs:us-west-2:123456789012:log-group:/aws/omics/
WorkflowLog:log-stream:run/1234567/task/1234567",
    "memory": 15,
    "name": "CramToBamTask",
    "startTime": "2022-11-30T23:17:47.016Z",
    "status": "COMPLETED",
    "stopTime": "2022-11-30T23:18:21.503Z",
    "taskId": "1234567"
}
```

For more information, see Task lifecycle in a HealthOmics run in the *AWS HealthOmics User Guide*.

- For API details, see GetRunTask in *AWS CLI Command Reference*.

get-run

The following code example shows how to use `get-run`.

AWS CLI

To view a workflow run

The following `get-run` example gets details about a workflow run.

```
aws omics get-run \
    --id 1234567
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:run/1234567",
    "creationTime": "2022-11-30T22:58:22.615865Z",
    "digest":

    "workflowType": "PRIVATE"
}
```

For more information, see Run lifecycle in a workflow in the *AWS HealthOmics User Guide*.

- For API details, see GetRun in *AWS CLI Command Reference*.

`get-sequence-store`

The following code example shows how to use `get-sequence-store`.

AWS CLI

To view a sequence store

The following `get-sequence-store` example gets details about a sequence store with ID 1234567890.

```
aws omics get-sequence-store \
    --id 1234567890
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:sequenceStore/1234567890",
    "creationTime": "2022-11-23T19:55:48.376Z",
    "id": "1234567890",
    "name": "my-seq-store"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetSequenceStore in *AWS CLI Command Reference*.

`get-share`

The following code example shows how to use `get-share`.

AWS CLI

To retrieves the metadata about a share of a HealthOmics analytics data

The following `get-share` example retrieves the metadata for a cross-account share of analytics data.

```
aws omics get-share \
    --share-id "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a"
```

Output:

```
{
    "share": {
        "shareId": "495c21bedc889d07d0ab69d710a6841e-
dd75ab7a1a9c384fa848b5bd8e5a7e0a",
        "shareName": "my_Share-123",
        "resourceArn": "arn:aws:omics:us-west-2:123456789111:variantStore/
omics_dev_var_store",
        "principalSubscriber": "123456789012",
        "ownerId": "123456789111",
        "status": "PENDING"
    }
}
```

For more information, see Cross-account sharing in the *AWS HealthOmics User Guide*.

- For API details, see GetShare in *AWS CLI Command Reference*.

`get-variant-import-job`

The following code example shows how to use `get-variant-import-job`.

AWS CLI

To view a variant import job

The following `get-variant-import-job` example gets details about a variant import job.

```
aws omics get-variant-import-job \
    --job-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "creationTime": "2022-11-23T22:42:50.037812Z",
    "destinationName": "my_var_store",
    "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "items": [
        {
            "jobStatus": "IN_PROGRESS",
            "source": "s3://amzn-s3-demo-bucket/
Homo_sapiens_assembly38.known_indels.vcf.gz"
        }
    ],
    "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W8O1XMPL7QZ",
    "runLeftNormalization": false,
    "status": "IN_PROGRESS",
    "updateTime": "2022-11-23T22:43:05.898309Z"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see GetVariantImportJob in *AWS CLI Command Reference*.

`get-variant-store`

The following code example shows how to use `get-variant-store`.

AWS CLI

To view a variant store

The following `get-variant-store` example gets details about a variant store.

```
aws omics get-variant-store \
    --name my_var_store
```

Output:

```
{
    "creationTime": "2022-11-23T22:09:07.534499Z",
    "id": "02dexmplcfdd",
```

```
    "name": "my_var_store",
    "reference": {
        "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
    },
    "status": "CREATING",
    "storeArn": "arn:aws:omics:us-west-2:123456789012:variantStore/my_var_store",
    "storeSizeBytes": 0,
    "tags": {},
    "updateTime": "2022-11-23T22:09:24.931711Z"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see GetVariantStore in *AWS CLI Command Reference*.

`get-workflow`

The following code example shows how to use `get-workflow`.

AWS CLI

To view a workflow

The following `get-workflow` example gets details about a workflow with ID 1234567.

```
aws omics get-workflow \
    --id 1234567
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:workflow/1234567",
    "creationTime": "2022-11-30T22:33:16.225368Z",
    "digest":
 "sha256:c54bxmpl742dcc26f7fa1f10e37550ddd8f251f418277c0a58e895b801ed28cf",
    "engine": "WDL",
    "id": "1234567",
    "main": "workflow-crambam.wdl",
    "name": "cram-converter",
    "parameterTemplate": {
        "ref_dict": {
```

```
            "description": "dictionary file for 'ref_fasta'"
        },
        "ref_fasta_index": {
            "description": "Index of the reference genome fasta file"
        },
        "ref_fasta": {
            "description": "Reference genome fasta file"
        },
        "input_cram": {
            "description": "The Cram file to convert to BAM"
        },
        "sample_name": {
            "description": "The name of the input sample, used to name the output
 BAM"
        }
    },
    "status": "ACTIVE",
    "statusMessage": "workflow-crambam.wdl\n    workflow CramToBamFlow\n
 call CramToBamTask\n        call ValidateSamFile\n    task CramToBamTask\n    task
 ValidateSamFile\n",
    "tags": {},
    "type": "PRIVATE"
}
```

For more information, see Creating private workflows in the *AWS HealthOmics User Guide*.

- For API details, see GetWorkflow in *AWS CLI Command Reference*.

`list-annotation-import-jobs`

The following code example shows how to use `list-annotation-import-jobs`.

AWS CLI

To get a list of annotation import jobs

The following `list-annotation-import-jobs` example gets a list of annotation import jobs.

```
aws omics list-annotation-import-jobs
```

Output:

```
{
    "annotationImportJobs": [
        {
            "creationTime": "2022-11-30T01:39:41.478294Z",
            "destinationName": "gff_ann_store",
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W8O1XMPL7QZ",
            "runLeftNormalization": false,
            "status": "COMPLETED",
            "updateTime": "2022-11-30T01:47:09.145178Z"
        },
        {
            "creationTime": "2022-11-30T00:45:58.007838Z",
            "destinationName": "my_ann_store",
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W8O1XMPL7QZ",
            "runLeftNormalization": false,
            "status": "FAILED",
            "updateTime": "2022-11-30T00:47:01.706325Z"
        }
    ]
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see ListAnnotationImportJobs in *AWS CLI Command Reference*.

`list-annotation-store-versions`

The following code example shows how to use `list-annotation-store-versions`.

AWS CLI

To list all the versions of an annotation store.

The following `list-annotation-store-versions` example lists all versions that exist of an annotation store.

```
aws omics list-annotation-store-versions \
    --name my_annotation_store
```

Output:

```
{
    "annotationStoreVersions": [
        {
            "storeId": "4934045d1c6d",
            "id": "2a3f4a44aa7b",
            "status": "CREATING",
            "versionArn": "arn:aws:omics:us-west-2:123456789012:annotationStore/
my_annotation_store/version/my_version_2",
            "name": "my_annotation_store",
            "versionName": "my_version_2",
            "creationTime": "2023-07-21T17:20:59.380043+00:00",
            "versionSizeBytes": 0
        },
        {
            "storeId": "4934045d1c6d",
            "id": "4934045d1c6d",
            "status": "ACTIVE",
            "versionArn": "arn:aws:omics:us-west-2:123456789012:annotationStore/
my_annotation_store/version/my_version_1",
            "name": "my_annotation_store",
            "versionName": "my_version_1",
            "creationTime": "2023-07-21T17:15:49.251040+00:00",
            "updateTime": "2023-07-21T17:15:56.434223+00:00",
            "statusMessage": "",
            "versionSizeBytes": 0
        }
    ]
}
```

For more information, see Creating new versions of annotation stores in the *AWS HealthOmics User Guide*.

- For API details, see ListAnnotationStoreVersions in *AWS CLI Command Reference*.

`list-annotation-stores`

The following code example shows how to use `list-annotation-stores`.

AWS CLI

To get a list of annotation stores

The following `list-annotation-stores` example gets a list of annotation stores.

```
aws omics list-annotation-stores
```

Output:

```
{
    "annotationStores": [
        {
            "creationTime": "2022-11-23T22:48:39.226492Z",
            "id": "0a91xmplc71f",
            "name": "my_ann_store",
            "reference": {
                "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
            },
            "status": "ACTIVE",
            "statusMessage": "",
            "storeArn": "arn:aws:omics:us-west-2:123456789012:annotationStore/
my_ann_store",
            "storeFormat": "VCF",
            "storeSizeBytes": 0,
            "updateTime": "2022-11-23T22:53:27.372840Z"
        }
    ]
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see ListAnnotationStores in *AWS CLI Command Reference*.

`list-multipart-read-set-uploads`

The following code example shows how to use `list-multipart-read-set-uploads`.

AWS CLI

To list all multipart read set uploads and their statuses.

The following `list-multipart-read-set-uploads` example lists all multipart read set uploads and their statuses.

```
aws omics list-multipart-read-set-uploads \
    --sequence-store-id 0123456789
```

Output:

```
{
    "uploads":
    [
        {
            "sequenceStoreId": "0123456789",
            "uploadId": "8749584421",
            "sourceFileType": "FASTQ",
            "subjectId": "mySubject",
            "sampleId": "mySample",

    ]
}
```

For more information, see Direct upload to a sequence store in the *AWS HealthOmics User Guide*.

- For API details, see ListMultipartReadSetUploads in *AWS CLI Command Reference*.

`list-read-set-activation-jobs`

The following code example shows how to use `list-read-set-activation-jobs`.

AWS CLI

To get a list of read set activation jobs

The following `list-read-set-activation-jobs` example gets a list of activation jobs for a sequence store with id `1234567890`.

```
aws omics list-read-set-activation-jobs \
    --sequence-store-id 1234567890
```

Output:

```
{
    "activationJobs": [
        {
            "completionTime": "2022-12-06T22:33:42.828Z",
            "creationTime": "2022-12-06T22:32:45.213Z",
            "id": "1234567890",
            "sequenceStoreId": "1234567890",
            "status": "COMPLETED"
        },
        {
            "creationTime": "2022-12-06T22:35:10.100Z",
            "id": "1234567890",
            "sequenceStoreId": "1234567890",
            "status": "IN_PROGRESS"
        }
    ]
```

```
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see ListReadSetActivationJobs in *AWS CLI Command Reference*.

`list-read-set-export-jobs`

The following code example shows how to use `list-read-set-export-jobs`.

AWS CLI

To gets a list of read set export jobs

The following `list-read-set-export-jobs` example gets a list of export jobs for a sequence store with id `1234567890`.

```
aws omics list-read-set-export-jobs \
    --sequence-store-id 1234567890
```

Output:

```
{
    "exportJobs": [
        {
            "completionTime": "2022-12-06T22:39:14.491Z",
            "creationTime": "2022-12-06T22:37:18.612Z",
            "destination": "s3://amzn-s3-demo-bucket/read-set-export/",
            "id": "1234567890",
            "sequenceStoreId": "1234567890",
            "status": "COMPLETED"
        },
        {
            "creationTime": "2022-12-06T22:38:04.871Z",
            "destination": "s3://amzn-s3-demo-bucket/read-set-export/",
            "id": "1234567890",
            "sequenceStoreId": "1234567890",
            "status": "IN_PROGRESS"
        }
    ]
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see ListReadSetExportJobs in *AWS CLI Command Reference*.

`list-read-set-import-jobs`

The following code example shows how to use `list-read-set-import-jobs`.

AWS CLI

To get a list of read set import jobs

The following `list-read-set-import-jobs` example gets a list of import jobs for a sequence store with id `1234567890`.

```
aws omics list-read-set-import-jobs \
    --sequence-store-id 1234567890
```

Output:

```
{
    "importJobs": [
        {
            "completionTime": "2022-11-29T18:17:49.244Z",
            "creationTime": "2022-11-29T17:32:47.700Z",
            "id": "1234567890",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W8O1XMPL7QZ",
            "sequenceStoreId": "1234567890",
            "status": "COMPLETED"
        },
        {
            "completionTime": "2022-11-23T22:01:34.090Z",
            "creationTime": "2022-11-23T21:52:43.289Z",
            "id": "1234567890",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W8O1XMPL7QZ",
            "sequenceStoreId": "1234567890",
            "status": "COMPLETED_WITH_FAILURES"
        }
    ]
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see ListReadSetImportJobs in *AWS CLI Command Reference*.

`list-read-set-upload-parts`

The following code example shows how to use `list-read-set-upload-parts`.

AWS CLI

To list all parts in a requested multipart upload for a sequence store.

The following `list-read-set-upload-parts` example list all parts in a requested multipart upload for a sequence store.

```
aws omics list-read-set-upload-parts \
    --sequence-store-id 0123456789 \
    --upload-id 1122334455 \
    --part-source SOURCE1
```

Output:

```
{
    "parts": [
        {
            "partNumber": 1,
            "partSize": 94371840,
            "partSource": "SOURCE1",
            "checksum":
 "984979b9928ae8d8622286c4a9cd8e99d964a22d59ed0f5722e1733eb280e635",
            "lastUpdatedTime": "2023-02-02T20:14:47.533000+00:00"
        },
        {
            "partNumber": 2,
            "partSize": 10471840,
            "partSource": "SOURCE1",
            "checksum":
 "984979b9928ae8d8622286c4a9cd8e99d964a22d59ed0f5722e1733eb280e635",
            "lastUpdatedTime": "2023-02-02T20:14:47.533000+00:00"
        }
    ]
}
```

For more information, see Direct upload to a sequence store in the *AWS HealthOmics User Guide*.

- For API details, see ListReadSetUploadParts in *AWS CLI Command Reference*.

`list-read-sets`

The following code example shows how to use `list-read-sets`.

AWS CLI

To get a list of read sets

The following `list-read-sets` example gets a list of read sets for a sequence store with id `1234567890`.

```
aws omics list-read-sets \
    --sequence-store-id 1234567890
```

Output:

```
{
    "readSets": [
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:sequenceStore/1234567890/
readSet/1234567890",
            "creationTime": "2022-11-23T21:55:00.515Z",
            "fileType": "FASTQ",
            "id": "1234567890",
            "name": "HG00146",
            "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890",
            "sampleId": "fastq-sample",
            "sequenceStoreId": "1234567890",
            "status": "ACTIVE",
            "subjectId": "fastq-subject"
        }
    ]
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see ListReadSets in *AWS CLI Command Reference*.

`list-reference-import-jobs`

The following code example shows how to use `list-reference-import-jobs`.

AWS CLI

To get a list of reference import jobs

The following `list-reference-import-jobs` example gets a list of reference import jobs for a reference store with id `1234567890`.

```
aws omics list-reference-import-jobs \
    --reference-store-id 1234567890
```

Output:

```
{
    "importJobs": [
        {
            "completionTime": "2022-11-23T19:54:58.204Z",
            "creationTime": "2022-11-23T19:53:20.729Z",
            "id": "1234567890",
            "referenceStoreId": "1234567890",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W8O1XMPL7QZ",
            "status": "COMPLETED"
        },
        {
            "creationTime": "2022-11-23T20:34:03.250Z",
            "id": "1234567890",
            "referenceStoreId": "1234567890",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W8O1XMPL7QZ",
            "status": "IN_PROGRESS"
        }
    ]
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see ListReferenceImportJobs in *AWS CLI Command Reference*.

`list-reference-stores`

The following code example shows how to use `list-reference-stores`.

AWS CLI

To get a list of reference stores

The following `list-reference-stores` example gets a list of reference stores.

```
aws omics list-reference-stores
```

Output:

```
{
    "referenceStores": [
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:referenceStore/1234567890",
            "creationTime": "2022-11-22T22:13:25.947Z",
            "id": "1234567890",
            "name": "my-ref-store"
        }
    ]
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see ListReferenceStores in *AWS CLI Command Reference*.

`list-references`

The following code example shows how to use `list-references`.

AWS CLI

To get a list of references

The following `list-references` example gets a list of genome references for a reference store with id `1234567890`.

```
aws omics list-references \
    --reference-store-id 1234567890
```

Output:

```
{
    "references": [
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:referenceStore/1234567890/
reference/1234567890",
            "creationTime": "2022-11-22T22:27:09.033Z",
            "id": "1234567890",
            "md5": "7ff134953dcca8c8997453bbb80b6b5e",
            "name": "assembly-38",
            "referenceStoreId": "1234567890",
            "status": "ACTIVE",
            "updateTime": "2022-11-22T22:27:09.033Z"
        }
    ]
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see ListReferences in *AWS CLI Command Reference*.

`list-run-groups`

The following code example shows how to use `list-run-groups`.

AWS CLI

To get a list of run groups

The following `list-run-groups` example gets a list of run groups.

```
aws omics list-run-groups
```

Output:

```
{
    "items": [
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:runGroup/1234567",
            "creationTime": "2022-12-01T00:58:42.915219Z",
            "id": "1234567",
```

```
            "maxCpus": 20,
            "maxDuration": 600,
            "name": "cram-convert"
        }
    ]
}
```

For more information, see Creating run groups in the *AWS HealthOmics User Guide*.

- For API details, see ListRunGroups in *AWS CLI Command Reference*.

`list-run-tasks`

The following code example shows how to use `list-run-tasks`.

AWS CLI

To get a list of tasks

The following `list-run-tasks` example gets a list of tasks for a workflow run.

```
aws omics list-run-tasks \
    --id 1234567
```

Output:

```
{
    "items": [
        {
            "cpus": 1,
            "creationTime": "2022-11-30T23:13:00.718651Z",
            "memory": 15,
            "name": "CramToBamTask",
            "startTime": "2022-11-30T23:17:47.016Z",
            "status": "COMPLETED",
            "stopTime": "2022-11-30T23:18:21.503Z",
            "taskId": "1234567"
        },
        {
            "cpus": 1,
            "creationTime": "2022-11-30T23:18:32.315606Z",
            "memory": 4,
            "name": "ValidateSamFile",
```

```
            "startTime": "2022-11-30T23:23:40.165Z",
            "status": "COMPLETED",
            "stopTime": "2022-11-30T23:24:14.766Z",
            "taskId": "1234567"
        }
    ]
}
```

For more information, see Task lifecycle in a HealthOmics run in the *AWS HealthOmics User Guide*.

- For API details, see ListRunTasks in *AWS CLI Command Reference*.

`list-runs`

The following code example shows how to use `list-runs`.

AWS CLI

To get a list of workflow runs

The following `list-runs` example gets a list of workflow runs.

```
aws omics list-runs
```

Output:

```
{
    "items": [
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:run/1234567",
            "creationTime": "2022-12-02T23:20:01.202074Z",
            "id": "1234567",
            "name": "cram-to-bam",
            "priority": 1,
            "startTime": "2022-12-02T23:29:18.115Z",
            "status": "COMPLETED",
            "stopTime": "2022-12-02T23:57:54.428812Z",
            "storageCapacity": 10,
            "workflowId": "1234567"
        },
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:run/1234567",
```

```
            "creationTime": "2022-12-03T00:16:57.180066Z",
            "id": "1234567",
            "name": "cram-to-bam",
            "priority": 1,
            "startTime": "2022-12-03T00:26:50.233Z",
            "status": "FAILED",
            "stopTime": "2022-12-03T00:37:21.451340Z",
            "storageCapacity": 10,
            "workflowId": "1234567"
        },
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:run/1234567",
            "creationTime": "2022-12-05T17:57:08.444817Z",
            "id": "1234567",
            "name": "cram-to-bam",
            "status": "STARTING",
            "workflowId": "1234567"
        }
    ]
}
```

For more information, see Run lifecycle in a workflow in the *AWS HealthOmics User Guide*.

- For API details, see ListRuns in *AWS CLI Command Reference*.

`list-sequence-stores`

The following code example shows how to use `list-sequence-stores`.

AWS CLI

To get a list of sequence stores

The following `list-sequence-stores` example gets a list of sequence stores.

```
aws omics list-sequence-stores
```

Output:

```
{
    "sequenceStores": [
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:sequenceStore/1234567890",
```

```
            "creationTime": "2022-11-23T01:24:33.629Z",
            "id": "1234567890",
            "name": "my-seq-store"
        }
    ]
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see ListSequenceStores in *AWS CLI Command Reference*.

`list-shares`

The following code example shows how to use `list-shares`.

AWS CLI

To list the available shares of a HealthOmics analytics data

The following `list-shares` example lists all shares that have been created for a resource-owner.

```
aws omics list-shares \
    --resource-owner SELF
```

Output:

```
{
    "shares": [
        {
            "shareId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "shareName": "myShare",
            "resourceArn": "arn:aws:omics:us-west-2:123456789111:variantStore/
store_1",
            "principalSubscriber": "123456789012",
            "ownerId": "123456789111",
            "status": "PENDING"
        },
        {
            "shareId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "shareName": "myShare3456",
            "resourceArn": "arn:aws:omics:us-west-2:123456789111:variantStore/
store_2",
```

```
            "principalSubscriber": "123456789012",
            "ownerId": "123456789111",
            "status": "ACTIVE"
        },
        {
            "shareId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "shareName": "myShare4",
            "resourceArn": "arn:aws:omics:us-west-2:123456789111:variantStore/
store_3",
            "principalSubscriber": "123456789012",
            "ownerId": "123456789111",
            "status": "ACTIVE"
        }
    ]
}
```

For more information, see Cross-account sharing in the *AWS HealthOmics User Guide*.

- For API details, see ListShares in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To get a list of tags

The following `list-tags-for-resource` example gets a list of tags for a workflow with id 1234567.

```
aws omics list-tags-for-resource \
    --resource-arn arn:aws:omics:us-west-2:123456789012:workflow/1234567
```

Output:

```
{
    "tags": {
        "department": "analytics"
    }
}
```

For more information, see Tagging resources in HealthOmics in the *Amazon Omics Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`list-variant-import-jobs`

The following code example shows how to use `list-variant-import-jobs`.

AWS CLI

To get a list of variant import jobs

The following `list-variant-import-jobs` example gets a list of variant import jobs.

```
aws omics list-variant-import-jobs
```

Output:

```
{
    "variantImportJobs": [
        {
            "creationTime": "2022-11-23T22:47:02.514002Z",
            "destinationName": "my_var_store",
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W8O1XMPL7QZ",
            "runLeftNormalization": false,
            "status": "COMPLETED",
            "updateTime": "2022-11-23T22:49:17.976597Z"
        },
        {
            "creationTime": "2022-11-23T22:42:50.037812Z",
            "destinationName": "my_var_store",
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W8O1XMPL7QZ",
            "runLeftNormalization": false,
            "status": "COMPLETED",
            "updateTime": "2022-11-23T22:45:26.009880Z"
        }
    ]
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see ListVariantImportJobs in *AWS CLI Command Reference*.

`list-variant-stores`

The following code example shows how to use `list-variant-stores`.

AWS CLI

To get a list of variant stores

The following `list-variant-stores` example gets a list of variant stores.

```
aws omics list-variant-stores
```

Output:

```
{
    "variantStores": [
        {
            "creationTime": "2022-11-23T22:09:07.534499Z",
            "id": "02dexmplcfdd",
            "name": "my_var_store",
            "reference": {
                "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
            },
            "status": "CREATING",
            "storeArn": "arn:aws:omics:us-west-2:123456789012:variantStore/
my_var_store",
            "storeSizeBytes": 0,
            "updateTime": "2022-11-23T22:09:24.931711Z"
        },
        {
            "creationTime": "2022-09-23T23:00:09.140265Z",
            "id": "8777xmpl1a24",
            "name": "myvstore0",
            "status": "ACTIVE",
            "storeArn": "arn:aws:omics:us-west-2:123456789012:variantStore/
myvstore0",
            "storeSizeBytes": 0,
            "updateTime": "2022-09-23T23:03:26.013220Z"
```

```
        }
    ]
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see ListVariantStores in *AWS CLI Command Reference*.

`list-workflows`

The following code example shows how to use `list-workflows`.

AWS CLI

To get a list of workflows

The following `list-workflows` example gets a list of workflows.

```
aws omics list-workflows
```

Output:

```
{
    "items": [
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:workflow/1234567",
            "creationTime": "2022-09-23T23:08:22.041227Z",
            "digest": "nSCNo/qMWFxmplXpUdokXJnwgneOaxyyc2YOxVxrJTE=",
            "id": "1234567",
            "name": "my-wkflow-0",
            "status": "ACTIVE",
            "type": "PRIVATE"
        },
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:workflow/1234567",
            "creationTime": "2022-11-30T22:33:16.225368Z",
            "digest":
 "sha256:c54bxmpl742dcc26f7fa1f10e37550ddd8f251f418277c0a58e895b801ed28cf",
            "id": "1234567",
            "name": "cram-converter",
            "status": "ACTIVE",
            "type": "PRIVATE"
        }
```

```
    ]
}
```

For more information, see Creating private workflows in the *AWS HealthOmics User Guide*.

- For API details, see ListWorkflows in *AWS CLI Command Reference*.

`start-annotation-import-job`

The following code example shows how to use `start-annotation-import-job`.

AWS CLI

To import annotations

The following `start-annotation-import-job` example imports annotations from Amazon S3.

```
aws omics start-annotation-import-job \
    --destination-name tsv_ann_store \
    --no-run-left-normalization \
    --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W801XMPL7QZ \
    --items source=s3://amzn-s3-demo-bucket/targetedregions.bed.gz
```

Output:

```
{
    "jobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see StartAnnotationImportJob in *AWS CLI Command Reference*.

`start-read-set-activation-job`

The following code example shows how to use `start-read-set-activation-job`.

AWS CLI

To activate an archived read set

The following `start-read-set-activation-job` example activates two read sets.

```
aws omics start-read-set-activation-job \
    --sequence-store-id 1234567890 \
    --sources readSetId=1234567890 readSetId=1234567890
```

Output:

```
{
    "creationTime": "2022-12-06T22:35:10.100Z",
    "id": "1234567890",
    "sequenceStoreId": "1234567890",
    "status": "SUBMITTED"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see StartReadSetActivationJob in *AWS CLI Command Reference*.

`start-read-set-export-job`

The following code example shows how to use `start-read-set-export-job`.

AWS CLI

To export a read set

The following `start-read-set-export-job` example exports two read sets to Amazon S3.

```
aws omics start-read-set-export-job \
    --sequence-store-id 1234567890 \
    --sources readSetId=1234567890 readSetId=1234567890 \
    --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W801XMPL7QZ \
    --destination s3://amzn-s3-demo-bucket/read-set-export/
```

Output:

```
{
    "creationTime": "2022-12-06T22:37:18.612Z",
    "destination": "s3://amzn-s3-demo-bucket/read-set-export/",
    "id": "1234567890",
```

```
    "sequenceStoreId": "1234567890",
    "status": "SUBMITTED"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see StartReadSetExportJob in *AWS CLI Command Reference*.

`start-read-set-import-job`

The following code example shows how to use `start-read-set-import-job`.

AWS CLI

To import a read set

The following `start-read-set-import-job` example imports a read set.

```
aws omics start-read-set-import-job \
    --sequence-store-id 1234567890 \
    --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W801XMPL7QZ \
    --sources file://readset-sources.json
```

Contents of `readset-sources.json`:

```
[
    {
        "sourceFiles":
        {
            "source1": "s3://amzn-s3-demo-bucket/
HG00100.chrom20.ILLUMINA.bwa.GBR.low_coverage.20101123.bam"
        },
        "sourceFileType": "BAM",
        "subjectId": "bam-subject",
        "sampleId": "bam-sample",
        "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890",
        "name": "HG00100"
    }
]
```

Output:

```
{
    "creationTime": "2022-11-23T01:36:38.158Z",
    "id": "1234567890",
    "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W801XMPL7QZ",
    "sequenceStoreId": "1234567890",
    "status": "SUBMITTED"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see StartReadSetImportJob in *AWS CLI Command Reference*.

`start-reference-import-job`

The following code example shows how to use `start-reference-import-job`.

AWS CLI

To import a reference genome

The following `start-reference-import-job` example imports a reference genome from Amazon S3.

```
aws omics start-reference-import-job \
    --reference-store-id 1234567890 \
    --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W801XMPL7QZ \
    --sources sourceFile=s3://amzn-s3-demo-bucket/
Homo_sapiens_assembly38.fasta,name=assembly-38
```

Output:

```
{
    "creationTime": "2022-11-22T22:25:41.124Z",
    "id": "1234567890",
    "referenceStoreId": "1234567890",
    "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W801XMPL7QZ",
    "status": "SUBMITTED"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see StartReferenceImportJob in *AWS CLI Command Reference*.

`start-run`

The following code example shows how to use `start-run`.

AWS CLI

Example 1: To run a workflow

The following `start-run` example runs a workflow with ID 1234567.

```
aws omics start-run \
    --workflow-id 1234567 \
    --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W801XMPL7QZ \
    --name 'cram-to-bam' \
    --output-uri s3://amzn-s3-demo-bucket/workflow-output/ \
    --run-group-id 1234567 \
    --priority 1 \
    --storage-capacity 10 \
    --log-level ALL \
    --parameters file://workflow-inputs.json
```

Contents of `workflow-inputs.json`:

```
{
    "sample_name": "NA12878",
    "input_cram": "s3://amzn-s3-demo-bucket/NA12878.cram",
    "ref_dict": "s3://amzn-s3-demo-bucket/Homo_sapiens_assembly38.dict",
    "ref_fasta": "s3://amzn-s3-demo-bucket/Homo_sapiens_assembly38.fasta",
    "ref_fasta_index": "amzn-s3-demo-bucket/Homo_sapiens_assembly38.fasta.fai"
}
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:run/1234567",
    "id": "1234567",
    "status": "PENDING",
```

```
    "tags": {}
}
```

For more information, see Starting a run in the *AWS HealthOmics User Guide*.

Example 2: To load source files from Amazon Omics

The following `start-run` example loads source files from Amazon Omics storage by using service-specific URIs. The `workflow-inputs.json` file for this example uses Amazon Omics URIs for read set and reference genome sources.

```
{
    "sample_name": "NA12878",
    "input_cram": "omics://123456789012.storage.us-west-2.amazonaws.com/1234567890/
readSet/1234567890/source1",
    "ref_dict": "s3://amzn-s3-demo-bucket/Homo_sapiens_assembly38.dict",
    "ref_fasta": "omics://123456789012.storage.us-west-2.amazonaws.com/1234567890/
reference/1234567890",
    "ref_fasta_index": "omics://123456789012.storage.us-
west-2.amazonaws.com/1234567890/reference/1234567890/index"
}
```

- For API details, see StartRun in *AWS CLI Command Reference*.

`start-variant-import-job`

The following code example shows how to use `start-variant-import-job`.

AWS CLI

To import a variant file

The following `start-variant-import-job` example imports a VCF format variant file.

```
aws omics start-variant-import-job \
    --destination-name my_var_store \
    --no-run-left-normalization  \
    --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W801XMPL7QZ \
    --items source=s3://amzn-s3-demo-bucket/
Homo_sapiens_assembly38.known_indels.vcf.gz
```

Output:

```
{
    "jobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see StartVariantImportJob in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a resource

The following `tag-resource` example adds a `department` tag to a workflow with id `1234567`.

```
aws omics tag-resource \
    --resource-arn arn:aws:omics:us-west-2:123456789012:workflow/1234567 \
    --tags department=analytics
```

This command produces no output.

For more information, see Tagging resources in HealthOmics in the *Amazon Omics Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a resource

The following `untag-resource` example removes the `department` tag from a workflow.

```
aws omics untag-resource \
    --resource-arn arn:aws:omics:us-west-2:123456789012:workflow/1234567 \
    --tag-keys department
```

This command produces no output.

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-annotation-store`

The following code example shows how to use `update-annotation-store`.

AWS CLI

To update an annotation store

The following `update-annotation-store` example updates the description of an annotation store named `my_vcf_store`.

```
aws omics update-annotation-store \
    --name my_vcf_store \
    --description "VCF annotation store"
```

Output:

```
{
    "creationTime": "2022-12-05T18:00:56.101860Z",
    "description": "VCF annotation store",
    "id": "bd6axmpl2444",
    "name": "my_vcf_store",
    "reference": {
        "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
    },
    "status": "ACTIVE",
    "storeFormat": "VCF",
    "updateTime": "2022-12-05T18:13:16.100051Z"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see UpdateAnnotationStore in *AWS CLI Command Reference*.

`update-run-group`

The following code example shows how to use `update-run-group`.

AWS CLI

To update a run group

The following `update-run-group` example updates the settings of a run group with id `1234567`.

```
aws omics update-run-group \
    --id 1234567 \
    --max-cpus 10
```

This command produces no output.

For more information, see Using HealthOmics run groups in the *Amazon Omics Developer Guide*.

- For API details, see UpdateRunGroup in *AWS CLI Command Reference*.

`update-variant-store`

The following code example shows how to use `update-variant-store`.

AWS CLI

To update a variant store

The following `update-variant-store` example updates the description of a variant store named `my_var_store`.

```
aws omics update-variant-store \
    --name my_var_store \
    --description "variant store"
```

Output:

```
{
    "creationTime": "2022-11-23T22:09:07.534499Z",
```

```
    "description": "variant store",
    "id": "02dexmplcfdd",
    "name": "my_var_store",
    "reference": {
        "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
    },
    "status": "ACTIVE",
    "updateTime": "2022-12-05T18:23:37.686402Z"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see UpdateVariantStore in *AWS CLI Command Reference*.

`update-workflow`

The following code example shows how to use `update-workflow`.

AWS CLI

To update a workflow

The following `update-workflow` example updates the description of a workflow with ID `1234567`.

```
aws omics update-workflow \
    --id 1234567 \
    --description "copy workflow"
```

This command produces no output.

For more information, see Creating or updating a workflow in the *AWS HealthOmics User Guide*.

- For API details, see UpdateWorkflow in *AWS CLI Command Reference*.

`upload-read-set-part`

The following code example shows how to use `upload-read-set-part`.

AWS CLI

To upload a read set part.

The following `upload-read-set-part` example uploads a specified part of a read set.

```
aws omics upload-read-set-part \
    --sequence-store-id 0123456789 \
    --upload-id 1122334455 \
    --part-source SOURCE1 \
    --part-number 1 \
    --payload /path/to/file/read_1_part_1.fastq.gz
```

Output:

```
{
    "checksum": "984979b9928ae8d8622286c4a9cd8e99d964a22d59ed0f5722e1733eb280e635"
}
```

For more information, see Direct upload to a sequence store in the *AWS HealthOmics User Guide*.

- For API details, see UploadReadSetPart in *AWS CLI Command Reference*.

IAM examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with IAM.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-client-id-to-open-id-connect-provider`

The following code example shows how to use `add-client-id-to-open-id-connect-provider`.

AWS CLI

To add a client ID (audience) to an Open-ID Connect (OIDC) provider

The following `add-client-id-to-open-id-connect-provider` example adds the client ID `my-application-ID` to the OIDC provider named `server.example.com`.

```
aws iam add-client-id-to-open-id-connect-provider \
    --client-id my-application-ID \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
server.example.com
```

This command produces no output.

To create an OIDC provider, use the `create-open-id-connect-provider` command.

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see AddClientIdToOpenIdConnectProvider in *AWS CLI Command Reference*.

`add-role-to-instance-profile`

The following code example shows how to use `add-role-to-instance-profile`.

AWS CLI

To add a role to an instance profile

The following `add-role-to-instance-profile` example adds the role named `S3Access` to the instance profile named `Webserver`.

```
aws iam add-role-to-instance-profile \
    --role-name S3Access \
    --instance-profile-name Webserver
```

This command produces no output.

To create an instance profile, use the `create-instance-profile` command.

For more information, see Using an IAM role to grant permissions to applications running on Amazon EC2 instances in the *AWS IAM User Guide*.

- For API details, see AddRoleToInstanceProfile in *AWS CLI Command Reference*.

`add-user-to-group`

The following code example shows how to use `add-user-to-group`.

AWS CLI

To add a user to an IAM group

The following `add-user-to-group` example adds an IAM user named Bob to the IAM group named `Admins`.

```
aws iam add-user-to-group \
    --user-name Bob \
    --group-name Admins
```

This command produces no output.

For more information, see Adding and removing users in an IAM user group in the *AWS IAM User Guide*.

- For API details, see AddUserToGroup in *AWS CLI Command Reference*.

`attach-group-policy`

The following code example shows how to use `attach-group-policy`.

AWS CLI

To attach a managed policy to an IAM group

The following `attach-group-policy` example attaches the AWS managed policy named `ReadOnlyAccess` to the IAM group named `Finance`.

```
aws iam attach-group-policy \
    --policy-arn arn:aws:iam::aws:policy/ReadOnlyAccess \
    --group-name Finance
```

This command produces no output.

For more information, see Managed policies and inline policies in the *AWS IAM User Guide*.

- For API details, see AttachGroupPolicy in *AWS CLI Command Reference*.

`attach-role-policy`

The following code example shows how to use `attach-role-policy`.

AWS CLI

To attach a managed policy to an IAM role

The following `attach-role-policy` example attaches the AWS managed policy named `ReadOnlyAccess` to the IAM role named `ReadOnlyRole`.

```
aws iam attach-role-policy \
    --policy-arn arn:aws:iam::aws:policy/ReadOnlyAccess \
    --role-name ReadOnlyRole
```

This command produces no output.

For more information, see Managed policies and inline policies in the *AWS IAM User Guide*.

- For API details, see AttachRolePolicy in *AWS CLI Command Reference*.

`attach-user-policy`

The following code example shows how to use `attach-user-policy`.

AWS CLI

To attach a managed policy to an IAM user

The following `attach-user-policy` example attaches the AWS managed policy named `AdministratorAccess` to the IAM user named `Alice`.

```
aws iam attach-user-policy \
    --policy-arn arn:aws:iam::aws:policy/AdministratorAccess \
    --user-name Alice
```

This command produces no output.

For more information, see Managed policies and inline policies in the *AWS IAM User Guide*.

- For API details, see AttachUserPolicy in *AWS CLI Command Reference*.

change-password

The following code example shows how to use change-password.

AWS CLI

To change the password for your IAM user

The following change-password example changes the password for your IAM user. To change the password, we recommend using the --cli-input-json parameter to pass a JSON file that contains your old and new passwords. Using this method, you can use strong passwords with non-alphanumeric characters. It can be difficult to use passwords with non-alphanumeric characters when you pass them as command line parameters. To use the --cli-input-json parameter, start by using the change-password command with the --generate-cli-skeleton parameter, as in the following example.

```
aws iam change-password \
    --generate-cli-skeleton > change-password.json
```

The previous command creates a JSON file called change-password.json that you can use to fill in your old and new passwords.

Next, to change your password, use the change-password command again, this time passing the --cli-input-json parameter to specify your JSON file. The following change-password command uses the --cli-input-json parameter with a JSON file called change-password.json.

```
aws iam change-password \
    --cli-input-json file://change-password.json
```

Contents of change-password.json:

```
{
    "OldPassword": "3s0K_;xh4~8XXI",
    "NewPassword": "]35d/{pB9Fo9wJ"
}
```

This command produces no output.

This command can be called by IAM users only. If this command is called using AWS account (root) credentials, the command returns an InvalidUserType error.

For more information, see How an IAM user changes their own password in the *AWS IAM User Guide*.

- For API details, see ChangePassword in *AWS CLI Command Reference*.

`create-access-key`

The following code example shows how to use `create-access-key`.

AWS CLI

To create an access key for an IAM user

The following `create-access-key` example creates an access key (access key ID and secret access key) for the IAM user named Bob.

```
aws iam create-access-key \
    --user-name Bob
```

Output:

```
{
    "AccessKey": {
        "UserName": "Bob",
        "Status": "Active",
        "CreateDate": "2015-03-09T18:39:23.411Z",
        "SecretAccessKey": "wJalrXUtnFEMI/K7MDENG/bPxRfiCYzEXAMPLEKEY",
        "AccessKeyId": "AKIAIOSFODNN7EXAMPLE"
    }
}
```

Store the secret access key in a secure location. If it is lost, it cannot be recovered, and you must create a new access key.

For more information, see Managing access keys for IAM users in the *AWS IAM User Guide*.

- For API details, see CreateAccessKey in *AWS CLI Command Reference*.

`create-account-alias`

The following code example shows how to use `create-account-alias`.

AWS CLI

To create an account alias

The following `create-account-alias` example creates the alias `examplecorp` for your AWS account.

```
aws iam create-account-alias \
    --account-alias examplecorp
```

This command produces no output.

For more information, see Your AWS account ID and its alias in the *AWS IAM User Guide*.

- For API details, see CreateAccountAlias in *AWS CLI Command Reference*.

`create-group`

The following code example shows how to use `create-group`.

AWS CLI

To create an IAM group

The following `create-group` example creates an IAM group named `Admins`.

```
aws iam create-group \
    --group-name Admins
```

Output:

```
{
    "Group": {
        "Path": "/",
        "CreateDate": "2015-03-09T20:30:24.940Z",
        "GroupId": "AIDGPMS9RO4H3FEXAMPLE",
        "Arn": "arn:aws:iam::123456789012:group/Admins",
        "GroupName": "Admins"
    }
}
```

For more information, see Creating IAM user groups in the *AWS IAM User Guide*.

- For API details, see CreateGroup in *AWS CLI Command Reference*.

`create-instance-profile`

The following code example shows how to use `create-instance-profile`.

AWS CLI

To create an instance profile

The following `create-instance-profile` example creates an instance profile named `Webserver`.

```
aws iam create-instance-profile \
    --instance-profile-name Webserver
```

Output:

```
{
    "InstanceProfile": {
        "InstanceProfileId": "AIPAJMBYC7DLSPEXAMPLE",
        "Roles": [],
        "CreateDate": "2015-03-09T20:33:19.626Z",
        "InstanceProfileName": "Webserver",
        "Path": "/",
        "Arn": "arn:aws:iam::123456789012:instance-profile/Webserver"
    }
}
```

To add a role to an instance profile, use the `add-role-to-instance-profile` command.

For more information, see Using an IAM role to grant permissions to applications running on Amazon EC2 instances in the *AWS IAM User Guide*.

- For API details, see CreateInstanceProfile in *AWS CLI Command Reference*.

`create-login-profile`

The following code example shows how to use `create-login-profile`.

AWS CLI

To create a password for an IAM user

The following `create-login-profile` example creates a password for an IAM user. To create the password, we recommend using the `--cli-input-json` parameter to pass a JSON file that contains the password. Using this method, you can create a strong password with non-alphanumeric characters. It can be difficult to create a password with non-alphanumeric characters when you pass it as a command line parameter.

To use the `--cli-input-json` parameter, start by using the `create-login-profile` command with the `--generate-cli-skeleton` parameter, as in the following example.

```
aws iam create-login-profile \
    --generate-cli-skeleton > create-login-profile.json
```

The previous command creates a JSON file called create-login-profile.json that you can use to fill in the information for a subsequent `create-login-profile` command.

Next, to create a password for an IAM user, use the `create-login-profile` command again, this time passing the `--cli-input-json` parameter to specify your JSON file. The following `create-login-profile` command uses the `--cli-input-json` parameter with a JSON file called create-login-profile.json.

```
aws iam create-login-profile \
    --cli-input-json file://create-login-profile.json
```

Contents of `create-login-profile.json`:

```
{
    "UserName": "Bob",
    "Password": "&1-3a6u:RA0djs",
    "PasswordResetRequired": true
}
```

Output:

```
{
    "LoginProfile": {
        "UserName": "Bob",
```

```
        "CreateDate": "2015-03-10T20:55:40.274Z",
        "PasswordResetRequired": true
    }
}
```

If the new password violates the account password policy, the command returns a `PasswordPolicyViolation` error.

To change the password for a user that already has one, use `update-login-profile`. To set a password policy for the account, use the `update-account-password-policy` command.

If the account password policy allows them to, IAM users can change their own passwords using the `change-password` command.

For more information, see Managing passwords for IAM users in the *AWS IAM User Guide*.

- For API details, see CreateLoginProfile in *AWS CLI Command Reference*.

`create-open-id-connect-provider`

The following code example shows how to use `create-open-id-connect-provider`.

AWS CLI

To create an OpenID Connect (OIDC) provider

The following `create-open-id-connect-provider` example creates an OpenID Connect (OIDC) provider. To create the provider, we recommend using the `--cli-input-json` parameter to pass a JSON file that contains the required parameters. When you create an OIDC provider, you must pass the URL of the provider, and the URL must begin with `https://`. It can be difficult to pass the URL as a command line parameter, because the colon (:) and forward slash (/) characters have special meaning in some command line environments. Using the `--cli-input-json` parameter gets around this limitation.

To use the `--cli-input-json` parameter, start by using the `create-open-id-connect-provider` command with the `--generate-cli-skeleton` parameter, as in the following example.

```
aws iam create-open-id-connect-provider \
    --generate-cli-skeleton > create-open-id-connect-provider.json
```

The previous command creates a JSON file called create-open-id-connect-provider.json that you can use to fill in the information for a subsequent `create-open-id-connect-provider` command.

Next, to create the OpenID Connect (OIDC) provider, use the `create-open-id-connect-provider` command again, this time passing the `--cli-input-json` parameter to specify your JSON file. The following `create-open-id-connect-provider` command uses the `--cli-input-json` parameter with a JSON file called create-open-id-connect-provider.json.

```
aws iam create-open-id-connect-provider \
    --cli-input-json file://create-open-id-connect-provider.json
```

Contents of `create-open-id-connect-provider.json`:

```
{
    "Url": "https://server.example.com",
    "ClientIDList": [
        "example-application-ID"
    ],
    "ThumbprintList": [
        "c3768084dfb3d2b68b7897bf5f565da8eEXAMPLE"
    ]
}
```

If your OIDC provider's discovery and JWKS endpoints use different certificates, include thumbprints for both endpoints in the `ThumbprintList`.

Output:

```
{
    "OpenIDConnectProviderArn": "arn:aws:iam::123456789012:oidc-provider/
server.example.com"
}
```

For more information about OIDC providers, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

For more information about obtaining thumbprints for an OIDC provider, see Obtaining the thumbprint for an OpenID Connect Identity Provider in the *AWS IAM User Guide*.

- For API details, see CreateOpenIdConnectProvider in *AWS CLI Command Reference*.

`create-policy-version`

The following code example shows how to use `create-policy-version`.

AWS CLI

To create a new version of a managed policy

The following `create-policy-version` example creates a new v2 version of the IAM policy whose ARN is `arn:aws:iam::123456789012:policy/MyPolicy` and makes it the default version.

```
aws iam create-policy-version \
    --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
    --policy-document file://NewPolicyVersion.json \
    --set-as-default
```

Contents of `NewPolicyVersion.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::amzn-s3-demo-bucket",
                "arn:aws:s3:::amzn-s3-demo-bucket/*"
            ]
        }
    ]
}
```

Output:

```
{
    "PolicyVersion": {
        "CreateDate": "2015-06-16T18:56:03.721Z",
        "VersionId": "v2",
        "IsDefaultVersion": true
```

```
    }
}
```

For more information, see Versioning IAM policies in the *AWS IAM User Guide*.

- For API details, see CreatePolicyVersion in *AWS CLI Command Reference*.

`create-policy`

The following code example shows how to use `create-policy`.

AWS CLI

Example 1: To create a customer managed policy

The following `create-policy` example creates a customer managed policy named `my-policy`. The file `policy.json` is a JSON document in the current folder that grants read only access to the `shared` folder in an Amazon S3 bucket named `amzn-s3-demo-bucket`.

```
aws iam create-policy \
    --policy-name my-policy \
    --policy-document file://policy.json
```

Contents of `policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:Get*",
                "s3:List*"
            ],
            "Resource": [
                "arn:aws:s3:::amzn-s3-demo-bucket/shared/*"
            ]
        }
    ]
}
```

Output:

```
{
    "Policy": {
        "PolicyName": "my-policy",
        "CreateDate": "2015-06-01T19:31:18.620Z",
        "AttachmentCount": 0,
        "IsAttachable": true,
        "PolicyId": "ZXR6A36LTYANPAI7NJ5UV",
        "DefaultVersionId": "v1",
        "Path": "/",
        "Arn": "arn:aws:iam::0123456789012:policy/my-policy",
        "UpdateDate": "2015-06-01T19:31:18.620Z"
    }
}
```

For more information on using files as input for string parameters, see Specify parameter values for the AWS CLI in the *AWS CLI User Guide*.

Example 2: To create a customer managed policy with a description

The following `create-policy` example creates a customer managed policy named `my-policy` with an immutable description.

The file `policy.json` is a JSON document in the current folder that grants access to all Put, List, and Get actions for an Amazon S3 bucket named `amzn-s3-demo-bucket`.

```
aws iam create-policy \
    --policy-name my-policy \
    --policy-document file://policy.json \
    --description "This policy grants access to all Put, Get, and List actions for
 amzn-s3-demo-bucket"
```

Contents of `policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:ListBucket*",
                "s3:PutBucket*",
                "s3:GetBucket*"
```

```
            ],
            "Resource": [
                "arn:aws:s3:::amzn-s3-demo-bucket"
            ]
        }
    ]
}
```

Output:

```
{
    "Policy": {
        "PolicyName": "my-policy",
        "PolicyId": "ANPAWGSUGIDPEXAMPLE",
        "Arn": "arn:aws:iam::123456789012:policy/my-policy",
        "Path": "/",
        "DefaultVersionId": "v1",
        "AttachmentCount": 0,
        "PermissionsBoundaryUsageCount": 0,
        "IsAttachable": true,
        "CreateDate": "2023-05-24T22:38:47+00:00",
        "UpdateDate": "2023-05-24T22:38:47+00:00"
    }
}
```

For more information on Idenity-based Policies, see Identity-based policies and resource-based policies in the *AWS IAM User Guide*.

Example 3: To create a customer managed policy with tags

The following `create-policy` example creates a customer managed policy named `my-policy` with tags. This example uses the `--tags` parameter with the following JSON-formatted tags: `'{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}'`. Alternatively, the `--tags` parameter can be used with tags in the shorthand format: `'Key=Department,Value=Accounting Key=Location,Value=Seattle'`.

The file `policy.json` is a JSON document in the current folder that grants access to all Put, List, and Get actions for an Amazon S3 bucket named `amzn-s3-demo-bucket`.

```
aws iam create-policy \
    --policy-name my-policy \
```

```
    --policy-document file://policy.json \
    --tags '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location",
 "Value": "Seattle"}'
```

Contents of `policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:ListBucket*",
                "s3:PutBucket*",
                "s3:GetBucket*"
            ],
            "Resource": [
                "arn:aws:s3:::amzn-s3-demo-bucket"
            ]
        }
    ]
}
```

Output:

```
{
    "Policy": {
        "PolicyName": "my-policy",
        "PolicyId": "ANPAWGSUGIDPEXAMPLE",
        "Arn": "arn:aws:iam::12345678012:policy/my-policy",
        "Path": "/",
        "DefaultVersionId": "v1",
        "AttachmentCount": 0,
        "PermissionsBoundaryUsageCount": 0,
        "IsAttachable": true,
        "CreateDate": "2023-05-24T23:16:39+00:00",
        "UpdateDate": "2023-05-24T23:16:39+00:00",
        "Tags": [
            {
                "Key": "Department",
                "Value": "Accounting"
            },
            {
```

```
                "Key": "Location",
                "Value": "Seattle"
            }
        ]
    }
}
```

For more information on Tagging policies, see Tagging customer managed policies in the *AWS IAM User Guide*.

- For API details, see CreatePolicy in *AWS CLI Command Reference*.

`create-role`

The following code example shows how to use `create-role`.

AWS CLI

Example 1: To create an IAM role

The following `create-role` example creates a role named `Test-Role` and attaches a trust policy to it.

```
aws iam create-role \
    --role-name Test-Role \
    --assume-role-policy-document file://Test-Role-Trust-Policy.json
```

Contents of `Test-Role-Trust-Policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "Statement1",
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::123456789012:root"
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

Output:

```
{
    "Role": {
        "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
        "RoleId": "AKIAIOSFODNN7EXAMPLE",
        "CreateDate": "2013-06-07T20:43:32.821Z",
        "RoleName": "Test-Role",
        "Path": "/",
        "Arn": "arn:aws:iam::123456789012:role/Test-Role"
    }
}
```

The trust policy is defined as a JSON document in the *Test-Role-Trust-Policy.json* file. (The file name and extension do not have significance.) The trust policy must specify a principal.

To attach a permissions policy to a role, use the `put-role-policy` command.

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

Example 2: To create an IAM role with specified maximum session duration

The following `create-role` example creates a role named `Test-Role` and sets a maximum session duration of 7200 seconds (2 hours).

```
aws iam create-role \
    --role-name Test-Role \
    --assume-role-policy-document file://Test-Role-Trust-Policy.json \
    --max-session-duration 7200
```

Contents of `Test-Role-Trust-Policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "Statement1",
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::123456789012:root"
            },
            "Action": "sts:AssumeRole"
        }
```

```
    ]
}
```

Output:

```
{
    "Role": {
        "Path": "/",
        "RoleName": "Test-Role",
        "RoleId": "AKIAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:role/Test-Role",
        "CreateDate": "2023-05-24T23:50:25+00:00",
        "AssumeRolePolicyDocument": {
            "Version":"2012-10-17",
            "Statement": [
                {
                    "Sid": "Statement1",
                    "Effect": "Allow",
                    "Principal": {
                        "AWS": "arn:aws:iam::123456789012:root"
                    },
                    "Action": "sts:AssumeRole"
                }
            ]
        }
    }
}
```

For more information, see Modifying a role maximum session duration (AWS API) in the *AWS IAM User Guide*.

Example 3: To create an IAM Role with tags

The following `create-role` example creates an IAM role `Test-Role` with tags. This example uses the `--tags` parameter flag with the following JSON-formatted tags: `'{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}'`. Alternatively, the `--tags` flag can be used with tags in the shorthand format: `'Key=Department,Value=Accounting Key=Location,Value=Seattle'`.

```
aws iam create-role \
    --role-name Test-Role \
    --assume-role-policy-document file://Test-Role-Trust-Policy.json \
```

```
    --tags '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location",
 "Value": "Seattle"}'
```

Contents of `Test-Role-Trust-Policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "Statement1",
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::123456789012:root"
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

Output:

```
{
    "Role": {
        "Path": "/",
        "RoleName": "Test-Role",
        "RoleId": "AKIAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:role/Test-Role",
        "CreateDate": "2023-05-25T23:29:41+00:00",
        "AssumeRolePolicyDocument": {
            "Version":"2012-10-17",
            "Statement": [
                {
                    "Sid": "Statement1",
                    "Effect": "Allow",
                    "Principal": {
                        "AWS": "arn:aws:iam::123456789012:root"
                    },
                    "Action": "sts:AssumeRole"
                }
            ]
        },
        "Tags": [
            {
```

```
                "Key": "Department",
                "Value": "Accounting"
            },
            {
                "Key": "Location",
                "Value": "Seattle"
            }
        ]
    }
}
```

For more information, see Tagging IAM roles in the *AWS IAM User Guide*.

- For API details, see CreateRole in *AWS CLI Command Reference*.

`create-saml-provider`

The following code example shows how to use `create-saml-provider`.

AWS CLI

To create a SAML provider

The following `create-saml-provider` example creates a new SAML provider in IAM named `MySAMLProvider`. It is described by the SAML metadata document found in the file `SAMLMetaData.xml`.

```
aws iam create-saml-provider \
    --saml-metadata-document file://SAMLMetaData.xml \
    --name MySAMLProvider
```

Contents of `SAMLMetaData.xml`:

```
<?xml version="1.0" encoding="UTF-8"?>
<md:EntityDescriptor xmlns:md="urn:oasis:names:tc:SAML:2.0:metadata"
 entityID="https://idp.example.com/saml/metadata">
    <md:IDPSSODescriptor
 protocolSupportEnumeration="urn:oasis:names:tc:SAML:2.0:protocol">
        <md:KeyDescriptor use="signing">
            <ds:KeyInfo xmlns:ds="http://www.w3.org/2000/09/xmldsig#">
                <ds:X509Data>
                    <ds:X509Certificate>MIIC8DCCAdigAwIBAgIQEXAMPLE...</
ds:X509Certificate>
```

```
                </ds:X509Data>
            </ds:KeyInfo>
        </md:KeyDescriptor>
        <md:NameIDFormat>urn:oasis:names:tc:SAML:2.0:nameid-format:persistent</
md:NameIDFormat>
        <md:NameIDFormat>urn:oasis:names:tc:SAML:1.1:nameid-format:emailAddress</
md:NameIDFormat>
        <md:SingleSignOnService Binding="urn:oasis:names:tc:SAML:2.0:bindings:HTTP-
Redirect" Location="https://idp.example.com/saml/sso"/>
        <md:SingleSignOnService Binding="urn:oasis:names:tc:SAML:2.0:bindings:HTTP-
POST" Location="https://idp.example.com/saml/sso"/>
    </md:IDPSSODescriptor>
</md:EntityDescriptor>
```

Output:

```
{
    "SAMLProviderArn": "arn:aws:iam::123456789012:saml-provider/MySAMLProvider"
}
```

For more information, see Creating IAM SAML identity providers in the *AWS IAM User Guide*.

- For API details, see CreateSAMLProvider in *AWS CLI Command Reference*.

`create-service-linked-role`

The following code example shows how to use `create-service-linked-role`.

AWS CLI

To create a service-linked role

The following `create-service-linked-role` example creates a service-linked role for the specified AWS service and attaches the specified description.

```
aws iam create-service-linked-role \
    --aws-service-name lex.amazonaws.com \
    --description "My service-linked role to support Lex"
```

Output:

```
{
```

```
    "Role": {
        "Path": "/aws-service-role/lex.amazonaws.com/",
        "RoleName": "AWSServiceRoleForLexBots",
        "RoleId": "AROA1234567890EXAMPLE",
        "Arn": "arn:aws:iam::1234567890:role/aws-service-role/lex.amazonaws.com/
AWSServiceRoleForLexBots",
        "CreateDate": "2019-04-17T20:34:14+00:00",
        "AssumeRolePolicyDocument": {
            "Version":"2012-10-17",
            "Statement": [
                {
                    "Action": [
                        "sts:AssumeRole"
                    ],
                    "Effect": "Allow",
                    "Principal": {
                        "Service": [
                            "lex.amazonaws.com"
                        ]
                    }
                }
            ]
        }
    }
}
```

For more information, see Using service-linked roles in the *AWS IAM User Guide*.

- For API details, see CreateServiceLinkedRole in *AWS CLI Command Reference*.

`create-service-specific-credential`

The following code example shows how to use `create-service-specific-credential`.

AWS CLI

To create a set of service-specific credentials for a user

The following `create-service-specific-credential` example creates a username and password that can be used to access only the configured service.

```
aws iam create-service-specific-credential \
    --user-name sofia \
```

```
    --service-name codecommit.amazonaws.com
```

Output:

```
{
    "ServiceSpecificCredential": {
        "CreateDate": "2019-04-18T20:45:36+00:00",
        "ServiceName": "codecommit.amazonaws.com",
        "ServiceUserName": "sofia-at-123456789012",
        "ServicePassword": "k1zPZM6uVxMQ3oxqgoYlNuJPyRTZ1vREs76zTQE3eJk=",
        "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
        "UserName": "sofia",
        "Status": "Active"
    }
}
```

For more information, see Create Git credentials for HTTPS connections to CodeCommit in the *AWS CodeCommit User Guide*.

- For API details, see CreateServiceSpecificCredential in *AWS CLI Command Reference*.

`create-user`

The following code example shows how to use `create-user`.

AWS CLI

Example 1: To create an IAM user

The following `create-user` example creates an IAM user named Bob in the current account.

```
aws iam create-user \
    --user-name Bob
```

Output:

```
{
    "User": {
        "UserName": "Bob",
        "Path": "/",
        "CreateDate": "2023-06-08T03:20:41.270Z",
        "UserId": "AIDAIOSFODNN7EXAMPLE",
```

```
        "Arn": "arn:aws:iam::123456789012:user/Bob"
    }
}
```

For more information, see Creating an IAM user in your AWS account in the *AWS IAM User Guide*.

Example 2: To create an IAM user at a specified path

The following `create-user` example creates an IAM user named Bob at the specified path.

```
aws iam create-user \
    --user-name Bob \
    --path /division_abc/subdivision_xyz/
```

Output:

```
{
    "User": {
        "Path": "/division_abc/subdivision_xyz/",
        "UserName": "Bob",
        "UserId": "AIDAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::12345678012:user/division_abc/subdivision_xyz/Bob",
        "CreateDate": "2023-05-24T18:20:17+00:00"
    }
}
```

For more information, see IAM identifiers in the *AWS IAM User Guide*.

Example 3: To create an IAM user with tags

The following `create-user` example creates an IAM user named Bob with tags. This example uses the `--tags` parameter flag with the following JSON-formatted tags: `'{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}'`. Alternatively, the `--tags` flag can be used with tags in the shorthand format: `'Key=Department,Value=Accounting Key=Location,Value=Seattle'`.

```
aws iam create-user \
    --user-name Bob \
    --tags '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location",
 "Value": "Seattle"}'
```

Output:

```
{
    "User": {
        "Path": "/",
        "UserName": "Bob",
        "UserId": "AIDAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::12345678012:user/Bob",
        "CreateDate": "2023-05-25T17:14:21+00:00",
        "Tags": [
            {
                "Key": "Department",
                "Value": "Accounting"
            },
            {
                "Key": "Location",
                "Value": "Seattle"
            }
        ]
    }
}
```

For more information, see Tagging IAM users in the *AWS IAM User Guide*.

Example 4: To create an IAM user with a set permissions boundary

The following `create-user` example creates an IAM user named Bob with the permissions boundary of AmazonS3FullAccess.

```
aws iam create-user \
    --user-name Bob \
    --permissions-boundary arn:aws:iam::aws:policy/AmazonS3FullAccess
```

Output:

```
{
    "User": {
        "Path": "/",
        "UserName": "Bob",
        "UserId": "AIDAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::12345678012:user/Bob",
        "CreateDate": "2023-05-24T17:50:53+00:00",
        "PermissionsBoundary": {
        "PermissionsBoundaryType": "Policy",
```

```
        "PermissionsBoundaryArn": "arn:aws:iam::aws:policy/AmazonS3FullAccess"
        }
    }
}
```

For more information, see Permissions boundaries for IAM entities in the *AWS IAM User Guide*.

- For API details, see CreateUser in *AWS CLI Command Reference*.

`create-virtual-mfa-device`

The following code example shows how to use `create-virtual-mfa-device`.

AWS CLI

To create a virtual MFA device

The following `create-virtual-mfa-device` example creates a new virtual MFA device called `BobsMFADevice`. It creates a file that contains bootstrap information called `QRCode.png` and places it in the `C:/` directory. The bootstrap method used in this example is `QRCodePNG`.

```
aws iam create-virtual-mfa-device \
    --virtual-mfa-device-name BobsMFADevice \
    --outfile C:/QRCode.png \
    --bootstrap-method QRCodePNG
```

Output:

```
{
    "VirtualMFADevice": {
        "SerialNumber": "arn:aws:iam::123456789012:mfa/BobsMFADevice"
    }
}
```

For more information, see Using multi-factor authentication (MFA) in AWS in the *AWS IAM User Guide*.

- For API details, see CreateVirtualMfaDevice in *AWS CLI Command Reference*.

`deactivate-mfa-device`

The following code example shows how to use `deactivate-mfa-device`.

AWS CLI

To deactivate an MFA device

The following `deactivate-mfa-device` example deactivates the virtual MFA device with the ARN `arn:aws:iam::123456789012:mfa/BobsMFADevice` that is associated with the user Bob.

```
aws iam deactivate-mfa-device \
    --user-name Bob \
    --serial-number arn:aws:iam::123456789012:mfa/BobsMFADevice
```

This command produces no output.

For more information, see Using multi-factor authentication (MFA) in AWS in the *AWS IAM User Guide*.

- For API details, see DeactivateMfaDevice in *AWS CLI Command Reference*.

`delete-access-key`

The following code example shows how to use `delete-access-key`.

AWS CLI

To delete an access key for an IAM user

The following `delete-access-key` example deletes the specified access key (access key ID and secret access key) for the IAM user named Bob.

```
aws iam delete-access-key \
    --access-key-id AKIDPMS9RO4H3FEXAMPLE \
    --user-name Bob
```

This command produces no output.

To list the access keys defined for an IAM user, use the `list-access-keys` command.

For more information, see Managing access keys for IAM users in the *AWS IAM User Guide*.

- For API details, see DeleteAccessKey in *AWS CLI Command Reference*.

`delete-account-alias`

The following code example shows how to use `delete-account-alias`.

AWS CLI

To delete an account alias

The following `delete-account-alias` example removes the alias `mycompany` for the current account.

```
aws iam delete-account-alias \
    --account-alias mycompany
```

This command produces no output.

For more information, see Your AWS account ID and its alias in the *AWS IAM User Guide*.

- For API details, see DeleteAccountAlias in *AWS CLI Command Reference*.

`delete-account-password-policy`

The following code example shows how to use `delete-account-password-policy`.

AWS CLI

To delete the current account password policy

The following `delete-account-password-policy` example removes the password policy for the current account.

```
aws iam delete-account-password-policy
```

This command produces no output.

For more information, see Setting an account password policy for IAM users in the *AWS IAM User Guide*.

- For API details, see DeleteAccountPasswordPolicy in *AWS CLI Command Reference*.

`delete-group-policy`

The following code example shows how to use `delete-group-policy`.

AWS CLI

To delete a policy from an IAM group

The following `delete-group-policy` example deletes the policy named `ExamplePolicy` from the group named `Admins`.

```
aws iam delete-group-policy \
    --group-name Admins \
    --policy-name ExamplePolicy
```

This command produces no output.

To see the policies attached to a group, use the `list-group-policies` command.

For more information, see Managing IAM policies in the *AWS IAM User Guide*.

- For API details, see DeleteGroupPolicy in *AWS CLI Command Reference*.

`delete-group`

The following code example shows how to use `delete-group`.

AWS CLI

To delete an IAM group

The following `delete-group` example deletes an IAM group named `MyTestGroup`.

```
aws iam delete-group \
    --group-name MyTestGroup
```

This command produces no output.

For more information, see Deleting an IAM user group in the *AWS IAM User Guide*.

- For API details, see DeleteGroup in *AWS CLI Command Reference*.

`delete-instance-profile`

The following code example shows how to use `delete-instance-profile`.

AWS CLI

To delete an instance profile

The following `delete-instance-profile` example deletes the instance profile named `ExampleInstanceProfile`.

```
aws iam delete-instance-profile \
    --instance-profile-name ExampleInstanceProfile
```

This command produces no output.

For more information, see Using instance profiles in the *AWS IAM User Guide*.

- For API details, see DeleteInstanceProfile in *AWS CLI Command Reference*.

`delete-login-profile`

The following code example shows how to use `delete-login-profile`.

AWS CLI

To delete a password for an IAM user

The following `delete-login-profile` example deletes the password for the IAM user named Bob.

```
aws iam delete-login-profile \
    --user-name Bob
```

This command produces no output.

For more information, see Managing passwords for IAM users in the *AWS IAM User Guide*.

- For API details, see DeleteLoginProfile in *AWS CLI Command Reference*.

`delete-open-id-connect-provider`

The following code example shows how to use `delete-open-id-connect-provider`.

AWS CLI

To delete an IAM OpenID Connect identity provider

The following `delete-open-id-connect-provider` example deletes the IAM OIDC provider that connects to the provider `example.oidcprovider.com`.

```
aws iam delete-open-id-connect-provider \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com
```

This command produces no output.

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see DeleteOpenIdConnectProvider in *AWS CLI Command Reference*.

`delete-policy-version`

The following code example shows how to use `delete-policy-version`.

AWS CLI

To delete a version of a managed policy

The following `delete-policy-version` example deletes the version identified as `v2` from the policy whose ARN is `arn:aws:iam::123456789012:policy/MyPolicy`.

```
aws iam delete-policy-version \
    --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
    --version-id v2
```

This command produces no output.

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see DeletePolicyVersion in *AWS CLI Command Reference*.

`delete-policy`

The following code example shows how to use `delete-policy`.

AWS CLI

To delete an IAM policy

The following `delete-policy` example deletes the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
aws iam delete-policy \
    --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

This command produces no output.

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see DeletePolicy in *AWS CLI Command Reference*.

`delete-role-permissions-boundary`

The following code example shows how to use `delete-role-permissions-boundary`.

AWS CLI

To delete a permissions boundary from an IAM role

The following `delete-role-permissions-boundary` example deletes the permissions boundary for the specified IAM role. To apply a permissions boundary to a role, use the `put-role-permissions-boundary` command.

```
aws iam delete-role-permissions-boundary \
    --role-name lambda-application-role
```

This command produces no output.

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see DeleteRolePermissionsBoundary in *AWS CLI Command Reference*.

`delete-role-policy`

The following code example shows how to use `delete-role-policy`.

AWS CLI

To remove a policy from an IAM role

The following `delete-role-policy` example removes the policy named `ExamplePolicy` from the role named `Test-Role`.

```
aws iam delete-role-policy \
    --role-name Test-Role \
    --policy-name ExamplePolicy
```

This command produces no output.

For more information, see IAM role management in the *AWS IAM User Guide*.

- For API details, see DeleteRolePolicy in *AWS CLI Command Reference*.

`delete-role`

The following code example shows how to use `delete-role`.

AWS CLI

To delete an IAM role

The following `delete-role` example removes the role named `Test-Role`.

```
aws iam delete-role \
    --role-name Test-Role
```

This command produces no output.

Before you can delete a role, you must remove the role from any instance profile (`remove-role-from-instance-profile`), detach any managed policies (`detach-role-policy`) and delete any inline policies that are attached to the role (`delete-role-policy`).

For more information, see Creating IAM roles and Using instance profiles in the *AWS IAM User Guide*.

- For API details, see DeleteRole in *AWS CLI Command Reference*.

`delete-saml-provider`

The following code example shows how to use `delete-saml-provider`.

AWS CLI

To delete a SAML provider

The following `delete-saml-provider` example deletes the IAM SAML 2.0 provider whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFSProvider`.

```
aws iam delete-saml-provider \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFSProvider
```

This command produces no output.

For more information, see Creating IAM SAML identity providers in the *AWS IAM User Guide*.

- For API details, see DeleteSAMLProvider in *AWS CLI Command Reference*.

`delete-server-certificate`

The following code example shows how to use `delete-server-certificate`.

AWS CLI

To delete a server certificate from your AWS account

The following `delete-server-certificate` example removes the specified server certificate from your AWS account.

```
aws iam delete-server-certificate \
    --server-certificate-name myUpdatedServerCertificate
```

This command produces no output.

To list the server certificates available in your AWS account, use the `list-server-certificates` command.

For more information, see Managing server certificates in IAM in the *AWS IAM User Guide*.

- For API details, see DeleteServerCertificate in *AWS CLI Command Reference*.

`delete-service-linked-role`

The following code example shows how to use `delete-service-linked-role`.

AWS CLI

To delete a service-linked role

The following `delete-service-linked-role` example deletes the specified service-linked role that you no longer need. The deletion happens asynchronously. You can check the status of the deletion and confirm when it is done by using the `get-service-linked-role-deletion-status` command.

```
aws iam delete-service-linked-role \
    --role-name AWSServiceRoleForLexBots
```

Output:

```
{
    "DeletionTaskId": "task/aws-service-role/lex.amazonaws.com/
AWSServiceRoleForLexBots/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Using service-linked roles in the *AWS IAM User Guide*.

- For API details, see DeleteServiceLinkedRole in *AWS CLI Command Reference*.

`delete-service-specific-credential`

The following code example shows how to use `delete-service-specific-credential`.

AWS CLI

Example 1: To delete a service-specific credential for the requesting user

The following `delete-service-specific-credential` example deletes the specified service-specific credential for the user making the request. The `service-specific-credential-id` is provided when you create the credential and you can retrieve it by using the `list-service-specific-credentials` command.

```
aws iam delete-service-specific-credential \
    --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

This command produces no output.

Example 2: To delete a service-specific credential for a specified user

The following `delete-service-specific-credential` example deletes the specified service-specific credential for the specified user. The `service-specific-credential-id` is provided when you create the credential and you can retrieve it by using the `list-service-specific-credentials` command.

```
aws iam delete-service-specific-credential \
    --user-name sofia \
    --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

This command produces no output.

For more information, see Create Git credentials for HTTPS connections to CodeCommit in the *AWS CodeCommit User Guide*.

- For API details, see DeleteServiceSpecificCredential in *AWS CLI Command Reference*.

`delete-signing-certificate`

The following code example shows how to use `delete-signing-certificate`.

AWS CLI

To delete a signing certificate for an IAM user

The following `delete-signing-certificate` example deletes the specified signing certificate for the IAM user named Bob.

```
aws iam delete-signing-certificate \
    --user-name Bob \
    --certificate-id TA7SMP42TDN5Z26OBPJE7EXAMPLE
```

This command produces no output.

To get the ID for a signing certificate, use the `list-signing-certificates` command.

For more information, see Manage signing certificates in the *Amazon EC2 User Guide*.

- For API details, see DeleteSigningCertificate in *AWS CLI Command Reference*.

`delete-ssh-public-key`

The following code example shows how to use `delete-ssh-public-key`.

AWS CLI

To delete an SSH public keys attached to an IAM user

The following `delete-ssh-public-key` example deletes the specified SSH public key attached to the IAM user `sofia`.

```
aws iam delete-ssh-public-key \
    --user-name sofia \
    --ssh-public-key-id APKA123456789EXAMPLE
```

This command produces no output.

For more information, see Use SSH keys and SSH with CodeCommit in the *AWS IAM User Guide*.

- For API details, see DeleteSshPublicKey in *AWS CLI Command Reference*.

`delete-user-permissions-boundary`

The following code example shows how to use `delete-user-permissions-boundary`.

AWS CLI

To delete a permissions boundary from an IAM user

The following `delete-user-permissions-boundary` example deletes the permissions boundary attached to the IAM user named `intern`. To apply a permissions boundary to a user, use the `put-user-permissions-boundary` command.

```
aws iam delete-user-permissions-boundary \
    --user-name intern
```

This command produces no output.

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see DeleteUserPermissionsBoundary in *AWS CLI Command Reference*.

`delete-user-policy`

The following code example shows how to use `delete-user-policy`.

AWS CLI

To remove a policy from an IAM user

The following `delete-user-policy` example removes the specified policy from the IAM user named Bob.

```
aws iam delete-user-policy \
    --user-name Bob \
    --policy-name ExamplePolicy
```

This command produces no output.

To get a list of policies for an IAM user, use the `list-user-policies` command.

For more information, see Creating an IAM user in your AWS account in the *AWS IAM User Guide*.

- For API details, see DeleteUserPolicy in *AWS CLI Command Reference*.

`delete-user`

The following code example shows how to use `delete-user`.

AWS CLI

To delete an IAM user

The following `delete-user` example removes the IAM user named Bob from the current account.

```
aws iam delete-user \
    --user-name Bob
```

This command produces no output.

For more information, see Deleting an IAM user in the *AWS IAM User Guide*.

- For API details, see DeleteUser in *AWS CLI Command Reference*.

`delete-virtual-mfa-device`

The following code example shows how to use `delete-virtual-mfa-device`.

AWS CLI

To remove a virtual MFA device

The following `delete-virtual-mfa-device` example removes the specified MFA device from the current account.

```
aws iam delete-virtual-mfa-device \
    --serial-number arn:aws:iam::123456789012:mfa/MFATest
```

This command produces no output.

For more information, see Deactivating MFA devices in the *AWS IAM User Guide*.

- For API details, see DeleteVirtualMfaDevice in *AWS CLI Command Reference*.

`detach-group-policy`

The following code example shows how to use `detach-group-policy`.

AWS CLI

To detach a policy from a group

The following `detach-group-policy` example removes the managed policy with the ARN `arn:aws:iam::123456789012:policy/TesterAccessPolicy` from the group called `Testers`.

```
aws iam detach-group-policy \
    --group-name Testers \
    --policy-arn arn:aws:iam::123456789012:policy/TesterAccessPolicy
```

This command produces no output.

For more information, see Managing IAM user groups in the *AWS IAM User Guide*.

- For API details, see DetachGroupPolicy in *AWS CLI Command Reference*.

`detach-role-policy`

The following code example shows how to use `detach-role-policy`.

AWS CLI

To detach a policy from a role

The following `detach-role-policy` example removes the managed policy with the ARN `arn:aws:iam::123456789012:policy/FederatedTesterAccessPolicy` from the role called `FedTesterRole`.

```
aws iam detach-role-policy \
    --role-name FedTesterRole \
    --policy-arn arn:aws:iam::123456789012:policy/FederatedTesterAccessPolicy
```

This command produces no output.

For more information, see IAM role management in the *AWS IAM User Guide*.

- For API details, see DetachRolePolicy in *AWS CLI Command Reference*.

`detach-user-policy`

The following code example shows how to use `detach-user-policy`.

AWS CLI

To detach a policy from a user

The following `detach-user-policy` example removes the managed policy with the ARN `arn:aws:iam::123456789012:policy/TesterPolicy` from the user Bob.

```
aws iam detach-user-policy \
    --user-name Bob \
    --policy-arn arn:aws:iam::123456789012:policy/TesterPolicy
```

This command produces no output.

For more information, see Changing permissions for an IAM user in the *AWS IAM User Guide*.

- For API details, see DetachUserPolicy in *AWS CLI Command Reference*.

`disable-organizations-root-credentials-management`

The following code example shows how to use `disable-organizations-root-credentials-management`.

AWS CLI

To disable the RootCredentialsManagement feature in your organization

The following `disable-organizations-root-credentials-management` example disables the management of privileged root user credentials across member accounts in your organization.

```
aws iam disable-organizations-root-credentials-management
```

Output:

```
{
    "EnabledFeatures": [
        "RootSessions"
    ],
    "OrganizationId": "o-aa111bb222"
}
```

For more information, see Centralize root access for member accounts in the *AWS IAM User Guide*.g

- For API details, see DisableOrganizationsRootCredentialsManagement in *AWS CLI Command Reference*.

`disable-organizations-root-sessions`

The following code example shows how to use `disable-organizations-root-sessions`.

AWS CLI

To disable the RootSessions feature in your organization

The following `disable-organizations-root-sessions` example disables root user sessions for privileged tasks across member accounts in your organization.

```
aws iam disable-organizations-root-sessions
```

Output:

```
{
```

```
    "EnabledFeatures": [
        "RootCredentialsManagement"
    ],
    "OrganizationId": "o-aa111bb222"
}
```

For more information, see Centralize root access for member accounts in the *AWS IAM User Guide*.

- For API details, see DisableOrganizationsRootSessions in *AWS CLI Command Reference*.

`enable-mfa-device`

The following code example shows how to use `enable-mfa-device`.

AWS CLI

To enable an MFA device

The following `enable-mfa-device` example assigns the MFA device with the serial number `arn:aws:iam::123456789012:mfa/BobsMFADevice` to the user Bob. The command also synchronizes the device with AWS by including the first two codes in sequence from the virtual MFA device. Before you assign a virtual MFA device to a user, you create it by using the `create-virtual-mfa-device` command.

```
aws iam enable-mfa-device \
    --user-name Bob \
    --serial-number arn:aws:iam::123456789012:mfa/BobsMFADevice \
    --authentication-code1 123456 \
    --authentication-code2 789012
```

This command produces no output.

For more information, see Enabling a virtual multi-factor authentication (MFA) device in the *AWS IAM User Guide*.

- For API details, see EnableMfaDevice in *AWS CLI Command Reference*.

`enable-organizations-root-credentials-management`

The following code example shows how to use `enable-organizations-root-credentials-management`.

AWS CLI

To enable the RootCredentialsManagement feature in your organization

The following `enable-organizations-root-credentials-management` example enables the management of privileged root user credentials across member accounts in your organization.

```
aws iam enable-organizations-root-credentials-management
```

Output:

```
{
    "EnabledFeatures": [
        "RootCredentialsManagement"
    ],
    "OrganizationId": "o-aa111bb222"
}
```

For more information, see Centralize root access for member accounts in the *AWS IAM User Guide*.

- For API details, see EnableOrganizationsRootCredentialsManagement in *AWS CLI Command Reference*.

`enable-organizations-root-sessions`

The following code example shows how to use `enable-organizations-root-sessions`.

AWS CLI

To enable the RootSessions feature in your organization

The following `enable-organizations-root-sessions` example allows the management account or delegated administrator to perform privileged tasks on member accounts in your organization.

```
aws iam enable-organizations-root-sessions
```

Output:

```
{
    "EnabledFeatures": [
        "RootSessions"
    ],
    "OrganizationId": "o-aa111bb222"
}
```

For more information, see Centralize root access for member accounts in the *AWS IAM User Guide*.

- For API details, see EnableOrganizationsRootSessions in *AWS CLI Command Reference*.

`generate-credential-report`

The following code example shows how to use `generate-credential-report`.

AWS CLI

To generate a credential report

The following `generate-credential-report` example attempts to generate a credential report for the AWS account.

```
aws iam generate-credential-report
```

Output:

```
{
    "State":  "STARTED",
    "Description": "No report exists. Starting a new report generation task"
}
```

For more information, see Getting credential reports for your AWS account in the *AWS IAM User Guide*.

- For API details, see GenerateCredentialReport in *AWS CLI Command Reference*.

`generate-organizations-access-report`

The following code example shows how to use `generate-organizations-access-report`.

AWS CLI

Example 1: To generate an access report for a root in an organization

The following `generate-organizations-access-report` example starts a background job to create an access report for the specified root in an organization. You can display the report after it's created by running the `get-organizations-access-report` command.

```
aws iam generate-organizations-access-report \
    --entity-path o-4fxmplt198/r-c3xb
```

Output:

```
{
    "JobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

Example 2: To generate an access report for an account in an organization

The following `generate-organizations-access-report` example starts a background job to create an access report for account ID `123456789012` in the organization `o-4fxmplt198`. You can display the report after it's created by running the `get-organizations-access-report` command.

```
aws iam generate-organizations-access-report \
    --entity-path o-4fxmplt198/r-c3xb/123456789012
```

Output:

```
{
    "JobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

Example 3: To generate an access report for an account in an organizational unit in an organization

The following `generate-organizations-access-report` example starts a background job to create an access report for account ID `123456789111` in organizational unit `ou-c3xb-lmu7j2yg` in the organization `o-4fxmplt198`. You can display the report after it's created by running the `get-organizations-access-report` command.

```
aws iam generate-organizations-access-report \
    --entity-path o-4fxmplt198/r-c3xb/ou-c3xb-lmu7j2yg/123456789111
```

Output:

```
{
    "JobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
}
```

To get details about roots and organizational units in your organization, use the `organizations list-roots` and `organizations list-organizational-units-for-parent` commands.

For more information, see Refining permissions in AWS using last accessed information in the *AWS IAM User Guide*.

- For API details, see GenerateOrganizationsAccessReport in *AWS CLI Command Reference*.

`generate-service-last-accessed-details`

The following code example shows how to use `generate-service-last-accessed-details`.

AWS CLI

Example 1: To generate a service access report for a custom policy

The following `generate-service-last-accessed-details` example starts a background job to generate a report that lists the services accessed by IAM users and other entities with a custom policy named `intern-boundary`. You can display the report after it is created by running the `get-service-last-accessed-details` command.

```
aws iam generate-service-last-accessed-details \
    --arn arn:aws:iam::123456789012:policy/intern-boundary
```

Output:

```
{
    "JobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

Example 2: To generate a service access report for the AWS managed AdministratorAccess policy

The following `generate-service-last-accessed-details` example starts a background job to generate a report that lists the services accessed by IAM users and other entities with the AWS managed `AdministratorAccess` policy. You can display the report after it is created by running the `get-service-last-accessed-details` command.

```
aws iam generate-service-last-accessed-details \
    --arn arn:aws:iam::aws:policy/AdministratorAccess
```

Output:

```
{
    "JobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Refining permissions in AWS using last accessed information in the *AWS IAM User Guide*.

- For API details, see GenerateServiceLastAccessedDetails in *AWS CLI Command Reference*.

`get-access-key-last-used`

The following code example shows how to use `get-access-key-last-used`.

AWS CLI

To retrieve information about when the specified access key was last used

The following `get-access-key-last-used` example retrieves information about when the access key `AKIAIOSFODNN7EXAMPLE` was last used.

```
aws iam get-access-key-last-used \
    --access-key-id AKIAIOSFODNN7EXAMPLE
```

Output:

```
{
    "UserName":  "Bob",
    "AccessKeyLastUsed": {
```

```
        "Region": "us-west-2",
        "ServiceName": "iam",
        "LastUsedDate": "2015-06-16T22:45:00Z"
    }
}
```

For more information, see Managing access keys for IAM users in the *AWS IAM User Guide*.

- For API details, see GetAccessKeyLastUsed in *AWS CLI Command Reference*.

`get-account-authorization-details`

The following code example shows how to use `get-account-authorization-details`.

AWS CLI

To list an AWS account's IAM users, groups, roles, and policies

The following `get-account-authorization-details` example returns information about all IAM users, groups, roles, and policies in the AWS account.

```
aws iam get-account-authorization-details
```

Output:

```
{
    "RoleDetailList": [
        {
            "AssumeRolePolicyDocument": {
                "Version":"2012-10-17",
                "Statement": [
                    {
                        "Sid": "",
                        "Effect": "Allow",
                        "Principal": {
                            "Service": "ec2.amazonaws.com"
                        },
                        "Action": "sts:AssumeRole"
                    }
                ]
            },
            "RoleId": "AROA1234567890EXAMPLE",
            "CreateDate": "2014-07-30T17:09:20Z",
```

```
            "InstanceProfileList": [
                {
                    "InstanceProfileId": "AIPA1234567890EXAMPLE",
                    "Roles": [
                        {
                            "AssumeRolePolicyDocument": {
                                "Version":"2012-10-17",
                                "Statement": [
                                    {
                                        "Sid": "",
                                        "Effect": "Allow",
                                        "Principal": {
                                            "Service": "ec2.amazonaws.com"
                                        },
                                        "Action": "sts:AssumeRole"
                                    }
                                ]
                            },
                            "RoleId": "AROA1234567890EXAMPLE",

  "IsTruncated": true
}
```

For more information, see AWS security audit guidelines in the *AWS IAM User Guide*.

- For API details, see GetAccountAuthorizationDetails in *AWS CLI Command Reference*.

`get-account-password-policy`

The following code example shows how to use `get-account-password-policy`.

AWS CLI

To see the current account password policy

The following `get-account-password-policy` example displays details about the password policy for the current account.

```
aws iam get-account-password-policy
```

Output:

```
{
    "PasswordPolicy": {
        "AllowUsersToChangePassword": false,
        "RequireLowercaseCharacters": false,
        "RequireUppercaseCharacters": false,
        "MinimumPasswordLength": 8,
        "RequireNumbers": true,
        "RequireSymbols": true
```

```
    }
}
```

If no password policy is defined for the account, the command returns a `NoSuchEntity` error.

For more information, see Setting an account password policy for IAM users in the *AWS IAM User Guide*.

- For API details, see GetAccountPasswordPolicy in *AWS CLI Command Reference*.

`get-account-summary`

The following code example shows how to use `get-account-summary`.

AWS CLI

To get information about IAM entity usage and IAM quotas in the current account

The following `get-account-summary` example returns information about the current IAM entity usage and current IAM entity quotas in the account.

```
aws iam get-account-summary
```

Output:

```
{
    "SummaryMap": {
        "UsersQuota": 5000,
        "GroupsQuota": 100,
        "InstanceProfiles": 6,
        "SigningCertificatesPerUserQuota": 2,
        "AccountAccessKeysPresent": 0,
        "RolesQuota": 250,
        "RolePolicySizeQuota": 10240,
        "AccountSigningCertificatesPresent": 0,
        "Users": 27,
        "ServerCertificatesQuota": 20,
        "ServerCertificates": 0,
        "AssumeRolePolicySizeQuota": 2048,
        "Groups": 7,
        "MFADevicesInUse": 1,
        "Roles": 3,
```

```
        "AccountMFAEnabled": 1,
        "MFADevices": 3,
        "GroupsPerUserQuota": 10,
        "GroupPolicySizeQuota": 5120,
        "InstanceProfilesQuota": 100,
        "AccessKeysPerUserQuota": 2,
        "Providers": 0,
        "UserPolicySizeQuota": 2048
    }
}
```

For more information about entity limitations, see IAM and AWS STS quotas in the *AWS IAM User Guide*.

- For API details, see GetAccountSummary in *AWS CLI Command Reference*.

`get-context-keys-for-custom-policy`

The following code example shows how to use `get-context-keys-for-custom-policy`.

AWS CLI

Example 1: To list the context keys referenced by one or more custom JSON policies provided as a parameter on the command line

The following `get-context-keys-for-custom-policy` example parses each supplied policy and lists the context keys used by those policies. Use this command to identify which context key values you must supply to successfully use the policy simulator commands `simulate-custom-policy` and `simulate-custom-policy`. You can also retrieve the list of context keys used by all policies associated by an IAM user or role by using the `get-context-keys-for-custom-policy` command. Parameter values that begin with `file://` instruct the command to read the file and use the contents as the value for the parameter instead of the file name itself.

```
aws iam get-context-keys-for-custom-policy \
    --policy-input-list '{"Version":"2012-10-17",       "Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"arn:aws:dynamodb:us-
west-2:123456789012:table/${aws:username}","Condition":{"DateGreaterThan":
{"aws:CurrentTime":"2015-08-16T12:00:00Z"}}}}'
```

Output:

```
{
    "ContextKeyNames": [
        "aws:username",
        "aws:CurrentTime"
    ]
}
```

Example 2: To list the context keys referenced by one or more custom JSON policies provided as a file input

The following `get-context-keys-for-custom-policy` example lists the context keys in the same way as the previous example, except that the policies are provided in a file instead of as a parameter. Because the command expects a JSON list of strings, and not a list of JSON structures, the file must contain a JSON array in which each policy is a string. You must escape each embedded double-quote inside the policy string by preceding it with a backslash.

```
aws iam get-context-keys-for-custom-policy \
    --policy-input-list file://policyfile.json
```

Contents of `policyfile.json`:

```
[
    "{\"Version\": \"2012-10-17\", \"Statement\": {\"Effect\": \"Allow\", \"Action
\": \"dynamodb:*\", \"Resource\": \"arn:aws:dynamodb:us-west-2:123456789012:table/
${aws:username}\", \"Condition\": {\"DateGreaterThan\": {\"aws:CurrentTime\":
 \"2015-08-16T12:00:00Z\"}}}}"
]
```

Output:

```
{
    "ContextKeyNames": [
        "aws:username",
        "aws:CurrentTime"
    ]
}
```

For more information, see Using the IAM Policy Simulator (AWS CLI and AWS API) in the *AWS IAM User Guide*.

- For API details, see GetContextKeysForCustomPolicy in *AWS CLI Command Reference*.

`get-context-keys-for-principal-policy`

The following code example shows how to use `get-context-keys-for-principal-policy`.

AWS CLI

To list the context keys referenced by all policies associated with an IAM principal

The following `get-context-keys-for-principal-policy` example retrieves all policies that are attached to the user `saanvi` and any groups she is a member of. It then parses each and lists the context keys used by those policies. Use this command to identify which context key values you must supply to successfully use the `simulate-custom-policy` and `simulate-principal-policy` commands. You can also retrieve the list of context keys used by an arbitrary JSON policy by using the `get-context-keys-for-custom-policy` command.

```
aws iam get-context-keys-for-principal-policy \
    --policy-source-arn arn:aws:iam::123456789012:user/saanvi
```

Output:

```
{
    "ContextKeyNames": [
        "aws:username",
        "aws:CurrentTime"
    ]
}
```

For more information, see Using the IAM Policy Simulator (AWS CLI and AWS API) in the *AWS IAM User Guide*.

- For API details, see GetContextKeysForPrincipalPolicy in *AWS CLI Command Reference*.

`get-credential-report`

The following code example shows how to use `get-credential-report`.

AWS CLI

To get a credential report

The following `get-credential-report` example opens the returned report and outputs it to the pipeline as an array of text lines.

```
aws iam get-credential-report
```

Output:

```
{
    "GeneratedTime":  "2015-06-17T19:11:50Z",
    "ReportFormat": "text/csv"
}
```

For more information, see Getting credential reports for your AWS account in the *AWS IAM User Guide*.

- For API details, see GetCredentialReport in *AWS CLI Command Reference*.

`get-group-policy`

The following code example shows how to use `get-group-policy`.

AWS CLI

To get information about a policy attached to an IAM group

The following `get-group-policy` example gets information about the specified policy attached to the group named `Test-Group`.

```
aws iam get-group-policy \
    --group-name Test-Group \
    --policy-name S3-ReadOnly-Policy
```

Output:

```
{
    "GroupName": "Test-Group",
    "PolicyDocument": {
        "Statement": [
            {
                "Action": [
                    "s3:Get*",
```

```
                    "s3:List*"
                ],
                "Resource": "*",
                "Effect": "Allow"
            }
        ]
    },
    "PolicyName": "S3-ReadOnly-Policy"
}
```

For more information, see Managing IAM policies in the *AWS IAM User Guide*.

- For API details, see GetGroupPolicy in *AWS CLI Command Reference*.

`get-group`

The following code example shows how to use `get-group`.

AWS CLI

To get an IAM group

The following `get-group` example returns details about the IAM group `Admins`.

```
aws iam get-group \
    --group-name Admins
```

Output:

```
{
    "Group": {
        "Path": "/",
        "CreateDate": "2015-06-16T19:41:48Z",
        "GroupId": "AIDGPMS9RO4H3FEXAMPLE",
        "Arn": "arn:aws:iam::123456789012:group/Admins",
        "GroupName": "Admins"
    },
    "Users": []
}
```

For more information, see IAM Identities (users, user groups, and roles) in the *AWS IAM User Guide*.

- For API details, see GetGroup in *AWS CLI Command Reference*.

`get-instance-profile`

The following code example shows how to use `get-instance-profile`.

AWS CLI

To get information about an instance profile

The following `get-instance-profile` example gets information about the instance profile named `ExampleInstanceProfile`.

```
aws iam get-instance-profile \
    --instance-profile-name ExampleInstanceProfile
```

Output:

```
{
    "InstanceProfile": {
        "InstanceProfileId": "AID2MAB8DPLSRHEXAMPLE",
        "Roles": [
            {
                "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
                "RoleId": "AIDGPMS9RO4H3FEXAMPLE",
                "CreateDate": "2013-01-09T06:33:26Z",
                "RoleName": "Test-Role",
                "Path": "/",
                "Arn": "arn:aws:iam::123456789012:role/Test-Role"
            }
        ],
        "CreateDate": "2013-06-12T23:52:02Z",
        "InstanceProfileName": "ExampleInstanceProfile",
        "Path": "/",
        "Arn": "arn:aws:iam::123456789012:instance-profile/ExampleInstanceProfile"
    }
}
```

For more information, see Using instance profiles in the *AWS IAM User Guide*.

- For API details, see GetInstanceProfile in *AWS CLI Command Reference*.

`get-login-profile`

The following code example shows how to use `get-login-profile`.

AWS CLI

To get password information for an IAM user

The following `get-login-profile` example gets information about the password for the IAM user named Bob.

```
aws iam get-login-profile \
    --user-name Bob
```

Output:

```
{
    "LoginProfile": {
        "UserName": "Bob",
        "CreateDate": "2012-09-21T23:03:39Z"
    }
}
```

The `get-login-profile` command can be used to verify that an IAM user has a password. The command returns a `NoSuchEntity` error if no password is defined for the user.

You cannot view a password using this command. If the password is lost, you can reset the password (`update-login-profile`) for the user. Alternatively, you can delete the login profile (`delete-login-profile`) for the user and then create a new one (`create-login-profile`).

For more information, see Managing passwords for IAM users in the *AWS IAM User Guide*.

- For API details, see GetLoginProfile in *AWS CLI Command Reference*.

`get-mfa-device`

The following code example shows how to use `get-mfa-device`.

AWS CLI

To retrieve information about a FIDO security key

The following `get-mfa-device` example retrieves information about the specified FIDO security key.

```
aws iam get-mfa-device \
    --serial-number arn:aws:iam::123456789012:u2f/user/alice/fidokeyname-
EXAMPLEBN5FHTECLFG7EXAMPLE
```

Output:

```
{
    "UserName": "alice",
    "SerialNumber": "arn:aws:iam::123456789012:u2f/user/alice/fidokeyname-
EXAMPLEBN5FHTECLFG7EXAMPLE",
    "EnableDate": "2023-09-19T01:49:18+00:00",
    "Certifications": {
        "FIDO": "L1"
    }
}
```

For more information, see Using multi-factor authentication (MFA) in AWS in the *AWS IAM User Guide*.

- For API details, see GetMfaDevice in *AWS CLI Command Reference*.

`get-open-id-connect-provider`

The following code example shows how to use `get-open-id-connect-provider`.

AWS CLI

To return information about the specified OpenID Connect provider

The following `get-open-id-connect-provider` example returns details about the OpenID Connect provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/server.example.com`.

```
aws iam get-open-id-connect-provider \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
server.example.com
```

Output:

```
{
    "Url": "server.example.com",
    "CreateDate": "2015-06-16T19:41:48Z",
    "ThumbprintList": [
        "12345abcdefghijk67890lmnopqrst987example"
    ],
    "ClientIDList": [
        "example-application-ID"
    ]
}
```

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see GetOpenIdConnectProvider in *AWS CLI Command Reference*.

`get-organizations-access-report`

The following code example shows how to use `get-organizations-access-report`.

AWS CLI

To retrieve an access report

The following `get-organizations-access-report` example displays a previously generated access report for an AWS Organizations entity. To generate a report, use the `generate-organizations-access-report` command.

```
aws iam get-organizations-access-report \
    --job-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "JobStatus": "COMPLETED",
    "JobCreationDate": "2019-09-30T06:53:36.187Z",
    "JobCompletionDate": "2019-09-30T06:53:37.547Z",
    "NumberOfServicesAccessible": 188,
    "NumberOfServicesNotAccessed": 171,
    "AccessDetails": [
        {
```

```
            "ServiceName": "Alexa for Business",
            "ServiceNamespace": "a4b",
            "TotalAuthenticatedEntities": 0
        }
    ],
    "IsTruncated": false
}
```

For more information, see Refining permissions in AWS using last accessed information in the *AWS IAM User Guide*.

- For API details, see GetOrganizationsAccessReport in *AWS CLI Command Reference*.

`get-policy-version`

The following code example shows how to use `get-policy-version`.

AWS CLI

To retrieve information about the specified version of the specified managed policy

The following `get-policy-version` example returns the policy document for the v2 version of the policy whose ARN is `arn:aws:iam::123456789012:policy/MyManagedPolicy`.

```
aws iam get-policy-version \
    --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
    --version-id v2
```

Output:

```
{
    "PolicyVersion": {
        "Document": {
            "Version":"2012-10-17",
            "Statement": [
                {
                    "Effect": "Allow",
                    "Action": "iam:*",
                    "Resource": "*"
                }
            ]
        },
```

```
        "VersionId": "v2",
        "IsDefaultVersion": true,
        "CreateDate": "2023-04-11T00:22:54+00:00"
    }
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see GetPolicyVersion in *AWS CLI Command Reference*.

`get-policy`

The following code example shows how to use `get-policy`.

AWS CLI

To retrieve information about the specified managed policy

The following `get-policy` example returns details about the managed policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
aws iam get-policy \
    --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

Output:

```
{
    "Policy": {
        "PolicyName": "MySamplePolicy",
        "CreateDate": "2015-06-17T19:23:32Z",
        "AttachmentCount": 0,
        "IsAttachable": true,
        "PolicyId": "Z27SI6FQMGNQ2EXAMPLE1",
        "DefaultVersionId": "v1",
        "Path": "/",
        "Arn": "arn:aws:iam::123456789012:policy/MySamplePolicy",
        "UpdateDate": "2015-06-17T19:23:32Z"
    }
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see GetPolicy in *AWS CLI Command Reference*.

`get-role-policy`

The following code example shows how to use `get-role-policy`.

AWS CLI

To get information about a policy attached to an IAM role

The following `get-role-policy` example gets information about the specified policy attached to the role named `Test-Role`.

```
aws iam get-role-policy \
    --role-name Test-Role \
    --policy-name ExamplePolicy
```

Output:

```
{
    "RoleName": "Test-Role",
    "PolicyDocument": {
        "Statement": [
            {
                "Action": [
                    "s3:ListBucket",
                    "s3:Put*",
                    "s3:Get*",
                    "s3:*MultipartUpload*"
                ],
                "Resource": "*",
                "Effect": "Allow",
                "Sid": "1"
            }
        ]
    },
    "PolicyName": "ExamplePolicy"
}
```

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

- For API details, see GetRolePolicy in *AWS CLI Command Reference*.

`get-role`

The following code example shows how to use `get-role`.

AWS CLI

To get information about an IAM role

The following `get-role` example gets information about the role named `Test-Role`.

```
aws iam get-role \
    --role-name Test-Role
```

Output:

```
{
    "Role": {
        "Description": "Test Role",
        "AssumeRolePolicyDocument":"<URL-encoded-JSON>",
        "MaxSessionDuration": 3600,
        "RoleId": "AROA1234567890EXAMPLE",
        "CreateDate": "2019-11-13T16:45:56Z",
        "RoleName": "Test-Role",
        "Path": "/",
        "RoleLastUsed": {
            "Region": "us-west-2",
            "LastUsedDate": "2019-11-13T17:14:00Z"
        },
        "Arn": "arn:aws:iam::123456789012:role/Test-Role"
    }
}
```

The command displays the trust policy attached to the role. To list the permissions policies attached to a role, use the `list-role-policies` command.

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

- For API details, see GetRole in *AWS CLI Command Reference*.

`get-saml-provider`

The following code example shows how to use `get-saml-provider`.

AWS CLI

To retrieve the SAML provider metadocument

The following `get-saml-provider` example retrieves the details about the SAML 2.0 provider whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFS`. The response includes the metadata document that you got from the identity provider to create the AWS SAML provider entity as well as the creation and expiration dates.

```
aws iam get-saml-provider \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFS
```

Output:

```
{
    "SAMLMetadataDocument": "...SAMLMetadataDocument-XML...",
    "CreateDate": "2017-03-06T22:29:46+00:00",
    "ValidUntil": "2117-03-06T22:29:46.433000+00:00",
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "123456"
        },
        {
            "Key": "Department",
            "Value": "Accounting"
        }
    ]
}
```

For more information, see Creating IAM SAML identity providers in the *AWS IAM User Guide*.

- For API details, see GetSamlProvider in *AWS CLI Command Reference*.

`get-server-certificate`

The following code example shows how to use `get-server-certificate`.

AWS CLI

To get details about a server certificate in your AWS account

The following `get-server-certificate` example retrieves all of the details about the specified server certificate in your AWS account.

```
aws iam get-server-certificate \
    --server-certificate-name myUpdatedServerCertificate
```

Output:

```
{
    "ServerCertificate": {
        "ServerCertificateMetadata": {
            "Path": "/",
            "ServerCertificateName": "myUpdatedServerCertificate",
            "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:server-certificate/
myUpdatedServerCertificate",
            "UploadDate": "2019-04-22T21:13:44+00:00",
            "Expiration": "2019-10-15T22:23:16+00:00"
        },
        "CertificateBody": "-----BEGIN CERTIFICATE-----

\n-----END CERTIFICATE-----"
    }
}
```

To list the server certificates available in your AWS account, use the `list-server-certificates` command.

For more information, see Managing server certificates in IAM in the *AWS IAM User Guide*.

- For API details, see GetServerCertificate in *AWS CLI Command Reference*.

`get-service-last-accessed-details-with-entities`

The following code example shows how to use `get-service-last-accessed-details-with-entities`.

AWS CLI

To retrieve a service access report with details for a service

The following `get-service-last-accessed-details-with-entities` example retrieves a report that contains details about IAM users and other entities that accessed the specified service. To generate a report, use the `generate-service-last-accessed-details` command. To get a list of services accessed with namespaces, use `get-service-last-accessed-details`.

```
aws iam get-service-last-accessed-details-with-entities \
    --job-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
    --service-namespace lambda
```

Output:

```
{
    "JobStatus": "COMPLETED",
    "JobCreationDate": "2019-10-01T03:55:41.756Z",
    "JobCompletionDate": "2019-10-01T03:55:42.533Z",
    "EntityDetailsList": [
        {
            "EntityInfo": {
                "Arn": "arn:aws:iam::123456789012:user/admin",
                "Name": "admin",
                "Type": "USER",
                "Id": "AIDAIO2XMPLENQEXAMPLE",
                "Path": "/"
            },
```

```
            "LastAuthenticated": "2019-09-30T23:02:00Z"
        },
        {
            "EntityInfo": {
                "Arn": "arn:aws:iam::123456789012:user/developer",
                "Name": "developer",
                "Type": "USER",
                "Id": "AIDAIBEYXMPL2YEXAMPLE",
                "Path": "/"
            },
            "LastAuthenticated": "2019-09-16T19:34:00Z"
        }
    ]
}
```

For more information, see Refining permissions in AWS using last accessed information in the *AWS IAM User Guide*.

- For API details, see GetServiceLastAccessedDetailsWithEntities in *AWS CLI Command Reference*.

`get-service-last-accessed-details`

The following code example shows how to use `get-service-last-accessed-details`.

AWS CLI

To retrieve a service access report

The following `get-service-last-accessed-details` example retrieves a previously generated report that lists the services accessed by IAM entities. To generate a report, use the `generate-service-last-accessed-details` command.

```
aws iam get-service-last-accessed-details \
    --job-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "JobStatus": "COMPLETED",
    "JobCreationDate": "2019-10-01T03:50:35.929Z",
    "ServicesLastAccessed": [
```

```
        {
            "ServiceName": "AWS Lambda",
            "LastAuthenticated": "2019-09-30T23:02:00Z",
            "ServiceNamespace": "lambda",
            "LastAuthenticatedEntity": "arn:aws:iam::123456789012:user/admin",
            "TotalAuthenticatedEntities": 6
        }
    ],
    "IsTruncated": false
}
```

For more information, see Refining permissions in AWS using last accessed information in the *AWS IAM User Guide*.

- For API details, see GetServiceLastAccessedDetails in *AWS CLI Command Reference*.

`get-service-linked-role-deletion-status`

The following code example shows how to use `get-service-linked-role-deletion-status`.

AWS CLI

To check the status of a request to delete a service-linked role

The following `get-service-linked-role-deletion-status` example displays the status of a previously request to delete a service-linked role. The delete operation occurs asynchronously. When you make the request, you get a `DeletionTaskId` value that you provide as a parameter for this command.

```
aws iam get-service-linked-role-deletion-status \
    --deletion-task-id task/aws-service-role/lex.amazonaws.com/
AWSServiceRoleForLexBots/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
"Status": "SUCCEEDED"
}
```

For more information, see Using service-linked roles in the *AWS IAM User Guide*.

- For API details, see GetServiceLinkedRoleDeletionStatus in *AWS CLI Command Reference*.

`get-ssh-public-key`

The following code example shows how to use `get-ssh-public-key`.

AWS CLI

Example 1: To retrieve an SSH public key attached to an IAM user in SSH encoded form

The following `get-ssh-public-key` example retrieves the specified SSH public key from the IAM user `sofia`. The output is in SSH encoding.

```
aws iam get-ssh-public-key \
    --user-name sofia \
    --ssh-public-key-id APKA123456789EXAMPLE \
    --encoding SSH
```

Output:

```
{
    "SSHPublicKey": {
        "UserName": "sofia",
        "SSHPublicKeyId": "APKA123456789EXAMPLE",
        "Fingerprint": "12:34:56:78:90:ab:cd:ef:12:34:56:78:90:ab:cd:ef",
        "SSHPublicKeyBody": "ssh-rsa <<long encoded SSH string>>",
        "Status": "Inactive",
        "UploadDate": "2019-04-18T17:04:49+00:00"
    }
}
```

Example 2: To retrieve an SSH public key attached to an IAM user in PEM encoded form

The following `get-ssh-public-key` example retrieves the specified SSH public key from the IAM user `sofia`. The output is in PEM encoding.

```
aws iam get-ssh-public-key \
    --user-name sofia \
    --ssh-public-key-id APKA123456789EXAMPLE \
    --encoding PEM
```

Output:

```
{
```

```
    "SSHPublicKey": {
        "UserName": "sofia",
        "SSHPublicKeyId": "APKA123456789EXAMPLE",
        "Fingerprint": "12:34:56:78:90:ab:cd:ef:12:34:56:78:90:ab:cd:ef",
        "SSHPublicKeyBody": "-----BEGIN PUBLIC KEY-----\n<<long encoded PEM string>>
\n-----END PUBLIC KEY-----\n",
        "Status": "Inactive",
        "UploadDate": "2019-04-18T17:04:49+00:00"
    }
}
```

For more information, see Use SSH keys and SSH with CodeCommit in the *AWS IAM User Guide*.

- For API details, see GetSshPublicKey in *AWS CLI Command Reference*.

`get-user-policy`

The following code example shows how to use `get-user-policy`.

AWS CLI

To list policy details for an IAM user

The following `get-user-policy` example lists the details of the specified policy that is attached to the IAM user named Bob.

```
aws iam get-user-policy \
    --user-name Bob \
    --policy-name ExamplePolicy
```

Output:

```
{
    "UserName": "Bob",
    "PolicyName": "ExamplePolicy",
    "PolicyDocument": {
        "Version":"2012-10-17",
        "Statement": [
            {
                "Action": "*",
                "Resource": "*",
                "Effect": "Allow"
            }
```

```
        ]
    }
}
```

To get a list of policies for an IAM user, use the `list-user-policies` command.

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see GetUserPolicy in *AWS CLI Command Reference*.

`get-user`

The following code example shows how to use `get-user`.

AWS CLI

To get information about an IAM user

The following `get-user` example gets information about the IAM user named `Paulo`.

```
aws iam get-user \
    --user-name Paulo
```

Output:

```
{
    "User": {
        "UserName": "Paulo",
        "Path": "/",
        "CreateDate": "2019-09-21T23:03:13Z",
        "UserId": "AIDA123456789EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:user/Paulo"
    }
}
```

For more information, see Managing IAM users in the *AWS IAM User Guide*.

- For API details, see GetUser in *AWS CLI Command Reference*.

`list-access-keys`

The following code example shows how to use `list-access-keys`.

AWS CLI

To list the access key IDs for an IAM user

The following `list-access-keys` example lists the access keys IDs for the IAM user named Bob.

```
aws iam list-access-keys \
    --user-name Bob
```

Output:

```
{
    "AccessKeyMetadata": [
        {
            "UserName": "Bob",
            "Status": "Active",
            "CreateDate": "2013-06-04T18:17:34Z",
            "AccessKeyId": "AKIAIOSFODNN7EXAMPLE"
        },
        {
            "UserName": "Bob",
            "Status": "Inactive",
            "CreateDate": "2013-06-06T20:42:26Z",
            "AccessKeyId": "AKIAI44QH8DHBEXAMPLE"
        }
    ]
}
```

You cannot list the secret access keys for IAM users. If the secret access keys are lost, you must create new access keys using the `create-access-keys` command.

For more information, see Managing access keys for IAM users in the *AWS IAM User Guide*.

- For API details, see ListAccessKeys in *AWS CLI Command Reference*.

`list-account-aliases`

The following code example shows how to use `list-account-aliases`.

AWS CLI

To list account aliases

The following `list-account-aliases` example lists the aliases for the current account.

```
aws iam list-account-aliases
```

Output:

```
{
    "AccountAliases": [
    "mycompany"
    ]
}
```

For more information, see Your AWS account ID and its alias in the *AWS IAM User Guide*.

- For API details, see ListAccountAliases in *AWS CLI Command Reference*.

`list-attached-group-policies`

The following code example shows how to use `list-attached-group-policies`.

AWS CLI

To list all managed policies that are attached to the specified group

The following `list-attached-group-policies` example returns the names and ARNs of the managed policies that are attached to the IAM group named `Admins` in the AWS account.

```
aws iam list-attached-group-policies \
    --group-name Admins
```

Output:

```
{
    "AttachedPolicies": [
        {
            "PolicyName": "AdministratorAccess",
            "PolicyArn": "arn:aws:iam::aws:policy/AdministratorAccess"
        },
        {
            "PolicyName": "SecurityAudit",
            "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
```

```
        }
    ],
    "IsTruncated": false
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListAttachedGroupPolicies in *AWS CLI Command Reference*.

`list-attached-role-policies`

The following code example shows how to use `list-attached-role-policies`.

AWS CLI

To list all managed policies that are attached to the specified role

The following `list-attached-role-policies` example returns the names and ARNs of the managed policies attached to the IAM role named `SecurityAuditRole` in the AWS account.

```
aws iam list-attached-role-policies \
    --role-name SecurityAuditRole
```

Output:

```
{
    "AttachedPolicies": [
        {
            "PolicyName": "SecurityAudit",
            "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListAttachedRolePolicies in *AWS CLI Command Reference*.

`list-attached-user-policies`

The following code example shows how to use `list-attached-user-policies`.

AWS CLI

To list all managed policies that are attached to the specified user

The following `list-attached-user-policies` example returns the names and ARNs of the managed policies for the IAM user named Bob in the AWS account.

```
aws iam list-attached-user-policies \
    --user-name Bob
```

Output:

```
{
    "AttachedPolicies": [
        {
            "PolicyName": "AdministratorAccess",
            "PolicyArn": "arn:aws:iam::aws:policy/AdministratorAccess"
        },
        {
            "PolicyName": "SecurityAudit",
            "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListAttachedUserPolicies in *AWS CLI Command Reference*.

`list-entities-for-policy`

The following code example shows how to use `list-entities-for-policy`.

AWS CLI

To list all users, groups, and roles that the specified managed policy is attached to

The following `list-entities-for-policy` example returns a list of IAM groups, roles, and users who have the policy `arn:aws:iam::123456789012:policy/TestPolicy` attached.

```
aws iam list-entities-for-policy \
```

```
    --policy-arn arn:aws:iam::123456789012:policy/TestPolicy
```

Output:

```
{
    "PolicyGroups": [
        {
            "GroupName": "Admins",
            "GroupId": "AGPACKCEVSQ6C2EXAMPLE"
        }
    ],
    "PolicyUsers": [
        {
            "UserName": "Alice",
            "UserId": "AIDACKCEVSQ6C2EXAMPLE"
        }
    ],
    "PolicyRoles": [
        {
            "RoleName": "DevRole",
            "RoleId": "AROADBQP57FF2AEXAMPLE"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListEntitiesForPolicy in *AWS CLI Command Reference*.

`list-group-policies`

The following code example shows how to use `list-group-policies`.

AWS CLI

To list all inline policies that are attached to the specified group

The following `list-group-policies` example lists the names of inline policies that are attached to the IAM group named `Admins` in the current account.

```
aws iam list-group-policies \
```

```
    --group-name Admins
```

Output:

```
{
    "PolicyNames": [
        "AdminRoot",
        "ExamplePolicy"
    ]
}
```

For more information, see Managing IAM policies in the *AWS IAM User Guide*.

- For API details, see ListGroupPolicies in *AWS CLI Command Reference*.

`list-groups-for-user`

The following code example shows how to use `list-groups-for-user`.

AWS CLI

To list the groups that an IAM user belongs to

The following `list-groups-for-user` example displays the groups that the IAM user named Bob belongs to.

```
aws iam list-groups-for-user \
    --user-name Bob
```

Output:

```
{
    "Groups": [
        {
            "Path": "/",
            "CreateDate": "2013-05-06T01:18:08Z",
            "GroupId": "AKIAIOSFODNN7EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:group/Admin",
            "GroupName": "Admin"
        },
        {
            "Path": "/",
```

```
            "CreateDate": "2013-05-06T01:37:28Z",
            "GroupId": "AKIAI44QH8DHBEXAMPLE",
            "Arn": "arn:aws:iam::123456789012:group/s3-Users",
            "GroupName": "s3-Users"
        }
    ]
}
```

For more information, see Managing IAM user groups in the *AWS IAM User Guide*.

- For API details, see ListGroupsForUser in *AWS CLI Command Reference*.

`list-groups`

The following code example shows how to use `list-groups`.

AWS CLI

To list the IAM groups for the current account

The following `list-groups` example lists the IAM groups in the current account.

```
aws iam list-groups
```

Output:

```
{
    "Groups": [
        {
            "Path": "/",
            "CreateDate": "2013-06-04T20:27:27.972Z",
            "GroupId": "AIDACKCEVSQ6C2EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:group/Admins",
            "GroupName": "Admins"
        },
        {
            "Path": "/",
            "CreateDate": "2013-04-16T20:30:42Z",
            "GroupId": "AIDGPMS9RO4H3FEXAMPLE",
            "Arn": "arn:aws:iam::123456789012:group/S3-Admins",
            "GroupName": "S3-Admins"
        }
    ]
```

```
}
```

For more information, see Managing IAM user groups in the *AWS IAM User Guide*.

- For API details, see ListGroups in *AWS CLI Command Reference*.

`list-instance-profile-tags`

The following code example shows how to use `list-instance-profile-tags`.

AWS CLI

To list the tags attached to an instance profile

The following `list-instance-profile-tags` example retrieves the list of tags associated with the specified instance profile.

```
aws iam list-instance-profile-tags \
    --instance-profile-name deployment-role
```

Output:

```
{
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "123456"
        },
        {
            "Key": "Department",
            "Value": "Accounting"
        }
    ]
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListInstanceProfileTags in *AWS CLI Command Reference*.

`list-instance-profiles-for-role`

The following code example shows how to use `list-instance-profiles-for-role`.

AWS CLI

To list the instance profiles for an IAM role

The following `list-instance-profiles-for-role` example lists the instance profiles that are associated with the role `Test-Role`.

```
aws iam list-instance-profiles-for-role \
    --role-name Test-Role
```

Output:

```
{
    "InstanceProfiles": [
        {
            "InstanceProfileId": "AIDGPMS9RO4H3FEXAMPLE",
            "Roles": [
                {
                    "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
                    "RoleId": "AIDACKCEVSQ6C2EXAMPLE",
                    "CreateDate": "2013-06-07T20:42:15Z",
                    "RoleName": "Test-Role",
                    "Path": "/",
                    "Arn": "arn:aws:iam::123456789012:role/Test-Role"
                }
            ],
            "CreateDate": "2013-06-07T21:05:24Z",
            "InstanceProfileName": "ExampleInstanceProfile",
            "Path": "/",
            "Arn": "arn:aws:iam::123456789012:instance-profile/
ExampleInstanceProfile"
        }
    ]
}
```

For more information, see Using instance profiles in the *AWS IAM User Guide*.

- For API details, see ListInstanceProfilesForRole in *AWS CLI Command Reference*.

`list-instance-profiles`

The following code example shows how to use `list-instance-profiles`.

AWS CLI

To lists the instance profiles for the account

The following `list-instance-profiles` example lists the instance profiles that are associated with the current account.

```
aws iam list-instance-profiles
```

Output:

```
{
    "InstanceProfiles": [
        {
            "Path": "/",
            "InstanceProfileName": "example-dev-role",
            "InstanceProfileId": "AIPAIXEU4NUHUPEXAMPLE",
            "Arn": "arn:aws:iam::123456789012:instance-profile/example-dev-role",
            "CreateDate": "2023-09-21T18:17:41+00:00",
            "Roles": [
                {
                    "Path": "/",
                    "RoleName": "example-dev-role",
                    "RoleId": "AROAJ52OTH4H7LEXAMPLE",
                    "Arn": "arn:aws:iam::123456789012:role/example-dev-role",
                    "CreateDate": "2023-09-21T18:17:40+00:00",
                    "AssumeRolePolicyDocument": {
                        "Version":"2012-10-17",
                        "Statement": [
                            {
                                "Effect": "Allow",
                                "Principal": {
                                    "Service": "ec2.amazonaws.com"
                                },
                                "Action": "sts:AssumeRole"
                            }
                        ]
                    }
                }
            ]
        },
        {
            "Path": "/",
```

```
            "InstanceProfileName": "example-s3-role",

            "Roles": [
                {
                    "Path": "/",
                    "RoleName": "example-s3-role",
                    "RoleId": "AROAINUBC5O7XLEXAMPLE",
                    "Arn": "arn:aws:iam::123456789012:role/example-s3-role",
                    "CreateDate": "2023-09-21T18:18:49+00:00",
                    "AssumeRolePolicyDocument": {
                        "Version":"2012-10-17",
                        "Statement": [
                            {
                                "Effect": "Allow",
                                "Principal": {
                                    "Service": "ec2.amazonaws.com"
                                },
                                "Action": "sts:AssumeRole"
                            }
                        ]
                    }
                }
            ]
        }
    ]
}
```

For more information, see Using instance profiles in the *AWS IAM User Guide*.

- For API details, see ListInstanceProfiles in *AWS CLI Command Reference*.

`list-mfa-device-tags`

The following code example shows how to use `list-mfa-device-tags`.

AWS CLI

To list the tags attached to an MFA device

The following `list-mfa-device-tags` example retrieves the list of tags associated with the specified MFA device.

```
aws iam list-mfa-device-tags \
    --serial-number arn:aws:iam::123456789012:mfa/alice
```

Output:

```
{
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "123456"
        },
        {
            "Key": "Department",
            "Value": "Accounting"
        }
    ]
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListMfaDeviceTags in *AWS CLI Command Reference*.

`list-mfa-devices`

The following code example shows how to use `list-mfa-devices`.

AWS CLI

To list all MFA devices for a specified user

The following `list-mfa-devices` example returns details about the MFA device assigned to the IAM user Bob.

```
aws iam list-mfa-devices \
    --user-name Bob
```

Output:

```
{
    "MFADevices": [
```

```
        {
            "UserName": "Bob",
            "SerialNumber": "arn:aws:iam::123456789012:mfa/Bob",
            "EnableDate": "2019-10-28T20:37:09+00:00"
        },
        {
            "UserName": "Bob",
            "SerialNumber": "GAKT12345678",
            "EnableDate": "2023-02-18T21:44:42+00:00"
        },
        {
            "UserName": "Bob",
            "SerialNumber": "arn:aws:iam::123456789012:u2f/user/Bob/
fidosecuritykey1-7XNL7NFNLZ123456789EXAMPLE",
            "EnableDate": "2023-09-19T02:25:35+00:00"
        },
        {
            "UserName": "Bob",
            "SerialNumber": "arn:aws:iam::123456789012:u2f/user/Bob/
fidosecuritykey2-VDRQTDBBN5123456789EXAMPLE",
            "EnableDate": "2023-09-19T01:49:18+00:00"
        }
    ]
}
```

For more information, see Using multi-factor authentication (MFA) in AWS in the *AWS IAM User Guide*.

- For API details, see ListMfaDevices in *AWS CLI Command Reference*.

`list-open-id-connect-provider-tags`

The following code example shows how to use `list-open-id-connect-provider-tags`.

AWS CLI

To list the tags attached to an OpenID Connect (OIDC)-compatible identity provider

The following `list-open-id-connect-provider-tags` example retrieves the list of tags associated with the specified OIDC identity provider.

```
aws iam list-open-id-connect-provider-tags \
```

```
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
server.example.com
```

Output:

```
{
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "123456"
        },
        {
            "Key": "Department",
            "Value": "Accounting"
        }
    ]
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListOpenIdConnectProviderTags in *AWS CLI Command Reference*.

`list-open-id-connect-providers`

The following code example shows how to use `list-open-id-connect-providers`.

AWS CLI

To list information about the OpenID Connect providers in the AWS account

The following `list-open-id-connect-providers` example returns a list of ARNs of all the OpenID Connect providers that are defined in the current AWS account.

```
aws iam list-open-id-connect-providers
```

Output:

```
{
    "OpenIDConnectProviderList": [
        {
            "Arn": "arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com"
```

```
        }
    ]
}
```

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see ListOpenIdConnectProviders in *AWS CLI Command Reference*.

`list-organizations-features`

The following code example shows how to use `list-organizations-features`.

AWS CLI

To list the centralized root access features enabled for your organization

The following `list-organizations-features` example lists the centralized root access features enabled for your organization.

```
aws iam list-organizations-features
```

Output:

```
{
    "EnabledFeatures": [
        "RootCredentialsManagement",
        "RootSessions"
    ],
    "OrganizationId": "o-aa111bb222"
}
```

For more information, see Centrally manage root access for member accounts in the *AWS IAM User Guide*.

- For API details, see ListOrganizationsFeatures in *AWS CLI Command Reference*.

`list-policies-granting-service-access`

The following code example shows how to use `list-policies-granting-service-access`.

AWS CLI

To list the policies that grant a principal access to the specified service

The following `list-policies-granting-service-access` example retrieves the list of policies that grant the IAM user `sofia` access to AWS CodeCommit service.

```
aws iam list-policies-granting-service-access \
    --arn arn:aws:iam::123456789012:user/sofia \
    --service-namespaces codecommit
```

Output:

```
{
    "PoliciesGrantingServiceAccess": [
        {
            "ServiceNamespace": "codecommit",
            "Policies": [
                {
                    "PolicyName": "Grant-Sofia-Access-To-CodeCommit",
                    "PolicyType": "INLINE",
                    "EntityType": "USER",
                    "EntityName": "sofia"
                }
            ]
        }
    ],
    "IsTruncated": false
}
```

For more information, see Using IAM with CodeCommit: Git credentials, SSH keys, and AWS access keys in the *AWS IAM User Guide*.

- For API details, see ListPoliciesGrantingServiceAccess in *AWS CLI Command Reference*.

`list-policies`

The following code example shows how to use `list-policies`.

AWS CLI

To list managed policies that are available to your AWS account

The following `list-policies` example returns a collection of the first three managed policies available in the current AWS account.

```
aws iam list-policies \
    --max-items 3
```

Output:

```
{
    "Policies": [
        {
            "PolicyName": "AWSCloudTrailAccessPolicy",
            "PolicyId": "ANPAXQE2B5PJ7YEXAMPLE",
            "Arn": "arn:aws:iam::123456789012:policy/AWSCloudTrailAccessPolicy",
            "Path": "/",
            "DefaultVersionId": "v1",
            "AttachmentCount": 0,
            "PermissionsBoundaryUsageCount": 0,
            "IsAttachable": true,
            "CreateDate": "2019-09-04T17:43:42+00:00",
            "UpdateDate": "2019-09-04T17:43:42+00:00"
        },
        {
            "PolicyName": "AdministratorAccess",
            "PolicyId": "ANPAIWMBCKSKIEE64ZLYK",
            "Arn": "arn:aws:iam::aws:policy/AdministratorAccess",
            "Path": "/",
            "DefaultVersionId": "v1",
            "AttachmentCount": 6,
            "PermissionsBoundaryUsageCount": 0,
            "IsAttachable": true,
            "CreateDate": "2015-02-06T18:39:46+00:00",
            "UpdateDate": "2015-02-06T18:39:46+00:00"
        },
        {
            "PolicyName": "PowerUserAccess",
            "PolicyId": "ANPAJYRXTHIB4FOVS3ZXS",
            "Arn": "arn:aws:iam::aws:policy/PowerUserAccess",
            "Path": "/",
            "DefaultVersionId": "v5",
            "AttachmentCount": 1,
            "PermissionsBoundaryUsageCount": 0,
            "IsAttachable": true,
```

```
            "CreateDate": "2015-02-06T18:39:47+00:00",
            "UpdateDate": "2023-07-06T22:04:00+00:00"
        }
    ],
    "NextToken": "EXAMPLErZXIiOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiA4fQ=="
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListPolicies in *AWS CLI Command Reference*.

`list-policy-tags`

The following code example shows how to use `list-policy-tags`.

AWS CLI

To list the tags attached to a managed policy

The following `list-policy-tags` example retrieves the list of tags associated with the specified managed policy.

```
aws iam list-policy-tags \
    --policy-arn arn:aws:iam::123456789012:policy/billing-access
```

Output:

```
{
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "123456"
        },
        {
            "Key": "Department",
            "Value": "Accounting"
        }
    ]
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListPolicyTags in *AWS CLI Command Reference*.

`list-policy-versions`

The following code example shows how to use `list-policy-versions`.

AWS CLI

To list information about the versions of the specified managed policy

The following `list-policy-versions` example returns the list of available versions of the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
aws iam list-policy-versions \
    --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

Output:

```
{
    "IsTruncated": false,
    "Versions": [
        {
        "VersionId": "v2",
        "IsDefaultVersion": true,
        "CreateDate": "2015-06-02T23:19:44Z"
        },
        {
        "VersionId": "v1",
        "IsDefaultVersion": false,
        "CreateDate": "2015-06-02T22:30:47Z"
        }
    ]
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListPolicyVersions in *AWS CLI Command Reference*.

`list-role-policies`

The following code example shows how to use `list-role-policies`.

AWS CLI

To list the policies attached to an IAM role

The following `list-role-policies` example lists the names of the permissions policies for the specified IAM role.

```
aws iam list-role-policies \
    --role-name Test-Role
```

Output:

```
{
    "PolicyNames": [
        "ExamplePolicy"
    ]
}
```

To see the trust policy attached to a role, use the `get-role` command. To see the details of a permissions policy, use the `get-role-policy` command.

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

- For API details, see ListRolePolicies in *AWS CLI Command Reference*.

`list-role-tags`

The following code example shows how to use `list-role-tags`.

AWS CLI

To list the tags attached to a role

The following `list-role-tags` example retrieves the list of tags associated with the specified role.

```
aws iam list-role-tags \
    --role-name production-role
```

Output:

```
{
    "Tags": [
        {
            "Key": "Department",
            "Value": "Accounting"
```

```
        },
        {
            "Key": "DeptID",
            "Value": "12345"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListRoleTags in *AWS CLI Command Reference*.

`list-roles`

The following code example shows how to use `list-roles`.

AWS CLI

To list IAM roles for the current account

The following `list-roles` example lists IAM roles for the current account.

```
aws iam list-roles
```

Output:

```
{
    "Roles": [
        {
            "Path": "/",
            "RoleName": "ExampleRole",
            "RoleId": "AROAJ52OTH4H7LEXAMPLE",
            "Arn": "arn:aws:iam::123456789012:role/ExampleRole",
            "CreateDate": "2017-09-12T19:23:36+00:00",
            "AssumeRolePolicyDocument": {
                "Version":"2012-10-17",
                "Statement": [
                    {
                        "Sid": "",
                        "Effect": "Allow",
                        "Principal": {
                            "Service": "ec2.amazonaws.com"
```

```
                        },
                        "Action": "sts:AssumeRole"
                    }
                ]
            },
            "MaxSessionDuration": 3600
        },
        {
            "Path": "/example_path/",
            "RoleName": "ExampleRoleWithPath",
            "RoleId": "AROAI4QRP7UFT7EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:role/example_path/
ExampleRoleWithPath",
            "CreateDate": "2023-09-21T20:29:38+00:00",
            "AssumeRolePolicyDocument": {
                "Version":"2012-10-17",
                "Statement": [
                    {
                        "Sid": "",
                        "Effect": "Allow",
                        "Principal": {
                            "Service": "ec2.amazonaws.com"
                        },
                        "Action": "sts:AssumeRole"
                    }
                ]
            },
            "MaxSessionDuration": 3600
        }
    ]
}
```

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

- For API details, see ListRoles in *AWS CLI Command Reference*.

`list-saml-provider-tags`

The following code example shows how to use `list-saml-provider-tags`.

AWS CLI

To list the tags attached to a SAML provider

The following `list-saml-provider-tags` example retrieves the list of tags associated with the specified SAML provider.

```
aws iam list-saml-provider-tags \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/ADFS
```

Output:

```
{
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "123456"
        },
        {
            "Key": "Department",
            "Value": "Accounting"
        }
    ]
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListSamlProviderTags in *AWS CLI Command Reference*.

`list-saml-providers`

The following code example shows how to use `list-saml-providers`.

AWS CLI

To list the SAML providers in the AWS account

The following `list-saml-providers` example retrieves the list of SAML 2.0 providers created in the current AWS account.

```
aws iam list-saml-providers
```

Output:

```
{
    "SAMLProviderList": [
```

```
        {
            "Arn": "arn:aws:iam::123456789012:saml-provider/SAML-ADFS",
            "ValidUntil": "2015-06-05T22:45:14Z",
            "CreateDate": "2015-06-05T22:45:14Z"
        }
    ]
}
```

For more information, see Creating IAM SAML identity providers in the *AWS IAM User Guide*.

- For API details, see ListSAMLProviders in *AWS CLI Command Reference*.

`list-server-certificate-tags`

The following code example shows how to use `list-server-certificate-tags`.

AWS CLI

To list the tags attached to a server certificate

The following `list-server-certificate-tags` example retrieves the list of tags associated with the specified server certificate.

```
aws iam list-server-certificate-tags \
    --server-certificate-name ExampleCertificate
```

Output:

```
{
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "123456"
        },
        {
            "Key": "Department",
            "Value": "Accounting"
        }
    ]
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListServerCertificateTags in *AWS CLI Command Reference*.

`list-server-certificates`

The following code example shows how to use `list-server-certificates`.

AWS CLI

To list the server certificates in your AWS account

The following `list-server-certificates` example lists all of the server certificates stored and available for use in your AWS account.

```
aws iam list-server-certificates
```

Output:

```
{
    "ServerCertificateMetadataList": [
        {
            "Path": "/",
            "ServerCertificateName": "myUpdatedServerCertificate",
            "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:server-certificate/
myUpdatedServerCertificate",
            "UploadDate": "2019-04-22T21:13:44+00:00",
            "Expiration": "2019-10-15T22:23:16+00:00"
        },
        {
            "Path": "/cloudfront/",
            "ServerCertificateName": "MyTestCert",
            "ServerCertificateId": "ASCAEXAMPLE456EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:server-certificate/Org1/Org2/
MyTestCert",
            "UploadDate": "2015-04-21T18:14:16+00:00",
            "Expiration": "2018-01-14T17:52:36+00:00"
        }
    ]
}
```

For more information, see Managing server certificates in IAM in the *AWS IAM User Guide*.

- For API details, see ListServerCertificates in *AWS CLI Command Reference*.

list-service-specific-credentials

The following code example shows how to use `list-service-specific-credentials`.

AWS CLI

Example 1: To retrieve a list of credentials

The following `list-service-specific-credentials` example lists the credentials generated for HTTPS access to AWS CodeCommit repositories for a user named `developer`.

```
aws iam list-service-specific-credentials \
    --user-name developer \
    --service-name codecommit.amazonaws.com
```

Output:

```
{
    "ServiceSpecificCredentials": [
        {
            "UserName": "developer",
            "Status": "Inactive",
            "ServiceUserName": "developer-at-123456789012",
            "CreateDate": "2019-10-01T04:31:41Z",
            "ServiceSpecificCredentialId": "ACCAQFODXMPL4YFHP7DZE",
            "ServiceName": "codecommit.amazonaws.com"
        },
        {
            "UserName": "developer",
            "Status": "Active",
            "ServiceUserName": "developer+1-at-123456789012",
            "CreateDate": "2019-10-01T04:31:45Z",
            "ServiceSpecificCredentialId": "ACCAQFOXMPL6VW57M7AJP",
            "ServiceName": "codecommit.amazonaws.com"
        }
    ]
}
```

Example 2: To list the service-specific credentials for a user

The following `list-service-specific-credentials` example displays all service-specific credentials assigned to the specified user. Passwords are not included in the response.

```
aws iam list-service-specific-credentials \
    --user-name sofia
```

Output:

```
{
    "ServiceSpecificCredentials": [
        {
            "CreateDate": "2019-04-18T20:45:36+00:00",
            "ServiceName": "codecommit.amazonaws.com",
            "ServiceUserName": "sofia-at-123456789012",
            "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
            "UserName": "sofia",
            "Status": "Active"
        }
    ]
}
```

Example 3: To list the service-specific credentials for a user filtered to a specified service

The following `list-service-specific-credentials` example displays the service-specific credentials assigned to the user making the request. The list is filtered to include only those credentials for the specified service. Passwords are not included in the response.

```
aws iam list-service-specific-credentials \
    --service-name codecommit.amazonaws.com
```

Output:

```
{
    "ServiceSpecificCredentials": [
        {
            "CreateDate": "2019-04-18T20:45:36+00:00",
            "ServiceName": "codecommit.amazonaws.com",
            "ServiceUserName": "sofia-at-123456789012",
            "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
            "UserName": "sofia",
            "Status": "Active"
        }
    ]
}
```

For more information, see Create Git credentials for HTTPS connections to CodeCommit in the *AWS CodeCommit User Guide*.

- For API details, see ListServiceSpecificCredentials in *AWS CLI Command Reference*.

`list-signing-certificates`

The following code example shows how to use `list-signing-certificates`.

AWS CLI

To list the signing certificates for an IAM user

The following `list-signing-certificates` example lists the signing certificates for the IAM user named Bob.

```
aws iam list-signing-certificates \
    --user-name Bob
```

Output:

```
{
    "Certificates": [
        {
            "UserName": "Bob",
            "Status": "Inactive",
            "CertificateBody": "-----BEGIN CERTIFICATE-----<certificate-body>-----
END CERTIFICATE-----",
            "CertificateId": "TA7SMP42TDN5Z26OBPJE7EXAMPLE",
            "UploadDate": "2013-06-06T21:40:08Z"
        }
    ]
}
```

For more information, see Manage signing certificates in the *Amazon EC2 User Guide*.

- For API details, see ListSigningCertificates in *AWS CLI Command Reference*.

`list-ssh-public-keys`

The following code example shows how to use `list-ssh-public-keys`.

AWS CLI

To list the SSH public keys attached to an IAM user

The following `list-ssh-public-keys` example lists the SSH public keys attached to the IAM user `sofia`.

```
aws iam list-ssh-public-keys \
    --user-name sofia
```

Output:

```
{
    "SSHPublicKeys": [
        {
            "UserName": "sofia",
            "SSHPublicKeyId": "APKA1234567890EXAMPLE",
            "Status": "Inactive",
            "UploadDate": "2019-04-18T17:04:49+00:00"
        }
    ]
}
```

For more information, see IAM credentials for CodeCommit: Git credentials, SSH keys, and AWS access keys in the *AWS IAM User Guide*.

- For API details, see ListSshPublicKeys in *AWS CLI Command Reference*.

`list-user-policies`

The following code example shows how to use `list-user-policies`.

AWS CLI

To list policies for an IAM user

The following `list-user-policies` example lists the policies that are attached to the IAM user named Bob.

```
aws iam list-user-policies \
    --user-name Bob
```

Output:

```
{
    "PolicyNames": [
        "ExamplePolicy",
        "TestPolicy"
    ]
}
```

For more information, see Creating an IAM user in your AWS account in the *AWS IAM User Guide*.

- For API details, see ListUserPolicies in *AWS CLI Command Reference*.

`list-user-tags`

The following code example shows how to use `list-user-tags`.

AWS CLI

To list the tags attached to a user

The following `list-user-tags` example retrieves the list of tags associated with the specified IAM user.

```
aws iam list-user-tags \
    --user-name alice
```

Output:

```
{
    "Tags": [
        {
            "Key": "Department",
            "Value": "Accounting"
        },
        {
            "Key": "DeptID",
            "Value": "12345"
        }
    ],
    "IsTruncated": false
```

```
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListUserTags in *AWS CLI Command Reference*.

`list-users`

The following code example shows how to use `list-users`.

AWS CLI

To list IAM users

The following `list-users` example lists the IAM users in the current account.

```
aws iam list-users
```

Output:

```
{
    "Users": [
        {
            "UserName": "Adele",
            "Path": "/",
            "CreateDate": "2013-03-07T05:14:48Z",
            "UserId": "AKIAI44QH8DHBEXAMPLE",
            "Arn": "arn:aws:iam::123456789012:user/Adele"
        },
        {
            "UserName": "Bob",
            "Path": "/",
            "CreateDate": "2012-09-21T23:03:13Z",
            "UserId": "AKIAIOSFODNN7EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:user/Bob"
        }
    ]
}
```

For more information, see Listing IAM users in the *AWS IAM User Guide*.

- For API details, see ListUsers in *AWS CLI Command Reference*.

`list-virtual-mfa-devices`

The following code example shows how to use `list-virtual-mfa-devices`.

AWS CLI

To list virtual MFA devices

The following `list-virtual-mfa-devices` example lists the virtual MFA devices that have been configured for the current account.

```
aws iam list-virtual-mfa-devices
```

Output:

```
{
    "VirtualMFADevices": [
        {
            "SerialNumber": "arn:aws:iam::123456789012:mfa/ExampleMFADevice"
        },
        {
            "SerialNumber": "arn:aws:iam::123456789012:mfa/Fred"
        }
    ]
}
```

For more information, see Enabling a virtual multi-factor authentication (MFA) device in the *AWS IAM User Guide*.

- For API details, see ListVirtualMfaDevices in *AWS CLI Command Reference*.

`put-group-policy`

The following code example shows how to use `put-group-policy`.

AWS CLI

To add a policy to a group

The following `put-group-policy` example adds a policy to the IAM group named `Admins`.

```
aws iam put-group-policy \
```

```
    --group-name Admins \
    --policy-document file://AdminPolicy.json \
    --policy-name AdminRoot
```

Contents of `AdminPolicy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "*",
            "Resource": "*"
        }
    ]
}
```

This command produces no output.

The policy is defined as a JSON document in the *AdminPolicy.json* file. (The file name and extension do not have significance.)

For more information, see Managing IAM policies in the *AWS IAM User Guide*.

- For API details, see PutGroupPolicy in *AWS CLI Command Reference*.

`put-role-permissions-boundary`

The following code example shows how to use `put-role-permissions-boundary`.

AWS CLI

Example 1: To apply a permissions boundary based on a custom policy to an IAM role

The following `put-role-permissions-boundary` example applies the custom policy named `intern-boundary` as the permissions boundary for the specified IAM role.

```
aws iam put-role-permissions-boundary \
    --permissions-boundary arn:aws:iam::123456789012:policy/intern-boundary \
    --role-name lambda-application-role
```

This command produces no output.

Example 2: To apply a permissions boundary based on an AWS managed policy to an IAM role

The following `put-role-permissions-boundary` example applies the AWS managed `PowerUserAccess` policy as the permissions boundary for the specified IAM role.

```
aws iam put-role-permissions-boundary \
    --permissions-boundary arn:aws:iam::aws:policy/PowerUserAccess \
    --role-name x-account-admin
```

This command produces no output.

For more information, see IAM role management in the *AWS IAM User Guide*.

- For API details, see PutRolePermissionsBoundary in *AWS CLI Command Reference*.

`put-role-policy`

The following code example shows how to use `put-role-policy`.

AWS CLI

To attach a permissions policy to an IAM role

The following `put-role-policy` example adds a permissions policy to the role named `Test-Role`.

```
aws iam put-role-policy \
    --role-name Test-Role \
    --policy-name ExamplePolicy \
    --policy-document file://AdminPolicy.json
```

Contents of `AdminPolicy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "*",
            "Resource": "*"
        }
```

```
    ]
}
```

This command produces no output.

The policy is defined as a JSON document in the *AdminPolicy.json* file. (The file name and extension do not have significance.)

To attach a trust policy to a role, use the `update-assume-role-policy` command.

For more information, see IAM role management in the *AWS IAM User Guide*.

- For API details, see PutRolePolicy in *AWS CLI Command Reference*.

`put-user-permissions-boundary`

The following code example shows how to use `put-user-permissions-boundary`.

AWS CLI

Example 1: To apply a permissions boundary based on a custom policy to an IAM user

The following `put-user-permissions-boundary` example applies a custom policy named `intern-boundary` as the permissions boundary for the specified IAM user.

```
aws iam put-user-permissions-boundary \
    --permissions-boundary arn:aws:iam::123456789012:policy/intern-boundary \
    --user-name intern
```

This command produces no output.

Example 2: To apply a permissions boundary based on an AWS managed policy to an IAM user

The following `put-user-permissions-boundary` example applies the AWS managed pollicy named `PowerUserAccess` as the permissions boundary for the specified IAM user.

```
aws iam put-user-permissions-boundary \
    --permissions-boundary arn:aws:iam::aws:policy/PowerUserAccess \
    --user-name developer
```

This command produces no output.

For more information, see Adding and removing IAM identity permissions in the *AWS IAM User Guide*.

- For API details, see PutUserPermissionsBoundary in *AWS CLI Command Reference*.

`put-user-policy`

The following code example shows how to use `put-user-policy`.

AWS CLI

To attach a policy to an IAM user

The following `put-user-policy` example attaches a policy to the IAM user named Bob.

```
aws iam put-user-policy \
    --user-name Bob \
    --policy-name ExamplePolicy \
    --policy-document file://AdminPolicy.json
```

Contents of `AdminPolicy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "*",
            "Resource": "*"
        }
    ]
}
```

This command produces no output.

The policy is defined as a JSON document in the *AdminPolicy.json* file. (The file name and extension do not have significance.)

For more information, see Adding and removing IAM identity permissions in the *AWS IAM User Guide*.

- For API details, see PutUserPolicy in *AWS CLI Command Reference*.

`remove-client-id-from-open-id-connect-provider`

The following code example shows how to use `remove-client-id-from-open-id-connect-provider`.

AWS CLI

To remove the specified client ID from the list of client IDs registered for the specified IAM OpenID Connect provider

The following `remove-client-id-from-open-id-connect-provider` example removes the client ID `My-TestApp-3` from the list of client IDs associated with the IAM OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com`.

```
aws iam remove-client-id-from-open-id-connect-provider \
    --client-id My-TestApp-3 \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com
```

This command produces no output.

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see RemoveClientIdFromOpenIdConnectProvider in *AWS CLI Command Reference*.

`remove-role-from-instance-profile`

The following code example shows how to use `remove-role-from-instance-profile`.

AWS CLI

To remove a role from an instance profile

The following `remove-role-from-instance-profile` example removes the role named `Test-Role` from the instance profile named `ExampleInstanceProfile`.

```
aws iam remove-role-from-instance-profile \
    --instance-profile-name ExampleInstanceProfile \
```

```
    --role-name Test-Role
```

This command produces no output.

For more information, see Using instance profiles in the *AWS IAM User Guide*.

- For API details, see RemoveRoleFromInstanceProfile in *AWS CLI Command Reference*.

`remove-user-from-group`

The following code example shows how to use `remove-user-from-group`.

AWS CLI

To remove a user from an IAM group

The following `remove-user-from-group` example removes the user named Bob from the IAM group named `Admins`.

```
aws iam remove-user-from-group \
    --user-name Bob \
    --group-name Admins
```

This command produces no output.

For more information, see Adding and removing users in an IAM user group in the *AWS IAM User Guide*.

- For API details, see RemoveUserFromGroup in *AWS CLI Command Reference*.

`reset-service-specific-credential`

The following code example shows how to use `reset-service-specific-credential`.

AWS CLI

Example 1: To reset the password for a service-specific credential attached to the user making the request

The following `reset-service-specific-credential` example generates a new cryptographically strong password for the specified service-specific credential attached to the user making the request.

```
aws iam reset-service-specific-credential \
    --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

Output:

```
{
    "ServiceSpecificCredential": {
        "CreateDate": "2019-04-18T20:45:36+00:00",
        "ServiceName": "codecommit.amazonaws.com",
        "ServiceUserName": "sofia-at-123456789012",
        "ServicePassword": "+oaFsNk7tLco+C/obP9GhhcOzGcKOayTmE3LnAmAmH4=",
        "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
        "UserName": "sofia",
        "Status": "Active"
    }
}
```

Example 2: To reset the password for a service-specific credential attached to a specified user

The following `reset-service-specific-credential` example generates a new cryptographically strong password for a service-specific credential attached to the specified user.

```
aws iam reset-service-specific-credential \
    --user-name sofia \
    --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

Output:

```
{
    "ServiceSpecificCredential": {
        "CreateDate": "2019-04-18T20:45:36+00:00",
        "ServiceName": "codecommit.amazonaws.com",
        "ServiceUserName": "sofia-at-123456789012",
        "ServicePassword": "+oaFsNk7tLco+C/obP9GhhcOzGcKOayTmE3LnAmAmH4=",
        "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
        "UserName": "sofia",
        "Status": "Active"
    }
}
```

For more information, see Create Git credentials for HTTPS connections to CodeCommit in the *AWS CodeCommit User Guide*.

- For API details, see ResetServiceSpecificCredential in *AWS CLI Command Reference*.

`resync-mfa-device`

The following code example shows how to use `resync-mfa-device`.

AWS CLI

To synchronize an MFA device

The following `resync-mfa-device` example synchronizes the MFA device that is associated with the IAM user Bob and whose ARN is `arn:aws:iam::123456789012:mfa/BobsMFADevice` with an authenticator program that provided the two authentication codes.

```
aws iam resync-mfa-device \
    --user-name Bob \
    --serial-number arn:aws:iam::123456789012:mfa/BobsMFADevice \
    --authentication-code1 123456 \
    --authentication-code2 987654
```

This command produces no output.

For more information, see Using multi-factor authentication (MFA) in AWS in the *AWS IAM User Guide*.

- For API details, see ResyncMfaDevice in *AWS CLI Command Reference*.

`set-default-policy-version`

The following code example shows how to use `set-default-policy-version`.

AWS CLI

To set the specified version of the specified policy as the policy's default version.

The following `set-default-policy-version` example sets the v2 version of the policy whose ARN is `arn:aws:iam::123456789012:policy/MyPolicy` as the default active version.

```
aws iam set-default-policy-version \
    --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
    --version-id v2
```

This command produces no output.

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see SetDefaultPolicyVersion in *AWS CLI Command Reference*.

`set-security-token-service-preferences`

The following code example shows how to use `set-security-token-service-preferences`.

AWS CLI

To set the global endpoint token version

The following `set-security-token-service-preferences` example configures Amazon STS to use version 2 tokens when you authenticate against the global endpoint.

```
aws iam set-security-token-service-preferences \
    --global-endpoint-token-version v2Token
```

This command produces no output.

For more information, see Managing AWS STS in an AWS Region in the *AWS IAM User Guide*.

- For API details, see SetSecurityTokenServicePreferences in *AWS CLI Command Reference*.

`simulate-custom-policy`

The following code example shows how to use `simulate-custom-policy`.

AWS CLI

Example 1: To simulate the effects of all IAM policies associated with an IAM user or role

The following `simulate-custom-policy` example shows how to provide both the policy and define variable values and simulate an API call to see if it is allowed or denied. The example uses a policy that enables database access only after a specified date and time. The simulation

succeeds because the simulated actions and the specified `aws:CurrentTime` variable all match the requirements of the policy.

```
aws iam simulate-custom-policy \
    --policy-input-list '{"Version":"2012-10-17",       "Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"*","Condition":
{"DateGreaterThan":{"aws:CurrentTime":"2018-08-16T12:00:00Z"}}}}' \
    --action-names dynamodb:CreateBackup \
    --context-
entries "ContextKeyName='aws:CurrentTime',ContextKeyValues='2019-04-25T11:00:00Z',ContextKey
```

Output:

```
{
    "EvaluationResults": [
        {
            "EvalActionName": "dynamodb:CreateBackup",
            "EvalResourceName": "*",
            "EvalDecision": "allowed",
            "MatchedStatements": [
                {
                    "SourcePolicyId": "PolicyInputList.1",
                    "StartPosition": {
                        "Line": 1,
                        "Column": 38
                    },
                    "EndPosition": {
                        "Line": 1,
                        "Column": 167
                    }
                }
            ],
            "MissingContextValues": []
        }
    ]
}
```

Example 2: To simulate a command that is prohibited by the policy

The following `simulate-custom-policy` example shows the results of simulating a command that is prohibited by the policy. In this example, the provided date is before that required by the policy's condition.

```
aws iam simulate-custom-policy \
    --policy-input-list '{"Version":"2012-10-17",       "Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"*","Condition":
{"DateGreaterThan":{"aws:CurrentTime":"2018-08-16T12:00:00Z"}}}}' \
    --action-names dynamodb:CreateBackup \
    --context-
entries "ContextKeyName='aws:CurrentTime',ContextKeyValues='2014-04-25T11:00:00Z',ContextKey
```

Output:

```
{
    "EvaluationResults": [
        {
            "EvalActionName": "dynamodb:CreateBackup",
            "EvalResourceName": "*",
            "EvalDecision": "implicitDeny",
            "MatchedStatements": [],
            "MissingContextValues": []
        }
    ]
}
```

For more information, see Testing IAM policies with the IAM policy simulator in the *AWS IAM User Guide*.

- For API details, see SimulateCustomPolicy in *AWS CLI Command Reference*.

`simulate-principal-policy`

The following code example shows how to use `simulate-principal-policy`.

AWS CLI

Example 1: To simulate the effects of an arbitrary IAM policy

The following `simulate-principal-policy` example shows how to simulate a user calling an API action and determining whether the policies associated with that user allow or deny the action. In the following example, the user has a policy that allows only the `codecommit:ListRepositories` action.

```
aws iam simulate-principal-policy \
```

```
    --policy-source-arn arn:aws:iam::123456789012:user/alejandro \
    --action-names codecommit:ListRepositories
```

Output:

```
{
    "EvaluationResults": [
        {
            "EvalActionName": "codecommit:ListRepositories",
            "EvalResourceName": "*",
            "EvalDecision": "allowed",
            "MatchedStatements": [
                {
                    "SourcePolicyId": "Grant-Access-To-CodeCommit-ListRepo",
                    "StartPosition": {
                        "Line": 3,
                        "Column": 19
                    },
                    "EndPosition": {
                        "Line": 9,
                        "Column": 10
                    }
                }
            ],
            "MissingContextValues": []
        }
    ]
}
```

Example 2: To simulate the effects of a prohibited command

The following `simulate-principal-policy` example shows the results of simulating a command that is prohibited by one of the user's policies. In the following example, the user has a policy that permits access to a DynamoDB database only after a certain date and time. The simulation has the user attempting to access the database with an `aws:CurrentTime` value that is earlier than the policy's condition permits.

```
aws iam simulate-principal-policy \
    --policy-source-arn arn:aws:iam::123456789012:user/alejandro \
    --action-names dynamodb:CreateBackup \
    --context-
entries "ContextKeyName='aws:CurrentTime',ContextKeyValues='2018-04-25T11:00:00Z',ContextKey
```

Output:

```
{
    "EvaluationResults": [
        {
            "EvalActionName": "dynamodb:CreateBackup",
            "EvalResourceName": "*",
            "EvalDecision": "implicitDeny",
            "MatchedStatements": [],
            "MissingContextValues": []
        }
    ]
}
```

For more information, see Testing IAM policies with the IAM policy simulator in the *AWS IAM User Guide*.

- For API details, see SimulatePrincipalPolicy in *AWS CLI Command Reference*.

`tag-instance-profile`

The following code example shows how to use `tag-instance-profile`.

AWS CLI

To add a tag to an instance profile

The following `tag-instance-profile` example adds a tag with a Department name to the specified instance profile.

```
aws iam tag-instance-profile \
    --instance-profile-name deployment-role \
    --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagInstanceProfile in *AWS CLI Command Reference*.

`tag-mfa-device`

The following code example shows how to use `tag-mfa-device`.

AWS CLI

To add a tag to an MFA device

The following `tag-mfa-device` example adds a tag with a Department name to the specified MFA device.

```
aws iam tag-mfa-device \
    --serial-number arn:aws:iam::123456789012:mfa/alice \
    --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagMfaDevice in *AWS CLI Command Reference*.

`tag-open-id-connect-provider`

The following code example shows how to use `tag-open-id-connect-provider`.

AWS CLI

To add a tag to an OpenID Connect (OIDC)-compatible identity provider

The following `tag-open-id-connect-provider` example adds a tag with a Department name to the specified OIDC identity provider.

```
aws iam tag-open-id-connect-provider \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
server.example.com \
    --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagOpenIdConnectProvider in *AWS CLI Command Reference*.

`tag-policy`

The following code example shows how to use `tag-policy`.

AWS CLI

To add a tag to a customer managed policy

The following `tag-policy` example adds a tag with a Department name to the specified customer managed policy.

```
aws iam tag-policy \
    --policy-arn arn:aws:iam::123456789012:policy/billing-access \
    --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagPolicy in *AWS CLI Command Reference*.

`tag-role`

The following code example shows how to use `tag-role`.

AWS CLI

To add a tag to a role

The following `tag-role` example adds a tag with a Department name to the specified role.

```
aws iam tag-role \
    --role-name my-role \
    --tags '{"Key": "Department", "Value": "Accounting"}'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagRole in *AWS CLI Command Reference*.

`tag-saml-provider`

The following code example shows how to use `tag-saml-provider`.

AWS CLI

To add a tag to a SAML provider

The following `tag-saml-provider` example adds a tag with a Department name to the specified SAML provider.

```
aws iam tag-saml-provider \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/ADFS \
    --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagSamlProvider in *AWS CLI Command Reference*.

`tag-server-certificate`

The following code example shows how to use `tag-server-certificate`.

AWS CLI

To add a tag to a server certificate

The following `tag-server-certificate` example adds a tag with a Department name to the specified server certificate.

```
aws iam tag-server-certificate \
    --server-certificate-name ExampleCertificate \
    --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagServerCertificate in *AWS CLI Command Reference*.

`tag-user`

The following code example shows how to use `tag-user`.

AWS CLI

To add a tag to a user

The following `tag-user` example adds a tag with the associated Department to the specified user.

```
aws iam tag-user \
    --user-name alice \
    --tags '{"Key": "Department", "Value": "Accounting"}'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagUser in *AWS CLI Command Reference*.

`untag-instance-profile`

The following code example shows how to use `untag-instance-profile`.

AWS CLI

To remove a tag from an instance profile

The following `untag-instance-profile` example removes any tag with the key name 'Department' from the specified instance profile.

```
aws iam untag-instance-profile \
    --instance-profile-name deployment-role \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagInstanceProfile in *AWS CLI Command Reference*.

`untag-mfa-device`

The following code example shows how to use `untag-mfa-device`.

AWS CLI

To remove a tag from an MFA device

The following `untag-mfa-device` example removes any tag with the key name 'Department' from the specified MFA device.

```
aws iam untag-mfa-device \
    --serial-number arn:aws:iam::123456789012:mfa/alice \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagMfaDevice in *AWS CLI Command Reference*.

`untag-open-id-connect-provider`

The following code example shows how to use `untag-open-id-connect-provider`.

AWS CLI

To remove a tag from an OIDC identity provider

The following `untag-open-id-connect-provider` example removes any tag with the key name 'Department' from the specified OIDC identity provider.

```
aws iam untag-open-id-connect-provider \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
server.example.com \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagOpenIdConnectProvider in *AWS CLI Command Reference*.

`untag-policy`

The following code example shows how to use `untag-policy`.

AWS CLI

To remove a tag from a customer managed policy

The following `untag-policy` example removes any tag with the key name 'Department' from the specified customer managed policy.

```
aws iam untag-policy \
    --policy-arn arn:aws:iam::123456789012:policy/billing-access \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagPolicy in *AWS CLI Command Reference*.

`untag-role`

The following code example shows how to use `untag-role`.

AWS CLI

To remove a tag from a role

The following `untag-role` example removes any tag with the key name 'Department' from the specified role.

```
aws iam untag-role \
    --role-name my-role \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagRole in *AWS CLI Command Reference*.

`untag-saml-provider`

The following code example shows how to use `untag-saml-provider`.

AWS CLI

To remove a tag from a SAML provider

The following `untag-saml-provider` example removes any tag with the key name 'Department' from the specified SAML provider.

```
aws iam untag-saml-provider \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/ADFS \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagSamlProvider in *AWS CLI Command Reference*.

`untag-server-certificate`

The following code example shows how to use `untag-server-certificate`.

AWS CLI

To remove a tag from a server certificate

The following `untag-server-certificate` example removes any tag with the key name 'Department' from the specified server certificate.

```
aws iam untag-server-certificate \
    --server-certificate-name ExampleCertificate \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagServerCertificate in *AWS CLI Command Reference*.

`untag-user`

The following code example shows how to use `untag-user`.

AWS CLI

To remove a tag from a user

The following `untag-user` example removes any tag with the key name 'Department' from the specified user.

```
aws iam untag-user \
    --user-name alice \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagUser in *AWS CLI Command Reference*.

`update-access-key`

The following code example shows how to use `update-access-key`.

AWS CLI

To activate or deactivate an access key for an IAM user

The following `update-access-key` example deactivates the specified access key (access key ID and secret access key) for the IAM user named Bob.

```
aws iam update-access-key \
    --access-key-id AKIAIOSFODNN7EXAMPLE \
    --status Inactive \
    --user-name Bob
```

This command produces no output.

Deactivating the key means that it cannot be used for programmatic access to AWS. However, the key is still available and can be reactivated.

For more information, see Managing access keys for IAM users in the *AWS IAM User Guide*.

- For API details, see UpdateAccessKey in *AWS CLI Command Reference*.

update-account-password-policy

The following code example shows how to use `update-account-password-policy`.

AWS CLI

To set or change the current account password policy

The following `update-account-password-policy` example sets the password policy to require a minimum length of eight characters and to require one or more numbers in the password.

```
aws iam update-account-password-policy \
    --minimum-password-length 8 \
    --require-numbers
```

This command produces no output.

Changes to an account's password policy affect any new passwords that are created for IAM users in the account. Password policy changes do not affect existing passwords.

For more information, see Setting an account password policy for IAM users in the *AWS IAM User Guide*.

- For API details, see UpdateAccountPasswordPolicy in *AWS CLI Command Reference*.

update-assume-role-policy

The following code example shows how to use `update-assume-role-policy`.

AWS CLI

To update the trust policy for an IAM role

The following `update-assume-role-policy` example updates the trust policy for the role named `Test-Role`.

```
aws iam update-assume-role-policy \
    --role-name Test-Role \
    --policy-document file://Test-Role-Trust-Policy.json
```

Contents of `Test-Role-Trust-Policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "Statement1",
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::123456789012:root"
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

This command produces no output.

The trust policy is defined as a JSON document in the *Test-Role-Trust-Policy.json* file. (The file name and extension do not have significance.) The trust policy must specify a principal.

To update the permissions policy for a role, use the `put-role-policy` command.

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

- For API details, see UpdateAssumeRolePolicy in *AWS CLI Command Reference*.

`update-group`

The following code example shows how to use `update-group`.

AWS CLI

To rename an IAM group

The following `update-group` example changes the name of the IAM group `Test` to `Test-1`.

```
aws iam update-group \
    --group-name Test \
    --new-group-name Test-1
```

This command produces no output.

For more information, see Renaming an IAM user group in the *AWS IAM User Guide*.

- For API details, see UpdateGroup in *AWS CLI Command Reference*.

`update-login-profile`

The following code example shows how to use `update-login-profile`.

AWS CLI

To update the password for an IAM user

The following `update-login-profile` example creates a new password for the IAM user named Bob.

```
aws iam update-login-profile \
    --user-name Bob \
    --password <password>
```

This command produces no output.

To set a password policy for the account, use the `update-account-password-policy` command. If the new password violates the account password policy, the command returns a `PasswordPolicyViolation` error.

If the account password policy allows them to, IAM users can change their own passwords using the `change-password` command.

Store the password in a secure place. If the password is lost, it cannot be recovered, and you must create a new one using the `create-login-profile` command.

For more information, see Managing passwords for IAM users in the *AWS IAM User Guide*.

- For API details, see UpdateLoginProfile in *AWS CLI Command Reference*.

`update-open-id-connect-provider-thumbprint`

The following code example shows how to use `update-open-id-connect-provider-thumbprint`.

AWS CLI

To replace the existing list of server certificate thumbprints with a new list

The following `update-open-id-connect-provider-thumbprint` example updates the certificate thumbprint list for the OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com` to use a new thumbprint.

```
aws iam update-open-id-connect-provider-thumbprint \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com \
    --thumbprint-list 7359755EXAMPLEabc3060bce3EXAMPLEec4542a3
```

If your OIDC provider's discovery and JWKS endpoints use different certificates, include thumbprints for both endpoints in the `--thumbprint-list` value.

This command produces no output.

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see UpdateOpenIdConnectProviderThumbprint in *AWS CLI Command Reference*.

`update-role-description`

The following code example shows how to use `update-role-description`.

AWS CLI

To change an IAM role's description

The following `update-role-description` example changes the description of the IAM role `production-role` to `Main production role`.

```
aws iam update-role-description \
    --role-name production-role \
    --description 'Main production role'
```

Output:

```
{
    "Role": {
        "Path": "/",
```

```
        "RoleName": "production-role",
        "RoleId": "AROA1234567890EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:role/production-role",
        "CreateDate": "2017-12-06T17:16:37+00:00",
        "AssumeRolePolicyDocument": {
            "Version":"2012-10-17",
            "Statement": [
                {
                    "Effect": "Allow",
                    "Principal": {
                        "AWS": "arn:aws:iam::123456789012:root"
                    },
                    "Action": "sts:AssumeRole",
                    "Condition": {}
                }
            ]
        },
        "Description": "Main production role"
    }
}
```

For more information, see IAM role management in the *AWS IAM User Guide*.

- For API details, see UpdateRoleDescription in *AWS CLI Command Reference*.

`update-role`

The following code example shows how to use `update-role`.

AWS CLI

To change an IAM role's description or session duration

The following `update-role` example changes the description of the IAM role `production-role` to `Main production role` and sets the maximum session duration to 12 hours.

```
aws iam update-role \
    --role-name production-role \
    --description 'Main production role' \
    --max-session-duration 43200
```

This command produces no output.

For more information, see IAM role management in the *AWS IAM User Guide*.

- For API details, see UpdateRole in *AWS CLI Command Reference*.

`update-saml-provider`

The following code example shows how to use `update-saml-provider`.

AWS CLI

To update the metadata document for an existing SAML provider

The following `update-saml-provider` example updates the SAML provider in IAM whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFS` with a new SAML metadata document from the file `SAMLMetaData.xml`.

```
aws iam update-saml-provider \
    --saml-metadata-document file://SAMLMetaData.xml \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFS
```

Contents of `SAMLMetaData.xml`:

```
<?xml version="1.0" encoding="UTF-8"?>
<md:EntityDescriptor xmlns:md="urn:oasis:names:tc:SAML:2.0:metadata"
 entityID="https://adfs.example.com/adfs/services/trust">
    <md:IDPSSODescriptor
 protocolSupportEnumeration="urn:oasis:names:tc:SAML:2.0:protocol">
        <md:KeyDescriptor use="signing">
            <ds:KeyInfo xmlns:ds="http://www.w3.org/2000/09/xmldsig#">
                <ds:X509Data>
                    <ds:X509Certificate>MIIC8DCCAdigAwIBAgIQEXAMPLE...</
ds:X509Certificate>
                </ds:X509Data>
            </ds:KeyInfo>
        </md:KeyDescriptor>
        <md:NameIDFormat>urn:oasis:names:tc:SAML:2.0:nameid-format:persistent</
md:NameIDFormat>
        <md:NameIDFormat>urn:oasis:names:tc:SAML:1.1:nameid-format:emailAddress</
md:NameIDFormat>
        <md:SingleSignOnService Binding="urn:oasis:names:tc:SAML:2.0:bindings:HTTP-
Redirect" Location="https://adfs.example.com/adfs/ls/"/>
        <md:SingleSignOnService Binding="urn:oasis:names:tc:SAML:2.0:bindings:HTTP-
POST" Location="https://adfs.example.com/adfs/ls/"/>
```

```
    </md:IDPSSODescriptor>
</md:EntityDescriptor>
```

Output:

```
{
    "SAMLProviderArn": "arn:aws:iam::123456789012:saml-provider/SAMLADFS"
}
```

For more information, see Creating IAM SAML identity providers in the *AWS IAM User Guide*.

- For API details, see UpdateSamlProvider in *AWS CLI Command Reference*.

`update-server-certificate`

The following code example shows how to use `update-server-certificate`.

AWS CLI

To change the path or name of a server certificate in your AWS account

The following `update-server-certificate` example changes the name of the certificate from `myServerCertificate` to `myUpdatedServerCertificate`. It also changes the path to `/cloudfront/` so that it can be accessed by the Amazon CloudFront service. You can see the results of the update by running the `list-server-certificates` command.

```
aws iam update-server-certificate \
    --server-certificate-name myServerCertificate \
    --new-server-certificate-name myUpdatedServerCertificate \
    --new-path /cloudfront/
```

This command produces no output.

For more information, see Managing server certificates in IAM in the *AWS IAM User Guide*.

- For API details, see UpdateServerCertificate in *AWS CLI Command Reference*.

`update-service-specific-credential`

The following code example shows how to use `update-service-specific-credential`.

AWS CLI

Example 1: To update the status of the requesting user's service-specific credential

The following `update-service-specific-credential` example changes the status for the specified credential for the user making the request to `Inactive`.

```
aws iam update-service-specific-credential \
    --service-specific-credential-id ACCAEXAMPLE123EXAMPLE \
    --status Inactive
```

This command produces no output.

Example 2: To update the status of a specified user's service-specific credential

The following `update-service-specific-credential` example changes the status for the credential of the specified user to Inactive.

```
aws iam update-service-specific-credential \
    --user-name sofia \
    --service-specific-credential-id ACCAEXAMPLE123EXAMPLE \
    --status Inactive
```

This command produces no output.

For more information, see Setup for HTTPS users using Git credentials in the *AWS CodeCommit User Guide*.

- For API details, see UpdateServiceSpecificCredential in *AWS CLI Command Reference*.

`update-signing-certificate`

The following code example shows how to use `update-signing-certificate`.

AWS CLI

To activate or deactivate a signing certificate for an IAM user

The following `update-signing-certificate` example deactivates the specified signing certificate for the IAM user named Bob.

```
aws iam update-signing-certificate \
```

```
    --certificate-id TA7SMP42TDN5Z26OBPJE7EXAMPLE \
    --status Inactive \
    --user-name Bob
```

This command produces no output.

To get the ID for a signing certificate, use the `list-signing-certificates` command.

For more information, see Manage signing certificates in the *Amazon EC2 User Guide*.

- For API details, see UpdateSigningCertificate in *AWS CLI Command Reference*.

`update-ssh-public-key`

The following code example shows how to use `update-ssh-public-key`.

AWS CLI

To change the status of an SSH public key

The following `update-ssh-public-key` example changes the status of the specified public key to `Inactive`.

```
aws iam update-ssh-public-key \
    --user-name sofia \
    --ssh-public-key-id APKA1234567890EXAMPLE \
    --status Inactive
```

This command produces no output.

For more information, see Use SSH keys and SSH with CodeCommit in the *AWS IAM User Guide*.

- For API details, see UpdateSshPublicKey in *AWS CLI Command Reference*.

`update-user`

The following code example shows how to use `update-user`.

AWS CLI

To change an IAM user's name

The following `update-user` example changes the name of the IAM user Bob to `Robert`.

```
aws iam update-user \
    --user-name Bob \
    --new-user-name Robert
```

This command produces no output.

For more information, see Renaming an IAM user group in the *AWS IAM User Guide*.

- For API details, see UpdateUser in *AWS CLI Command Reference*.

`upload-server-certificate`

The following code example shows how to use `upload-server-certificate`.

AWS CLI

To upload a server certificate to your AWS account

The following `upload-server-certificate` example uploads a server certificate to your AWS account. In this example, the certificate is in the file `public_key_cert_file.pem`, the associated private key is in the file `my_private_key.pem`, and the certificate chain provided by the certificate authority (CA) is in the `my_certificate_chain_file.pem` file. When the file has finished uploading, it is available under the name *myServerCertificate*. Parameters that begin with `file://` tell the command to read the contents of the file and use that as the parameter value instead of the file name itself.

```
aws iam upload-server-certificate \
    --server-certificate-name myServerCertificate \
    --certificate-body file://public_key_cert_file.pem \
    --private-key file://my_private_key.pem \
    --certificate-chain file://my_certificate_chain_file.pem
```

Contents of `public_key_cert_file.pem`:

```
-----BEGIN CERTIFICATE-----
MIIDXTCCAkWgAwIBAgIJAEXAMPLE...
-----END CERTIFICATE-----
```

Contents of `my_private_key.pem`:

```
-----BEGIN PRIVATE KEY-----
```

```
MIIEvQIBADANBgkqhkiG9w0BAQEFAAEXAMPLE...
-----END PRIVATE KEY-----
```

Contents of `my_certificate_chain_file.pem`:

```
-----BEGIN CERTIFICATE-----
MIIEkjCCA3qgAwIBAgIQEXAMPLE...
-----END CERTIFICATE-----
-----BEGIN CERTIFICATE-----
MIIDSjCCAjKgAwIBAgIQEXAMPLE...
-----END CERTIFICATE-----
```

Output:

```
{
    "ServerCertificateMetadata": {
        "Path": "/",
        "ServerCertificateName": "myServerCertificate",
        "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
        "Arn": "arn:aws:iam::1234567989012:server-certificate/myServerCertificate",
        "UploadDate": "2019-04-22T21:13:44+00:00",
        "Expiration": "2019-10-15T22:23:16+00:00"
    }
}
```

For more information, see Manage server certificates in IAM in the *AWS IAM User Guide*.

- For API details, see UploadServerCertificate in *AWS CLI Command Reference*.

`upload-signing-certificate`

The following code example shows how to use `upload-signing-certificate`.

AWS CLI

To upload a signing certificate for an IAM user

The following `upload-signing-certificate` example uploads a signing certificate for the IAM user named Bob.

```
aws iam upload-signing-certificate \
```

```
    --user-name Bob \
    --certificate-body file://certificate.pem
```

Contents of `certificate.pem`:

```
-----BEGIN CERTIFICATE-----
MIICdzCCAeCgAwIBAgIGANc+EXAMPLE...
-----END CERTIFICATE-----
```

Output:

```
{
    "Certificate": {
        "UserName": "Bob",
        "Status": "Active",
        "CertificateBody": "-----BEGIN CERTIFICATE-----<certificate-body>-----END
 CERTIFICATE-----",
        "CertificateId": "TA7SMP42TDN5Z26OBPJE7EXAMPLE",
        "UploadDate": "2013-06-06T21:40:08.121Z"
    }
}
```

The certificate is in a file named *certificate.pem* in PEM format.

For more information, see Set up the Amazon EC2 AMI tools in the *Amazon EC2 User Guide*.

- For API details, see UploadSigningCertificate in *AWS CLI Command Reference*.

`upload-ssh-public-key`

The following code example shows how to use `upload-ssh-public-key`.

AWS CLI

To upload an SSH public key and associate it with a user

The following `upload-ssh-public-key` example uploads the public key found in the file `sshkey.pub` and attaches it to the user `sofia`.

```
aws iam upload-ssh-public-key \
    --user-name sofia \
```

```
    --ssh-public-key-body file://sshkey.pub
```

Contents of `sshkey.pub`:

```
ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAABAQEXAMPLE... sofia@example.com
```

Output:

```
{
    "SSHPublicKey": {
        "UserName": "sofia",
        "SSHPublicKeyId": "APKA1234567890EXAMPLE",
        "Fingerprint": "12:34:56:78:90:ab:cd:ef:12:34:56:78:90:ab:cd:ef",
        "SSHPublicKeyBody": "ssh-rsa <<long string generated by ssh-keygen
 command>>",
        "Status": "Active",
        "UploadDate": "2019-04-18T17:04:49+00:00"
    }
}
```

For more information about how to generate keys in a format suitable for this command, see SSH and Linux, macOS, or Unix: Set up the public and private keys for Git and CodeCommit or SSH and Windows: Set up the public and private keys for Git and CodeCommit in the *AWS CodeCommit User Guide*.

- For API details, see UploadSshPublicKey in *AWS CLI Command Reference*.

IAM Access Analyzer examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with IAM Access Analyzer.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`apply-archive-rule`

The following code example shows how to use `apply-archive-rule`.

AWS CLI

To apply an archive rule to existing findings that meet the archive rule criteria

The following `apply-archive-rule` example applies an archive rule to existing findings that meet the archive rule criteria.

```
aws accessanalyzer apply-archive-rule \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:123456789012:analyzer/
UnusedAccess-ConsoleAnalyzer-organization \
    --rule-name MyArchiveRule
```

This command produces no output.

For more information, see Archive rules in the *AWS IAM User Guide*.

- For API details, see ApplyArchiveRule in *AWS CLI Command Reference*.

`cancel-policy-generation`

The following code example shows how to use `cancel-policy-generation`.

AWS CLI

To cancel the requested policy generation

The following `cancel-policy-generation` example cancels the requested policy generation job id.

```
aws accessanalyzer cancel-policy-generation \
    --job-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see IAM Access Analyzer policy generation in the *AWS IAM User Guide*.

- For API details, see CancelPolicyGeneration in *AWS CLI Command Reference*.

`check-access-not-granted`

The following code example shows how to use `check-access-not-granted`.

AWS CLI

To check whether the specified access isn't allowed by a policy

The following `check-access-not-granted` example checks whether the specified access isn't allowed by a policy.

```
aws accessanalyzer check-access-not-granted \
    --policy-document file://myfile.json \
    --access actions="s3:DeleteBucket","s3:GetBucketLocation" \
    --policy-type IDENTITY_POLICY
```

Contents of `myfile.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::amzn-s3-demo-bucket",
                "arn:aws:s3:::amzn-s3-demo-bucket/*"
            ]
        }
    ]
}
```

Output:

```
{
    "result": "PASS",
```

```
    "message": "The policy document does not grant access to perform one or more of
 the listed actions."
}
```

For more information, see Previewing access with IAM Access Analyzer APIs in the *AWS IAM User Guide*.

- For API details, see CheckAccessNotGranted in *AWS CLI Command Reference*.

`check-no-new-access`

The following code example shows how to use `check-no-new-access`.

AWS CLI

To check whether new access is allowed for an updated policy when compared to the existing policy

The following `check-no-new-access` example checks whether new access is allowed for an updated policy when compared to the existing policy.

```
aws accessanalyzer check-no-new-access \
    --existing-policy-document file://existing-policy.json \
    --new-policy-document file://new-policy.json \
    --policy-type IDENTITY_POLICY
```

Contents of `existing-policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::amzn-s3-demo-bucket",
                "arn:aws:s3:::amzn-s3-demo-bucket/*"
            ]
```

```
        }
    ]
}
```

Contents of `new-policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:GetObjectAcl",
                "s3:ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::amzn-s3-demo-bucket",
                "arn:aws:s3:::amzn-s3-demo-bucket/*"
            ]
        }
    ]
}
```

Output:

```
{
    "result": "FAIL",
    "message": "The modified permissions grant new access compared to your existing
 policy.",
    "reasons": [
        {
            "description": "New access in the statement with index: 0.",
            "statementIndex": 0
        }
    ]
}
```

For more information, see Previewing access with IAM Access Analyzer APIs in the *AWS IAM User Guide*.

- For API details, see CheckNoNewAccess in *AWS CLI Command Reference*.

`check-no-public-access`

The following code example shows how to use `check-no-public-access`.

AWS CLI

To check whether a resource policy can grant public access to the specified resource type

The following `check-no-public-access` example checks whether a resource policy can grant public access to the specified resource type.

```
aws accessanalyzer check-no-public-access \
    --policy-document file://check-no-public-access-myfile.json \
    --resource-type AWS::S3::Bucket
```

Contents of `check-no-public-access-myfile.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "CheckNoPublicAccess",
            "Effect": "Allow",
            "Principal": { "AWS": "arn:aws:iam::123456789012:user/JohnDoe" },
            "Action": [
                "s3:GetObject"
            ]
        }
    ]
}
```

Output:

```
{
    "result": "PASS",
    "message": "The resource policy does not grant public access for the given
 resource type."
}
```

For more information, see Previewing access with IAM Access Analyzer APIs in the *AWS IAM User Guide*.

- For API details, see CheckNoPublicAccess in *AWS CLI Command Reference*.

`create-access-preview`

The following code example shows how to use `create-access-preview`.

AWS CLI

To create an access preview that allows you to preview IAM Access Analyzer findings for your resource before deploying resource permissions

The following `create-access-preview` example creates an access preview that allows you to preview IAM Access Analyzer findings for your resource before deploying resource permissions in your AWS account.

```
aws accessanalyzer create-access-preview \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:123456789012:analyzer/
ConsoleAnalyzer-account \
    --configurations file://myfile.json
```

Contents of `myfile.json`:

```
{
    "arn:aws:s3:::amzn-s3-demo-bucket": {
        "s3Bucket": {
            "bucketPolicy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Principal\":{\"AWS\":[\"arn:aws:iam::123456789012:root\"]},\"Action
\":[\"s3:PutObject\",\"s3:PutObjectAcl\"],\"Resource\":\"arn:aws:s3:::amzn-s3-demo-
bucket/*\"}]}",
            "bucketPublicAccessBlock": {
                "ignorePublicAcls": true,
                "restrictPublicBuckets": true
            },
            "bucketAclGrants": [
                {
                    "grantee": {
                        "id":
 "79a59df900b949e55d96a1e698fbacedfd6e09d98eacf8f8d5218e7cd47ef2be"
                    },
                    "permission": "READ"
                }
            ]
        }
    }
```

```
}
```

Output:

```
{
    "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Previewing access with IAM Access Analyzer APIs in the *AWS IAM User Guide*.

- For API details, see CreateAccessPreview in *AWS CLI Command Reference*.

`create-analyzer`

The following code example shows how to use `create-analyzer`.

AWS CLI

To create an analyzer

The following `create-analyzer` example creates an analyzer in your AWS account.

```
aws accessanalyzer create-analyzer \
    --analyzer-name example \
    --type ACCOUNT
```

Output:

```
{
    "arn": "arn:aws:access-analyzer:us-west-2:123456789012:analyzer/example"
}
```

For more information, see Getting started with AWS Identity and Access Management Access Analyzer findings in the *AWS IAM User Guide*.

- For API details, see CreateAnalyzer in *AWS CLI Command Reference*.

`create-archive-rule`

The following code example shows how to use `create-archive-rule`.

AWS CLI

To create an archive rule for the specified analyzer

The following `create-archive-rule` example creates an archive rule for the specified analyzer in your AWS account.

```
aws accessanalyzer create-archive-rule \
    --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \
    --rule-name MyRule \
    --filter '{"resource": {"contains": ["Cognito"]}, "resourceType": {"eq":
 ["AWS::IAM::Role"]}}'
```

This command produces no output.

For more information, see Archive rules in the *AWS IAM User Guide*.

- For API details, see CreateArchiveRule in *AWS CLI Command Reference*.

`delete-analyzer`

The following code example shows how to use `delete-analyzer`.

AWS CLI

To delete the specified analyzer

The following `delete-analyzer` example deletes the specified analyzer in your AWS account.

```
aws accessanalyzer delete-analyzer \
    --analyzer-name example
```

This command produces no output.

For more information, see Archive rules in the *AWS IAM User Guide*.

- For API details, see DeleteAnalyzer in *AWS CLI Command Reference*.

`delete-archive-rule`

The following code example shows how to use `delete-archive-rule`.

AWS CLI

To delete the specified archive rule

The following `delete-archive-rule` example deletes the specified archive rule in your AWS account.

```
aws accessanalyzer delete-archive-rule \
    --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \
    --rule-name MyRule
```

This command produces no output.

For more information, see Archive rules in the *AWS IAM User Guide*.

- For API details, see DeleteArchiveRule in *AWS CLI Command Reference*.

`get-access-preview`

The following code example shows how to use `get-access-preview`.

AWS CLI

To retrieves information about an access preview for the specified analyzer

The following `get-access-preview` example retrieves information about an access preview for the specified analyzer in your AWS account.

```
aws accessanalyzer get-access-preview \
    --access-preview-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:123456789012:analyzer/
ConsoleAnalyzer-account
```

Output:

```
{
    "accessPreview": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "analyzerArn": "arn:aws:access-analyzer:us-west-2:123456789012:analyzer/
ConsoleAnalyzer-account",
        "configurations": {
            "arn:aws:s3:::amzn-s3-demo-bucket": {
```

```
                "s3Bucket": {
                    "bucketPolicy": "{\"Version\":\"2012-10-17\",\"Statement\":
[{\"Effect\":\"Allow\",\"Principal\":{\"AWS\":[\"arn:aws:iam::123456789012:root\"]},
\"Action\":[\"s3:PutObject\",\"s3:PutObjectAcl\"],\"Resource\":\"arn:aws:s3:::amzn-
s3-demo-bucket/*\"}]}",
                    "bucketAclGrants": [
                        {
                            "permission": "READ",
                            "grantee": {
                                "id":
 "79a59df900b949e55d96a1e698fbacedfd6e09d98eacf8f8d5218e7cd47ef2be"
                            }
                        }
                    ],
                    "bucketPublicAccessBlock": {
                        "ignorePublicAcls": true,
                        "restrictPublicBuckets": true
                    }
                }
            }
        },
        "createdAt": "2024-02-17T00:18:44+00:00",
        "status": "COMPLETED"
    }
}
```

For more information, see Previewing access with IAM Access Analyzer APIs in the *AWS IAM User Guide*.

- For API details, see GetAccessPreview in *AWS CLI Command Reference*.

`get-analyzed-resource`

The following code example shows how to use `get-analyzed-resource`.

AWS CLI

To retrieve information about a resource that was analyzed

The following `get-analyzed-resource` example retrieves information about a resource that was analyzed in your AWS account.

```
aws accessanalyzer get-analyzed-resource \
```

```
    --analyzer-arn arn:aws:access-analyzer:us-west-2:123456789012:analyzer/
ConsoleAnalyzer-account \
    --resource-arn arn:aws:s3:::amzn-s3-demo-bucket
```

Output:

```
{
    "resource": {
        "analyzedAt": "2024-02-15T18:01:53.002000+00:00",
        "isPublic": false,
        "resourceArn": "arn:aws:s3:::amzn-s3-demo-bucket",
        "resourceOwnerAccount": "123456789012",
        "resourceType": "AWS::S3::Bucket"
    }
}
```

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see GetAnalyzedResource in *AWS CLI Command Reference*.

`get-analyzer`

The following code example shows how to use `get-analyzer`.

AWS CLI

To retrieve information about the specified analyzer

The following `get-analyzer` example retrieves information about the specified analyzer in your AWS account.

```
aws accessanalyzer get-analyzer \
    --analyzer-name ConsoleAnalyzer-account
```

Output:

```
{
    "analyzer": {
        "arn": "arn:aws:access-analyzer:us-west-2:123456789012:analyzer/
ConsoleAnalyzer-account",
```

```
        "createdAt": "2019-12-03T07:28:17+00:00",
        "lastResourceAnalyzed": "arn:aws:sns:us-west-2:123456789012:config-topic",
        "lastResourceAnalyzedAt": "2024-02-15T18:01:53.003000+00:00",
        "name": "ConsoleAnalyzer-account",
        "status": "ACTIVE",
        "tags": {
            "auto-delete": "no"
        },
        "type": "ACCOUNT"
    }
}
```

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see GetAnalyzer in *AWS CLI Command Reference*.

`get-archive-rule`

The following code example shows how to use `get-archive-rule`.

AWS CLI

To retrieve information about an archive rule

The following `get-archive-rule` example retrieves information about an archive rule in your AWS account.

```
aws accessanalyzer get-archive-rule \
    --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \
    --rule-name MyArchiveRule
```

Output:

```
{
    "archiveRule": {
        "createdAt": "2024-02-15T00:49:27+00:00",
        "filter": {
            "resource": {
                "contains": [
                    "Cognito"
```

```
                ]
            },
            "resourceType": {
                "eq": [
                    "AWS::IAM::Role"
                ]
            }
        },
        "ruleName": "MyArchiveRule",
        "updatedAt": "2024-02-15T00:49:27+00:00"
    }
}
```

For more information, see Archive rules in the *AWS IAM User Guide*.

- For API details, see GetArchiveRule in *AWS CLI Command Reference*.

`get-finding-v2`

The following code example shows how to use `get-finding-v2`.

AWS CLI

To retrieve information about the specified finding

The following `get-finding-v2` example etrieves information about the specified finding in your AWS account.

```
aws accessanalyzer get-finding-v2 \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:123456789012:analyzer/
ConsoleAnalyzer-organization \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "findingDetails": [
        {
            "externalAccessDetails": {
                "action": [
                    "sts:AssumeRoleWithWebIdentity"
                ],
```

```
                "condition": {
                    "cognito-identity.amazonaws.com:aud": "us-
west-2:a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
                },
                "isPublic": false,
                "principal": {
                    "Federated": "cognito-identity.amazonaws.com"
                }
            }
        }
    ],
    "resource": "arn:aws:iam::123456789012:role/Cognito_testpoolAuth_Role",
    "status": "ACTIVE",
    "error": null,
    "createdAt": "2021-02-26T21:17:50.905000+00:00",
    "resourceType": "AWS::IAM::Role",
    "findingType": "ExternalAccess",
    "resourceOwnerAccount": "123456789012",
    "analyzedAt": "2024-02-16T18:17:47.888000+00:00",
    "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "updatedAt": "2021-02-26T21:17:50.905000+00:00"
}
```

For more information, see Reviewing findings in the *AWS IAM User Guide*.

- For API details, see GetFindingV2 in *AWS CLI Command Reference*.

`get-finding`

The following code example shows how to use `get-finding`.

AWS CLI

To retrieve information about the specified finding

The following `get-finding` example etrieves information about the specified finding in your AWS account.

```
aws accessanalyzer get-finding \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:123456789012:analyzer/
ConsoleAnalyzer-organization \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "finding": {
        "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "principal": {
            "Federated": "cognito-identity.amazonaws.com"
        },
        "action": [
            "sts:AssumeRoleWithWebIdentity"
        ],
        "resource": "arn:aws:iam::123456789012:role/Cognito_testpoolAuth_Role",
        "isPublic": false,
        "resourceType": "AWS::IAM::Role",
        "condition": {
            "cognito-identity.amazonaws.com:aud": "us-west-2:a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222"
        },
        "createdAt": "2021-02-26T21:17:50.905000+00:00",
        "analyzedAt": "2024-02-16T18:17:47.888000+00:00",
        "updatedAt": "2021-02-26T21:17:50.905000+00:00",
        "status": "ACTIVE",
        "resourceOwnerAccount": "123456789012"
    }
}
```

For more information, see Reviewing findings in the *AWS IAM User Guide*.

- For API details, see GetFinding in *AWS CLI Command Reference*.

`get-generated-policy`

The following code example shows how to use `get-generated-policy`.

AWS CLI

To retrieve the policy that was generated using the `StartPolicyGeneration` API

The following `get-generated-policy` example retrieves the policy that was generated using the StartPolicyGeneration API in your AWS account.

```
aws accessanalyzer get-generated-policy \
    --job-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "generatedPolicyResult": {
        "generatedPolicies": [
            {
                "policy": "{\"Version\":\"2012-10-17\",\"Statement\":
[{\"Sid\":\"SupportedServiceSid0\",\"Effect\":\"Allow\",\"Action\":
[\"access-analyzer:GetAnalyzer\",\"access-analyzer:ListAnalyzers\",

\"cloudtrail:GetEventSelectors\",\"cloudtrail:GetInsightSelectors
\",\"cloudtrail:GetTrailStatus\",\"cloudtrail:ListChannels\",
\"cloudtrail:ListEventDataStores\",\"cloudtrail:ListQueries\",\"cloudtrail:ListTags
\",\"cloudtrail:LookupEvents\",\"ec2:DescribeRegions\",\"iam:GetAccountSummary
\",\"iam:GetOpenIDConnectProvider\",\"iam:GetRole\",\"iam:ListAccessKeys\",
\"iam:ListAccountAliases\",\"iam:ListOpenIDConnectProviders\",\"iam:ListRoles
\",\"iam:ListSAMLProviders\",\"kms:ListAliases\",\"s3:GetBucketLocation\",
\"s3:ListAllMyBuckets\"],\"Resource\":\"*\"}]}"
            }
        ],
        "properties": {
            "cloudTrailProperties": {
                "endTime": "2024-02-14T22:44:40+00:00",
                "startTime": "2024-02-13T00:30:00+00:00",
                "trailProperties": [
                    {
                        "allRegions": true,
                        "cloudTrailArn": "arn:aws:cloudtrail:us-
west-2:123456789012:trail/my-trail",
                        "regions": []
                    }
                ]
            },
            "isComplete": false,
            "principalArn": "arn:aws:iam::123456789012:role/Admin"
        }
    },
    "jobDetails": {
        "completedOn": "2024-02-14T22:47:01+00:00",
        "jobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "startedOn": "2024-02-14T22:44:41+00:00",
        "status": "SUCCEEDED"
    }
```

```
}
```

For more information, see IAM Access Analyzer policy generation in the *AWS IAM User Guide*.

- For API details, see GetGeneratedPolicy in *AWS CLI Command Reference*.

`list-access-preview-findings`

The following code example shows how to use `list-access-preview-findings`.

AWS CLI

To retrieve a list of access preview findings generated by the specified access preview

The following `list-access-preview-findings` example retrieves a list of access preview findings generated by the specified access preview in your AWS account.

```
aws accessanalyzer list-access-preview-findings \
    --access-preview-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:123456789012:analyzer/
ConsoleAnalyzer-account
```

Output:

```
{
    "findings": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "principal": {
                "AWS": "123456789012"
            },
            "action": [
                "s3:PutObject",
                "s3:PutObjectAcl"
            ],
            "condition": {},
            "resource": "arn:aws:s3:::amzn-s3-demo-bucket",
            "isPublic": false,
            "resourceType": "AWS::S3::Bucket",
            "createdAt": "2024-02-17T00:18:46+00:00",
            "changeType": "NEW",
            "status": "ACTIVE",
            "resourceOwnerAccount": "123456789012",
```

```
            "sources": [
                {
                    "type": "POLICY"
                }
            ]
        }
    ]
}
```

For more information, see Previewing access with IAM Access Analyzer APIs in the *AWS IAM User Guide*.

- For API details, see ListAccessPreviewFindings in *AWS CLI Command Reference*.

`list-access-previews`

The following code example shows how to use `list-access-previews`.

AWS CLI

To retrieve a list of access previews for the specified analyzer

The following `list-access-previews` example retrieves a list of access previews for the specified analyzer in your AWS account.

```
aws accessanalyzer list-access-previews \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:123456789012:analyzer/
ConsoleAnalyzer-account
```

Output:

```
{
    "accessPreviews": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "analyzerArn": "arn:aws:access-analyzer:us-west-2:123456789012:analyzer/
ConsoleAnalyzer-account",
            "createdAt": "2024-02-17T00:18:44+00:00",
            "status": "COMPLETED"
        }
    ]
}
```

For more information, see Previewing access with IAM Access Analyzer APIs in the *AWS IAM User Guide*.

- For API details, see ListAccessPreviews in *AWS CLI Command Reference*.

`list-analyzed-resources`

The following code example shows how to use `list-analyzed-resources`.

AWS CLI

To list the available widgets

The following `list-analyzed-resources` example lists the available widgets in your AWS account.

```
aws accessanalyzer list-analyzed-resources \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:123456789012:analyzer/
ConsoleAnalyzer-account \
    --resource-type AWS::IAM::Role
```

Output:

```
{
    "analyzedResources": [
        {
            "resourceArn": "arn:aws:sns:us-west-2:123456789012:Validation-Email",
            "resourceOwnerAccount": "123456789012",
            "resourceType": "AWS::SNS::Topic"
        },
        {
            "resourceArn": "arn:aws:sns:us-west-2:123456789012:admin-alerts",
            "resourceOwnerAccount": "123456789012",
            "resourceType": "AWS::SNS::Topic"
        },
        {
            "resourceArn": "arn:aws:sns:us-west-2:123456789012:config-topic",
            "resourceOwnerAccount": "123456789012",
            "resourceType": "AWS::SNS::Topic"
        },
        {
            "resourceArn": "arn:aws:sns:us-west-2:123456789012:inspector-topic",
            "resourceOwnerAccount": "123456789012",
```

```
            "resourceType": "AWS::SNS::Topic"
        }
    ]
}
```

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see ListAnalyzedResources in *AWS CLI Command Reference*.

`list-analyzers`

The following code example shows how to use `list-analyzers`.

AWS CLI

To retrieve a list of analyzers

The following `list-analyzers` example retrieves a list of analyzers in your AWS account.

```
aws accessanalyzer list-analyzers
```

Output:

```
{
    "analyzers": [
        {
            "arn": "arn:aws:access-analyzer:us-west-2:123456789012:analyzer/
UnusedAccess-ConsoleAnalyzer-organization",
            "createdAt": "2024-02-15T00:46:40+00:00",
            "name": "UnusedAccess-ConsoleAnalyzer-organization",
            "status": "ACTIVE",
            "tags": {

`list-archive-rules`

The following code example shows how to use `list-archive-rules`.

AWS CLI

To retrieve a list of archive rules created for the specified analyzer

The following `list-archive-rules` example retrieves a list of archive rules created for the specified analyzer in your AWS account.

```
aws accessanalyzer list-archive-rules \
    --analyzer-name UnusedAccess-ConsoleAnalyzer-organization
```

Output:

```
{
    "archiveRules": [
        {
            "createdAt": "2024-02-15T00:49:27+00:00",
            "filter": {
                "resource": {
                    "contains": [
                        "Cognito"
                    ]
                },
                "resourceType": {
                    "eq": [
                        "AWS::IAM::Role"
                    ]
                }
            },
            "ruleName": "MyArchiveRule",
            "updatedAt": "2024-02-15T00:49:27+00:00"
        },
        {
            "createdAt": "2024-02-15T23:27:45+00:00",
            "filter": {
                "findingType": {
                    "eq": [
                        "UnusedIAMUserAccessKey"
                    ]
                }
            },
            "ruleName": "ArchiveRule-56125a39-e517-4ff8-afb1-ef06f58db612",
            "updatedAt": "2024-02-15T23:27:45+00:00"
        }
    ]
}
```

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see ListArchiveRules in *AWS CLI Command Reference*.

`list-findings-v2`

The following code example shows how to use `list-findings-v2`.

AWS CLI

To retrieve a list of findings generated by the specified analyzer

The following `list-findings-v2` example retrieves a list of findings generated by the specified analyzer in your AWS account. This example filters the results to include only IAM roles whose name contains `Cognito`.

```
aws accessanalyzer list-findings-v2 \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:123456789012:analyzer/
ConsoleAnalyzer-account \
    --filter '{"resource": {"contains": ["Cognito"]}, "resourceType": {"eq":
 ["AWS::IAM::Role"]}}'
```

Output:

```
{
    "findings": [
        {
            "analyzedAt": "2024-02-16T18:17:47.888000+00:00",
            "createdAt": "2021-02-26T21:17:24.710000+00:00",
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "resource": "arn:aws:iam::123456789012:role/
Cognito_testpoolUnauth_Role",
            "resourceType": "AWS::IAM::Role",
            "resourceOwnerAccount": "123456789012",
            "status": "ACTIVE",

            "findingType": "ExternalAccess"
        },
        {
            "analyzedAt": "2024-02-16T18:17:47.888000+00:00",
            "createdAt": "2021-02-26T21:17:50.905000+00:00",
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "resource": "arn:aws:iam::123456789012:role/Cognito_testpoolAuth_Role",
            "resourceType": "AWS::IAM::Role",
            "resourceOwnerAccount": "123456789012",
            "status": "ACTIVE",
```

```
            "updatedAt": "2021-02-26T21:17:50.905000+00:00",
            "findingType": "ExternalAccess"
        }
    ]
}
```

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see ListFindingsV2 in *AWS CLI Command Reference*.

`list-findings`

The following code example shows how to use `list-findings`.

AWS CLI

To retrieve a list of findings generated by the specified analyzer

The following `list-findings` example retrieves a list of findings generated by the specified analyzer in your AWS account. This example filters the results to include only IAM roles whose name contains `Cognito`.

```
aws accessanalyzer list-findings \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:123456789012:analyzer/
ConsoleAnalyzer-account \
    --filter '{"resource": {"contains": ["Cognito"]}, "resourceType": {"eq":
 ["AWS::IAM::Role"]}}'
```

Output:

```
{
    "findings": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "principal": {
                "Federated": "cognito-identity.amazonaws.com"
            },
            "action": [
                "sts:AssumeRoleWithWebIdentity"
            ],
```

```
            "resource": "arn:aws:iam::123456789012:role/
Cognito_testpoolUnauth_Role",
            "isPublic": false,

            "status": "ACTIVE",
            "resourceOwnerAccount": "123456789012"
        }
    ]
}
```

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see ListFindings in *AWS CLI Command Reference*.

`list-policy-generations`

The following code example shows how to use `list-policy-generations`.

AWS CLI

To list all of the policy generations requested in the last seven days

The following `list-policy-generations` example lists all of the policy generations requested in the last seven days in your AWS account.

```
aws accessanalyzer list-policy-generations
```

Output:

```
{
    "policyGenerations": [
        {
            "completedOn": "2024-02-14T23:43:38+00:00",
            "jobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "principalArn": "arn:aws:iam::123456789012:role/Admin",
            "startedOn": "2024-02-14T23:43:02+00:00",
            "status": "CANCELED"
        },
        {
            "completedOn": "2024-02-14T22:47:01+00:00",
            "jobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "principalArn": "arn:aws:iam::123456789012:role/Admin",
            "startedOn": "2024-02-14T22:44:41+00:00",
            "status": "SUCCEEDED"
        }
    ]
}
```

For more information, see IAM Access Analyzer policy generation in the *AWS IAM User Guide*.

- For API details, see ListPolicyGenerations in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To retrieve a list of tags applied to the specified resource

The following `list-tags-for-resource` example retrieves a list of tags applied to the specified resource in your AWS account.

```
aws accessanalyzer list-tags-for-resource \
    --resource-arn arn:aws:access-analyzer:us-west-2:123456789012:analyzer/
ConsoleAnalyzer-account
```

Output:

```
{
    "tags": {
        "Zone-of-trust": "Account",
        "Name": "ConsoleAnalyzer"
    }
}
```

For more information, see IAM Access Analyzer policy generation in the *AWS IAM User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`start-policy-generation`

The following code example shows how to use `start-policy-generation`.

AWS CLI

To start a policy generation request

The following `start-policy-generation` example starts a policy generation request in your AWS account.

```
aws accessanalyzer start-policy-generation \
    --policy-generation-details '{"principalArn":"arn:aws:iam::123456789012:role/
Admin"}' \
    --cloud-trail-details file://myfile.json
```

Contents of `myfile.json`:

```
{
    "accessRole": "arn:aws:iam::123456789012:role/service-role/
AccessAnalyzerMonitorServiceRole",
    "startTime": "2024-02-13T00:30:00Z",
    "trails": [
        {
            "allRegions": true,
            "cloudTrailArn": "arn:aws:cloudtrail:us-west-2:123456789012:trail/my-
trail"
        }
    ]
}
```

Output:

```
{
    "jobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see IAM Access Analyzer policy generation in the *AWS IAM User Guide*.

- For API details, see StartPolicyGeneration in *AWS CLI Command Reference*.

`start-resource-scan`

The following code example shows how to use `start-resource-scan`.

AWS CLI

To immediately start a scan of the policies applied to the specified resource

The following `start-resource-scan` example mmediately starts a scan of the policies applied to the specified resource in your AWS account.

```
aws accessanalyzer start-resource-scan \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:123456789012:analyzer/
ConsoleAnalyzer-account \
    --resource-arn arn:aws:iam::123456789012:role/Cognito_testpoolAuth_Role
```

This command produces no output.

For more information, see IAM Access Analyzer policy generation in the *AWS IAM User Guide*.

- For API details, see StartResourceScan in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to the specified resource

The following `tag-resource` example adds a tag to the specified resource in your AWS account.

```
aws accessanalyzer tag-resource \
    --resource-arn arn:aws:access-analyzer:us-west-2:123456789012:analyzer/
ConsoleAnalyzer-account \
    --tags Environment=dev,Purpose=testing
```

This command produces no output.

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from the specified resources

The following `untag-resource` example removes tags from the specified resource in your AWS account.

```
aws accessanalyzer untag-resource \
    --resource-arn arn:aws:access-analyzer:us-west-2:123456789012:analyzer/
ConsoleAnalyzer-account \
    --tag-keys Environment Purpose
```

This command produces no output.

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-archive-rule`

The following code example shows how to use `update-archive-rule`.

AWS CLI

To update the criteria and values for the specified archive rule

The following `update-archive-rule` example updates the criteria and values for the specified archive rule in your AWS account.

```
aws accessanalyzer update-archive-rule \
    --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \
    --rule-name MyArchiveRule \
    --filter '{"resource": {"contains": ["Cognito"]}, "resourceType": {"eq":
 ["AWS::IAM::Role"]}}'
```

This command produces no output.

For more information, see Archive rules in the *AWS IAM User Guide*.

- For API details, see UpdateArchiveRule in *AWS CLI Command Reference*.

`update-findings`

The following code example shows how to use `update-findings`.

AWS CLI

To update the status for the specified findings

The following `update-findings` example updates the status for the specified findings in your AWS account.

```
aws accessanalyzer update-findings \
```

```
    --analyzer-arn arn:aws:access-analyzer:us-west-2:123456789012:analyzer/
UnusedAccess-ConsoleAnalyzer-organization \
    --ids a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
 \
    --status ARCHIVED
```

This command produces no output.

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see UpdateFindings in *AWS CLI Command Reference*.

`validate-policy`

The following code example shows how to use `validate-policy`.

AWS CLI

To request the validation of a policy and returns a list of findings

The following `validate-policy` example requests the validation of a policy and returns a list of findings. The policy in the example is a role trust policy for an Amazon Cognito role used for web identity federation. The findings generated from the trust policy relate to an empty `Sid` element value and a mismatched policy principal due to the incorrect assume role action being used, `sts:AssumeRole`. The correct assume role action for use with Cognito is `sts:AssumeRoleWithWebIdentity`.

```
aws accessanalyzer validate-policy \
    --policy-document file://myfile.json \
    --policy-type RESOURCE_POLICY
```

Contents of `myfile.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "",
            "Effect": "Allow",
            "Principal": {
```

```
                "Federated": "cognito-identity.amazonaws.com"
            },
            "Action": [
                "sts:AssumeRole",
                "sts:TagSession"
            ],
            "Condition": {
                "StringEquals": {
                    "cognito-identity.amazonaws.com:aud": "us-west-2_EXAMPLE"
                }
            }
        }
    ]
}
```

Output:

```
{
    "findings": [
        {
            "findingDetails": "Add a value to the empty string in the Sid element.",
            "findingType": "SUGGESTION",

            ]
        }
    ]
}
```

For more information, see Checks for validating policies in the *AWS IAM User Guide*.

- For API details, see ValidatePolicy in *AWS CLI Command Reference*.

Image Builder examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Image Builder.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-component`

The following code example shows how to use `create-component`.

AWS CLI

To create a component

The following `create-component` example creates a component that uses a JSON document file and references a component document in YAML format that is uploaded to an Amazon S3 bucket.

```
aws imagebuilder create-component \
    --cli-input-json file://create-component.json
```

Contents of `create-component.json`:

```
{
    "name": "MyExampleComponent",
    "semanticVersion": "2019.12.02",
    "description": "An example component that builds, validates and tests an image",
    "changeDescription": "Initial version.",
    "platform": "Windows",
    "uri": "s3://amzn-s3-demo-bucket/s3-bucket-path/component.yaml"
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "componentBuildVersionArn": "arn:aws:imagebuilder:us-
west-2:123456789012:component/examplecomponent/2019.12.02/1"
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see CreateComponent in *AWS CLI Command Reference*.

create-distribution-configuration

The following code example shows how to use `create-distribution-configuration`.

AWS CLI

To create a distribution configuration

The following `create-distribution-configuration` example creates a distribution configuration using a JSON file.

```
aws imagebuilder create-distribution-configuration \
    --cli-input-json file://create-distribution-configuration.json
```

Contents of `create-distribution-configuration.json`:

```
{
    "name": "MyExampleDistribution",
    "description": "Copies AMI to eu-west-1",
    "distributions": [
        {
            "region": "us-west-2",
            "amiDistributionConfiguration": {
                "name": "Name {{imagebuilder:buildDate}}",
                "description": "An example image name with parameter references",
                "amiTags": {
                    "KeyName": "{{ssm:parameter_name}}"
                },
                "launchPermission": {
                    "userIds": [
                        "123456789012"
                    ]
                }
            }
        },
        {
            "region": "eu-west-1",
            "amiDistributionConfiguration": {
                "name": "My {{imagebuilder:buildVersion}} image
 {{imagebuilder:buildDate}}",
                "amiTags": {
                    "KeyName": "Value"
                },
```

```
                "launchPermission": {
                    "userIds": [
                        "123456789012"
                    ]
                }
            }
        }
    ]
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "distributionConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:distribution-configuration/myexampledistribution"
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see CreateDistributionConfiguration in *AWS CLI Command Reference*.

`create-image-pipeline`

The following code example shows how to use `create-image-pipeline`.

AWS CLI

To create an image pipeline

The following `create-image-pipeline` example creates an image pipeline using a JSON file.

```
aws imagebuilder create-image-pipeline \
    --cli-input-json file://create-image-pipeline.json
```

Contents of `create-image-pipeline.json`:

```
{
    "name": "MyWindows2016Pipeline",
    "description": "Builds Windows 2016 Images",
```

```
    "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
mybasicrecipe/2019.12.03",
    "infrastructureConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure",
    "distributionConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:distribution-configuration/myexampledistribution",
    "imageTestsConfiguration": {
        "imageTestsEnabled": true,
        "timeoutMinutes": 60
    },
    "schedule": {
        "scheduleExpression": "cron(0 0 * * SUN)",
        "pipelineExecutionStartCondition":
 "EXPRESSION_MATCH_AND_DEPENDENCY_UPDATES_AVAILABLE"
    },
    "status": "ENABLED"
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "imagePipelineArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline"
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see CreateImagePipeline in *AWS CLI Command Reference*.

`create-image-recipe`

The following code example shows how to use `create-image-recipe`.

AWS CLI

To create a recipe

The following `create-image-recipe` example creates an image recipe using a JSON file. Components are installed in the order in which they are specified.

```
aws imagebuilder create-image-recipe \
    --cli-input-json file://create-image-recipe.json
```

Contents of `create-image-recipe.json`:

```
{
    "name": "MyBasicRecipe",
    "description": "This example image recipe creates a Windows 2016 image.",
    "semanticVersion": "2019.12.03",
    "components":
    [
        {
            "componentArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/
myexamplecomponent/2019.12.02/1"
        },
        {
            "componentArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/
myimportedcomponent/1.0.0/1"
        }
    ],
    "parentImage": "arn:aws:imagebuilder:us-west-2:aws:image/windows-server-2016-
english-full-base-x86/xxxx.x.x"
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
mybasicrecipe/2019.12.03"
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see CreateImageRecipe in *AWS CLI Command Reference*.

`create-image`

The following code example shows how to use `create-image`.

AWS CLI

To create an image

The following `create-image` example creates an image.

```
aws imagebuilder create-image \
    --image-recipe-arn arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/mybasicrecipe/2019.12.03 \
    --infrastructure-configuration-arn arn:aws:imagebuilder:us-west-2:123456789012:infrastructure-configuration/myexampleinfrastructure
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "imageBuildVersionArn": "arn:aws:imagebuilder:us-west-2:123456789012:image/mybasicrecipe/2019.12.03/1"
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see CreateImage in *AWS CLI Command Reference*.

`create-infrastructure-configuration`

The following code example shows how to use `create-infrastructure-configuration`.

AWS CLI

To create an infrastructure configuration

The following `create-infrastructure-configuration` example creates an infrastructure configuration using a JSON file.

```
aws imagebuilder create-infrastructure-configuration \
    --cli-input-json file://create-infrastructure-configuration.json
```

Contents of `create-infrastructure-configuration.json`:

```
{
    "name": "MyExampleInfrastructure",
    "description": "An example that will retain instances of failed builds",
    "instanceTypes": [
        "m5.large", "m5.xlarge"
    ],
    "instanceProfileName": "EC2InstanceProfileForImageBuilder",
    "securityGroupIds": [
        "sg-a1b2c3d4"
    ],
    "subnetId": "subnet-a1b2c3d4",
    "logging": {
        "s3Logs": {
            "s3BucketName": "bucket-name",
            "s3KeyPrefix": "bucket-path"
        }
    },
    "keyPair": "key-pair-name",
    "terminateInstanceOnFailure": false,
    "snsTopicArn": "arn:aws:sns:us-west-2:123456789012:sns-topic-name"
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "infrastructureConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure"
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see CreateInfrastructureConfiguration in *AWS CLI Command Reference*.

`delete-component`

The following code example shows how to use `delete-component`.

AWS CLI

To delete a component

The following `delete-component` example deletes a component build version by specifying its ARN.

```
aws imagebuilder delete-component \
    --component-build-version-arn arn:aws:imagebuilder:us-
west-2:123456789012:component/myexamplecomponent/2019.12.02/1
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "componentBuildVersionArn": "arn:aws:imagebuilder:us-
west-2:123456789012:component/myexamplecomponent/2019.12.02/1"
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see DeleteComponent in *AWS CLI Command Reference*.

`delete-image-pipeline`

The following code example shows how to use `delete-image-pipeline`.

AWS CLI

To delete an image pipeline

The following `delete-image-pipeline` example deletes an image pipeline by specifying its ARN.

```
aws imagebuilder delete-image-pipeline \
    --image-pipeline-arn arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
my-example-pipeline
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imagePipelineArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline"
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see DeleteImagePipeline in *AWS CLI Command Reference*.

`delete-image-recipe`

The following code example shows how to use `delete-image-recipe`.

AWS CLI

To delete an image recipe

The following `delete-image-recipe` example deletes an image recipe by specifying its ARN.

```
aws imagebuilder delete-image-recipe \
    --image-recipe-arn arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
mybasicrecipe/2019.12.03
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
mybasicrecipe/2019.12.03"
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see DeleteImageRecipe in *AWS CLI Command Reference*.

`delete-image`

The following code example shows how to use `delete-image`.

AWS CLI

To delete an image

The following `delete-image` example deletes an image build version by specifying its ARN.

```
aws imagebuilder delete-image \
    --image-build-version-arn arn:aws:imagebuilder:us-west-2:123456789012:image/my-example-image/2019.12.02/1
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageBuildVersionArn": "arn:aws:imagebuilder:us-west-2:123456789012:image/mybasicrecipe/2019.12.03/1"
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see DeleteImage in *AWS CLI Command Reference*.

`delete-infrastructure-configuration`

The following code example shows how to use `delete-infrastructure-configuration`.

AWS CLI

To delete an infrastructure configuration

The following `delete-infrastructure-configuration` example deletes an image pipeline by specifying its ARN.

```
aws imagebuilder delete-infrastructure-configuration \
    --infrastructure-configuration-arn arn:aws:imagebuilder:us-west-2:123456789012:infrastructure-configuration/myexampleinfrastructure
```

Output:

```
{
```

```
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "infrastructureConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure"
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see DeleteInfrastructureConfiguration in *AWS CLI Command Reference*.

`get-component-policy`

The following code example shows how to use `get-component-policy`.

AWS CLI

To get component policy details

The following `get-component-policy` example lists the details of a component policy by specifying its ARN.

```
aws imagebuilder get-component-policy \
    --component-arn arn:aws:imagebuilder:us-west-2:123456789012:component/my-
example-component/2019.12.03/1
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "policy": "{ \"Version\": \"2012-10-17\", \"Statement\": [ { \"Effect\":
 \"Allow\", \"Principal\": { \"AWS\": [ \"123456789012\" ] }, \"Action\":
 [ \"imagebuilder:GetComponent\", \"imagebuilder:ListComponents\" ], \"Resource
\": [ \"arn:aws:imagebuilder:us-west-2:123456789012:component/my-example-
component/2019.12.03/1\" ] } ] }"
}
```

For more information, see Share Image Builder resources with AWS RAM in the *EC2 Image Builder User Guide*.

- For API details, see GetComponentPolicy in *AWS CLI Command Reference*.

`get-component`

The following code example shows how to use `get-component`.

AWS CLI

To get component details

The following `get-component` example lists the details of a component by specifying its ARN.

```
aws imagebuilder get-component \
    --component-build-version-arn arn:aws:imagebuilder:us-
west-2:123456789012:component/component-name/1.0.0/1
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "component": {
        "arn": "arn:aws:imagebuilder:us-west-2:123456789012:component/component-
name/1.0.0/1",
        "name": "component-name",
        "version": "1.0.0",
        "type": "TEST",
        "platform": "Linux",
        "owner": "123456789012",
        "data": "name: HelloWorldTestingDocument\ndescription: This is hello world
 testing document.\nschemaVersion: 1.0\n\nphases:\n  - name: test\n    steps:\n
   - name: HelloWorldStep\n        action: ExecuteBash\n        inputs:\n
 commands:\n            - echo \"Hello World! Test.\"\n",
        "encrypted": true,
        "dateCreated": "2020-01-27T20:43:30.306Z",
        "tags": {}
    }
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see GetComponent in *AWS CLI Command Reference*.

get-distribution-configuration

The following code example shows how to use get-distribution-configuration.

AWS CLI

To get the details of a distribution configuration

The following get-distribution-configuration example displays the details of a distribution configuration by specifying its ARN.

```
aws imagebuilder get-distribution-configuration \
    --distribution-configuration-arn arn:aws:imagebuilder:us-
west-2:123456789012:distribution-configuration/myexampledistribution
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "distributionConfiguration": {
        "arn": "arn:aws:imagebuilder:us-west-2:123456789012:distribution-
configuration/myexampledistribution",
        "name": "MyExampleDistribution",
        "description": "Copies AMI to eu-west-1 and exports to S3",
        "distributions": [
            {
                "region": "us-west-2",
                "amiDistributionConfiguration": {
                    "name": "Name {{imagebuilder:buildDate}}",
                    "description": "An example image name with parameter
 references",
                    "amiTags": {
                        "KeyName": "{{ssm:parameter_name}}"
                    },
                    "launchPermission": {
                        "userIds": [
                            "123456789012"
                        ]
                    }
                }
            },
            {
                "region": "eu-west-1",
```

```
                "amiDistributionConfiguration": {
                    "name": "My {{imagebuilder:buildVersion}} image
 {{imagebuilder:buildDate}}",
                    "amiTags": {
                        "KeyName": "Value"
                    },
                    "launchPermission": {
                        "userIds": [
                            "123456789012"
                        ]
                    }
                }
            }
        ],
        "dateCreated": "2020-02-19T18:40:10.529Z",
        "tags": {}
    }
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see GetDistributionConfiguration in *AWS CLI Command Reference*.

`get-image-pipeline`

The following code example shows how to use `get-image-pipeline`.

AWS CLI

To get image pipeline details

The following `get-image-pipeline` example lists the details of an image pipeline by specifying its ARN.

```
aws imagebuilder get-image-pipeline \
    --image-pipeline-arn arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
```

```
    "imagePipeline": {
        "arn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline",
        "name": "MyWindows2016Pipeline",
        "description": "Builds Windows 2016 Images",
        "platform": "Windows",
        "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
mybasicrecipe/2019.12.03",
        "infrastructureConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure",
        "distributionConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:distribution-configuration/myexampledistribution",
        "imageTestsConfiguration": {
            "imageTestsEnabled": true,
            "timeoutMinutes": 60
        },
        "schedule": {
            "scheduleExpression": "cron(0 0 * * SUN)",
            "pipelineExecutionStartCondition":
 "EXPRESSION_MATCH_AND_DEPENDENCY_UPDATES_AVAILABLE"
        },
        "status": "ENABLED",
        "dateCreated": "2020-02-19T19:04:01.253Z",
        "dateUpdated": "2020-02-19T19:04:01.253Z",
        "tags": {}
    }
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see GetImagePipeline in *AWS CLI Command Reference*.

`get-image-policy`

The following code example shows how to use `get-image-policy`.

AWS CLI

To get image policy details

The following `get-image-policy` example lists the details of an image policy by specifying its ARN.

```
aws imagebuilder get-image-policy \
    --image-arn arn:aws:imagebuilder:us-west-2:123456789012:image/my-example-image/2019.12.03/1
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "policy": "{ \"Version\": \"2012-10-17\", \"Statement\": [ { \"Effect
\": \"Allow\", \"Principal\": { \"AWS\": [ \"123456789012\" ] }, \"Action
\": [ \"imagebuilder:GetImage\", \"imagebuilder:ListImages\" ], \"Resource
\": [ \"arn:aws:imagebuilder:us-west-2:123456789012:image/my-example-
image/2019.12.03/1\" ] } ] }"
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see GetImagePolicy in *AWS CLI Command Reference*.

`get-image-recipe-policy`

The following code example shows how to use `get-image-recipe-policy`.

AWS CLI

To get image recipe policy details

The following `get-image-recipe-policy` example lists the details of an image recipe policy by specifying its ARN.

```
aws imagebuilder get-image-recipe-policy \
    --image-recipe-arn arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/my-example-image-recipe/2019.12.03/1
```

Output:

```
{
    "policy": "{ \"Version\": \"2012-10-17\", \"Statement\": [ { \"Effect\":
 \"Allow\", \"Principal\": { \"AWS\": [ \"123456789012\" ] }, \"Action\":
 [ \"imagebuilder:GetImageRecipe\", \"imagebuilder:ListImageRecipes\" ], \"Resource
```

```
\": [ \"arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/my-example-image-
recipe/2019.12.03/1\" ] } ] }"
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see GetImageRecipePolicy in *AWS CLI Command Reference*.

`get-image`

The following code example shows how to use `get-image`.

AWS CLI

To get image details

The following `get-image` example lists the details of an image by specifying its ARN.

```
aws imagebuilder get-image \
    --image-build-version-arn arn:aws:imagebuilder:us-west-2:123456789012:image/
mybasicrecipe/2019.12.03/1
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "image": {
        "arn": "arn:aws:imagebuilder:us-west-2:123456789012:image/

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see GetImage in *AWS CLI Command Reference*.

`get-infrastructure-configuration`

The following code example shows how to use `get-infrastructure-configuration`.

AWS CLI

To get infrastructure configuration details

The following `get-infrastructure-configuration` example lists the details of an infrastructure configuration by specifying its ARN.

```
aws imagebuilder get-infrastructure-configuration \
    --infrastructure-configuration-arn arn:aws:imagebuilder:us-
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "infrastructureConfiguration": {
        "arn": "arn:aws:imagebuilder:us-west-2:123456789012:infrastructure-
configuration/myexampleinfrastructure",
        "name": "MyExampleInfrastructure",
        "description": "An example that will retain instances of failed builds",
        "instanceTypes": [
            "m5.large",
            "m5.xlarge"
        ],
```

```
        "instanceProfileName": "EC2InstanceProfileForImageBuilder",
        "securityGroupIds": [
            "sg-a48c95ef"
        ],
        "subnetId": "subnet-a48c95ef",
        "logging": {
            "s3Logs": {
                "s3BucketName": "bucket-name",
                "s3KeyPrefix": "bucket-path"
            }
        },
        "keyPair": "Name",
        "terminateInstanceOnFailure": false,
        "snsTopicArn": "arn:aws:sns:us-west-2:123456789012:sns-name",
        "dateCreated": "2020-02-19T19:11:51.858Z",
        "tags": {}
    }
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see GetInfrastructureConfiguration in *AWS CLI Command Reference*.

`import-component`

The following code example shows how to use `import-component`.

AWS CLI

To import a component

The following `import-component` example imports a preexisting script using a JSON file.

```
aws imagebuilder import-component \
    --cli-input-json file://import-component.json
```

Contents of `import-component.json`:

```
{
    "name": "MyImportedComponent",
    "semanticVersion": "1.0.0",
    "description": "An example of how to import a component",
```

```
    "changeDescription": "First commit message.",
    "format": "SHELL",
    "platform": "Windows",
    "type": "BUILD",
    "uri": "s3://amzn-s3-demo-bucket/s3-bucket-path/component.yaml"
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "componentBuildVersionArn": "arn:aws:imagebuilder:us-
west-2:123456789012:component/myimportedcomponent/1.0.0/1"
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see ImportComponent in *AWS CLI Command Reference*.

`list-component-build-versions`

The following code example shows how to use `list-component-build-versions`.

AWS CLI

To list component build versions

The following `list-component-build-versions` example lists the component build versions with a specific semantic version.

```
aws imagebuilder list-component-build-versions \
    --component-version-arn arn:aws:imagebuilder:us-west-2:123456789012:component/
myexamplecomponent/2019.12.02
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "componentSummaryList": [
        {
```

```
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:component/
myexamplecomponent/2019.12.02/1",
            "name": "MyExampleComponent",
            "version": "2019.12.02",
            "platform": "Windows",
            "type": "BUILD",
            "owner": "123456789012",
            "description": "An example component that builds, validates and tests an
 image",
            "changeDescription": "Initial version.",
            "dateCreated": "2020-02-19T18:53:45.940Z",
            "tags": {
                "KeyName": "KeyValue"
            }
        }
    ]
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see ListComponentBuildVersions in *AWS CLI Command Reference*.

`list-components`

The following code example shows how to use `list-components`.

AWS CLI

To list all of the component semantic versions

The following `list-components` example lists all of the component semantic versions to which you have access. You can optionally filter on whether to list components owned by you, by Amazon, or that have been shared with you by other accounts.

```
aws imagebuilder list-components
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "componentVersionList": [
        {
```

```
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:component/component-
name/1.0.0",
            "name": "component-name",
            "version": "1.0.0",
            "platform": "Linux",
            "type": "TEST",
            "owner": "123456789012",
            "dateCreated": "2020-01-27T20:43:30.306Z"
        }
    ]
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see ListComponents in *AWS CLI Command Reference*.

`list-distribution-configurations`

The following code example shows how to use `list-distribution-configurations`.

AWS CLI

To list distributions

The following `list-distribution-configurations` example lists all of your distributions.

```
aws imagebuilder list-distribution-configurations
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "distributionConfigurationSummaryList": [
        {
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:distribution-
configuration/myexampledistribution",
            "name": "MyExampleDistribution",
            "description": "Copies AMI to eu-west-1 and exports to S3",
            "dateCreated": "2020-02-19T18:40:10.529Z",
            "tags": {
                "KeyName": "KeyValue"
            }
```

```
        }
    ]
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see ListDistributionConfigurations in *AWS CLI Command Reference*.

`list-image-build-versions`

The following code example shows how to use `list-image-build-versions`.

AWS CLI

To list image build versions

The following `list-image-build-versions` example lists all of the image build versions with a semantic version.

```
aws imagebuilder list-image-build-versions \
    --image-version-arn arn:aws:imagebuilder:us-west-2:123456789012:image/
mybasicrecipe/2019.12.03
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageSummaryList": [
        {
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:image/
mybasicrecipe/2019.12.03/7",
            "name": "MyBasicRecipe",

`list-image-pipeline-images`

The following code example shows how to use `list-image-pipeline-images`.

AWS CLI

To list image pipeline pipeline images

The following `list-image-pipeline-images` example lists all images that were created by a specific image pipeline.

```
aws imagebuilder list-image-pipeline-images \
    --image-pipeline-arn arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageSummaryList": [
        {
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:image/
mybasicrecipe/2019.12.03/1",
            "name": "MyBasicRecipe",
            "version": "2019.12.03/1",
```

```
            "platform": "Windows",
            "state": {
                "status": "AVAILABLE"
            },

}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see ListImageRecipes in *AWS CLI Command Reference*.

`list-images`

The following code example shows how to use `list-images`.

AWS CLI

To list images

The following `list-images` example lists all of the semantic versions you have access to.

```
aws imagebuilder list-images
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageVersionList": [
        {
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:image/
mybasicrecipe/2019.12.03",
            "name": "MyBasicRecipe",
            "version": "2019.12.03",
            "platform": "Windows",
            "owner": "123456789012",
            "dateCreated": "2020-02-14T21:29:18.810Z"
        }
    ]
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see ListImages in *AWS CLI Command Reference*.

`list-infrastructure-configurations`

The following code example shows how to use `list-infrastructure-configurations`.

AWS CLI

To list infrastructure configurations

The following `list-infrastructure-configurations` example lists all of your infrastructure configurations.

```
aws imagebuilder list-infrastructure-configurations
```

Output:

```
{
```

```
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "infrastructureConfigurationSummaryList": [
        {
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:infrastructure-
configuration/myexampleinfrastructure",
            "name": "MyExampleInfrastructure",
            "description": "An example that will retain instances of failed builds",
            "dateCreated": "2020-02-19T19:11:51.858Z",
            "tags": {}
        },
        {
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:infrastructure-
configuration/infrastructureconfiguration-name-a1b2c3d45678",
            "name": "infrastructureConfiguration-name-a1b2c3d45678",
            "dateCreated": "2019-12-16T18:19:01.038Z",
            "tags": {
                "KeyName": "KeyValue"
            }
        }
    ]
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see ListInfrastructureConfigurations in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a specific resource

The following `list-tags-for-resource` example lists all of the tags for a specific resource.

```
aws imagebuilder list-tags-for-resource \
    --resource-arn arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline
```

Output:

```
{
    "tags": {
        "KeyName": "KeyValue"
    }
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`put-component-policy`

The following code example shows how to use `put-component-policy`.

AWS CLI

To apply a resource policy to a component

The following `put-component-policy` example applies a resource policy to a build component to enable cross-account sharing of build components. We recommend you use the RAM CLI command `create-resource-share`. If you use the EC2 Image Builder CLI command `put-component-policy`, you must also use the RAM CLI command `promote-resource-share-create-from-policy` in order for the resource to be visible to all principals with whom the resource is shared.

```
aws imagebuilder put-component-policy \
    --component-arn arn:aws:imagebuilder:us-west-2:123456789012:component/
examplecomponent/2019.12.02/1 \
    --policy '{ "Version":"2012-10-17",        "Statement": [ { "Effect":
 "Allow", "Principal": { "AWS": [ "123456789012" ] }, "Action":
 [ "imagebuilder:GetComponent", "imagebuilder:ListComponents" ],
 "Resource": [ "arn:aws:imagebuilder:us-west-2:123456789012:component/
examplecomponent/2019.12.02/1" ] } ] }'
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "componentArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/
examplecomponent/2019.12.02/1"
```

```
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see PutComponentPolicy in *AWS CLI Command Reference*.

`put-image-policy`

The following code example shows how to use `put-image-policy`.

AWS CLI

To apply a resource policy to an image

The following `put-image-policy` example applies a resource policy to an image to enable cross-account sharing of images. We recommend you use the RAM CLI command create-resource-share. If you use the EC2 Image Builder CLI command put-image-policy, you must also use the RAM CLI command promote-resource-share-create-from-policy in order for the resource to be visible to all principals with whom the resource is shared.

```
aws imagebuilder put-image-policy \
    --image-arn arn:aws:imagebuilder:us-west-2:123456789012:image/example-image/2019.12.02/1 \
    --policy '{ "Version":"2012-10-17",        "Statement": [ { "Effect": "Allow", "Principal": { "AWS": [ "123456789012" ] }, "Action": [ "imagebuilder:GetImage", "imagebuilder:ListImages" ], "Resource": [ "arn:aws:imagebuilder:us-west-2:123456789012:image/example-image/2019.12.02/1" ] } ] }'
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageArn": "arn:aws:imagebuilder:us-west-2:123456789012:image/example-image/2019.12.02/1"
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see PutImagePolicy in *AWS CLI Command Reference*.

`put-image-recipe-policy`

The following code example shows how to use `put-image-recipe-policy`.

AWS CLI

To apply a resource policy to an image recipe

The following `put-image-recipe-policy` example applies a resource policy to an image recipe to enable cross-account sharing of image recipes. We recommend that you use the RAM CLI command `create-resource-share`. If you use the EC2 Image Builder CLI command `put-image-recipe-policy`, you must also use the RAM CLI command `promote-resource-share-create-from-policy` in order for the resource to be visible to all principals with whom the resource is shared.

```
aws imagebuilder put-image-recipe-policy \
    --image-recipe-arn arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
example-image-recipe/2019.12.02 \
    --policy '{ "Version":"2012-10-17",        "Statement": [ { "Effect":
 "Allow", "Principal": { "AWS": [ "123456789012" ] }, "Action":
 [ "imagebuilder:GetImageRecipe", "imagebuilder:ListImageRecipes" ], "Resource":
 [ "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/example-image-
recipe/2019.12.02" ] } ] }'
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
example-image-recipe/2019.12.02/1"
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see PutImageRecipePolicy in *AWS CLI Command Reference*.

`start-image-pipeline-execution`

The following code example shows how to use `start-image-pipeline-execution`.

AWS CLI

To start an image pipeline manually

The following `start-image-pipeline-execution` example manually starts an image pipeline.

```
aws imagebuilder start-image-pipeline-execution \
    --image-pipeline-arn arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "imageBuildVersionArn": "arn:aws:imagebuilder:us-west-2:123456789012:image/
mybasicrecipe/2019.12.03/1"
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see StartImagePipelineExecution in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a resource

The following `tag-resource` example adds and tags a resource to EC2 Image Builder using a JSON file.

```
aws imagebuilder tag-resource \
    --cli-input-json file://tag-resource.json
```

Contents of `tag-resource.json`:

```
{
```

```
    "resourceArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline",
    "tags": {
        "KeyName": "KeyValue"
    }
}
```

This command produces no output.

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a resource

The following `untag-resource` example removes a tag from a resource using a JSON file.

```
aws imagebuilder untag-resource \
    --cli-input-json file://untag-resource.json
```

Contents of `untag-resource.json`:

```
{
    "resourceArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline",
    "tagKeys": [
        "KeyName"
    ]
}
```

This command produces no output.

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

update-distribution-configuration

The following code example shows how to use update-distribution-configuration.

AWS CLI

To update a distribution configuration

The following update-distribution-configuration example updates a distribution configuration using a JSON file.

```
aws imagebuilder update-distribution-configuration \
    --cli-input-json file://update-distribution-configuration.json
```

Contents of update-distribution-configuration.json:

```
{
    "distributionConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:distribution-configuration/myexampledistribution",
    "description": "Copies AMI to eu-west-2 and exports to S3",
    "distributions": [
        {
            "region": "us-west-2",
            "amiDistributionConfiguration": {
                "name": "Name {{imagebuilder:buildDate}}",
                "description": "An example image name with parameter references"
            }
        },
        {
            "region": "eu-west-2",
            "amiDistributionConfiguration": {
                "name": "My {{imagebuilder:buildVersion}} image
 {{imagebuilder:buildDate}}"
            }
        }
    ]
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

```
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see UpdateDistributionConfiguration in *AWS CLI Command Reference*.

`update-image-pipeline`

The following code example shows how to use `update-image-pipeline`.

AWS CLI

To update an image pipeline

The following `update-image-pipeline` example updates an image pipeline using a JSON file.

```
aws imagebuilder update-image-pipeline \
    --cli-input-json file://update-image-pipeline.json
```

Contents of `update-image-pipeline.json`:

```
{
    "imagePipelineArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline",
    "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
mybasicrecipe/2019.12.03",
    "infrastructureConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure",
    "distributionConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:distribution-configuration/myexampledistribution",
    "imageTestsConfiguration": {
        "imageTestsEnabled": true,
        "timeoutMinutes": 120
    },
    "schedule": {
        "scheduleExpression": "cron(0 0 * * MON)",
        "pipelineExecutionStartCondition":
 "EXPRESSION_MATCH_AND_DEPENDENCY_UPDATES_AVAILABLE"
    },
    "status": "DISABLED"
```

```
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see UpdateImagePipeline in *AWS CLI Command Reference*.

`update-infrastructure-configuration`

The following code example shows how to use `update-infrastructure-configuration`.

AWS CLI

To update an infrastructure configuration

The following `update-infrastructure-configuration` example updates an infrastructure configuration using a JSON file.

```
aws imagebuilder update-infrastructure-configuration \
    --cli-input-json file://update-infrastructure-configuration.json
```

Contents of `update-infrastructure-configuration.json`:

```
{
    "infrastructureConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure",
    "description": "An example that will terminate instances of failed builds",
    "instanceTypes": [
        "m5.large", "m5.2xlarge"
    ],
    "instanceProfileName": "EC2InstanceProfileForImageFactory",
    "securityGroupIds": [
        "sg-a48c95ef"
    ],
    "subnetId": "subnet-a48c95ef",
```

```
    "logging": {
        "s3Logs": {
            "s3BucketName": "bucket-name",
            "s3KeyPrefix": "bucket-path"
        }
    },
    "terminateInstanceOnFailure": true,
    "snsTopicArn": "arn:aws:sns:us-west-2:123456789012:sns-name"
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Manage custom image creation in Image Builder through a repeatable pipeline process in the *EC2 Image Builder Users Guide*.

- For API details, see UpdateInfrastructureConfiguration in *AWS CLI Command Reference*.

Incident Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Incident Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-replication-set`

The following code example shows how to use `create-replication-set`.

AWS CLI

To create the replication set

The following `create-replication-set` example creates the replication set Incident Manager uses to replicate and encrypt data in your Amazon Web Services account. This example uses the us-east-1 and us-east-2 Regions while creating the replication set.

```
aws ssm-incidents create-replication-set \
    --regions '{"us-east-1": {"sseKmsKeyId": "arn:aws:kms:us-
east-1:123456789012:key/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"}, "us-east-2":
 {"sseKmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111"}}'
```

Output:

```
{
    "arn": "arn:aws:ssm-incidents::123456789012:replication-set/a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222"
}
```

For more information, see Configuring replication sets and Findings in Incident Manager in the *Incident Manager User Guide*.

- For API details, see CreateReplicationSet in *AWS CLI Command Reference*.

`create-response-plan`

The following code example shows how to use `create-response-plan`.

AWS CLI

To create a response plan

The following `create-response-plan` example creates a response plan with the specified details.

```
aws ssm-incidents create-response-plan \
    --chat-channel '{"chatbotSns": ["arn:aws:sns:us-
west-2:123456789012:Standard_User"]}' \
    --display-name "Example response plan" \
    --incident-template '{"impact": 5, "title": "example-incident"}' \
```

```
    --name "example-response" \
    --actions '[{"ssmAutomation": {"documentName": "AWSIncidents-
CriticalIncidentRunbookTemplate", "documentVersion": "$DEFAULT",
 "roleArn": "arn:aws:iam::123456789012:role/aws-service-role/ssm-
incidents.amazonaws.com/AWSServiceRoleForIncidentManager", "targetAccount":
 "RESPONSE_PLAN_OWNER_ACCOUNT"}}]' \
    --engagements '["arn:aws:ssm-contacts:us-west-2:123456789012:contact/example"]'
```

Output:

```
{
    "arn": "arn:aws:ssm-incidents::123456789012:response-plan/example-response"
}
```

For more information, see Incident preparation in the *Incident Manager User Guide*.

- For API details, see CreateResponsePlan in *AWS CLI Command Reference*.

`create-timeline-event`

The following code example shows how to use `create-timeline-event`.

AWS CLI

Example 1: To create a custom timeline event

The following `create-timeline-event` example creates a custom timeline event at the specified time on the specified incident.

```
aws ssm-incidents create-timeline-event \
    --event-data "\"example timeline event\"" \
    --event-time 2022-10-01T20:30:00.000 \
    --event-type "Custom Event" \
    --incident-record-arn "arn:aws:ssm-incidents::123456789012:incident-record/
Example-Response-Plan/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "eventId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "incidentRecordArn": "arn:aws:ssm-incidents::123456789012:incident-record/
Example-Response-Plan/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

```
}
```

Example 2: To create a timeline event with an incident note

The following `create-timeline-event` example creates a timeline event that is listed in the 'Incident notes' panel.

```
aws ssm-incidents create-timeline-event \
    --event-data "\"New Note\"" \
    --event-type "Note" \
    --incident-record-arn "arn:aws:ssm-incidents::123456789012:incident-record/Test/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333" \
    --event-time 2023-06-20T12:06:00.000 \
    --event-references '[{"resource":"arn:aws:ssm-incidents::123456789012:incident-record/Test/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"}]'
```

Output:

```
{
    "eventId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
    "incidentRecordArn": "arn:aws:ssm-incidents::123456789012:incident-record/Example-Response-Plan/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Incident details in the *Incident Manager User Guide*.

- For API details, see CreateTimelineEvent in *AWS CLI Command Reference*.

`delete-incident-record`

The following code example shows how to use `delete-incident-record`.

AWS CLI

To delete an incident record

The following `delete-incident-record` example deletes the specified incident record.

```
aws ssm-incidents delete-incident-record \
    --arn "arn:aws:ssm-incidents::123456789012:incident-record/Example-Response-Plan/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Incident tracking in the *Incident Manager User Guide*.

- For API details, see DeleteIncidentRecord in *AWS CLI Command Reference*.

`delete-replication-set`

The following code example shows how to use `delete-replication-set`.

AWS CLI

To delete the replication set

The following `delete-replication-set` example deletes the replication set from your Amazon Web Services account. Deleting the replication set also deletes all Incident Manager data. This can't be undone.

```
aws ssm-incidents delete-replication-set \
    --arn "arn:aws:ssm-incidents::123456789012:replication-set/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Configuring replication sets and Findings in Incident Manager in the *Incident Manager User Guide*.

- For API details, see DeleteReplicationSet in *AWS CLI Command Reference*.

`delete-resource-policy`

The following code example shows how to use `delete-resource-policy`.

AWS CLI

To delete a resource policy

The following `delete-resource-policy` example deletes a resource policy from a response plan. This will revoke access from the principal or organization that the response plan was shared with.

```
aws ssm-incidents delete-resource-policy \
```

```
    --policy-id "be8b57191f0371f1c6827341aa3f0a03" \
    --resource-arn "arn:aws:ssm-incidents::123456789012:response-plan/Example-
Response-Plan"
```

This command produces no output.

For more information, see Working with shared contacts and response plans in the *Incident Manager User Guide*.

- For API details, see DeleteResourcePolicy in *AWS CLI Command Reference*.

`delete-response-plan`

The following code example shows how to use `delete-response-plan`.

AWS CLI

To delete a response plan

The following `delete-response-plan` example deletes the specified response plan.

```
aws ssm-incidents delete-response-plan \
    --arn "arn:aws:ssm-incidents::123456789012:response-plan/example-response"
```

This command produces no output.

For more information, see Incident preparation in the *Incident Manager User Guide*.

- For API details, see DeleteResponsePlan in *AWS CLI Command Reference*.

`delete-timeline-event`

The following code example shows how to use `delete-timeline-event`.

AWS CLI

To delete a timeline event

The following `delete-timeline-event` example deletes a custom timeline event from the specified incident record.

```
aws ssm-incidents delete-timeline-event \
    --event-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
```

```
    --incident-record-arn "arn:aws:ssm-incidents::123456789012:incident-record/
Example-Response-Plan/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

This command produces no output.

For more information, see Incident details in the *Incident Manager User Guide*.

- For API details, see DeleteTimelineEvent in *AWS CLI Command Reference*.

`get-incident-record`

The following code example shows how to use `get-incident-record`.

AWS CLI

To get an incident record

The following `get-incident-record` example gets details about the specified incident record.

```
aws ssm-incidents get-incident-record \
    --arn "arn:aws:ssm-incidents::123456789012:incident-record/Example-Response-
Plan/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "incidentRecord": {
        "arn": "arn:aws:ssm-incidents::123456789012:incident-record/Example-
Response-Plan/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "automationExecutions": [],
        "creationTime": "2021-05-21T18:16:57.579000+00:00",
        "dedupeString": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "impact": 5,
        "incidentRecordSource": {
            "createdBy": "arn:aws:iam::123456789012:user/draliatp",
            "invokedBy": "arn:aws:iam::123456789012:user/draliatp",
            "source": "aws.ssm-incidents.custom"
        },
        "lastModifiedBy": "arn:aws:iam::123456789012:user/draliatp",
        "lastModifiedTime": "2021-05-21T18:16:59.149000+00:00",
        "notificationTargets": [],
        "status": "OPEN",
```

```
        "title": "Example-Incident"
    }
}
```

For more information, see Incident details in the *Incident Manager User Guide*.

- For API details, see GetIncidentRecord in *AWS CLI Command Reference*.

`get-replication-set`

The following code example shows how to use `get-replication-set`.

AWS CLI

To get the replication set

The following `get-replication-set` example gets the details of the replication set Incident Manager uses to replicate and encrypt data in your Amazon Web Services account.

```
aws ssm-incidents get-replication-set \
    --arn "arn:aws:ssm-incidents::123456789012:replication-set/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "replicationSet": {
        "createdBy": "arn:aws:sts::123456789012:assumed-role/Admin/username",
        "createdTime": "2021-05-14T17:57:22.010000+00:00",
        "deletionProtected": false,
        "lastModifiedBy": "arn:aws:sts::123456789012:assumed-role/Admin/username",
        "lastModifiedTime": "2021-05-14T17:57:22.010000+00:00",
        "regionMap": {
            "us-east-1": {
                "sseKmsKeyId": "DefaultKey",
                "status": "ACTIVE"
            },
            "us-east-2": {
                "sseKmsKeyId": "DefaultKey",
                "status": "ACTIVE",
                "statusMessage": "Tagging inaccessible"
            }
        },
```

```
        "status": "ACTIVE"
    }
}
```

For more information, see Configuring replication sets and Findings in Incident Manager in the *Incident Manager User Guide*.

- For API details, see GetReplicationSet in *AWS CLI Command Reference*.

`get-resource-policies`

The following code example shows how to use `get-resource-policies`.

AWS CLI

To list resource policies for a response plan

The following `get-resource-policies` example lists the resource policies associated with the specified response plan.

```
aws ssm-incidents get-resource-policies \
    --resource-arn "arn:aws:ssm-incidents::123456789111:response-plan/Example-Response-Plan"
```

Output:

```
{
    "resourcePolicies": [
        {
            "policyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":\"d901b37a-dbb0-458a-8842-75575c464219-external-principals\",\"Effect\":\"Allow\",\"Principal\":{\"AWS\":\"arn:aws:iam::123456789222:root\"},\"Action\":[\"ssm-incidents:GetResponsePlan\",\"ssm-incidents:StartIncident\",\"ssm-incidents:UpdateIncidentRecord\",\"ssm-incidents:GetIncidentRecord\",\"ssm-incidents:CreateTimelineEvent\",\"ssm-incidents:UpdateTimelineEvent\",\"ssm-incidents:GetTimelineEvent\",\"ssm-incidents:ListTimelineEvents\",\"ssm-incidents:UpdateRelatedItems\",\"ssm-incidents:ListRelatedItems\"],\"Resource\":[\"arn:aws:ssm-incidents:*:123456789111:response-plan/Example-Response-Plan\",\"arn:aws:ssm-incidents:*:123456789111:incident-record/Example-Response-Plan/*\"]}]}",

            "ramResourceShareRegion": "us-west-2"
```

```
        }
    ]
}
```

For more information, see Working with shared contacts and response plans in the *Incident Manager User Guide*.

- For API details, see GetResourcePolicies in *AWS CLI Command Reference*.

`get-response-plan`

The following code example shows how to use `get-response-plan`.

AWS CLI

To get details of a response plan

The following `get-response-plan` example gets details about a specified response plan in your AWS account.

```
aws ssm-incidents get-response-plan \
    --arn "arn:aws:ssm-incidents::123456789012:response-plan/Example-Response-Plan"
```

Output:

```
{
    "actions": [
        {
            "ssmAutomation": {
                "documentName": "AWSIncidents-CriticalIncidentRunbookTemplate",
                "documentVersion": "$DEFAULT",
                "roleArn": "arn:aws:iam::123456789012:role/aws-service-role/ssm-
incidents.amazonaws.com/AWSServiceRoleForIncidentManager",
                "targetAccount": "RESPONSE_PLAN_OWNER_ACCOUNT"
            }
        }
    ],
    "arn": "arn:aws:ssm-incidents::123456789012:response-plan/Example-Response-
Plan",
    "chatChannel": {
        "chatbotSns": [
            "arn:aws:sns:us-west-2:123456789012:Standard_User"
```

```
        ]
    },
    "displayName": "Example response plan",
    "engagements": [
        "arn:aws:ssm-contacts:us-west-2:123456789012:contact/example"
    ],
    "incidentTemplate": {
        "impact": 5,
        "title": "Example-Incident"
    },
    "name": "Example-Response-Plan"
}
```

For more information, see Incident preparation in the *Incident Manager User Guide*.

- For API details, see GetResponsePlan in *AWS CLI Command Reference*.

`get-timeline-event`

The following code example shows how to use `get-timeline-event`.

AWS CLI

To get details of a timeline event

The following `get-timeline-event` example returns details of the specified timeline event.

```
aws ssm-incidents get-timeline-event \
    --event-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --incident-record-arn "arn:aws:ssm-incidents::123456789012:incident-record/
Example-Response-Plan/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

Output:

```
{
    "event": {
        "eventData": "\"Incident Started\"",
        "eventId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "eventTime": "2021-05-21T18:16:57+00:00",
        "eventType": "Custom Event",
        "eventUpdatedTime": "2021-05-21T18:16:59.944000+00:00",
        "incidentRecordArn": "arn:aws:ssm-incidents::123456789012:incident-record/
Example-Response-Plan/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

```
    }
}
```

For more information, see Incident details in the *Incident Manager User Guide*.

- For API details, see GetTimelineEvent in *AWS CLI Command Reference*.

`list-incident-records`

The following code example shows how to use `list-incident-records`.

AWS CLI

To list incident records

The following `list-incident-records` example lists the incident records in your Amazon Web Services account.

```
aws ssm-incidents list-incident-records
```

Output:

```
{
    "incidentRecordSummaries": [
        {
            "arn": "arn:aws:ssm-incidents::123456789012:incident-record/Example-
Response-Plan/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "creationTime": "2021-05-21T18:16:57.579000+00:00",
            "impact": 5,
            "incidentRecordSource": {
                "createdBy": "arn:aws:iam::123456789012:user/draliatp",
                "invokedBy": "arn:aws:iam::123456789012:user/draliatp",
                "source": "aws.ssm-incidents.custom"
            },
            "status": "OPEN",
            "title": "Example-Incident"
        }
    ]
}
```

For more information, see Incident list in the *Incident Manager User Guide*.

- For API details, see ListIncidentRecords in *AWS CLI Command Reference*.

`list-related-items`

The following code example shows how to use `list-related-items`.

AWS CLI

To list related items

The following `list-related-items` example lists the related items of the specified incident.

```
aws ssm-incidents list-related-items \
    --incident-record-arn "arn:aws:ssm-incidents::123456789012:incident-record/
Example-Response-Plan/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "relatedItems": [
        {
            "identifier": {
                "type": "OTHER",
                "value": {
                    "url": "https://console.aws.amazon.com/systems-manager/opsitems/
oi-8ef82158e190/workbench?region=us-west-2"
                }
            },
            "title": "Example related item"
        },
        {
            "identifier": {
                "type": "PARENT",
                "value": {
                    "arn": "arn:aws:ssm:us-west-2:123456789012:opsitem/
oi-8084126392ac"
                }
            },
            "title": "parentItem"
        }
    ]
}
```

For more information, see Incident details in the *Incident Manager User Guide*.

- For API details, see ListRelatedItems in *AWS CLI Command Reference*.

`list-replication-sets`

The following code example shows how to use `list-replication-sets`.

AWS CLI

To list the replication set

The following `list-replication-sets` example lists the replication set Incident Manager uses to replicate and encrypt data in your AWS account.

```
aws ssm-incidents list-replication-sets
```

Output:

```
{
    "replicationSetArns": [
        "arn:aws:ssm-incidents::123456789012:replication-set/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111"
    ]
}
```

For more information, see Configuring replication sets and Findings in Incident Manager in the *Incident Manager User Guide*.

- For API details, see ListReplicationSets in *AWS CLI Command Reference*.

`list-response-plans`

The following code example shows how to use `list-response-plans`.

AWS CLI

To list the available response plans

The following `list-response-plans` example lists the available response plans in your Amazon Web Services account.

```
aws ssm-incidents list-response-plans
```

Output:

```
{
    "responsePlanSummaries": [
        {
            "arn": "arn:aws:ssm-incidents::123456789012:response-plan/Example-
Response-Plan",
            "displayName": "Example response plan",
            "name": "Example-Response-Plan"
        }
    ]
}
```

For more information, see Incident preparation in the *Incident Manager User Guide*.

- For API details, see ListResponsePlans in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a response plan

The following `list-tags-for-resource` example lists the tags associated with the specified response plan.

```
aws ssm-incidents list-tags-for-resource \
    --resource-arn "arn:aws:ssm-incidents::123456789012:response-plan/Example-
Response-Plan"
```

Output:

```
{
    "tags": {
    "group1": "1"
    }
}
```

For more information, see Tagging in the *Incident Manager User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`list-timeline-events`

The following code example shows how to use `list-timeline-events`.

AWS CLI

To list timeline events of an incident

The following `list-timeline-events` example lists the timeline events of the specified incident.

```
aws ssm-incidents list-timeline-events \
    --incident-record-arn "arn:aws:ssm-incidents::123456789012:incident-record/
Example-Response-Plan/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "eventSummaries": [
        {
            "eventId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "eventTime": "2021-05-21T22:36:13.766000+00:00",
            "eventType": "SSM Incident Record Update",
            "eventUpdatedTime": "2021-05-21T22:36:13.766000+00:00",
            "incidentRecordArn": "arn:aws:ssm-incidents::123456789012:incident-
record/Example-Response-Plan/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        },
        {
            "eventId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "eventTime": "2021-05-21T18:58:46.443000+00:00",
            "eventType": "SSM Incident Record Update",
            "eventUpdatedTime": "2021-05-21T18:58:46.443000+00:00",
            "incidentRecordArn": "arn:aws:ssm-incidents::123456789012:incident-
record/Example-Response-Plan/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        },
        {
            "eventId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "eventTime": "2021-05-21T18:16:59.149000+00:00",
```

```
            "eventType": "SSM Incident Record Update",
            "eventUpdatedTime": "2021-05-21T18:16:59.149000+00:00",
            "incidentRecordArn": "arn:aws:ssm-incidents::123456789012:incident-
record/Example-Response-Plan/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        },
        {
            "eventId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE55555",

record/Example-Response-Plan/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        },
        {
            "eventId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE77777",
            "eventTime": "2020-10-01T20:30:00+00:00",
            "eventType": "Custom Event",
            "eventUpdatedTime": "2021-05-21T22:28:26.299000+00:00",
            "incidentRecordArn": "arn:aws:ssm-incidents::123456789012:incident-
record/Example-Response-Plan/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        }
    ]
}
```

For more information, see Incident details in the *Incident Manager User Guide*.

- For API details, see ListTimelineEvents in *AWS CLI Command Reference*.

`put-resource-policy`

The following code example shows how to use `put-resource-policy`.

AWS CLI

To share a response plan and incidents

The following `put-resource-policy` example adds a resource policy to the Example-Response-Plan that shares the response plan and associated incidents with the specified principal.

```
aws ssm-incidents put-resource-policy \
    --resource-arn "arn:aws:ssm-incidents::123456789111:response-plan/Example-Response-Plan" \
    --policy "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":\"ExampleResourcePolciy\",\"Effect\":\"Allow\",\"Principal\":{\"AWS\":\"arn:aws:iam::123456789222:root\"},\"Action\":[\"ssm-incidents:GetResponsePlan\",\"ssm-incidents:StartIncident\",\"ssm-incidents:UpdateIncidentRecord\",\"ssm-incidents:GetIncidentRecord\",\"ssm-incidents:CreateTimelineEvent\",\"ssm-incidents:UpdateTimelineEvent\",\"ssm-incidents:GetTimelineEvent\",\"ssm-incidents:ListTimelineEvents\",\"ssm-incidents:UpdateRelatedItems\",\"ssm-incidents:ListRelatedItems\"],\"Resource\":[\"arn:aws:ssm-incidents:*:123456789111:response-plan/Example-Response-Plan\",\"arn:aws:ssm-incidents:*:123456789111:incident-record/Example-Response-Plan/*\"]}]}"
```

Output:

```
{
    "policyId": "be8b57191f0371f1c6827341aa3f0a03"
}
```

For more information, see Working with shared contacts and response plans in the *Incident Manager User Guide*.

- For API details, see PutResourcePolicy in *AWS CLI Command Reference*.

`start-incident`

The following code example shows how to use `start-incident`.

AWS CLI

To start an incident

The following `start-incident` example starts an incident using the specified response plan.

```
aws ssm-incidents start-incident \
    --response-plan-arn "arn:aws:ssm-incidents::123456789012:response-plan/Example-Response-Plan"
```

Output:

```
{
    "incidentRecordArn": "arn:aws:ssm-incidents::123456789012:incident-record/
Example-Response-Plan/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Incident creation in the *Incident Manager User Guide*.

- For API details, see StartIncident in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a response plan

The following `tag-resource` example tags a specified response plan with the provided tag key-value pair.

```
aws ssm-incidents tag-resource \
    --resource-arn "arn:aws:ssm-incidents::123456789012:response-plan/Example-
Response-Plan" \
    --tags '{"group1":"1"}'
```

This command produces no output.

For more information, see Tagging in the *Incident Manager User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a response plan

The following `untag-resource` example removes the specified tags from the response plan.

```
aws ssm-incidents untag-resource \
    --resource-arn "arn:aws:ssm-incidents::123456789012:response-plan/Example-Response-Plan" \
    --tag-keys '["group1"]'
```

This command produces no output.

For more information, see Tagging in the *Incident Manager User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-deletion-protection`

The following code example shows how to use `update-deletion-protection`.

AWS CLI

To update replication set deletion protection

The following `update-deletion-protection` example updates the deletion protection in your account to protect you from deleting the last Region in your replication set.

```
aws ssm-incidents update-deletion-protection \
    --arn "arn:aws:ssm-incidents::123456789012:replication-set/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --deletion-protected
```

This command produces no output.

For more information, see Configuring replication sets and Findings in Incident Manager in the *Incident Manager User Guide*.

- For API details, see UpdateDeletionProtection in *AWS CLI Command Reference*.

`update-incident-record`

The following code example shows how to use `update-incident-record`.

AWS CLI

To update an incident record

The following `update-incident-record` example resolves the specified incident.

```
aws ssm-incidents update-incident-record \
    --arn "arn:aws:ssm-incidents::123456789012:incident-record/Example-Response-Plan/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --status "RESOLVED"
```

This command produces no output.

For more information, see Incident details in the *Incident Manager User Guide*.

- For API details, see UpdateIncidentRecord in *AWS CLI Command Reference*.

`update-related-items`

The following code example shows how to use `update-related-items`.

AWS CLI

To update an incidents related item

The following `update-related-items` example removes a related item from the specified incident record.

```
aws ssm-incidents update-related-items \
    --incident-record-arn "arn:aws:ssm-incidents::123456789012:incident-record/Example-Response-Plan/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --related-items-update '{"itemToRemove": {"type": "OTHER", "value": {"url": "https://console.aws.amazon.com/systems-manager/opsitems/oi-8ef82158e190/workbench?region=us-west-2"}}}'
```

This command produces no output.

For more information, see Incident details in the *Incident Manager User Guide*.

- For API details, see UpdateRelatedItems in *AWS CLI Command Reference*.

`update-replication-set`

The following code example shows how to use `update-replication-set`.

AWS CLI

To update a replication set

The following `update-replication-set` example deletes the us-west-2 Region from the replication set.

```
aws ssm-incidents update-replication-set \
    --arn "arn:aws:ssm-incidents::123456789012:replication-set/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --actions '[{"deleteRegionAction": {"regionName": "us-west-2"}}]'
```

This command produces no output.

For more information, see Configuring replication sets and Findings in Incident Manager in the *Incident Manager User Guide*.

- For API details, see UpdateReplicationSet in *AWS CLI Command Reference*.

`update-response-plan`

The following code example shows how to use `update-response-plan`.

AWS CLI

To update a response plan

The following `update-response-plan` example removes a chat channel from the specified response plan.

```
aws ssm-incidents update-response-plan \
    --arn "arn:aws:ssm-incidents::123456789012:response-plan/Example-Response-Plan" \
    --chat-channel '{"empty":{}}'
```

This command produces no output.

For more information, see Incident preparation in the *Incident Manager User Guide*.

- For API details, see UpdateResponsePlan in *AWS CLI Command Reference*.

`update-timeline-event`

The following code example shows how to use `update-timeline-event`.

AWS CLI

To update a timeline event

The following `update-timeline-event` example updates the time that the event occurred.

```
aws ssm-incidents update-timeline-event \
    --event-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --incident-record-arn "arn:aws:ssm-incidents::123456789012:incident-record/
Example-Response-Plan/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222" \
    --event-time "2021-05-21T18:10:57+00:00"
```

This command produces no output.

For more information, see Incident details in the *Incident Manager User Guide*.

- For API details, see UpdateTimelineEvent in *AWS CLI Command Reference*.

Incident Manager Contacts examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Incident Manager Contacts.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`accept-page`

The following code example shows how to use `accept-page`.

AWS CLI

To accept a page during and engagement

The following `accept-page` example uses an accept code sent to the contact channel to accept a page.

```
aws ssm-contacts accept-page \
    --page-id "arn:aws:ssm-contacts:us-west-2:123456789012:page/akuam/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --accept-type READ \
    --accept-code 425440
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see AcceptPage in *AWS CLI Command Reference*.

`activate-contact-channel`

The following code example shows how to use `activate-contact-channel`.

AWS CLI

To activate a contact's contact channel

The following `activate-contact-channel` example activates a contact channel and makes it usable as part of an incident.

```
aws ssm-contacts activate-contact-channel \
    --contact-channel-id "arn:aws:ssm-contacts:us-west-2:123456789012:contact-
channel/akuam/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --activation-code "466136"
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see ActivateContactChannel in *AWS CLI Command Reference*.

`create-contact-channel`

The following code example shows how to use `create-contact-channel`.

AWS CLI

To create a contact channel

The following `create-contact-channel` example creates a contact channel of type SMS for the contact Akua Mansa. Contact channels can be created of type SMS, EMAIL, or VOICE.

```
aws ssm-contacts create-contact-channel \
    --contact-id "arn:aws:ssm-contacts:us-west-2:123456789012:contact/akuam" \
    --name "akuas sms-test" \
    --type SMS \
    --delivery-address '{"SimpleAddress": "+15005550199"}'
```

Output:

```
{
    "ContactChannelArn": "arn:aws:ssm-contacts:us-west-2:123456789012:contact-
channel/akuam/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see CreateContactChannel in *AWS CLI Command Reference*.

`create-contact`

The following code example shows how to use `create-contact`.

AWS CLI

To create a contact

The following `create-contact` example creates a contact in your environment with a blank plan. The plan can be updated after creating contact channels. Use the create-contact-channel command with the output ARN of this command. After you have created contact channels for this contact use update-contact to update the plan.

```
aws ssm-contacts create-contact \
    --alias "akuam" \
    --display-name "Akua Mansa" \
    --type PERSONAL \
```

```
    --plan '{"Stages": []}'
```

Output:

```
{
    "ContactArn": "arn:aws:ssm-contacts:us-west-2:123456789012:contact/akuam"
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see CreateContact in *AWS CLI Command Reference*.

`deactivate-contact-channel`

The following code example shows how to use `deactivate-contact-channel`.

AWS CLI

To deactivate a contact channel

The following `deactivate-contact-channel` example deactivates a contact channel. Deactivating a contact channel means the contact channel will no longer be paged during an incident. You can also reactivate a contact channel at any time using the `activate-contact-channel` command.

```
aws ssm-contacts deactivate-contact-channel \
    --contact-channel-id "arn:aws:ssm-contacts:us-west-2:123456789012:contact-channel/akuam/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see DeactivateContactChannel in *AWS CLI Command Reference*.

`delete-contact-channel`

The following code example shows how to use `delete-contact-channel`.

AWS CLI

To delete a contact channel

The following `delete-contact-channel` example deletes a contact channel. Deleting a contact channel ensures the contact channel will not be paged during an incident.

```
aws ssm-contacts delete-contact-channel \
    --contact-channel-id "arn:aws:ssm-contacts:us-west-2:123456789012:contact-channel/akuam/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see DeleteContactChannel in *AWS CLI Command Reference*.

`delete-contact`

The following code example shows how to use `delete-contact`.

AWS CLI

To delete a contact

The following `delete-contact` example deletes a contact. The contact will no longer be reachable from any escalation plan that refers to them.

```
aws ssm-contacts delete-contact \
    --contact-id "arn:aws:ssm-contacts:us-west-2:123456789012:contact/alejr"
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see DeleteContact in *AWS CLI Command Reference*.

`describe-engagement`

The following code example shows how to use `describe-engagement`.

AWS CLI

To describe the details of an engagement

The following `describe-engagement` example lists the details of an engagement to a contact or escalation plan. The subject and content are sent to the contact channels.

```
aws ssm-contacts describe-engagement \
    --engagement-id "arn:aws:ssm-contacts:us-west-2:123456789012:engagement/
example_escalation/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "ContactArn": "arn:aws:ssm-contacts:us-west-2:123456789012:contact/
example_escalation",
    "EngagementArn": "arn:aws:ssm-contacts:us-west-2:123456789012:engagement/
example_escalation/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Sender": "cli",
    "Subject": "cli-test",
    "Content": "Testing engagements via CLI",
    "PublicSubject": "cli-test",
    "PublicContent": "Testing engagements va CLI",
    "StartTime": "2021-05-18T18:25:41.151000+00:00"
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see DescribeEngagement in *AWS CLI Command Reference*.

`describe-page`

The following code example shows how to use `describe-page`.

AWS CLI

To list the details of a page to a contact channel

The following `describe-page` example lists details of a page to a contact channel. The page will include the subject and content provided.

```
aws ssm-contacts describe-page \
    --page-id "arn:aws:ssm-contacts:us-west-2:123456789012:page/akuam/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "PageArn": "arn:aws:ssm-contacts:us-west-2:123456789012:page/akuam/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "EngagementArn": "arn:aws:ssm-contacts:us-west-2:123456789012:engagement/akuam/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "ContactArn": "arn:aws:ssm-contacts:us-west-2:123456789012:contact/akuam",
    "Sender": "cli",
    "Subject": "cli-test",
    "Content": "Testing engagements via CLI",
    "PublicSubject": "cli-test",
    "PublicContent": "Testing engagements va CLI",
    "SentTime": "2021-05-18T18:43:29.301000+00:00",
    "ReadTime": "2021-05-18T18:43:55.708000+00:00",
    "DeliveryTime": "2021-05-18T18:43:55.265000+00:00"
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see DescribePage in *AWS CLI Command Reference*.

`get-contact-channel`

The following code example shows how to use `get-contact-channel`.

AWS CLI

To list the details of a contact channel

The following `get-contact-channel` example lists the details of a contact channel.

```
aws ssm-contacts get-contact-channel \
    --contact-channel-id "arn:aws:ssm-contacts:us-west-2:123456789012:contact-
channel/akuam/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "ContactArn": "arn:aws:ssm-contacts:us-west-2:123456789012:contact/akuam",
    "ContactChannelArn": "arn:aws:ssm-contacts:us-west-2:123456789012:contact-
channel/akuam/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Name": "akuas sms",
    "Type": "SMS",
```

```
    "DeliveryAddress": {
        "SimpleAddress": "+15005550199"
    },
    "ActivationStatus": "ACTIVATED"
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see GetContactChannel in *AWS CLI Command Reference*.

`get-contact-policy`

The following code example shows how to use `get-contact-policy`.

AWS CLI

To list the resource policies of a contact

The following `get-contact-policy` example lists the resource policies associated with the specified contact.

```
aws ssm-contacts get-contact-policy \
    --contact-arn "arn:aws:ssm-contacts:us-west-2:123456789012:contact/akuam"
```

Output:

```
{
    "ContactArn": "arn:aws:ssm-contacts:us-west-2:123456789012:contact/akuam",
    "Policy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":
\"SharePolicyForDocumentationDralia\",\"Effect\":\"Allow\",\"Principal\":
{\"AWS\":\"123456789111\"},\"Action\":[\"ssm-contacts:GetContact\",\"ssm-
contacts:StartEngagement\",\"ssm-contacts:DescribeEngagement\",\"ssm-
contacts:ListPagesByEngagement\",\"ssm-contacts:StopEngagement\"],\"Resource
\":[\"arn:aws:ssm-contacts:*:123456789012:contact/akuam\",\"arn:aws:ssm-
contacts:*:123456789012:engagement/akuam/*\"]}]}"
}
```

For more information, see Working with shared contacts and response plans in the *Incident Manager User Guide*.

- For API details, see GetContactPolicy in *AWS CLI Command Reference*.

get-contact

The following code example shows how to use `get-contact`.

AWS CLI

Example 1: To describe a contact plan

The following `get-contact` example describes a contact.

```
aws ssm-contacts get-contact \
    --contact-id "arn:aws:ssm-contacts:us-west-2:123456789012:contact/akuam"
```

Output:

```
{
    "ContactArn": "arn:aws:ssm-contacts:us-west-2:123456789012:contact/akuam",
    "Alias": "akuam",
    "DisplayName": "Akua Mansa",
    "Type": "PERSONAL",
    "Plan": {
        "Stages": [
            {
                "DurationInMinutes": 5,
                "Targets": [
                    {
                        "ChannelTargetInfo": {
                            "ContactChannelId": "arn:aws:ssm-contacts:us-
west-2:123456789012:contact-channel/akuam/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
                            "RetryIntervalInMinutes": 1
                        }
                    }
                ]
            },
            {
                "DurationInMinutes": 5,
                "Targets": [
                    {
                        "ChannelTargetInfo": {
                            "ContactChannelId": "arn:aws:ssm-contacts:us-
west-2:123456789012:contact-channel/akuam/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
                            "RetryIntervalInMinutes": 1
                        }
                    }
```

```
                ]
            },
            {
                "DurationInMinutes": 5,
                "Targets": [
                    {
                        "ChannelTargetInfo": {
                            "ContactChannelId": "arn:aws:ssm-contacts:us-
west-2:123456789012:contact-channel/akuam/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
                            "RetryIntervalInMinutes": 1
                        }
                    }
                ]
            }
        ]
    }
}
```

Example 2: To describe an escalation plan

The following `get-contact` example describes an escalation plan.

```
aws ssm-contacts get-contact \
    --contact-id "arn:aws:ssm-contacts:us-west-2:123456789012:contact/
example_escalation"
```

Output:

```
{
    "ContactArn": "arn:aws:ssm-contacts:us-west-2:123456789012:contact/
example_escalation",
    "Alias": "example_escalation",
    "DisplayName": "Example Escalation",
    "Type": "ESCALATION",
    "Plan": {
        "Stages": [
            {
                "DurationInMinutes": 5,
                "Targets": [
                    {
                        "ContactTargetInfo": {
                            "ContactId": "arn:aws:ssm-contacts:us-
west-2:123456789012:contact/akuam",
```

```
                            "IsEssential": true
                        }
                    }
                ]
            },
            {
                "DurationInMinutes": 5,
                "Targets": [
                    {
                        "ContactTargetInfo": {
                            "ContactId": "arn:aws:ssm-contacts:us-
west-2:123456789012:contact/alejr",
                            "IsEssential": false
                        }
                    }
                ]
            },
            {
                "DurationInMinutes": 0,
                "Targets": [
                    {
                        "ContactTargetInfo": {
                            "ContactId": "arn:aws:ssm-contacts:us-
west-2:123456789012:contact/anasi",
                            "IsEssential": false
                        }
                    }
                ]
            }
        ]
    }
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see GetContact in *AWS CLI Command Reference*.

`list-contact-channels`

The following code example shows how to use `list-contact-channels`.

AWS CLI

To list the contact channels of a contact

The following `list-contact-channels` example lists the available contact channels of the specified contact.

```
aws ssm-contacts list-contact-channels \
    --contact-id "arn:aws:ssm-contacts:us-west-2:123456789012:contact/akuam"
```

Output:

```
{
    "ContactChannels": [
        {
            "ContactChannelArn": "arn:aws:ssm-contacts:us-
west-2:123456789012:contact-channel/akuam/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ContactArn": "arn:aws:ssm-contacts:us-west-2:123456789012:contact/
akuam",
            "Name": "akuas email",
            "Type": "EMAIL",
            "DeliveryAddress": {
                "SimpleAddress": "akuam@example.com"
            },
            "ActivationStatus": "NOT_ACTIVATED"
        },
        {
            "ContactChannelArn": "arn:aws:ssm-contacts:us-
west-2:123456789012:contact-channel/akuam/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ContactArn": "arn:aws:ssm-contacts:us-west-2:123456789012:contact/
akuam",
            "Name": "akuas sms",
            "Type": "SMS",
            "DeliveryAddress": {
                "SimpleAddress": "+15005550100"
            },
            "ActivationStatus": "ACTIVATED"
        }
    ]
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see ListContactChannels in *AWS CLI Command Reference*.

`list-contacts`

The following code example shows how to use `list-contacts`.

AWS CLI

To list all escalation plans and contacts

The following `list-contacts` example lists the contacts and escalation plans in your account.

```
aws ssm-contacts list-contacts
```

Output:

```
{
    "Contacts": [
        {
            "ContactArn": "arn:aws:ssm-contacts:us-west-2:123456789012:contact/
akuam",
            "Alias": "akuam",
            "DisplayName": "Akua Mansa",
            "Type": "PERSONAL"
        },
        {
            "ContactArn": "arn:aws:ssm-contacts:us-west-2:123456789012:contact/
alejr",
            "Alias": "alejr",
            "DisplayName": "Alejandro Rosalez",
            "Type": "PERSONAL"
        },
        {
            "ContactArn": "arn:aws:ssm-contacts:us-west-2:123456789012:contact/
anasi",
            "Alias": "anasi",
            "DisplayName": "Ana Carolina Silva",
            "Type": "PERSONAL"
        },
        {
            "ContactArn": "arn:aws:ssm-contacts:us-west-2:123456789012:contact/
example_escalation",
            "Alias": "example_escalation",
            "DisplayName": "Example Escalation",
            "Type": "ESCALATION"
```

```
        }
    ]
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see ListContacts in *AWS CLI Command Reference*.

`list-engagements`

The following code example shows how to use `list-engagements`.

AWS CLI

To list all engagements

The following `list-engagements` example lists engagements to escalation plans and contacts. You can also list engagements for a single incident.

```
aws ssm-contacts list-engagements
```

Output:

```
{
    "Engagements": [
        {
            "EngagementArn": "arn:aws:ssm-contacts:us-
west-2:123456789012:engagement/akuam/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ContactArn": "arn:aws:ssm-contacts:us-west-2:123456789012:contact/
akuam",
            "Sender": "cli",
            "StartTime": "2021-05-18T20:37:50.300000+00:00"
        },
        {
            "EngagementArn": "arn:aws:ssm-contacts:us-
west-2:123456789012:engagement/akuam/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "ContactArn": "arn:aws:ssm-contacts:us-west-2:123456789012:contact/
akuam",
            "Sender": "cli",
            "StartTime": "2021-05-18T18:40:26.666000+00:00"
        },
        {
```

```
            "EngagementArn": "arn:aws:ssm-contacts:us-
west-2:123456789012:engagement/example_escalation/a1b2c3d4-5678-90ab-cdef-
EXAMPLE33333",
            "ContactArn": "arn:aws:ssm-contacts:us-west-2:123456789012:contact/
example_escalation",
            "Sender": "cli",
            "StartTime": "2021-05-18T18:25:41.151000+00:00"
        },
        {
            "EngagementArn": "arn:aws:ssm-contacts:us-
west-2:123456789012:engagement/akuam/a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "ContactArn": "arn:aws:ssm-contacts:us-west-2:123456789012:contact/
akuam",
            "Sender": "cli",
            "StartTime": "2021-05-18T18:20:58.093000+00:00"
        }
    ]
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see ListEngagements in *AWS CLI Command Reference*.

`list-page-receipts`

The following code example shows how to use `list-page-receipts`.

AWS CLI

To list page receipts

The following `list-page-receipts` example lists whether a page was received or not by a contact.

```
aws ssm-contacts list-page-receipts \
    --page-id "arn:aws:ssm-contacts:us-west-2:123456789012:page/akuam/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "Receipts": [
```

```
        {
            "ContactChannelArn": "arn:aws:ssm-contacts:us-
west-2:123456789012:contact-channel/akuam/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "ReceiptType": "DELIVERED",

        }
    ]
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see ListPageReceipts in *AWS CLI Command Reference*.

`list-pages-by-contact`

The following code example shows how to use `list-pages-by-contact`.

AWS CLI

To list pages by contact

The following `list-pages-by-contact` example lists all pages to the specified contact.

```
aws ssm-contacts list-pages-by-contact \
    --contact-id "arn:aws:ssm-contacts:us-west-2:123456789012:contact/akuam"
```

Output:

```
{
    "Pages": [
        {
            "PageArn": "arn:aws:ssm-contacts:us-west-2:123456789012:page/akuam/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "EngagementArn": "arn:aws:ssm-contacts:us-
west-2:123456789012:engagement/akuam/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "ContactArn": "arn:aws:ssm-contacts:us-west-2:123456789012:contact/
akuam",
            "Sender": "cli",
            "SentTime": "2021-05-18T18:43:29.301000+00:00",
            "DeliveryTime": "2021-05-18T18:43:55.265000+00:00",
            "ReadTime": "2021-05-18T18:43:55.708000+00:00"
        }
    ]
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see ListPagesByContact in *AWS CLI Command Reference*.

`list-pages-by-engagement`

The following code example shows how to use `list-pages-by-engagement`.

AWS CLI

To list pages to contact channels started from an engagement.

The following `list-pages-by-engagement` example lists the pages that occurred while engaging the defined engagement plan.

```
aws ssm-contacts list-pages-by-engagement \
    --engagement-id "arn:aws:ssm-contacts:us-west-2:123456789012:engagement/akuam/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "Pages": [
        {
```

```
            "PageArn": "arn:aws:ssm-contacts:us-west-2:123456789012:page/akuam/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "EngagementArn": "arn:aws:ssm-contacts:us-
west-2:123456789012:engagement/akuam/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ContactArn": "arn:aws:ssm-contacts:us-west-2:123456789012:contact/
akuam",
            "Sender": "cli",
            "SentTime": "2021-05-18T18:40:27.245000+00:00"
        }
    ]
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see ListPagesByEngagement in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a contact

The following `list-tags-for-resource` example lists the tags of the specified contact.

```
aws ssm-contacts list-tags-for-resource \
    --resource-arn "arn:aws:ssm-contacts:us-west-2:123456789012:contact/akuam"
```

Output:

```
{
    "Tags": [
        {
            "Key": "group1",
            "Value": "1"
        }
    ]
}
```

For more information, see Tagging in the *Incident Manager User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`put-contact-policy`

The following code example shows how to use `put-contact-policy`.

AWS CLI

To share a contact and engagements

The following `put-contact-policy` example adds a resource policy to the contact Akua that shares the contact and related engagements with the principal.

```
aws ssm-contacts put-contact-policy \
    --contact-arn "arn:aws:ssm-contacts:us-west-2:123456789012:contact/akuam" \
    --policy "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":
\"ExampleResourcePolicy\",\"Action\":[\"ssm-contacts:GetContact\",\"ssm-
contacts:StartEngagement\",\"ssm-contacts:DescribeEngagement\",\"ssm-
contacts:ListPagesByEngagement\",\"ssm-contacts:StopEngagement\"],
\"Principal\":{\"AWS\":\"123456789111\"},\"Effect\":\"Allow\",\"Resource
\":[\"arn:aws:ssm-contacts:*:123456789012:contact\/akuam\",\"arn:aws:ssm-
contacts:*:123456789012:engagement\/akuam\/*\"]}]}"
```

This command produces no output.

For more information, see Working with shared contacts and response plans in the *Incident Manager User Guide*.

- For API details, see PutContactPolicy in *AWS CLI Command Reference*.

`send-activation-code`

The following code example shows how to use `send-activation-code`.

AWS CLI

To send an activation code

The following `send-activation-code` example sends an activation code and message to the specified contact channel.

```
aws ssm-contacts send-activation-code \
```

```
    --contact-channel-id "arn:aws:ssm-contacts:us-west-2:123456789012:contact-
channel/akuam/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see SendActivationCode in *AWS CLI Command Reference*.

`start-engagement`

The following code example shows how to use `start-engagement`.

AWS CLI

Example 1: To page a contact's contact channels

The following `start-engagement` example pages a contact's contact channels. Sender, subject, public-subject, and public-content are all free from fields. Incident Manager sends the subject and content to the provided VOICE or EMAIL contact channels. Incident Manager sends the public-subject and public-content to the provided SMS contact channels. Sender is used to track who started the engagement.

```
aws ssm-contacts start-engagement \
    --contact-id  "arn:aws:ssm-contacts:us-west-2:123456789012:contact/akuam" \
    --sender "cli" \
    --subject "cli-test" \
    --content "Testing engagements via CLI" \
    --public-subject "cli-test" \
    --public-content "Testing engagements va CLI"
```

Output:

```
{
    "EngagementArn": "arn:aws:ssm-contacts:us-west-2:123456789012:engagement/akuam/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

Example 2: To page a contact in the provided escalation plan.

The following `start-engagement` example engages contacts through an escalation plan. Each contact is paged according to their engagement plan.

```
aws ssm-contacts start-engagement \
    --contact-id  "arn:aws:ssm-contacts:us-west-2:123456789012:contact/
example_escalation" \
    --sender "cli" \
    --subject "cli-test" \
    --content "Testing engagements via CLI" \
    --public-subject "cli-test" \
    --public-content "Testing engagements va CLI"
```

Output:

```
{
    "EngagementArn": "arn:aws:ssm-contacts:us-west-2:123456789012:engagement/
example_escalation/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see StartEngagement in *AWS CLI Command Reference*.

`stop-engagement`

The following code example shows how to use `stop-engagement`.

AWS CLI

To stop an engagement

The following `stop-engagement` example stops an engagement from paging further contacts and contact channels.

```
aws ssm-contacts stop-engagement \
    --engagement-id "arn:aws:ssm-contacts:us-west-2:123456789012:engagement/
example_escalation/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see StopEngagement in *AWS CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a contact

The following `tag-resource` example tags a specified contact with the provided tag key value pair.

```
aws ssm-contacts tag-resource \
    --resource-arn "arn:aws:ssm-contacts:us-west-2:123456789012:contact/akuam" \
    --tags '[{"Key":"group1","Value":"1"}]'
```

This command produces no output.

For more information, see Tagging in the *Incident Manager User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a contact

The following `untag-resource` example removes the group1 tag from the specified contact.

```
aws ssm-contacts untag-resource \
    --resource-arn "arn:aws:ssm-contacts:us-west-2:123456789012:contact/akuam" \
    --tag-keys "group1"
```

This command produces no output.

For more information, see Tagging in the *Incident Manager User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

`update-contact-channel`

The following code example shows how to use `update-contact-channel`.

AWS CLI

To update a contact channel

The following `update-contact-channel` example updates the name and delivery address of a contact channel.

```
aws ssm-contacts update-contact-channel \
    --contact-channel-id "arn:aws:ssm-contacts:us-west-2:123456789012:contact-channel/akuam/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --name "akuas voice channel" \
    --delivery-address '{"SimpleAddress": "+15005550198"}'
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see UpdateContactChannel in *AWS CLI Command Reference*.

`update-contact`

The following code example shows how to use `update-contact`.

AWS CLI

To update the engagement plan of contact

The following `update-contact` example updates the engagement plan of the contact Akua to include the three types of contacts channels. This is done after creating contact channels for Akua.

```
aws ssm-contacts update-contact \
    --contact-id "arn:aws:ssm-contacts:us-west-2:123456789012:contact/akuam" \
    --plan '{"Stages": [{"DurationInMinutes": 5, "Targets": [{"ChannelTargetInfo":
 {"ContactChannelId": "arn:aws:ssm-contacts:us-west-2:123456789012:contact-channel/
akuam/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111","RetryIntervalInMinutes": 1 }}]},
 {"DurationInMinutes": 5, "Targets": [{"ChannelTargetInfo":{"ContactChannelId":
 "arn:aws:ssm-contacts:us-west-2:123456789012:contact-channel/akuam/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222", "RetryIntervalInMinutes": 1}}]},
```

```
 {"DurationInMinutes": 5, "Targets": [{"ChannelTargetInfo": {"ContactChannelId":
 "arn:aws:ssm-contacts:us-west-2:123456789012:contact-channel/akuam/
a1b2c3d4-5678-90ab-cdef-EXAMPLE33333","RetryIntervalInMinutes": 1 }}]}]}'
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see UpdateContact in *AWS CLI Command Reference*.

Amazon Inspector examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Inspector.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-attributes-to-findings`

The following code example shows how to use `add-attributes-to-findings`.

AWS CLI

To add attributes to findings

The following `add-attributes-to-findings` example assigns an attribute with the key of `Example` and value of `example` to the finding with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-8l1VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU`.

```
aws inspector add-attributes-to-findings \
```

```
    --finding-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-8l1VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU \
    --attributes key=Example,value=example
```

Output:

```
{
    "failedItems": {}
}
```

- For API details, see AddAttributesToFindings in *AWS CLI Command Reference*.

`associate-member`

The following code example shows how to use `associate-member`.

AWS CLI

To associate an AWS account with an Amazon Inspector delegated administrator

The following `associate-member` example associates an AWS account with an Amazon Inspector delegated administrator.

```
aws inspector2 associate-member \
    --account-id 123456789012
```

Output:

```
{
    "accountId": "123456789012"
}
```

For more information, see Managing multiple accounts in Amazon Inspector with AWS Organizations in the *Amazon Inspector User Guide*.

- For API details, see AssociateMember in *AWS CLI Command Reference*.

`create-assessment-target`

The following code example shows how to use `create-assessment-target`.

AWS CLI

To create an assessment target

The following `create-assessment-target` example creates an assessment target named `ExampleAssessmentTarget` using the resource group with the ARN of `arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-AB6DMKnv`.

```
aws inspector create-assessment-target \
    --assessment-target-name ExampleAssessmentTarget \
    --resource-group-arn arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-AB6DMKnv
```

Output:

```
{
    "assessmentTargetArn": "arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX"
}
```

- For API details, see CreateAssessmentTarget in *AWS CLI Command Reference*.

`create-assessment-template`

The following code example shows how to use `create-assessment-template`.

AWS CLI

To create an assessment template

The following `create-assessment-template` example creates an assessment template called `ExampleAssessmentTemplate` for the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX`.

```
aws inspector create-assessment-template \
    --assessment-target-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX \
    --assessment-template-name ExampleAssessmentTemplate \
    --duration-in-seconds 180 \
    --rules-package-arns arn:aws:inspector:us-west-2:758058086616:rulespackage/0-9hgA516p \
```

```
    --user-attributes-for-findings key=ExampleTag,value=examplevalue
```

Output:

```
{
    "assessmentTemplateArn": "arn:aws:inspector:us-west-2:123456789012:target/0-
nvgVhaxX/template/0-it5r2S4T"
}
```

- For API details, see CreateAssessmentTemplate in *AWS CLI Command Reference*.

`create-filter`

The following code example shows how to use `create-filter`.

AWS CLI

To create a filter

The following `create-filter` example creates a suppression rule that omits ECR instance type findings.

```
aws inspector2 create-filter \
    --name "ExampleSuppressionRuleECR" \
    --description "This suppression rule omits ECR instance type findings" \
    --action SUPPRESS \
    --filter-criteria 'resourceType=[{comparison="EQUALS",
 value="AWS_ECR_INSTANCE"}]'
```

Output:

```
{
    "arn": "arn:aws:inspector2:us-west-2:123456789012:owner/o-EXAMPLE222/filter/
EXAMPLE444444444"
}
```

For more information, see Filtering Amazon Inspector findings in the *Amazon Inspector User Guide*.

- For API details, see CreateFilter in *AWS CLI Command Reference*.

`create-findings-report`

The following code example shows how to use `create-findings-report`.

AWS CLI

To create a findings report

The following `create-findings-report` example creates a finding report.

```
aws inspector2 create-findings-report \
    --report-format CSV \
    --s3-destination bucketName=inspector-sbom-123456789012,keyPrefix=sbom-key,kmsKeyArn=arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333 \
    --filter-criteria '{"ecrImageRepositoryName":[{"comparison":"EQUALS","value":"debian"}]}'
```

Output:

```
{
    "reportId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
}
```

For more information, see Managing findings in Amazon Inspector in the *Amazon Inspector User Guide*.

- For API details, see CreateFindingsReport in *AWS CLI Command Reference*.

`create-resource-group`

The following code example shows how to use `create-resource-group`.

AWS CLI

To create a resource group

The following `create-resource-group` example creates a resource group using the tag key of `Name` and value of `example`.

```
aws inspector create-resource-group \
```

```
    --resource-group-tags key=Name,value=example
```

Output:

```
{
    "resourceGroupArn": "arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-
AB6DMKnv"
}
```

- For API details, see CreateResourceGroup in *AWS CLI Command Reference*.

`create-sbom-export`

The following code example shows how to use `create-sbom-export`.

AWS CLI

To create a software bill of materials (SBOM) report

The following `create-sbom-export` example creates a software bill of materials (SBOM) report.

```
aws inspector2 create-sbom-export \
    --report-format SPDX_2_3 \
    --resource-filter-criteria
 'ecrRepositoryName=[{comparison="EQUALS",value="debian"}]' \
    --s3-destination bucketName=inspector-sbom-123456789012,keyPrefix=sbom-
key,kmsKeyArn=arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE33333
```

Output:

```
{
    "reportId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333"
}
```

For more information, see Exporting SBOMs with Amazon Inspector in the *Amazon Inspector User Guide*.

- For API details, see CreateSbomExport in *AWS CLI Command Reference*.

`delete-assessment-run`

The following code example shows how to use `delete-assessment-run`.

AWS CLI

To delete an assessment run

The following `delete-assessment-run` example deletes the assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-11LMTAVe`.

```
aws inspector delete-assessment-run \
    --assessment-run-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-11LMTAVe
```

This command produces no output.

- For API details, see DeleteAssessmentRun in *AWS CLI Command Reference*.

`delete-assessment-target`

The following code example shows how to use `delete-assessment-target`.

AWS CLI

To delete an assessment target

The following `delete-assessment-target` example deletes the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq`.

```
aws inspector delete-assessment-target \
    --assessment-target-arn arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq
```

This command produces no output.

- For API details, see DeleteAssessmentTarget in *AWS CLI Command Reference*.

`delete-assessment-template`

The following code example shows how to use `delete-assessment-template`.

AWS CLI

To delete an assessment template

The following `delete-assessment-template` example deletes the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T`.

```
aws inspector delete-assessment-template \
    --assessment-template-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T
```

This command produces no output.

- For API details, see DeleteAssessmentTemplate in *AWS CLI Command Reference*.

`delete-filter`

The following code example shows how to use `delete-filter`.

AWS CLI

To delete a filter

The following `delete-filter` example deletes a filter.

```
aws inspector2 delete-filter \
    --arn "arn:aws:inspector2:us-west-2:123456789012:owner/o-EXAMPLE222/filter/EXAMPLE444444444"
```

Output:

```
{
    "arn": "arn:aws:inspector2:us-west-2:123456789012:owner/o-EXAMPLE222/filter/EXAMPLE444444444"
}
```

For more information, see Filtering Amazon Inspector findings in the *Amazon Inspector User Guide*.

- For API details, see DeleteFilter in *AWS CLI Command Reference*.

describe-assessment-runs

The following code example shows how to use `describe-assessment-runs`.

AWS CLI

To describe assessment runs

The following `describe-assessment-runs` example describes an assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE`.

```
aws inspector describe-assessment-runs \
    --assessment-run-arns arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE
```

Output:

```
{
    "assessmentRuns": [
        {
            "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw/run/0-MKkpXXPE",
            "assessmentTemplateArn": "arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw",
            "completedAt": 1458680301.4,
            "createdAt": 1458680170.035,
            "dataCollected": true,
            "durationInSeconds": 3600,
            "name": "Run 1 for ExampleAssessmentTemplate",
            "notifications": [],
            "rulesPackageArns": [

`describe-assessment-targets`

The following code example shows how to use `describe-assessment-targets`.

AWS CLI

To describe assessment targets

The following `describe-assessment-targets` example describes the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq`.

```
aws inspector describe-assessment-targets \
    --assessment-target-arns arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq
```

Output:

```
{
    "assessmentTargets": [
        {
            "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq",
            "createdAt": 1458074191.459,
            "name": "ExampleAssessmentTarget",
            "resourceGroupArn": "arn:aws:inspector:us-
west-2:123456789012:resourcegroup/0-PyGXopAI",
            "updatedAt": 1458074191.459
        }
    ],
    "failedItems": {}
}
```

- For API details, see DescribeAssessmentTargets in *AWS CLI Command Reference*.

`describe-assessment-templates`

The following code example shows how to use `describe-assessment-templates`.

AWS CLI

To describe assessment templates

The following `describe-assessment-templates` example describes the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw`.

```
aws inspector describe-assessment-templates \
    --assessment-template-arns arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw
```

Output:

```
{
    "assessmentTemplates": [
        {
            "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw",
            "assessmentTargetArn": "arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq",
            "createdAt": 1458074191.844,
            "durationInSeconds": 3600,
            "name": "ExampleAssessmentTemplate",
            "rulesPackageArns": [
                "arn:aws:inspector:us-west-2:758058086616:rulespackage/0-X1KXtawP"
            ],
            "userAttributesForFindings": []
        }
    ],
    "failedItems": {}
}
```

- For API details, see DescribeAssessmentTemplates in *AWS CLI Command Reference*.

`describe-cross-account-access-role`

The following code example shows how to use `describe-cross-account-access-role`.

AWS CLI

To describe the cross account access role

The following `describe-cross-account-access-role` example describes the IAM role that enables Amazon Inspector to access your AWS account.

```
aws inspector describe-cross-account-access-role
```

Output:

```
{
    "registeredAt": 1458069182.826,
    "roleArn": "arn:aws:iam::123456789012:role/inspector",
```

```
    "valid": true
}
```

- For API details, see DescribeCrossAccountAccessRole in *AWS CLI Command Reference*.

`describe-findings`

The following code example shows how to use `describe-findings`.

AWS CLI

To describe findings

The following `describe-findings` example describes the finding with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4`.

```
aws inspector describe-findings \
    --finding-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4
```

Output:

```
{
    "failedItems": {},
    "findings": [
        {
            "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4",
            "assetAttributes": {
                "ipv4Addresses": [],
                "schemaVersion": 1
            },
            "assetType": "ec2-instance",
            "attributes": [],
            "confidence": 10,
            "createdAt": 1458680301.37,
            "description": "Amazon Inspector did not find any potential security
 issues during this assessment.",
            "indicatorOfCompromise": false,
            "numericSeverity": 0,
            "recommendation": "No remediation needed.",
```

```
            "schemaVersion": 1,
            "service": "Inspector",
            "serviceAttributes": {
                "assessmentRunArn": "arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE",
                "rulesPackageArn": "arn:aws:inspector:us-
west-2:758058086616:rulespackage/0-X1KXtawP",
                "schemaVersion": 1
            },
            "severity": "Informational",
            "title": "No potential security issues found",
            "updatedAt": 1458680301.37,
            "userAttributes": []
        }
    ]
}
```

- For API details, see DescribeFindings in *AWS CLI Command Reference*.

`describe-resource-groups`

The following code example shows how to use `describe-resource-groups`.

AWS CLI

To describe resource groups

The following `describe-resource-groups` example describes the resource group with the ARN of `arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-PyGXopAI`.

```
aws inspector describe-resource-groups \
    --resource-group-arns arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-
PyGXopAI
```

Output:

```
{
    "failedItems": {},
    "resourceGroups": [
        {
            "arn": "arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-
PyGXopAI",
```

```
            "createdAt": 1458074191.098,
            "tags": [
                {
                    "key": "Name",
                    "value": "example"
                }
            ]
        }
    ]
}
```

- For API details, see DescribeResourceGroups in *AWS CLI Command Reference*.

`describe-rules-packages`

The following code example shows how to use `describe-rules-packages`.

AWS CLI

To describe rules packages

The following `describe-rules-packages` example describes the rules package with the ARN of `arn:aws:inspector:us-west-2:758058086616:rulespackage/0-9hgA516p`.

```
aws inspector describe-rules-packages \
    --rules-package-arns arn:aws:inspector:us-
west-2:758058086616:rulespackage/0-9hgA516p
```

Output:

```
{
    "failedItems": {},
    "rulesPackages": [
        {
            "arn": "arn:aws:inspector:us-
west-2:758058086616:rulespackage/0-9hgA516p",
            "description": "The rules in this package help verify whether the
 EC2 instances in your application are exposed to Common Vulnerabilities and
 Exposures (CVEs). Attacks can exploit unpatched vulnerabilities to compromise
 the confidentiality, integrity, or availability of your service or data. The CVE
 system provides a reference for publicly known information security vulnerabilities
 and exposures. For more information, see [https://cve.mitre.org/](https://
```

```
cve.mitre.org/). If a particular CVE appears in one of the produced Findings at the
 end of a completed Inspector assessment, you can search [https://cve.mitre.org/]
(https://cve.mitre.org/) using the CVE's ID (for example, \"CVE-2009-0021\") to find
 detailed information about this CVE, its severity, and how to mitigate it. ",
            "name": "Common Vulnerabilities and Exposures",
            "provider": "Amazon Web Services, Inc.",
            "version": "1.1"
        }
    ]
}
```

- For API details, see DescribeRulesPackages in *AWS CLI Command Reference*.

`disassociate-member`

The following code example shows how to use `disassociate-member`.

AWS CLI

To disassociate a member account from an Amazon Inspector delegated administrator

The following `disassociate-member` example disassociates an AWS account from an Amazon Inspector delegated administrator.

```
aws inspector2 disassociate-member \
    --account-id 123456789012
```

Output:

```
{
    "accountId": "123456789012"
}
```

For more information, see Managing multiple accounts in Amazon Inspector with AWS Organizations in the *Amazon Inspector User Guide*.

- For API details, see DisassociateMember in *AWS CLI Command Reference*.

`get-configuration`

The following code example shows how to use `get-configuration`.

AWS CLI

To get the setting configuration for Inspector scans

The following `get-configuration` example gets the setting configuration for Inspector scans.

```
aws inspector2 get-configuration
```

Output:

```
{
    "ec2Configuration": {
        "scanModeState": {
            "scanMode": "EC2_HYBRID",
            "scanModeStatus": "SUCCESS"
        }
    },
    "ecrConfiguration": {
        "rescanDurationState": {
            "pullDateRescanDuration": "DAYS_90",
            "rescanDuration": "DAYS_30",
            "status": "SUCCESS",
            "updatedAt": "2024-05-14T21:16:20.237000+00:00"
        }
    }
}
```

For more information, see Automated resource scanning with Amazon Inspector in the *Amazon Inspector User Guide*.

- For API details, see GetConfiguration in *AWS CLI Command Reference*.

`get-member`

The following code example shows how to use `get-member`.

AWS CLI

To get member information for your organization

The following `get-member` example retrieves information about the member account 123456789012 in your organization.

```
aws inspector2 get-member \
    --account-id 123456789012
```

Output:

```
{
        "member": {
        "accountId": "123456789012",
        "delegatedAdminAccountId": "123456789012",
        "relationshipStatus": "ENABLED",
        "updatedAt": "2023-09-11T09:57:20.520000-07:00"
    }
}
```

For more information, see Managing multiple accounts in Amazon Inspector with AWS Organizations in the *Amazon Inspector User Guide*.

- For API details, see GetMember in *AWS CLI Command Reference*.

`get-telemetry-metadata`

The following code example shows how to use `get-telemetry-metadata`.

AWS CLI

To get the telemetry metadata

The following `get-telemetry-metadata` example generates information about the data that is collected for the assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE`.

```
aws inspector get-telemetry-metadata \
    --assessment-run-arn arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw/run/0-MKkpXXPE
```

Output:

```
{
    "telemetryMetadata": [
        {
            "count": 2,
```

```
            "dataSize": 345,
            "messageType": "InspectorDuplicateProcess"
        },
        {
            "count": 3,
            "dataSize": 255,
            "messageType": "InspectorTimeEventMsg"
        },
        {
            "count": 4,
            "dataSize": 1082,
            "messageType": "InspectorNetworkInterface"
        },

        }
    ]
}
```

- For API details, see GetTelemetryMetadata in *AWS CLI Command Reference*.

`list-account-permissions`

The following code example shows how to use `list-account-permissions`.

AWS CLI

To list account permissions

The following `list-account-permissions` example lists your account permissions.

```
aws inspector2 list-account-permissions
```

Output:

```
{
    "permissions": [
        {
            "operation": "ENABLE_SCANNING",
            "service": "ECR"
        },
        {
            "operation": "DISABLE_SCANNING",
            "service": "ECR"
        },
        {
            "operation": "ENABLE_REPOSITORY",
            "service": "ECR"
```

```
        },
        {
            "operation": "DISABLE_REPOSITORY",
            "service": "ECR"
        },
        {
            "operation": "ENABLE_SCANNING",
            "service": "EC2"
        },
        {
            "operation": "DISABLE_SCANNING",
            "service": "EC2"
        },
        {
            "operation": "ENABLE_SCANNING",
            "service": "LAMBDA"
        },
        {
            "operation": "DISABLE_SCANNING",
            "service": "LAMBDA"
        }
    ]
}
```

For more information, see Identity and Access Management for Amazon Inspector in the *Amazon Inspector User Guide*.

- For API details, see ListAccountPermissions in *AWS CLI Command Reference*.

`list-assessment-run-agents`

The following code example shows how to use `list-assessment-run-agents`.

AWS CLI

To list assessment run agents

The following `list-assessment-run-agents` example lists the agents of the assessment run with the specified ARN.

```
aws inspector list-assessment-run-agents \
    --assessment-run-arn arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE
```

Output:

```
{
    "assessmentRunAgents": [
        {
            "agentHealth": "HEALTHY",
            "agentHealthCode": "HEALTHY",
            "agentId": "i-49113b93",
            "assessmentRunArn": "arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE",
            "telemetryMetadata": [
                {
                    "count": 2,
                    "dataSize": 345,
                    "messageType": "InspectorDuplicateProcess"
                },
                {
                    "count": 3,
                    "dataSize": 255,
                    "messageType": "InspectorTimeEventMsg"
                },
                {
                    "count": 4,
                    "dataSize": 1082,
                    "messageType": "InspectorNetworkInterface"
                },
                {

                },
                {
                    "count": 1,
                    "dataSize": 612,
                    "messageType": "InspectorLoadImageInProcess"
                }
            ]
        }
    ]
}
```

- For API details, see ListAssessmentRunAgents in *AWS CLI Command Reference*.

`list-assessment-runs`

The following code example shows how to use `list-assessment-runs`.

AWS CLI

To list assessment runs

The following `list-assessment-runs` example lists all existing assessment runs.

```
aws inspector list-assessment-runs
```

Output:

```
{
    "assessmentRunArns": [
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw/run/0-MKkpXXPE",
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw/run/0-v5D6fI3v"
    ]
}
```

- For API details, see ListAssessmentRuns in *AWS CLI Command Reference*.

`list-assessment-targets`

The following code example shows how to use `list-assessment-targets`.

AWS CLI

To list assessment targets

The following `list-assessment-targets` example lists all existing assessment targets.

```
aws inspector list-assessment-targets
```

Output:

```
{
    "assessmentTargetArns": [
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq"
    ]
}
```

- For API details, see ListAssessmentTargets in *AWS CLI Command Reference*.

`list-assessment-templates`

The following code example shows how to use `list-assessment-templates`.

AWS CLI

To list assessment templates

The following `list-assessment-templates` example lists all existing assessment templates.

```
aws inspector list-assessment-templates
```

Output:

```
{
    "assessmentTemplateArns": [
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw",
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-
Uza6ihLh"
    ]
}
```

- For API details, see ListAssessmentTemplates in *AWS CLI Command Reference*.

`list-coverage-statistics`

The following code example shows how to use `list-coverage-statistics`.

AWS CLI

Example 1: To list coverage statistics by groups

The following `list-coverage-statistics` example lists the coverage statistics of your AWS environment by groups.

```
aws inspector2 list-coverage-statistics \
    --group-by RESOURCE_TYPE
```

Output:

```
{
    "countsByGroup": [
        {
            "count": 56,
            "groupKey": "AWS_LAMBDA_FUNCTION"
        },
        {
            "count": 27,
```

```
            "groupKey": "AWS_ECR_REPOSITORY"
        },
        {
            "count": 18,
            "groupKey": "AWS_EC2_INSTANCE"
        },
        {
            "count": 3,
            "groupKey": "AWS_ECR_CONTAINER_IMAGE"
        },
        {
            "count": 1,
            "groupKey": "AWS_ACCOUNT"
        }
    ],
    "totalCounts": 105
}
```

For more information, see Assessing Amazon Inspector coverage of your AWS environment in the *Amazon Inspector User Guide*.

Example 2: To list coverage statistics by resource type

The following `list-coverage-statistics` example lists the coverage statistics of your AWS environment by resource type.

```
aws inspector2 list-coverage-statistics \
    --filter-criteria '{"resourceType":
[{"comparison":"EQUALS","value":"AWS_ECR_REPOSITORY"}]}' \
    --group-by SCAN_STATUS_REASON
```

Output:

```
{
    "countsByGroup": [
        {
            "count": 27,
            "groupKey": "SUCCESSFUL"
        }
    ],
    "totalCounts": 27
}
```

For more information, see Assessing Amazon Inspector coverage of your AWS environment in the *Amazon Inspector User Guide*.

Example 3: To list coverage statistics by ECR repository name

The following `list-coverage-statistics` example lists the coverage statistics of your AWS environment by ECR repository name.

```
aws inspector2 list-coverage-statistics \
    --filter-criteria '{"ecrRepositoryName":
[{"comparison":"EQUALS","value":"debian"}]}' \
    --group-by SCAN_STATUS_REASON
```

Output:

```
{
    "countsByGroup": [
        {
            "count": 3,
            "groupKey": "SUCCESSFUL"
        }
    ],
    "totalCounts": 3
}
```

For more information, see Assessing Amazon Inspector coverage of your AWS environment in the *Amazon Inspector User Guide*.

- For API details, see ListCoverageStatistics in *AWS CLI Command Reference*.

`list-coverage`

The following code example shows how to use `list-coverage`.

AWS CLI

Example 1: To list coverage details about your environment

The following `list-coverage` example lists your environment's coverage details.

```
aws inspector2 list-coverage
```

Output:

```
{
    "coveredResources": [
        {
            "accountId": "123456789012",
            "lastScannedAt": "2024-05-20T16:23:20-07:00",
            "resourceId": "i-EXAMPLE55555555555",
            "resourceMetadata": {
                "ec2": {
                    "amiId": "ami-EXAMPLE6666666666",
                    "platform": "LINUX"
                }
            },
            "resourceType": "AWS_EC2_INSTANCE",
            "scanStatus": {
                "reason": "SUCCESSFUL",
                "statusCode": "ACTIVE"
            },
            "scanType": "PACKAGE"
        }
    ]
}
```

Example 2: To list coverage details about the Lambda function resource type

The following `list-coverage` example lists your Lambda function resource type details.

```
aws inspector2 list-coverage \
    --filter-criteria '{"resourceType":
[{"comparison":"EQUALS","value":"AWS_LAMBDA_FUNCTION"}]}'
```

Output:

```
{
    "coveredResources": [
        {
            "accountId": "123456789012",
            "resourceId": "arn:aws:lambda:us-west-2:123456789012:function:Eval-
container-scan-results:$LATEST",
            "resourceMetadata": {
                "lambdaFunction": {
```

```
                    "functionName": "Eval-container-scan-results",
                    "functionTags": {},
                    "layers": [],
                    "runtime": "PYTHON_3_7"
                }
            },
            "resourceType": "AWS_LAMBDA_FUNCTION",
            "scanStatus": {
                "reason": "SUCCESSFUL",
                "statusCode": "ACTIVE"
            },
            "scanType": "CODE"
        }
    ]
}
```

For more information, see Assessing Amazon Inspector coverage of your AWS environment in the *Amazon Inspector User Guide*.

- For API details, see ListCoverage in *AWS CLI Command Reference*.

`list-delegated-admin-accounts`

The following code example shows how to use `list-delegated-admin-accounts`.

AWS CLI

To list information about the delegated administrator account of your organization

The following `list-delegated-admin-accounts` example lists information about the delegated administrator account of your organization.

```
aws inspector2 list-delegated-admin-accounts
```

Output:

```
{
    "delegatedAdminAccounts": [
        {
            "accountId": "123456789012",
            "status": "ENABLED"
        }
```

```
    ]
}
```

For more information, see Designating a delegated administrator for Amazon Inspector in the *Amazon Inspector User Guide*.

- For API details, see ListDelegatedAdminAccounts in *AWS CLI Command Reference*.

`list-event-subscriptions`

The following code example shows how to use `list-event-subscriptions`.

AWS CLI

To list event subscriptions

The following `list-event-subscriptions` example lists all the event subscriptions for the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0`.

```
aws inspector list-event-subscriptions \
    --resource-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/
template/0-7sbz2Kz0
```

Output:

```
{
    "subscriptions": [
        {
            "eventSubscriptions": [
                {
                    "event": "ASSESSMENT_RUN_COMPLETED",
                    "subscribedAt": 1459455440.867
                }
            ],
            "resourceArn": "arn:aws:inspector:us-west-2:123456789012:target/0-
nvgVhaxX/template/0-7sbz2Kz0",
            "topicArn": "arn:aws:sns:us-west-2:123456789012:exampletopic"
        }
    ]
}
```

- For API details, see ListEventSubscriptions in *AWS CLI Command Reference*.

`list-filters`

The following code example shows how to use `list-filters`.

AWS CLI

To list filters associated with the account that you used to activated Amazon Inspector

The following `list-filters` examples lists filters associated with the account that you used to activated Amazon Inspector.

```
aws inspector2 list-filters
```

Output:

```
{
    "filters": [
        {
            "action": "SUPPRESS",
            "arn": "arn:aws:inspector2:us-west-2:123456789012:owner/o-EXAMPLE222/
filter/EXAMPLE444444444",
            "createdAt": "2024-05-15T21:11:08.602000+00:00",
            "criteria": {
                "resourceType": [
                    {
                        "comparison": "EQUALS",
                        "value": "AWS_EC2_INSTANCE"
                    }
                ]
            },
            "description": "This suppression rule omits EC2 instance type findings",
            "name": "ExampleSuppressionRuleEC2",
            "ownerId": "o-EXAMPLE222",
            "tags": {},

```

For more information, see Filtering Amazon Inspector findings in the *Amazon Inspector User Guide*.

- For API details, see ListFilters in *AWS CLI Command Reference*.

`list-findings`

The following code example shows how to use `list-findings`.

AWS CLI

To list findings

The following `list-findings` example lists all of the generated findings.

```
aws inspector list-findings
```

Output:

```
{
    "findingArns": [
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4",
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw/run/0-v5D6fI3v/finding/0-tyvmqBLy"
```

```
    ]
}
```

- For API details, see ListFindings in *AWS CLI Command Reference*.

`list-members`

The following code example shows how to use `list-members`.

AWS CLI

Example 1: To list all member accounts associated with the Amazon Inspector delegated administrator for your organization

The following `list-members` example lists all member accounts associated with the Amazon Inspector delegated administrator for your organization.

```
aws inspector2 list-members \
    --only-associated
```

Output:

```
{
    "members": [
        {
            "accountId": "123456789012",
            "delegatedAdminAccountId": "123456789012",
            "relationshipStatus": "ENABLED",
            "updatedAt": "2023-09-11T09:57:20.520000-07:00"
        },
        {
            "accountId": "123456789012",
            "delegatedAdminAccountId": "123456789012",
            "relationshipStatus": "ENABLED",
            "updatedAt": "2024-08-12T10:13:01.472000-07:00"
        },
        {
            "accountId": "123456789111",
            "delegatedAdminAccountId": "123456789012",
            "relationshipStatus": "ENABLED",
            "updatedAt": "2023-09-11T09:57:20.438000-07:00"
        },
```

```
        {
            "accountId": "123456789222",
            "delegatedAdminAccountId": "123456789012",
            "relationshipStatus": "ENABLED",
            "updatedAt": "2024-04-24T09:14:57.471000-07:00"
        }
    ]
}
```

For more information, see Managing multiple accounts in Amazon Inspector with AWS Organizations in the *Amazon Inspector User Guide*.

Example 2: To list all member accounts associated with and disassociated from the Amazon Inspector delegated administrator for your organization

The following `list-members` example lists all member accounts associated with and disassociated from the Amazon Inspector delegated administrator for your organization.

```
aws inspector2 list-members \
    --no-only-associated
```

Output:

```
{
    "members": [
        {
            "accountId": "123456789012",
            "delegatedAdminAccountId": "123456789012",
            "relationshipStatus": "REMOVED",
            "updatedAt": "2024-05-15T11:34:53.326000-07:00"
        },
        {
            "accountId": "123456789012",
            "delegatedAdminAccountId": "123456789012",
            "relationshipStatus": "ENABLED",
            "updatedAt": "2023-09-11T09:57:20.520000-07:00"
        },
        {
            "accountId": "123456789012",
            "delegatedAdminAccountId": "123456789012",
            "relationshipStatus": "ENABLED",
            "updatedAt": "2024-08-12T10:13:01.472000-07:00"
        },
```

```
        {
            "accountId": "123456789012",
            "delegatedAdminAccountId": "123456789012",
            "relationshipStatus": "ENABLED",
            "updatedAt": "2023-09-11T09:57:20.438000-07:00"
        },
        {
            "accountId": "123456789012",
            "delegatedAdminAccountId": "123456789012",
            "relationshipStatus": "ENABLED",
            "updatedAt": "2024-04-24T09:14:57.471000-07:00"
        }
    ]
}
```

For more information, see Managing multiple accounts in Amazon Inspector with AWS Organizations in the *Amazon Inspector User Guide*.

- For API details, see ListMembers in *AWS CLI Command Reference*.

`list-rules-packages`

The following code example shows how to use `list-rules-packages`.

AWS CLI

To list rules packages

The following `list-rules-packages` example lists all available Inspector rules packages.

```
aws inspector list-rules-packages
```

Output:

```
{
    "rulesPackageArns": [
        "arn:aws:inspector:us-west-2:758058086616:rulespackage/0-9hgA516p",
        "arn:aws:inspector:us-west-2:758058086616:rulespackage/0-H5hpSawc",
        "arn:aws:inspector:us-west-2:758058086616:rulespackage/0-JJOtZiqQ",
        "arn:aws:inspector:us-west-2:758058086616:rulespackage/0-vg5GGHSD"
    ]
}
```

- For API details, see ListRulesPackages in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for resource

The following `list-tags-for-resource` example lists all tags associated with the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-gcwFliYu`.

```
aws inspector list-tags-for-resource \
    --resource-arn arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-gcwFliYu
```

Output:

```
{
    "tags": [
        {
            "key": "Name",
            "value": "Example"
        }
    ]
}
```

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`list-usage-totals`

The following code example shows how to use `list-usage-totals`.

AWS CLI

To list usage totals over the last 30 days

The following `list-usage-totals` examples lists usage totals over the last 30 days.

```
aws inspector2 list-usage-totals
```

Output:

```
{
    "totals": [
        {
            "accountId": "123456789012",
            "usage": [
                {
                    "currency": "USD",
                    "estimatedMonthlyCost": 4.6022044647,
                    "total": 1893.4784083333334,
                    "type": "EC2_AGENTLESS_INSTANCE_HOURS"
                },
                {
                    "currency": "USD",
                    "estimatedMonthlyCost": 18.892449279,
                    "total": 10882.050784722222,
                    "type": "EC2_INSTANCE_HOURS"
                },
                {
                    "currency": "USD",
                    "estimatedMonthlyCost": 5.4525363736,
                    "total": 6543.043648333333,
                    "type": "LAMBDA_FUNCTION_CODE_HOURS"
                },
                {
                    "currency": "USD",
                    "estimatedMonthlyCost": 3.9064080309,
                    "total": 9375.379274166668,
                    "type": "LAMBDA_FUNCTION_HOURS"
                },
                {
                    "currency": "USD",
                    "estimatedMonthlyCost": 0.06,
                    "total": 6.0,
                    "type": "ECR_RESCAN"
                },
                {
                    "currency": "USD",
                    "estimatedMonthlyCost": 0.09,
                    "total": 1.0,
```

```
                    "type": "ECR_INITIAL_SCAN"
                }
            ]
        }
    ]
}
```

For more information, see Monitoring usage and cost in Amazon Inspector in the *Amazon Inspector User Guide*.

- For API details, see ListUsageTotals in *AWS CLI Command Reference*.

`preview-agents`

The following code example shows how to use `preview-agents`.

AWS CLI

To preview agents

The following `preview-agents` example previews the agents installed on the EC2 instances that are part of the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq`.

```
aws inspector preview-agents \
    --preview-agents-arn arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq
```

Output:

```
{
    "agentPreviews": [
        {
            "agentId": "i-49113b93"
        }
    ]
}
```

- For API details, see PreviewAgents in *AWS CLI Command Reference*.

`register-cross-account-access-role`

The following code example shows how to use `register-cross-account-access-role`.

AWS CLI

To register the cross account access role

The following `register-cross-account-access-role` example registers the IAM role with the ARN of `arn:aws:iam::123456789012:role/inspector` that Amazon Inspector uses to list your EC2 instances at the start of the assessment run or when you call the `preview-agents` command.

```
aws inspector register-cross-account-access-role \
    --role-arn arn:aws:iam::123456789012:role/inspector
```

This command produces no output.

- For API details, see RegisterCrossAccountAccessRole in *AWS CLI Command Reference*.

`remove-attributes-from-findings`

The following code example shows how to use `remove-attributes-from-findings`.

AWS CLI

To remove attributes from findings

The following `remove-attributes-from-findings` example removes the attribute with the key of `Example` and value of `example` from the finding with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-8l1VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU`.

```
aws inspector remove-attributes-from-findings \
    --finding-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-8l1VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU \
    --attribute-keys key=Example,value=example
```

Output:

```
{
    "failedItems": {}
}
```

- For API details, see RemoveAttributesFromFindings in *AWS CLI Command Reference*.

`set-tags-for-resource`

The following code example shows how to use `set-tags-for-resource`.

AWS CLI

To set tags for a resource

The following `set-tags-for-resource` example sets the tag with the key of `Example` and value of `example` to the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0`.

```
aws inspector set-tags-for-resource \
    --resource-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0 \
    --tags key=Example,value=example
```

This command produces no output.

- For API details, see SetTagsForResource in *AWS CLI Command Reference*.

`start-assessment-run`

The following code example shows how to use `start-assessment-run`.

AWS CLI

To start an assessment run

The following `start-assessment-run` example starts the assessment run named `examplerun` using the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T`.

```
aws inspector start-assessment-run \
    --assessment-run-name examplerun \
    --assessment-template-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T
```

Output:

```
{
```

```
    "assessmentRunArn": "arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/
template/0-it5r2S4T/run/0-jOoroxyY"
}
```

- For API details, see StartAssessmentRun in *AWS CLI Command Reference*.

`stop-assessment-run`

The following code example shows how to use `stop-assessment-run`.

AWS CLI

To stop an assessment run

The following `stop-assessment-run` example stops the assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-jOoroxyY`.

```
aws inspector stop-assessment-run \
    --assessment-run-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/
template/0-it5r2S4T/run/0-jOoroxyY
```

This command produces no output.

- For API details, see StopAssessmentRun in *AWS CLI Command Reference*.

`subscribe-to-event`

The following code example shows how to use `subscribe-to-event`.

AWS CLI

To subscribe to an event

The following `subscribe-to-event` example enables the process of sending Amazon SNS notifications about the `ASSESSMENT_RUN_COMPLETED` event to the topic with the ARN of `arn:aws:sns:us-west-2:123456789012:exampletopic`.

```
aws inspector subscribe-to-event \
    --event ASSESSMENT_RUN_COMPLETED \
```

```
    --resource-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/
template/0-7sbz2Kz0 \
    --topic-arn arn:aws:sns:us-west-2:123456789012:exampletopic
```

This command produces no output.

- For API details, see SubscribeToEvent in *AWS CLI Command Reference*.

`unsubscribe-from-event`

The following code example shows how to use `unsubscribe-from-event`.

AWS CLI

To unsubscribe from an event

The following `unsubscribe-from-event` example disables the process of sending Amazon SNS notifications about the `ASSESSMENT_RUN_COMPLETED` event to the topic with the ARN of `arn:aws:sns:us-west-2:123456789012:exampletopic`.

```
aws inspector unsubscribe-from-event \
    --event ASSESSMENT_RUN_COMPLETED \
    --resource-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/
template/0-7sbz2Kz0 \
    --topic-arn arn:aws:sns:us-west-2:123456789012:exampletopic
```

This command produces no output.

- For API details, see UnsubscribeFromEvent in *AWS CLI Command Reference*.

`update-assessment-target`

The following code example shows how to use `update-assessment-target`.

AWS CLI

To update an assessment target

The following `update-assessment-target` example updates the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX` and the name of `Example`, and the resource group with the ARN of `arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-yNbgL5Pt`.

```
aws inspector update-assessment-target \
    --assessment-target-arn arn:aws:inspector:us-west-2:123456789012:target/0-
nvgVhaxX \
    --assessment-target-name Example \
    --resource-group-arn arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-
yNbgL5Pt
```

This command produces no output.

- For API details, see UpdateAssessmentTarget in *AWS CLI Command Reference*.

`update-filter`

The following code example shows how to use `update-filter`.

AWS CLI

To update a filter

The following `update-filter` example updates a filter to omit Lambda findings instead of ECR instance findings.

```
aws inspector2 update-filter \
    --filter-arn "arn:aws:inspector2:us-west-2:123456789012:owner/o-EXAMPLE222/
filter/EXAMPLE444444444" \
    --name "ExampleSuppressionRuleLambda" \
    --description "This suppression rule omits Lambda instance findings" \
    --reason "Updating filter to omit Lambda instance findings instead of ECR
 instance findings"
```

Output:

```
{
    "arn": "arn:aws:inspector2:us-west-2:123456789012:owner/o-EXAMPLE222/filter/
EXAMPLE444444444"
}
```

For more information, see Managing findings in Amazon Inspector in the *Amazon Inspector User Guide*.

- For API details, see UpdateFilter in *AWS CLI Command Reference*.

AWS IoT examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`accept-certificate-transfer`

The following code example shows how to use `accept-certificate-transfer`.

AWS CLI

To accept a device certificate transferred from a different AWS account

The following `accept-certificate-transfer` example accepts a device certificate transferred from another AWS account. The certificate is identified by its ID.

```
aws iot accept-certificate-transfer \
    --certificate-
id 488b6a7f2acdeb00a77384e63c4e40b18bEXAMPLEe57b7272ba44c45e3448142
```

This command produces no output.

For more information, see Transfer a certificate to another account in the *AWS IoT Core Developer Guide*.

- For API details, see AcceptCertificateTransfer in *AWS CLI Command Reference*.

`add-thing-to-billing-group`

The following code example shows how to use `add-thing-to-billing-group`.

AWS CLI

Example 1: To add a thing by name to a billing group

The following `add-thing-to-billing-group` example adds the thing named `MyLightBulb` to the billing group named `GroupOne`.

```
aws iot add-thing-to-billing-group \
    --billing-group-name GroupOne \
    --thing-name MyLightBulb
```

This command produces no output.

Example 2: To add a thing by ARN to a billing group

The following `add-thing-to-billing-group` example adds a thing with a specified ARN to a billing group with the specified ARN. Specifying an ARN is helpful if you work with multiple AWS Regions or accounts. It can help ensure that you are adding to the right Region and account.

```
aws iot add-thing-to-billing-group \
    --billing-group-arn "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne" \
    --thing-arn "arn:aws:iot:us-west-2:123456789012:thing/MyOtherLightBulb"
```

This command produces no output.

For more information, see Billing Groups in the *AWS IoT Developers Guide*.

- For API details, see AddThingToBillingGroup in *AWS CLI Command Reference*.

`add-thing-to-thing-group`

The following code example shows how to use `add-thing-to-thing-group`.

AWS CLI

To add a thing to a group

The following `add-thing-to-thing-group` example adds the specified thing to the specified thing group.

```
aws iot add-thing-to-thing-group \
```

```
    --thing-name MyLightBulb \
    --thing-group-name LightBulbs
```

This command produces no output.

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see AddThingToThingGroup in *AWS CLI Command Reference*.

`associate-targets-with-job`

The following code example shows how to use `associate-targets-with-job`.

AWS CLI

To associate a thing group with a continuous job

The following `associate-targets-with-job` example associates the specified thing group with the specified continuous job.

```
aws iot associate-targets-with-job \
    --targets "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs" \
    --job-id "example-job-04"
```

Output:

```
{
    "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-04",
    "jobId": "example-job-04",
    "description": "example continuous job"
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see AssociateTargetsWithJob in *AWS CLI Command Reference*.

`attach-policy`

The following code example shows how to use `attach-policy`.

AWS CLI

Example 1: To attach a policy to a thing group

The following `attach-policy` example attaches the specified policy to a thing group identified by its ARN.

```
aws iot attach-policy \
    --target "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs" \
    --policy-name "UpdateDeviceCertPolicy"
```

This command produces no output.

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

Example 2: To attach a policy to a certificate

The following `attach-policy` example attaches the policy `UpdateDeviceCertPolicy` to the principal specified by a certificate.

```
aws iot attach-policy \
    --policy-name UpdateDeviceCertPolicy \
    --target "arn:aws:iot:us-
west-2:123456789012:cert/4f0ba725787aa94d67d2fca420eca022242532e8b3c58e7465c7778b443fd65e"
```

This command produces no output.

For more information, see Attach an AWS IoT Policy to a Device Certificate in the *AWS IoT Developers Guide*.

- For API details, see AttachPolicy in *AWS CLI Command Reference*.

`attach-security-profile`

The following code example shows how to use `attach-security-profile`.

AWS CLI

To associate a security profile with all unregistered devices

The following `attach-security-profile` example associates the AWS IoT Device Defender security profile named `Testprofile` with all unregistered devices in the `us-west-2` region for this AWS account.

```
aws iot attach-security-profile \
    --security-profile-name Testprofile \
```

```
    --security-profile-target-arn "arn:aws:iot:us-west-2:123456789012:all/
unregistered-things"
```

This command produces no output.

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see AttachSecurityProfile in *AWS CLI Command Reference*.

`attach-thing-principal`

The following code example shows how to use `attach-thing-principal`.

AWS CLI

To attach a certificate to your thing

The following `attach-thing-principal` example attaches a certificate to the MyTemperatureSensor thing. The certificate is identified by an ARN. You can find the ARN for a certificate in the AWS IoT console.

```
aws iot attach-thing-principal \
    --thing-name MyTemperatureSensor \
    --principal arn:aws:iot:us-
west-2:123456789012:cert/2e1eb273792174ec2b9bf4e9b37e6c6c692345499506002a35159767055278e8
```

This command produces no output.

For more information, see How to Manage Things with the Registry in the *AWS IoT Developers Guide*.

- For API details, see AttachThingPrincipal in *AWS CLI Command Reference*.

`cancel-audit-mitigation-actions-task`

The following code example shows how to use `cancel-audit-mitigation-actions-task`.

AWS CLI

To cancel an audit mitigation actions task

The following `cancel-audit-mitigation-actions-task` example cancels the application of mitigation actions for the specified task. You cannot cancel tasks that are already completed.

```
aws iot cancel-audit-mitigation-actions-task \
    --task-id "myActionsTaskId"
```

This command produces no output.

For more information, see CancelAuditMitigationActionsTask (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see CancelAuditMitigationActionsTask in *AWS CLI Command Reference*.

`cancel-audit-task`

The following code example shows how to use `cancel-audit-task`.

AWS CLI

To cancel an audit task

The following `cancel-audit-task` example cancels an audit task with the specified task ID. You cannot cancel a task that is complete.

```
aws iot cancel-audit-task \
    --task-id a3aea009955e501a31b764abe1bebd3d
```

This command produces no output.

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see CancelAuditTask in *AWS CLI Command Reference*.

`cancel-certificate-transfer`

The following code example shows how to use `cancel-certificate-transfer`.

AWS CLI

To cancel the transfer a certificate to a different AWS account

The following `cancel-certificate-transfer` example cancels the transfer of the specified certificate transfer. The certificate is identified by a certificate ID. You can find the ID for a certificate in the AWS IoT console.

```
aws iot cancel-certificate-transfer \
    --certificate-
id f0f33678c7c9a046e5cc87b2b1a58dfa0beec26db78addd5e605d630e05c7fc8
```

This command produces no output.

For more information, see Transfer a certificate to another account in the *AWS IoT Core Developer Guide*.

- For API details, see CancelCertificateTransfer in *AWS CLI Command Reference*.

`cancel-job-execution`

The following code example shows how to use `cancel-job-execution`.

AWS CLI

To cancel a job execution on a device

The following `cancel-job-execution` example cancels the execution of the specified job on a device. If the job is not in the QUEUED state, you must add the `--force` parameter.

```
aws iot cancel-job-execution \
    --job-id "example-job-03" \
    --thing-name "MyRPi"
```

This command produces no output.

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see CancelJobExecution in *AWS CLI Command Reference*.

`cancel-job`

The following code example shows how to use `cancel-job`.

AWS CLI

To cancel a job

The following `cancel-job` example cancels the specified job.

```
aws iot cancel-job \
```

```
    --job-id "example-job-03"
```

Output:

```
{
    "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-03",
    "jobId": "example-job-03",
    "description": "example job test"
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see CancelJob in *AWS CLI Command Reference*.

`clear-default-authorizer`

The following code example shows how to use `clear-default-authorizer`.

AWS CLI

To clear the default authorizer

The following `clear-default-authorizer` example clears the currently configured default custom authorizer. After you run this command, there is no default authorizer. When you use a custom authorizer, you must specify it by name in the HTTP request headers.

```
aws iot clear-default-authorizer
```

This command produces no output.

For more information, see Creating and managing custom authorizers (CLI) in the *AWS IoT Developer Guide*.

- For API details, see ClearDefaultAuthorizer in *AWS CLI Command Reference*.

`confirm-topic-rule-destination`

The following code example shows how to use `confirm-topic-rule-destination`.

AWS CLI

To confirm a topic rule destination

The following `confirm-topic-rule-destination` example confirms a topic rule destination with a confirmation token received at an HTTP endpoint.

```
aws iot confirm-topic-rule-destination \
    --confirmation-token "AYADeIcmtq-
ZkxfpiWIQqHWM5ucAXwABABVhd3MtY3J5cHRvLXB1YmxpYy1rZXkAREFxY1E0UmlGeDg0V21BZWZ1VjZtZWFRVUJJUkt
aywpPqg8YEsa1lD4B40aJ2s1wEHKMybiF1RoOZzYisI0IvslzQY5UmCkqq3tV-3f7-

iufgrzTePl8RZYOWr0O6Aj9DiVzJZx-1iD6Pu-
G6PUw1kaO7Knzs2B4AD0qfrHUF4pYRTvyUgBnMGUCMQC8ZRmhKqntd_c6Kgrow3bMUDBvNqo2qZr8Z8Jm2rzgseROlAn
PIetJ803Z4IlIlF8xXlcdPGP-PV1dOXFemyL8g"
```

This command produces no output.

For more information, see Confirming HTTP action destinations in the *AWS IoT Developer Guide*.

- For API details, see ConfirmTopicRuleDestination in *AWS CLI Command Reference*.

`create-audit-suppression`

The following code example shows how to use `create-audit-suppression`.

AWS CLI

To create an audit finding suppression

The following `create-audit-suppression` example creates an audit finding suppression for a policy named "virtualMachinePolicy" that has been flagged for being overly permissive.

```
aws iot create-audit-suppression \
    --check-name IOT_POLICY_OVERLY_PERMISSIVE_CHECK \
    --resource-identifier
 policyVersionIdentifier={"policyName"="virtualMachinePolicy","policyVersionId"="1"}
 \
    --no-suppress-indefinitely \
    --expiration-date 2020-10-20
```

This command produces no output.

For more information, see Audit finding suppressions in the *AWS IoT Developers Guide*.

- For API details, see CreateAuditSuppression in *AWS CLI Command Reference*.

`create-authorizer`

The following code example shows how to use `create-authorizer`.

AWS CLI

To create a custom authorizer

The following `create-authorizer` example creates a custom authorizer that uses the specified Lambda function as part of a custom authentication service.

```
   aws iot create-authorizer \
       --authorizer-name "CustomAuthorizer" \
       --authorizer-function-arn "arn:aws:lambda:us-
west-2:123456789012:function:CustomAuthorizerFunction" \
       --token-key-name "MyAuthToken" \
       --status ACTIVE \
       --token-signing-public-keys FIRST_KEY="-----BEGIN PUBLIC KEY-----
MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEA1uJOB4lQPgG/lM6ZfIwo

50g2LW2Oy9R/dmqtDmJiVP97Z4GykxPvwlYHrUXY0iW1R3AR/Ac1NhCTGZMwVDB1
lQIDAQAB
-----END PUBLIC KEY-----"
```

Output:

```
{
    "authorizerName": "CustomAuthorizer",
    "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer2"
}
```

For more information, see Creating and managing custom authorizers (CLI) in the *AWS IoT Developer Guide*.

- For API details, see CreateAuthorizer in *AWS CLI Command Reference*.

`create-billing-group`

The following code example shows how to use `create-billing-group`.

AWS CLI

To create a billing group

The following `create-billing-group` example creates a simple billing group named `GroupOne`.

```
aws iot create-billing-group \
    --billing-group-name GroupOne
```

Output:

```
{
    "billingGroupName": "GroupOne",
    "billingGroupArn": "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne",
    "billingGroupId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Billing Groups in the *AWS IoT Developers Guide*.

- For API details, see CreateBillingGroup in *AWS CLI Command Reference*.

`create-certificate-from-csr`

The following code example shows how to use `create-certificate-from-csr`.

AWS CLI

To create a device certificate from a certificate signing request (CSR)

The following `create-certificate-from-csr` example creates a device certificate from a CSR. You can use the `openssl` command to create a CSR.

```
aws iot create-certificate-from-csr \
    --certificate-signing-request=file://certificate.csr
```

Contents of `certificate.csr`:

```
-----BEGIN CERTIFICATE REQUEST-----
MIICvDCCAaQCAQAwdzELMAkGA1UEBhMCVVMxEXAMPLE...
```

```
-----END CERTIFICATE REQUEST-----
```

Output:

```
{
    "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/
c0c57bbc8baaf4631a9a0345c957657f5e710473e3ddbee1428d216d54d53ac9",
        "certificateId":
 "c0c57bbc8baaf4631a9a0345c957657f5e710473e3ddbee1428d216d54d53ac9",
        "certificatePem": "<certificate-text>"
}
```

For more information, see Create AWS IoT client certificates in the *AWS IoT Developer Guide*.

- For API details, see CreateCertificateFromCsr in *AWS CLI Command Reference*.

`create-custom-metric`

The following code example shows how to use `create-custom-metric`.

AWS CLI

To create a custom metric published by your devices to Device Defender

The following `create-custom-metric` example creates a custom metric that measures battery percentage.

```
aws iot create-custom-metric \
    --metric-name "batteryPercentage" \
    --metric-type "number" \
    --display-name "Remaining battery percentage." \
    --client-request-token "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "metricName": "batteryPercentage",
    "metricArn": "arn:aws:iot:us-west-2:1234564789012:custommetric/
batteryPercentage"
}
```

For more information, see Custom metrics in the *AWS IoT Core Developer Guide*.

- For API details, see CreateCustomMetric in *AWS CLI Command Reference*.

`create-dimension`

The following code example shows how to use `create-dimension`.

AWS CLI

To create a dimension

The following `create-dimension` example creates a dimension with a single topic filter called `TopicFilterForAuthMessages`.

```
aws iot create-dimension \
    --name TopicFilterForAuthMessages \
    --type TOPIC_FILTER \
    --string-values device/+/auth
```

Output:

```
{
    "name": "TopicFilterForAuthMessages",
    "arn": "arn:aws:iot:us-west-2:123456789012:dimension/TopicFilterForAuthMessages"
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see CreateDimension in *AWS CLI Command Reference*.

`create-domain-configuration`

The following code example shows how to use `create-domain-configuration`.

AWS CLI

To create a domain configuration

The following `create-domain-configuration` example creates an AWS-managed domain configuration with a service type of `DATA`.

```
aws iot create-domain-configuration \
```

```
    --domain-configuration-name "additionalDataDomain" \
    --service-type "DATA"
```

Output:

```
{
    "domainConfigurationName": "additionalDataDomain",
    "domainConfigurationArn": "arn:aws:iot:us-
west-2:123456789012:domainconfiguration/additionalDataDomain/dikMh"
}
```

For more information, see Configurable Endpoints in the *AWS IoT Developer Guide*.

- For API details, see CreateDomainConfiguration in *AWS CLI Command Reference*.

`create-dynamic-thing-group`

The following code example shows how to use `create-dynamic-thing-group`.

AWS CLI

To create a dynamic thing group

The following `create-dynamic-thing-group` example creates a dynamic thing group that contains any thing with a temperature attribute that is greater than 60 degrees. You must enable AWS IoT fleet indexing before you can use dynamic thing groups.

```
aws iot create-dynamic-thing-group \
    --thing-group-name "RoomTooWarm" \
    --query-string "attributes.temperature>60"
```

Output:

```
{
    "thingGroupName": "RoomTooWarm",
    "thingGroupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/RoomTooWarm",
    "thingGroupId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "indexName": "AWS_Things",
    "queryString": "attributes.temperature>60",
    "queryVersion": "2017-09-30"
}
```

For more information, see Dynamic Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see CreateDynamicThingGroup in *AWS CLI Command Reference*.

`create-job`

The following code example shows how to use `create-job`.

AWS CLI

Example 1: To create a job

The following `create-job` example creates a simple AWS IoT job that sends a JSON document to the `MyRaspberryPi` device.

```
aws iot create-job \
    --job-id "example-job-01" \
    --targets "arn:aws:iot:us-west-2:123456789012:thing/MyRaspberryPi" \
    --document file://example-job.json \
    --description "example job test" \
    --target-selection SNAPSHOT
```

Contents of `example-job.json`:

```
{
    "operation": "customJob",
    "otherInfo": "someValue"
}
```

Output:

```
{
    "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-01",
    "jobId": "example-job-01",
    "description": "example job test"
}
```

Example 2: To create a continuous job

The following `create-job` example creates a job that continues to run after the things specified as targets have completed the job. In this example, the target is a thing group, so when new devices are added to the group, the continuous job runs on those new things.

aws iot create-job --job-id "example-job-04" --targets "arn:aws:iot:us-west-2:123456789012:thinggroup/DeadBulbs" --document file://example-job.json --description "example continuous job" --target-selection CONTINUOUS

Output:

```
{
    "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-04",
    "jobId": "example-job-04",
    "description": "example continuous job"
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see CreateJob in *AWS CLI Command Reference*.

`create-keys-and-certificate`

The following code example shows how to use `create-keys-and-certificate`.

AWS CLI

To create an RSA key pair and issue an X.509 certificate

The following `create-keys-and-certificate` example creates a 2048-bit RSA key pair and issues an X.509 certificate using the issued public key. Because this is the only time that AWS IoT provides the private key for this certificate, be sure to keep it in a secure location.

```
aws iot create-keys-and-certificate \
    --certificate-pem-outfile "myTest.cert.pem" \
    --public-key-outfile "myTest.public.key" \
    --private-key-outfile "myTest.private.key"
```

Output:

```
{
    "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/9894ba17925e663f1d29c23af4582b8e3b7619c31f3fbd93adcb51ae54b83dc2",
    "certificateId":
 "9894ba17925e663f1d29c23af4582b8e3b7619c31f3fbd93adcb51ae54b83dc2",
    "certificatePem": "-----BEGIN CERTIFICATE-----

}
```

For more information, see Create AWS IoT client certificates in the *AWS IoT Developer Guide*.

- For API details, see CreateKeysAndCertificate in *AWS CLI Command Reference*.

`create-mitigation-action`

The following code example shows how to use `create-mitigation-action`.

AWS CLI

To create a mitigation action

The following `create-mitigation-action` example defines a mitigation action named `AddThingsToQuarantineGroup1Action` that, when applied, moves things into the thing group named `QuarantineGroup1`. This action overrides dynamic thing groups.

```
aws iot create-mitigation-action \
```

```
    --cli-input-json file://params.json
```

Contents of `params.json`:

```
{
    "actionName": "AddThingsToQuarantineGroup1Action",
    "actionParams": {
        "addThingsToThingGroupParams": {
            "thingGroupNames": [
                "QuarantineGroup1"
            ],
            "overrideDynamicGroups": true
        }
    },
    "roleArn": "arn:aws:iam::123456789012:role/service-role/
MoveThingsToQuarantineGroupRole"
}
```

Output:

```
{
    "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
AddThingsToQuarantineGroup1Action",
    "actionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see CreateMitigationAction (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see CreateMitigationAction in *AWS CLI Command Reference*.

`create-ota-update`

The following code example shows how to use `create-ota-update`.

AWS CLI

To create an OTA update for use with Amazon FreeRTOS

The following `create-ota-update` example creates an AWS IoT OTAUpdate on a target group of things or groups. This is part of an Amazon FreeRTOS over-the-air update which makes it possible for you to deploy new firmware images to a single device or a group of devices.

```
aws iot create-ota-update \
    --cli-input-json file://create-ota-update.json
```

Contents of `create-ota-update.json`:

```
{
    "otaUpdateId": "ota12345",
    "description": "A critical update needed right away.",
    "targets": [
        "device1",
        "device2",
        "device3",
        "device4"
    ],
    "targetSelection": "SNAPSHOT",
    "awsJobExecutionsRolloutConfig": {
        "maximumPerMinute": 10
    },
    "files": [
        {
            "fileName": "firmware.bin",
            "fileLocation": {
                "stream": {
                    "streamId": "004",
                    "fileId": 123
                }
            },
            "codeSigning": {
                "awsSignerJobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
            }
        }
    ],
    "roleArn": "arn:aws:iam::123456789012:role/service-role/my_ota_role"
}
```

Output:

```
{
    "otaUpdateId": "ota12345",
    "awsIotJobId": "job54321",
    "otaUpdateArn": "arn:aws:iot:us-west-2:123456789012:otaupdate/itsaupdate",
    "awsIotJobArn": "arn:aws:iot:us-west-2:123456789012:job/itsajob",
```

```
    "otaUpdateStatus": "CREATE_IN_PROGRESS"
}
```

For more information, see Creating an OTA update with the AWS CLI in the *FreeRTOS User Guide*.

- For API details, see CreateOtaUpdate in *AWS CLI Command Reference*.

`create-policy-version`

The following code example shows how to use `create-policy-version`.

AWS CLI

To update a policy with a new version

The following `create-policy-version` example updates a policy definition, creating a new policy version. This example also makes the new version the default.

```
aws iot create-policy-version \
    --policy-name UpdateDeviceCertPolicy \
    --policy-document file://policy.json \
    --set-as-default
```

Contents of `policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action":  "iot:UpdateCertificate",
            "Resource": "*"
        }
    ]
}
```

Output:

```
{
```

```
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/UpdateDeviceCertPolicy",
    "policyDocument": "{ \"Version\": \"2012-10-17\", \"Statement\": [ { \"Effect\":
 \"Allow\", \"Action\":  \"iot:UpdateCertificate\", \"Resource\": \"*\" } ] }",
    "policyVersionId": "2",
    "isDefaultVersion": true
}
```

For more information, see AWS IoT Policies in the *AWS IoT Developers Guide*.

- For API details, see CreatePolicyVersion in *AWS CLI Command Reference*.

`create-policy`

The following code example shows how to use `create-policy`.

AWS CLI

To create an AWS IoT policy

The following `create-policy` example creates an AWS IoT policy named TemperatureSensorPolicy. The `policy.json` file contains statements that allow AWS IoT policy actions.

```
aws iot create-policy \
    --policy-name TemperatureSensorPolicy \
    --policy-document file://policy.json
```

Contents of `policy.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "iot:Publish",
                "iot:Receive"
            ],
            "Resource": [
                "arn:aws:iot:us-west-2:123456789012:topic/topic_1",
                "arn:aws:iot:us-west-2:123456789012:topic/topic_2"
            ]
```

```
        },
        {
            "Effect": "Allow",
            "Action": [
                "iot:Subscribe"
            ],
            "Resource": [
                "arn:aws:iot:us-west-2:123456789012:topicfilter/topic_1",
                "arn:aws:iot:us-west-2:123456789012:topicfilter/topic_2"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "iot:Connect"
            ],
            "Resource": [
                "arn:aws:iot:us-west-2:123456789012:client/basicPubSub"
            ]
        }
    ]
}
```

Output:

```
{
    "policyName": "TemperatureSensorPolicy",
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
TemperatureSensorPolicy",
    "policyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Receive\"],\"Resource\":
[\"arn:aws:iot:us-west-2:123456789012:topic/topic_1\",\"arn:aws:iot:us-

\":\"Allow\",\"Action\":[\"iot:Connect\"],\"Resource\":[\"arn:aws:iot:us-
west-2:123456789012:client/basicPubSub\"]}]}",
    "policyVersionId": "1"
}
```

For more information, see AWS IoT Policies in the *AWS IoT Developers Guide*.

- For API details, see CreatePolicy in *AWS CLI Command Reference*.

`create-provisioning-claim`

The following code example shows how to use `create-provisioning-claim`.

AWS CLI

To create a provisioning claim

The following `create-provisioning-claim` example creates a provisioning claim from a provisioning template.

```
aws iot create-provisioning-claim \
    --template-name MyTestProvisioningTemplate
```

Output:

```
{
    "certificateId":
 "78de02184b2ce80cf8fb709bda59e62b19fb83513590483eb0434589476ab09f",

`create-provisioning-template-version`

The following code example shows how to use `create-provisioning-template-version`.

AWS CLI

To create a provisioning template version

The following `create-provisioning-template-version` example creates a version for the specified provisioning template. The body of the new version is supplied in the file `template.json`.

```
aws iot create-provisioning-template-version \
    --template-name widget-template \
    --template-body file://template.json
```

Contents of `template.json`:

```
{
    "Parameters" : {
        "DeviceLocation": {
            "Type": "String"
        }
    },
    "Mappings": {
        "LocationTable": {
            "Seattle": {
                "LocationUrl": "https://example.aws"
            }
        }
    },
    "Resources" : {
        "thing" : {
            "Type" : "AWS::IoT::Thing",
            "Properties" : {
                "AttributePayload" : {
                    "version" : "v1",
                    "serialNumber" : "serialNumber"
                },
                "ThingName" : {"Fn::Join":["",["ThingPrefix_",
{"Ref":"SerialNumber"}]]},
                "ThingTypeName" : {"Fn::Join":["",["ThingTypePrefix_",
{"Ref":"SerialNumber"}]]},

                "BillingGroup": "BillingGroup"
            },
            "OverrideSettings" : {
                "AttributePayload" : "MERGE",
                "ThingTypeName" : "REPLACE",
                "ThingGroups" : "DO_NOTHING"
            }
```

```
        },
        "certificate" : {
            "Type" : "AWS::IoT::Certificate",
            "Properties" : {
                "CertificateId": {"Ref": "AWS::IoT::Certificate::Id"},
                "Status" : "Active"
            }
        },
        "policy" : {
            "Type" : "AWS::IoT::Policy",
            "Properties" : {
                "PolicyDocument" : {
                    "Version":"2012-10-17",
                    "Statement": [{
                        "Effect": "Allow",
                        "Action":["iot:Publish"],
                        "Resource": ["arn:aws:iot:us-west-2:123456789012:topic/foo/
bar"]
                    }]
                }
            }
        }
    },
    "DeviceConfiguration": {
        "FallbackUrl": "https://www.example.com/test-site",
        "LocationUrl": {
            "Fn::FindInMap": ["LocationTable",{"Ref": "DeviceLocation"},
 "LocationUrl"]}
        }
    }
}
```

Output:

```
{
    "templateArn": "arn:aws:iot:us-west-2:123456789012:provisioningtemplate/widget-
template",
    "templateName": "widget-template",
    "versionId": 2,
    "isDefaultVersion": false
}
```

For more information, see AWS IoT Secure Tunneling in the *AWS IoT Core Developer Guide*.

- For API details, see CreateProvisioningTemplateVersion in *AWS CLI Command Reference*.

`create-provisioning-template`

The following code example shows how to use `create-provisioning-template`.

AWS CLI

To create a provisioning template

The following `create-provisioning-template` example creates a provisioning template as defined by the file `template.json`.

```
aws iot create-provisioning-template \
    --template-name widget-template \
    --description "A provisioning template for widgets" \
    --provisioning-role-arn arn:aws:iam::123456789012:role/Provision_role \
    --template-body file://template.json
```

Contents of `template.json`:

```
{
    "Parameters" : {
        "DeviceLocation": {
            "Type": "String"
        }
    },
    "Mappings": {
        "LocationTable": {
            "Seattle": {
                "LocationUrl": "https://example.aws"
            }
        }
    },
    "Resources" : {
        "thing" : {
            "Type" : "AWS::IoT::Thing",
            "Properties" : {
                "AttributePayload" : {
                    "version" : "v1",
                    "serialNumber" : "serialNumber"
                },
```

```
                "ThingName" : {"Fn::Join":["",["ThingPrefix_",
{"Ref":"SerialNumber"}]]},
                "ThingTypeName" : {"Fn::Join":["",["ThingTypePrefix_",
{"Ref":"SerialNumber"}]]},
                "ThingGroups" : ["widgets", "WA"],
                "BillingGroup": "BillingGroup"
            },
            "OverrideSettings" : {
                "AttributePayload" : "MERGE",
                "ThingTypeName" : "REPLACE",
                "ThingGroups" : "DO_NOTHING"
            }
        },
        "certificate" : {
            "Type" : "AWS::IoT::Certificate",
            "Properties" : {
                "CertificateId": {"Ref": "AWS::IoT::Certificate::Id"},
                "Status" : "Active"
            }
        },
        "policy" : {
            "Type" : "AWS::IoT::Policy",
            "Properties" : {
                "PolicyDocument" : {
                    "Version":"2012-10-17",
                    "Statement": [{
                        "Effect": "Allow",
                        "Action":["iot:Publish"],
                        "Resource": ["arn:aws:iot:us-west-2:123456789012:topic/foo/
bar"]
                    }]
                }
            }
        }
    },
    "DeviceConfiguration": {
        "FallbackUrl": "https://www.example.com/test-site",
        "LocationUrl": {
            "Fn::FindInMap": ["LocationTable",{"Ref": "DeviceLocation"},
 "LocationUrl"]}
        }
    }
}
```

Output:

```
{
    "templateArn": "arn:aws:iot:us-west-2:123456789012:provisioningtemplate/widget-
template",
    "templateName": "widget-template",
    "defaultVersionId": 1
}
```

For more information, see AWS IoT Secure Tunneling in the *AWS IoT Core Developer Guide*.

- For API details, see CreateProvisioningTemplate in *AWS CLI Command Reference*.

`create-role-alias`

The following code example shows how to use `create-role-alias`.

AWS CLI

To create a role alias

The following `create-role-alias` example creates a role alias called `LightBulbRole` for the specified role.

```
aws iot create-role-alias \
    --role-alias LightBulbRole \
    --role-arn arn:aws:iam::123456789012:role/lightbulbrole-001
```

Output:

```
{
    "roleAlias": "LightBulbRole",
    "roleAliasArn": "arn:aws:iot:us-west-2:123456789012:rolealias/LightBulbRole"
}
```

For more information, see Authorizing direct calls to AWS services using AWS IoT Core credential provider in the *AWS IoT Developer Guide*.

- For API details, see CreateRoleAlias in *AWS CLI Command Reference*.

`create-scheduled-audit`

The following code example shows how to use `create-scheduled-audit`.

AWS CLI

To create a scheduled audit

The following `create-scheduled-audit` example creates a scheduled audit that runs weekly, on Wednesday, to check if CA certificates or device certificates are expiring.

```
aws iot create-scheduled-audit \
    --scheduled-audit-name WednesdayCertCheck \
    --frequency WEEKLY \
    --day-of-week WED \
    --target-check-
names CA_CERTIFICATE_EXPIRING_CHECK DEVICE_CERTIFICATE_EXPIRING_CHECK
```

Output:

```
{
    "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/
WednesdayCertCheck"
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see CreateScheduledAudit in *AWS CLI Command Reference*.

`create-security-profile`

The following code example shows how to use `create-security-profile`.

AWS CLI

To create a security profile

The following `create-security-profile` example creates a security profile that checks if cellular bandwidth exceeds a threshold or if more than 10 authorization failures occur within a five-minute period.

```
aws iot create-security-profile \
```

```
    --security-profile-name PossibleIssue \
    --security-profile-description "Check to see if authorization fails 10 times in
 5 minutes or if cellular bandwidth exceeds 128"  \
    --behaviors "[{\"name\":\"CellularBandwidth\",\"metric\":\"aws:message-byte-size
\",\"criteria\":{\"comparisonOperator\":\"greater-than\",\"value\":{\"count\":128},
\"consecutiveDatapointsToAlarm\":1,\"consecutiveDatapointsToClear\":1}},{\"name
\":\"Authorization\",\"metric\":\"aws:num-authorization-failures\",\"criteria\":
{\"comparisonOperator\":\"less-than\",\"value\":{\"count\":10},\"durationSeconds
\":300,\"consecutiveDatapointsToAlarm\":1,\"consecutiveDatapointsToClear\":1}}]"
```

Output:

```
{
    "securityProfileName": "PossibleIssue",
    "securityProfileArn": "arn:aws:iot:us-west-2:123456789012:securityprofile/
PossibleIssue"
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see CreateSecurityProfile in *AWS CLI Command Reference*.

`create-stream`

The following code example shows how to use `create-stream`.

AWS CLI

To create a stream for delivering one or more large files in chunks over MQTT

The following `create-stream` example creates a stream for delivering one or more large files in chunks over MQTT. A stream transports data bytes in chunks or blocks packaged as MQTT messages from a source like S3. You can have one or more files associated with a stream.

```
aws iot create-stream \
    --cli-input-json file://create-stream.json
```

Contents of `create-stream.json`:

```
{
    "streamId": "stream12345",
    "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
```

```
    "files": [
        {
            "fileId": 123,
            "s3Location": {
                "bucket":"codesign-ota-bucket",
                "key":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
            }
        }
    ],
    "roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_stream_role"
}
```

Output:

```
{
    "streamId": "stream12345",
    "streamArn": "arn:aws:iot:us-west-2:123456789012:stream/stream12345",
    "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
    "streamVersion": 1
}
```

For more information, see MQTT-based file delivery in the *AWS IoT Developer Guide*.

- For API details, see CreateStream in *AWS CLI Command Reference*.

`create-thing-group`

The following code example shows how to use `create-thing-group`.

AWS CLI

Example 1: To create a thing group

The following `create-thing-group` example creates a thing group named `LightBulbs` with a description and two attributes.

```
aws iot create-thing-group \
    --thing-group-name LightBulbs \
    --thing-group-properties "thingGroupDescription=\"Generic bulb group\",
 attributePayload={attributes={Manufacturer=AnyCompany,wattage=60}}"
```

Output:

```
{
    "thingGroupName": "LightBulbs",
    "thingGroupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs",
    "thingGroupId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

Example 2: To create a thing group that's part of a parent group

The following `create-thing-group` example creates a thing group named `HalogenBulbs` that has a parent thing group named `LightBulbs`.

```
aws iot create-thing-group \
    --thing-group-name HalogenBulbs \
    --parent-group-name LightBulbs
```

Output:

```
{
    "thingGroupName": "HalogenBulbs",
    "thingGroupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/HalogenBulbs",
    "thingGroupId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see CreateThingGroup in *AWS CLI Command Reference*.

`create-thing-type`

The following code example shows how to use `create-thing-type`.

AWS CLI

To define a thing type

The following `create-thing-type` example defines a thing type and associated attributes.

```
aws iot create-thing-type \
    --thing-type-name "LightBulb" \
    --thing-type-properties "thingTypeDescription=light bulb type,
 searchableAttributes=wattage,model"
```

Output:

```
{
    "thingTypeName": "LightBulb",
    "thingTypeArn": "arn:aws:iot:us-west-2:123456789012:thingtype/LightBulb",
    "thingTypeId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Thing Types in the *AWS IoT Developers Guide*.

- For API details, see CreateThingType in *AWS CLI Command Reference*.

`create-thing`

The following code example shows how to use `create-thing`.

AWS CLI

Example 1: To create a thing record in the registry

The following `create-thing` example creates an entry for a device in the AWS IoT thing registry.

```
aws iot create-thing \
    --thing-name SampleIoTThing
```

Output:

```
{
    "thingName": "SampleIoTThing",
    "thingArn": "arn:aws:iot:us-west-2: 123456789012:thing/SampleIoTThing",
    "thingId": " a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 "
}
```

Example 2: To define a thing that is associated with a thing type

The following `create-thing` example create a thing that has the specified thing type and its attributes.

```
aws iot create-thing \
    --thing-name "MyLightBulb" \
```

```
    --thing-type-name "LightBulb" \
    --attribute-payload '{"attributes": {"wattage":"75", "model":"123"}}'
```

Output:

```
{
    "thingName": "MyLightBulb",
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyLightBulb",
    "thingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
}
```

For more information, see How to Manage Things with the Registry and Thing Types in the *AWS IoT Developers Guide*.

- For API details, see CreateThing in *AWS CLI Command Reference*.

`create-topic-rule-destination`

The following code example shows how to use `create-topic-rule-destination`.

AWS CLI

To create a topic rule destination

The following `create-topic-rule-destination` example creates a topic rule destination for an HTTP endpoint.

```
aws iot create-topic-rule-destination \
    --destination-configuration httpUrlConfiguration={confirmationUrl=https://
example.com}
```

Output:

```
{
    "topicRuleDestination": {
        "arn": "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "status": "IN_PROGRESS",
        "statusReason": "Awaiting confirmation. Confirmation message sent on
 2020-07-09T22:47:54.154Z; no response received from the endpoint.",
        "httpUrlProperties": {
            "confirmationUrl": "https://example.com"
```

```
        }
    }
}
```

For more information, see Creating HTTP action destinations in the *AWS IoT Developer Guide*.

- For API details, see CreateTopicRuleDestination in *AWS CLI Command Reference*.

`create-topic-rule`

The following code example shows how to use `create-topic-rule`.

AWS CLI

To create a rule that sends an Amazon SNS alert

The following `create-topic-rule` example creates a rule that sends an Amazon SNS message when soil moisture level readings, as found in a device shadow, are low.

```
aws iot create-topic-rule \
    --rule-name "LowMoistureRule" \
    --topic-rule-payload file://plant-rule.json
```

Contents of `plant-rule.json`:

```
{
    "sql": "SELECT * FROM '$aws/things/MyRPi/shadow/update/accepted' WHERE
 state.reported.moisture = 'low'\n",
    "description": "Sends an alert whenever soil moisture level readings are too
 low.",
    "ruleDisabled": false,
    "awsIotSqlVersion": "2016-03-23",
    "actions": [
        {
            "sns": {
                "targetArn": "arn:aws:sns:us-
west-2:123456789012:MyRPiLowMoistureTopic",
                "roleArn": "arn:aws:iam::123456789012:role/service-role/
MyRPiLowMoistureTopicRole",
                "messageFormat": "RAW"
            }
        }
    ]
```

```
}
```

This command produces no output.

For more information, see Creating an AWS IoT Rule in the *AWS IoT Developers Guide*.

- For API details, see CreateTopicRule in *AWS CLI Command Reference*.

`delete-account-audit-configuration`

The following code example shows how to use `delete-account-audit-configuration`.

AWS CLI

To disable all audit checks for your AWS account

The following `delete-account-audit-configuration` example restores the default settings for AWS IoT Device Defender for this account, disabling all audit checks and clearing configuration data. It also deletes any scheduled audits for this account. **Use this command with caution**.

```
aws iot delete-account-audit-configuration \
    --delete-scheduled-audits
```

This command produces no output.

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see DeleteAccountAuditConfiguration in *AWS CLI Command Reference*.

`delete-audit-suppression`

The following code example shows how to use `delete-audit-suppression`.

AWS CLI

To delete an audit finding suppression

The following `delete-audit-suppression` example deletes an audit finding suppression for DEVICE_CERTIFICATE_EXPIRING_CHECK.

```
aws iot delete-audit-suppression \
```

```
    --check-name DEVICE_CERTIFICATE_EXPIRING_CHECK \
    --resource-identifier
deviceCertificateId="c7691e8b4a5f7d9e8c6b3a2f1e0d9c8b7a6f5e4d3c2b1a0f9e8d7c6b5a4f3e2d"
```

This command produces no output.

For more information, see Audit finding suppressions in the *AWS IoT Developers Guide*.

- For API details, see DeleteAuditSuppression in *AWS CLI Command Reference*.

`delete-authorizer`

The following code example shows how to use `delete-authorizer`.

AWS CLI

To delete a custom authorizer

The following `delete-authorizer` example deletes the authorizer named `CustomAuthorizer`. A custom authorizer must be in the `INACTIVE` state before you can delete it.

```
aws iot delete-authorizer \
    --authorizer-name CustomAuthorizer
```

This command produces no output.

For more information, see Creating and managing custom authorizers (CLI) in the *AWS IoT Core Developer Guide*.

- For API details, see DeleteAuthorizer in *AWS CLI Command Reference*.

`delete-billing-group`

The following code example shows how to use `delete-billing-group`.

AWS CLI

To delete a billing group

The following `delete-billing-group` example deletes the specified billing group. You can delete a billing group even if it contains one or more things.

```
aws iot delete-billing-group \
    --billing-group-name BillingGroupTwo
```

This command produces no output.

For more information, see Billing Groups in the *AWS IoT Developers Guide*.

- For API details, see DeleteBillingGroup in *AWS CLI Command Reference*.

`delete-ca-certificate`

The following code example shows how to use `delete-ca-certificate`.

AWS CLI

To delete a CA certificate

The following `delete-ca-certificate` example deletes the CA certificate with the specified certificate ID.

```
aws iot delete-ca-certificate \
    --certificate-
id f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467
```

This command produces no output.

For more information, see Manage your CA certificates in the *AWS IoT Developer Guide*.

- For API details, see DeleteCaCertificate in *AWS CLI Command Reference*.

`delete-certificate`

The following code example shows how to use `delete-certificate`.

AWS CLI

To delete a device certificate

The following `delete-certificate` example deletes the device certificate with the specified ID.

```
aws iot delete-certificate \
    --certificate-
id c0c57bbc8baaf4631a9a0345c957657f5e710473e3ddbee1428d216d54d53ac9
```

This command produces no output.

For more information, see X.509 client certificates in the *AWS IoT Developer Guide*.

- For API details, see DeleteCertificate in *AWS CLI Command Reference*.

`delete-custom-metric`

The following code example shows how to use `delete-custom-metric`.

AWS CLI

To delete a custom metric

The following `delete-custom-metric` example deletes a custom metric.

```
aws iot delete-custom-metric \
    --metric-name batteryPercentage
```

This command produces no output.

For more information, see Custom metrics in the *AWS IoT Core Developer Guide*.

- For API details, see DeleteCustomMetric in *AWS CLI Command Reference*.

`delete-dimension`

The following code example shows how to use `delete-dimension`.

AWS CLI

To delete a dimension

The following `delete-dimension` example deletes a dimension called `TopicFilterForAuthMessages`.

```
aws iot delete-dimension \
```

```
    --name TopicFilterForAuthMessages
```

This command produces no output.

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see DeleteDimension in *AWS CLI Command Reference*.

`delete-domain-configuration`

The following code example shows how to use `delete-domain-configuration`.

AWS CLI

To delete a domain configuration

The following `delete-domain-configuration` example deletes a domain configuration named `additionalDataDomain` from your AWS account.

```
aws iot delete-domain-configuration \
    --domain-configuration-name "additionalDataDomain"
```

This command produces no output.

For more information, see Configurable Endpoints in the *AWS IoT Developer Guide*.

- For API details, see DeleteDomainConfiguration in *AWS CLI Command Reference*.

`delete-dynamic-thing-group`

The following code example shows how to use `delete-dynamic-thing-group`.

AWS CLI

To delete a dynamic thing group

The following `delete-dynamic-thing-group` example deletes the specified dynamic thing group.

```
aws iot delete-dynamic-thing-group \
    --thing-group-name "RoomTooWarm"
```

This command produces no output.

For more information, see Dynamic Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see DeleteDynamicThingGroup in *AWS CLI Command Reference*.

`delete-job-execution`

The following code example shows how to use `delete-job-execution`.

AWS CLI

To delete a job execution

The following `delete-job-execution` example deletes the job execution of the specified job on a device. Use `describe-job-execution` to get the execution number.

```
aws iot delete-job-execution \
    --job-id "example-job-02" \
    --thing-name "MyRaspberryPi" \
    --execution-number 1
```

This command produces no output.

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see DeleteJobExecution in *AWS CLI Command Reference*.

`delete-job`

The following code example shows how to use `delete-job`.

AWS CLI

To delete a job

The following `delete-job` example deletes the specified job. By specifying the `--force` option, the job is deleted even if the status is `IN_PROGRESS`.

```
aws iot delete-job \
    --job-id "example-job-04" \
    --force
```

This command produces no output.

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see DeleteJob in *AWS CLI Command Reference*.

`delete-mitigation-action`

The following code example shows how to use `delete-mitigation-action`.

AWS CLI

To delete a mitigation action

The following `delete-mitigation-action` example deletes the specified mitigation action.

```
aws iot delete-mitigation-action \
    --action-name AddThingsToQuarantineGroup1Action
```

This command produces no output.

For more information, see DeleteMitigationAction (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see DeleteMitigationAction in *AWS CLI Command Reference*.

`delete-ota-update`

The following code example shows how to use `delete-ota-update`.

AWS CLI

To delete an OTA update

The following `delete-ota-update` example deletes the specified OTA update.

```
aws iot delete-ota-update \
    --ota-update-id ota12345 \
    --delete-stream \
    --force-delete-aws-job
```

This command produces no output.

For more information, see Creating an OTA update with the AWS CLI in the *FreeRTOS User Guide*.

- For API details, see DeleteOtaUpdate in *AWS CLI Command Reference*.

`delete-policy-version`

The following code example shows how to use `delete-policy-version`.

AWS CLI

To delete a version of policy

The following `delete-policy-version` example deletes version 2 of the specified policy from your AWS account.

```
aws iot delete-policy-version \
    --policy-name UpdateDeviceCertPolicy \
    --policy-version-id 2
```

This command produces no output.

For more information, see AWS IoT Policies in the *AWS IoT Developer Guide*.

- For API details, see DeletePolicyVersion in *AWS CLI Command Reference*.

`delete-policy`

The following code example shows how to use `delete-policy`.

AWS CLI

To delete a policy

The following `delete-policy` example deletes the specified policy from your AWS account.

```
aws iot delete-policy \
    --policy-name UpdateDeviceCertPolicy
```

This command produces no output.

For more information, see AWS IoT Policies in the *AWS IoT Developers Guide*.

- For API details, see DeletePolicy in *AWS CLI Command Reference*.

`delete-provisioning-template-version`

The following code example shows how to use `delete-provisioning-template-version`.

AWS CLI

To delete a provisioning template version

The following `delete-provisioning-template-version` example deletes version 2 of the specified provisioning template.

```
aws iot delete-provisioning-template-version \
    --version-id 2 \
    --template-name "widget-template"
```

This command produces no output.

For more information, see AWS IoT Secure Tunneling in the *AWS IoT Core Developer Guide*.

- For API details, see DeleteProvisioningTemplateVersion in *AWS CLI Command Reference*.

`delete-provisioning-template`

The following code example shows how to use `delete-provisioning-template`.

AWS CLI

To delete a provisioning template

The following `delete-provisioning-template` example deletes the specified provisioning template.

```
aws iot delete-provisioning-template \
    --template-name widget-template
```

This command produces no output.

For more information, see AWS IoT Secure Tunneling in the *AWS IoT Core Developer Guide*.

- For API details, see DeleteProvisioningTemplate in *AWS CLI Command Reference*.

`delete-registration-code`

The following code example shows how to use `delete-registration-code`.

AWS CLI

To delete your registration cod

The following `delete-registration-code` example deletes an AWS IoT account-specific registration code.

```
aws iot delete-registration-code
```

This command produces no output.

For more information, see Use Your Own Certificate in the *AWS IoT Developer Guide*.

- For API details, see DeleteRegistrationCode in *AWS CLI Command Reference*.

`delete-role-alias`

The following code example shows how to use `delete-role-alias`.

AWS CLI

To delete an AWS IoT role alias

The following `delete-role-alias` example deletes an AWS IoT role alias named `LightBulbRole`.

```
aws iot delete-role-alias \
    --role-alias LightBulbRole
```

This command produces no output.

For more information, see Authorizing Direct Calls to AWS Services in the *AWS IoT Developer Guide*.

- For API details, see DeleteRoleAlias in *AWS CLI Command Reference*.

`delete-scheduled-audit`

The following code example shows how to use `delete-scheduled-audit`.

AWS CLI

To delete a scheduled audit

The following `delete-scheduled-audit` example deletes the AWS IoT Device Defender scheduled audit named `AWSIoTDeviceDefenderDailyAudit`.

```
aws iot delete-scheduled-audit \
    --scheduled-audit-name AWSIoTDeviceDefenderDailyAudit
```

This command produces no output.

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see DeleteScheduledAudit in *AWS CLI Command Reference*.

`delete-security-profile`

The following code example shows how to use `delete-security-profile`.

AWS CLI

To delete a security profile

The following `delete-security-profile` example deletes a security profile named `PossibleIssue`.

```
aws iot delete-security-profile \
    --security-profile-name PossibleIssue
```

This command produces no output.

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see DeleteSecurityProfile in *AWS CLI Command Reference*.

`delete-stream`

The following code example shows how to use `delete-stream`.

AWS CLI

To delete a stream

The following `delete-stream` example deletes the specified stream.

```
aws iot delete-stream \
    --stream-id stream12345
```

This command produces no output.

For more information, see MQTT-based file delivery in the *AWS IoT Developer Guide*.

- For API details, see DeleteStream in *AWS CLI Command Reference*.

`delete-thing-group`

The following code example shows how to use `delete-thing-group`.

AWS CLI

To delete a thing group

The following `delete-thing-group` example deletes the specified thing group. You cannot delete a thing group if it contains child thing groups.

```
aws iot delete-thing-group \
    --thing-group-name DefectiveBulbs
```

This command produces no output.

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see DeleteThingGroup in *AWS CLI Command Reference*.

`delete-thing-type`

The following code example shows how to use `delete-thing-type`.

AWS CLI

Example 1: To delete a thing type

The following `delete-thing-type` example deletes a deprecated thing type.

```
aws iot delete-thing-type \
    --thing-type-name "obsoleteThingType"
```

This command produces no output.

For more information, see Thing Types in the *AWS IoT Developers Guide*.

- For API details, see DeleteThingType in *AWS CLI Command Reference*.

`delete-thing`

The following code example shows how to use `delete-thing`.

AWS CLI

To display detailed information about a thing

The following `delete-thing` example deletes a thing from the AWS IoT registry for your AWS account.

```
aws iot delete-thing \
    --thing-name "FourthBulb"
```

This command produces no output.

For more information, see How to Manage Things with the Registry in the *AWS IoT Developers Guide*.

- For API details, see DeleteThing in *AWS CLI Command Reference*.

`delete-topic-rule-destination`

The following code example shows how to use `delete-topic-rule-destination`.

AWS CLI

To delete a topic rule destination

The following `delete-topic-rule-destination` example deletes the specified topic rule destination.

```
aws iot delete-topic-rule-destination \
    --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Disabling and deleting an HTTP action destination in the *AWS IoT Developer Guide*.

- For API details, see DeleteTopicRuleDestination in *AWS CLI Command Reference*.

`delete-topic-rule`

The following code example shows how to use `delete-topic-rule`.

AWS CLI

To delete a rule

The following `delete-topic-rule` example deletes the specified rule.

```
aws iot delete-topic-rule \
    --rule-name "LowMoistureRule"
```

This command produces no output.

For more information, see Deleting a rule in the *AWS IoT Developers Guide*.

- For API details, see DeleteTopicRule in *AWS CLI Command Reference*.

`delete-v2-logging-level`

The following code example shows how to use `delete-v2-logging-level`.

AWS CLI

To delete the logging level for a thing group

The following `delete-v2-logging-level` example deletes the logging level for the specified thing group.

```
aws iot delete-v2-logging-level \
    --target-type THING_GROUP \
    --target-name LightBulbs
```

This command produces no output.

For more information, see Configure AWS IoT logging in the *AWS IoT Developer Guide*.

- For API details, see DeleteV2LoggingLevel in *AWS CLI Command Reference*.

`deprecate-thing-type`

The following code example shows how to use `deprecate-thing-type`.

AWS CLI

Example 1: To deprecate a thing type

The following `deprecate-thing-type` example deprecates a thing type so that users can't associate any new things with it.

```
aws iot deprecate-thing-type \
    --thing-type-name "obsoleteThingType"
```

This command produces no output.

Example 2: To reverse the deprecation of a thing type

The following `deprecate-thing-type` example reverses the deprecation of a thing type, which makes it possible for users to associate new things with it again.

```
aws iot deprecate-thing-type \
    --thing-type-name "obsoleteThingType" \
    --undo-deprecate
```

This command produces no output.

For more information, see Thing Types in the *AWS IoT Developers Guide*.

- For API details, see DeprecateThingType in *AWS CLI Command Reference*.

describe-account-audit-configuration

The following code example shows how to use `describe-account-audit-configuration`.

AWS CLI

To view current audit configuration settings

The following `describe-account-audit-configuration` example lists the current settings for your AWS IoT Device Defender audit configuration.

```
aws iot describe-account-audit-configuration
```

Output:

```
{
    "roleArn": "arn:aws:iam::123456789012:role/service-role/
AWSIoTDeviceDefenderAudit_1551201085996",
    "auditNotificationTargetConfigurations": {
        "SNS": {
            "targetArn": "arn:aws:sns:us-west-2:123456789012:ddaudits",
            "roleArn": "arn:aws:iam::123456789012:role/service-role/
AWSIoTDeviceDefenderAudit",
            "enabled": true
        }
    },
    "auditCheckConfigurations": {
        "AUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK": {
            "enabled": true
        },

            "enabled": true
        },
        "LOGGING_DISABLED_CHECK": {
            "enabled": true
        },
        "REVOKED_CA_CERTIFICATE_STILL_ACTIVE_CHECK": {
            "enabled": true
        },
        "REVOKED_DEVICE_CERTIFICATE_STILL_ACTIVE_CHECK": {
            "enabled": true
        },
        "UNAUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK": {
            "enabled": true
        }
    }
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see DescribeAccountAuditConfiguration in *AWS CLI Command Reference*.

`describe-audit-finding`

The following code example shows how to use `describe-audit-finding`.

AWS CLI

To list details for an audit finding

The following `describe-audit-finding` example lists the details for the specified AWS IoT Device Defender audit finding. An audit can produce multiple findings. Use the `list-audit-findings` command to get a list of the findings from an audit to get the `findingId`.

```
aws iot describe-audit-finding \
    --finding-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "finding": {
        "findingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
```

```
        "taskId": "873ed69c74a9ec8fa9b8e88e9abc4661",
        "checkName": "IOT_POLICY_OVERLY_PERMISSIVE_CHECK",
        "taskStartTime": 1576012045.745,
        "findingTime": 1576012046.168,
        "severity": "CRITICAL",
        "nonCompliantResource": {
            "resourceType": "IOT_POLICY",
            "resourceIdentifier": {
                "policyVersionIdentifier": {
                    "policyName": "smp-ggrass-group_Core-policy",
                    "policyVersionId": "1"
                }
            }
        },
        "reasonForNonCompliance": "Policy allows broad access to IoT data plane
 actions: [iot:Subscribe, iot:Connect, iot:GetThingShadow, iot:DeleteThingShadow,
 iot:UpdateThingShadow, iot:Publish].",
        "reasonForNonComplianceCode":
 "ALLOWS_BROAD_ACCESS_TO_IOT_DATA_PLANE_ACTIONS"
    }
}
```

For more information, see Check Audit Results (Audit Commands) in the *AWS IoT Developer Guide*.

- For API details, see DescribeAuditFinding in *AWS CLI Command Reference*.

`describe-audit-mitigation-actions-task`

The following code example shows how to use `describe-audit-mitigation-actions-task`.

AWS CLI

To show the details of an audit mitigation actions task

The following `describe-audit-mitigation-actions-task` example shows the details for the specified task, where the `ResetPolicyVersionAction` was applied to a finding. The results include when the task started and ended, how many findings were targeted (and the outcome), and the definition of the action that is applied as part of this task.

```
aws iot describe-audit-mitigation-actions-task \
    --task-id ResetPolicyTask01
```

Output:

```
{
    "taskStatus": "COMPLETED",
    "startTime": "2019-12-10T15:13:19.457000-08:00",
    "endTime": "2019-12-10T15:13:19.947000-08:00",
    "taskStatistics": {
        "IOT_POLICY_OVERLY_PERMISSIVE_CHECK": {
            "totalFindingsCount": 1,
            "failedFindingsCount": 0,
            "succeededFindingsCount": 1,
            "skippedFindingsCount": 0,
            "canceledFindingsCount": 0
        }
    },
    "target": {
        "findingIds": [
            "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        ]
    },
    "auditCheckToActionsMapping": {
        "IOT_POLICY_OVERLY_PERMISSIVE_CHECK": [
            "ResetPolicyVersionAction"
        ]
    },
    "actionsDefinition": [
        {
            "name": "ResetPolicyVersionAction",
            "id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "roleArn": "arn:aws:iam::123456789012:role/service-role/
ReplacePolicyVersionRole",
            "actionParams": {
                "replaceDefaultPolicyVersionParams": {
                    "templateName": "BLANK_POLICY"
                }
            }
        }
    ]
}
```

For more information, see DescribeAuditMitigationActionsTask (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see DescribeAuditMitigationActionsTask in *AWS CLI Command Reference*.

`describe-audit-suppression`

The following code example shows how to use `describe-audit-suppression`.

AWS CLI

To get details about an audit finding suppression

The following `describe-audit-suppression` example gets details about the audit finding suppression for an expiring device certificate.

```
aws iot describe-audit-suppression \
    --check-name DEVICE_CERTIFICATE_EXPIRING_CHECK \
    --resource-
identifier deviceCertificateId=c7691e8b4a5f7d9e8c6b3a2f1e0d9c8b7a6f5e4d3c2b1a0f9e8d7c6b5a4f3
```

Output:

```
{
    "checkName": "DEVICE_CERTIFICATE_EXPIRING_CHECK",
    "resourceIdentifier": {
        "deviceCertificateId":
 "c7691e8b4a5f7d9e8c6b3a2f1e0d9c8b7a6f5e4d3c2b1a0f9e8d7c6b5a4f3e2d"
    },
    "expirationDate": "2020-08-20T00:00:00+00:00",
    "suppressIndefinitely": false
}
```

For more information, see Audit finding suppressions in the *AWS IoT Developers Guide*.

- For API details, see DescribeAuditSuppression in *AWS CLI Command Reference*.

`describe-audit-task`

The following code example shows how to use `describe-audit-task`.

AWS CLI

To get information about an audit instance

The following `describe-audit-task` example gets information about an instance of an AWS IoT Device Defender audit. If the audit is complete, summary statistics for the run are included in the results.

```
aws iot describe-audit-task \
    --task-id a3aea009955e501a31b764abe1bebd3d
```

Output:

```
{
    "taskStatus": "COMPLETED",
    "taskType": "ON_DEMAND_AUDIT_TASK",
    "taskStartTime": 1560356923.434,
    "taskStatistics": {
        "totalChecks": 3,
        "inProgressChecks": 0,
        "waitingForDataCollectionChecks": 0,
        "compliantChecks": 3,
        "nonCompliantChecks": 0,
        "failedChecks": 0,
        "canceledChecks": 0
    },
    "auditDetails": {
        "CA_CERTIFICATE_EXPIRING_CHECK": {
            "checkRunStatus": "COMPLETED_COMPLIANT",
            "checkCompliant": true,
            "totalResourcesCount": 0,
            "nonCompliantResourcesCount": 0
        },
        "DEVICE_CERTIFICATE_EXPIRING_CHECK": {
            "checkRunStatus": "COMPLETED_COMPLIANT",
            "checkCompliant": true,
            "totalResourcesCount": 6,
            "nonCompliantResourcesCount": 0
        },
        "REVOKED_CA_CERTIFICATE_STILL_ACTIVE_CHECK": {
            "checkRunStatus": "COMPLETED_COMPLIANT",
            "checkCompliant": true,
            "totalResourcesCount": 0,
            "nonCompliantResourcesCount": 0
        }
    }
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see DescribeAuditTask in *AWS CLI Command Reference*.

describe-authorizer

The following code example shows how to use `describe-authorizer`.

AWS CLI

To get information about a custom authorizer

The following `describe-authorizer` example displays details for the specified custom authorizer.

```
aws iot describe-authorizer \
    --authorizer-name CustomAuthorizer
```

Output:

```
{
    "authorizerDescription": {
        "authorizerName": "CustomAuthorizer",
        "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer",
        "authorizerFunctionArn": "arn:aws:lambda:us-
west-2:123456789012:function:CustomAuthorizerFunction",
        "tokenKeyName": "MyAuthToken",
        "tokenSigningPublicKeys": {
            "FIRST_KEY": "-----BEGIN PUBLIC KEY-----

        },
        "status": "ACTIVE",
        "creationDate": 1571245658.069,
        "lastModifiedDate": 1571245658.069
    }
}
```

For more information, see Creating and managing custom authorizers (CLI) in the *AWS IoT Developer Guide*.

- For API details, see DescribeAuthorizer in *AWS CLI Command Reference*.

`describe-billing-group`

The following code example shows how to use `describe-billing-group`.

AWS CLI

To get information about a billing group

The following `describe-billing-group` example gets information for the specified billing group.

```
aws iot describe-billing-group \
    --billing-group-name GroupOne
```

Output:

```
{
    "billingGroupName": "GroupOne",
    "billingGroupId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "billingGroupArn": "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne",
    "version": 1,
    "billingGroupProperties": {},
    "billingGroupMetadata": {
        "creationDate": 1560199355.378
    }
}
```

For more information, see Billing Groups in the *AWS IoT Developers Guide*.

- For API details, see DescribeBillingGroup in *AWS CLI Command Reference*.

`describe-ca-certificate`

The following code example shows how to use `describe-ca-certificate`.

AWS CLI

To get details about a CA certificate

The following `describe-ca-certificate` example displays the details for the specified CA certificate.

```
aws iot describe-ca-certificate \
    --certificate-
id f4efed62c0142f16af278166f61962501165c4f053629520742646005 8cd1467
```

Output:

```
{
    "certificateDescription": {
        "certificateArn": "arn:aws:iot:us-west-2:123456789012:cacert/

    }
}
```

For more information, see X.509 client certificates in the *AWS IoT Developer Guide*.

- For API details, see DescribeCertificate in *AWS CLI Command Reference*.

`describe-custom-metric`

The following code example shows how to use `describe-custom-metric`.

AWS CLI

To get information about a Device Defender custom metric

The following `describe-custom-metric` example gets information about a custom metric named `myCustomMetric`.

```
aws iot describe-custom-metric \
    --metric-name myCustomMetric
```

Output:

```
{
    "metricName": "myCustomMetric",
    "metricArn": "arn:aws:iot:us-west-2:1234564789012:custommetric/myCustomMetric",
    "metricType": "number",
    "displayName": "My custom metric",
    "creationDate": "2020-11-17T23:02:12.879000-09:00",
```

```
    "lastModifiedDate": "2020-11-17T23:02:12.879000-09:00"
}
```

For more information, see Custom metrics in the *AWS IoT Core Developer Guide*.

- For API details, see DescribeCustomMetric in *AWS CLI Command Reference*.

`describe-default-authorizer`

The following code example shows how to use `describe-default-authorizer`.

AWS CLI

To get information about the default custom authorizer

The following `describe-default-authorizer` example displays details for the default custom authorizer.

```
aws iot describe-default-authorizer
```

Output:

```
{
    "authorizerDescription": {
        "authorizerName": "CustomAuthorizer",
        "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer"
    }
}
```

For more information, see Creating and managing custom authorizers (CLI) in the *AWS IoT Developer Guide*.

- For API details, see DescribeDefaultAuthorizer in *AWS CLI Command Reference*.

`describe-dimension`

The following code example shows how to use `describe-dimension`.

AWS CLI

To get information about a dimension

The following `describe-dimension` example gets information about a dimension named `TopicFilterForAuthMessages`.

```
aws iot describe-dimension \
    --name TopicFilterForAuthMessages
```

Output:

```
{
    "name": "TopicFilterForAuthMessages",
    "arn": "arn:aws:iot:us-west-2:123456789012:dimension/
TopicFilterForAuthMessages",
    "type": "TOPIC_FILTER",
    "stringValues": [
        "device/+/auth"
    ],
    "creationDate": 1578620223.255,
    "lastModifiedDate": 1578620223.255
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see DescribeDimension in *AWS CLI Command Reference*.

`describe-domain-configuration`

The following code example shows how to use `describe-domain-configuration`.

AWS CLI

To describe a domain configuration

The following `describe-domain-configuration` example displays details about the specified domain configuration.

```
aws iot describe-domain-configuration \
    --domain-configuration-name "additionalDataDomain"
```

Output:

```
{
```

```
    "domainConfigurationName": "additionalDataDomain",
    "domainConfigurationArn": "arn:aws:iot:us-
west-2:758EXAMPLE143:domainconfiguration/additionalDataDomain/norpw",
    "domainName": "d055exampleed74y71zfd-ats.beta.us-west-2.iot.amazonaws.com",
    "serverCertificates": [],
    "domainConfigurationStatus": "ENABLED",
    "serviceType": "DATA",
    "domainType": "AWS_MANAGED",
    "lastStatusChangeDate": 1601923783.774
}
```

For more information, see Configurable Endpoints in the *AWS IoT Developer Guide*.

- For API details, see DescribeDomainConfiguration in *AWS CLI Command Reference*.

`describe-endpoint`

The following code example shows how to use `describe-endpoint`.

AWS CLI

Example 1: To get your current AWS endpoint

The following `describe-endpoint` example retrieves the default AWS endpoint to which all commands are applied.

```
aws iot describe-endpoint
```

Output:

```
{
    "endpointAddress": "abc123defghijk.iot.us-west-2.amazonaws.com"
}
```

For more information, see DescribeEndpoint in the *AWS IoT Developer Guide*.

Example 2: To get your ATS endpoint

The following `describe-endpoint` example retrieves the Amazon Trust Services (ATS) endpoint.

```
aws iot describe-endpoint \
    --endpoint-type iot:Data-ATS
```

Output:

```
{
    "endpointAddress": "abc123defghijk-ats.iot.us-west-2.amazonaws.com"
}
```

For more information, see X.509 Certificates and AWS IoT in the *AWS IoT Developer Guide*.

- For API details, see DescribeEndpoint in *AWS CLI Command Reference*.

`describe-event-configurations`

The following code example shows how to use `describe-event-configurations`.

AWS CLI

To show which event types are published

The following `describe-event-configurations` example lists the configuration that controls which events are generated when something is added, updated, or deleted.

```
aws iot describe-event-configurations
```

Output:

```
{
    "eventConfigurations": {
        "CA_CERTIFICATE": {
            "Enabled": false
        },
        "CERTIFICATE": {
            "Enabled": false
        },
        "JOB": {
            "Enabled": false
        },
        "JOB_EXECUTION": {
```

```
            "Enabled": false
        },
        "POLICY": {
            "Enabled": false
        },
        "THING": {
            "Enabled": false
        },
        "THING_GROUP": {
            "Enabled": false
        },
        "THING_GROUP_HIERARCHY": {
            "Enabled": false
        },
        "THING_GROUP_MEMBERSHIP": {
            "Enabled": false
        },
        "THING_TYPE": {
            "Enabled": false
        },
        "THING_TYPE_ASSOCIATION": {
            "Enabled": false
        }
    }
}
```

For more information, see Event Messages in the *AWS IoT Developer Guide*.

- For API details, see DescribeEventConfigurations in *AWS CLI Command Reference*.

`describe-index`

The following code example shows how to use `describe-index`.

AWS CLI

To retrieve the current status of the thing index

The following `describe-index` example retrieves the current status of the thing index.

```
aws iot describe-index \
    --index-name "AWS_Things"
```

Output:

```
{
    "indexName": "AWS_Things",
    "indexStatus": "ACTIVE",
    "schema": "REGISTRY_AND_SHADOW_AND_CONNECTIVITY_STATUS"
}
```

For more information, see Managing Thing Indexing in the *AWS IoT Developer Guide*.

- For API details, see DescribeIndex in *AWS CLI Command Reference*.

`describe-job-execution`

The following code example shows how to use `describe-job-execution`.

AWS CLI

To get execution details for a job on a device

The following `describe-job-execution` example gets execution details for the specified job.

```
aws iot describe-job-execution \
    --job-id "example-job-01" \
    --thing-name "MyRaspberryPi"
```

Output:

```
{
    "execution": {
        "jobId": "example-job-01",
        "status": "QUEUED",
        "statusDetails": {},
        "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyRaspberryPi",
        "queuedAt": 1560787023.636,
        "lastUpdatedAt": 1560787023.636,
        "executionNumber": 1,
        "versionNumber": 1
    }
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see DescribeJobExecution in *AWS CLI Command Reference*.

`describe-job`

The following code example shows how to use `describe-job`.

AWS CLI

To get detailed status for a job

The following `describe-job` example gets detailed status for the job whose ID is `example-job-01`.

```
aws iot describe-job \
    --job-id "example-job-01"
```

Output:

```
{
    "job": {
        "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-01",
        "jobId": "example-job-01",
        "targetSelection": "SNAPSHOT",
        "status": "IN_PROGRESS",
        "targets": [
            "arn:aws:iot:us-west-2:123456789012:thing/MyRaspberryPi"
        ],
        "description": "example job test",
        "presignedUrlConfig": {},
        "jobExecutionsRolloutConfig": {},
        "createdAt": 1560787022.733,
        "lastUpdatedAt": 1560787026.294,
        "jobProcessDetails": {
            "numberOfCanceledThings": 0,
            "numberOfSucceededThings": 0,
            "numberOfFailedThings": 0,
            "numberOfRejectedThings": 0,
            "numberOfQueuedThings": 1,
            "numberOfInProgressThings": 0,
            "numberOfRemovedThings": 0,
            "numberOfTimedOutThings": 0
        },
```

```
        "timeoutConfig": {}
    }
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see DescribeJob in *AWS CLI Command Reference*.

`describe-mitigation-action`

The following code example shows how to use `describe-mitigation-action`.

AWS CLI

To view the details for a defined mitigation action

The following `describe-mitigation-action` example displays details for the specified mitigation action.

```
aws iot describe-mitigation-action \
    --action-name AddThingsToQuarantineGroupAction
```

Output:

```
{
    "actionName": "AddThingsToQuarantineGroupAction",
    "actionType": "ADD_THINGS_TO_THING_GROUP",
    "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
AddThingsToQuarantineGroupAction",
    "actionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "roleArn": "arn:aws:iam::123456789012:role/service-role/
MoveThingsToQuarantineGroupRole",
    "actionParams": {
        "addThingsToThingGroupParams": {
            "thingGroupNames": [
                "QuarantineGroup1"
            ],
            "overrideDynamicGroups": true
        }
    },
    "creationDate": "2019-12-10T11:09:35.999000-08:00",
    "lastModifiedDate": "2019-12-10T11:09:35.999000-08:00"
```

```
}
```

For more information, see DescribeMitigationAction (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see DescribeMitigationAction in *AWS CLI Command Reference*.

`describe-provisioning-template-version`

The following code example shows how to use `describe-provisioning-template-version`.

AWS CLI

To describe a provisioning template version

The following `describe-provisioning-template-version` example describes a provisioning template version.

```
aws iot describe-provisioning-template-version \
    --template-name MyTestProvisioningTemplate \
    --version-id 1
```

Output:

```
{
    "versionId": 1,
    "creationDate": 1589308310.574,
    "templateBody": "{\"Parameters\":{\"SerialNumber\":{\"Type\":\"String\"},
\"AWS::IoT::Certificate::Id\":{\"Type\":\"String\"}},\"Resources\":{\"certificate
\":{\"Properties\":{\"CertificateId\":{\"Ref\":\"AWS::IoT::Certificate::Id\"},
\"Status\":\"Active\"},\"Type\":\"AWS::IoT::Certificate\"},\"policy\":{\"Properties
\":{\"PolicyName\":\"MyIotPolicy\"},\"Type\":\"AWS::IoT::Policy\"},\"thing\":
{\"OverrideSettings\":{\"AttributePayload\":\"MERGE\",\"ThingGroups\":\"DO_NOTHING
\",\"ThingTypeName\":\"REPLACE\"},\"Properties\":{\"AttributePayload\":{},
\"ThingGroups\":[],\"ThingName\":{\"Fn::Join\":[\"\",[\"DemoGroup_\",{\"Ref\":
\"SerialNumber\"}]]},\"ThingTypeName\":\"VirtualThings\"},\"Type\":\"AWS::IoT::Thing
\"}}}",
    "isDefaultVersion": true
}
```

For more information, see Provisioning devices that don't have device certificates using fleet provisioning in the *AWS IoT Core Developers Guide*.

- For API details, see DescribeProvisioningTemplateVersion in *AWS CLI Command Reference*.

`describe-provisioning-template`

The following code example shows how to use `describe-provisioning-template`.

AWS CLI

To describe a provisioning template

The following `describe-provisioning-template` example describes a provisioning template.

```
aws iot describe-provisioning-template \
    --template-name MyTestProvisioningTemplate
```

Output:

```
{
    "templateArn": "arn:aws:iot:us-west-2:57EXAMPLE833:provisioningtemplate/
MyTestProvisioningTemplate",
    "templateName": "MyTestProvisioningTemplate",
    "creationDate": 1589308310.574,
    "lastModifiedDate": 1589308345.539,
    "defaultVersionId": 1,
    "templateBody": "{\"Parameters\":{\"SerialNumber\":{\"Type\":\"String\"},
\"AWS::IoT::Certificate::Id\":{\"Type\":\"String\"}},\"Resources\":{\"certificate
\":{\"Properties\":{\"CertificateId\":{\"Ref\":\"AWS::IoT::Certificate::Id\"},
\"Status\":\"Active\"},\"Type\":\"AWS::IoT::Certificate\"},\"policy\":{\"Properties
\":{\"PolicyName\":\"MyIotPolicy\"},\"Type\":\"AWS::IoT::Policy\"},\"thing\":
{\"OverrideSettings\":{\"AttributePayload\":\"MERGE\",\"ThingGroups\":\"DO_NOTHING
\",\"ThingTypeName\":\"REPLACE\"},\"Properties\":{\"AttributePayload\":{},
\"ThingGroups\":[],\"ThingName\":{\"Fn::Join\":[\"\",[\"DemoGroup_\",{\"Ref\":
\"SerialNumber\"}]]},\"ThingTypeName\":\"VirtualThings\"},\"Type\":\"AWS::IoT::Thing
\"}}}",
    "enabled": true,
    "provisioningRoleArn": "arn:aws:iam::123456789012:role/service-role/IoT_access"
}
```

For more information, see Provisioning devices that don't have device certificates using fleet provisioning in the *AWS IoT Core Developers Guide*.

- For API details, see DescribeProvisioningTemplate in *AWS CLI Command Reference*.

`describe-role-alias`

The following code example shows how to use `describe-role-alias`.

AWS CLI

To get information about an AWS IoT role alias

The following `describe-role-alias` example displays details for the specified role alias.

```
aws iot describe-role-alias \
    --role-alias LightBulbRole
```

Output:

```
{
    "roleAliasDescription": {
        "roleAlias": "LightBulbRole",
        "roleAliasArn": "arn:aws:iot:us-west-2:123456789012:rolealias/
LightBulbRole",
        "roleArn": "arn:aws:iam::123456789012:role/light_bulb_role_001",
        "owner": "123456789012",
        "credentialDurationSeconds": 3600,
        "creationDate": 1570558643.221,
        "lastModifiedDate": 1570558643.221
    }
}
```

For more information, see Authorizing direct calls to AWS services using AWS IoT Core credential provider in the *AWS IoT Core Developer Guide*.

- For API details, see DescribeRoleAlias in *AWS CLI Command Reference*.

`describe-scheduled-audit`

The following code example shows how to use `describe-scheduled-audit`.

AWS CLI

To get information about a scheduled audit

The following `describe-scheduled-audit` example gets detailed information about an AWS IOT Device Defender scheduled audit named `AWSIoTDeviceDefenderDailyAudit`.

```
aws iot describe-scheduled-audit \
    --scheduled-audit-name AWSIoTDeviceDefenderDailyAudit
```

Output:

```
{
    "frequency": "DAILY",
    "targetCheckNames": [
        "AUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK",
        "CONFLICTING_CLIENT_IDS_CHECK",
        "DEVICE_CERTIFICATE_SHARED_CHECK",
        "IOT_POLICY_OVERLY_PERMISSIVE_CHECK",
        "REVOKED_CA_CERTIFICATE_STILL_ACTIVE_CHECK",
        "UNAUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK"
    ],
    "scheduledAuditName": "AWSIoTDeviceDefenderDailyAudit",
    "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/
AWSIoTDeviceDefenderDailyAudit"
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see DescribeScheduledAudit in *AWS CLI Command Reference*.

`describe-security-profile`

The following code example shows how to use `describe-security-profile`.

AWS CLI

To get information about a security profile

The following `describe-security-profile` example gets information about the AWS IoT Device Defender security profile named `PossibleIssue`.

```
aws iot describe-security-profile \
    --security-profile-name PossibleIssue
```

Output:

```
{
    "securityProfileName": "PossibleIssue",
```

```
    "securityProfileArn": "arn:aws:iot:us-west-2:123456789012:securityprofile/
PossibleIssue",
    "securityProfileDescription": "check to see if authorization fails 10 times in 5
 minutes or if cellular bandwidth exceeds 128",
    "behaviors": [
        {
            "name": "CellularBandwidth",
            "metric": "aws:message-byte-size",
            "criteria": {
                "comparisonOperator": "greater-than",
                "value": {
                    "count": 128
                },
                "consecutiveDatapointsToAlarm": 1,
                "consecutiveDatapointsToClear": 1
            }
        },
        {
            "name": "Authorization",
            "metric": "aws:num-authorization-failures",
            "criteria": {
                "comparisonOperator": "greater-than",
                "value": {
                    "count": 10
                },
                "durationSeconds": 300,
                "consecutiveDatapointsToAlarm": 1,
                "consecutiveDatapointsToClear": 1
            }
        }
    ],
    "version": 1,
    "creationDate": 1560278102.528,
    "lastModifiedDate": 1560278102.528
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see DescribeSecurityProfile in *AWS CLI Command Reference*.

`describe-stream`

The following code example shows how to use `describe-stream`.

AWS CLI

To get information about a stream

The following `describe-stream` example displays the details about the specified stream.

```
aws iot describe-stream \
    --stream-id stream12345
```

Output:

```
{
    "streamInfo": {
        "streamId": "stream12345",
        "streamArn": "arn:aws:iot:us-west-2:123456789012:stream/stream12345",
        "streamVersion": 1,
        "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
        "files": [
            {
                "fileId": 123,
                "s3Location": {
                    "bucket":"codesign-ota-bucket",
                    "key":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
                }
            }
        ],
        "createdAt": 1557863215.995,
        "lastUpdatedAt": 1557863215.995,
        "roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_stream_role"
    }
}
```

For more information, see MQTT-based file delivery in the *AWS IoT Core Developer Guide*.

- For API details, see DescribeStream in *AWS CLI Command Reference*.

`describe-thing-group`

The following code example shows how to use `describe-thing-group`.

AWS CLI

To get information about a thing group

The following `describe-thing-group` example gets information about the thing group named `HalogenBulbs`.

```
aws iot describe-thing-group \
    --thing-group-name HalogenBulbs
```

Output:

```
{
    "thingGroupName": "HalogenBulbs",
    "thingGroupId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "thingGroupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/HalogenBulbs",
    "version": 1,
    "thingGroupProperties": {},
    "thingGroupMetadata": {
        "parentGroupName": "LightBulbs",
        "rootToParentThingGroups": [
            {
                "groupName": "LightBulbs",
                "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/
LightBulbs"
            }
        ],
        "creationDate": 1559927609.897
    }
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see DescribeThingGroup in *AWS CLI Command Reference*.

`describe-thing-type`

The following code example shows how to use `describe-thing-type`.

AWS CLI

To get information about a thing type

The following `describe-thing-type` example display information about the specified thing type defined in your AWS account.

```
aws iot describe-thing-type \
    --thing-type-name "LightBulb"
```

Output:

```
{
    "thingTypeName": "LightBulb",
    "thingTypeId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "thingTypeArn": "arn:aws:iot:us-west-2:123456789012:thingtype/LightBulb",
    "thingTypeProperties": {
        "thingTypeDescription": "light bulb type",
        "searchableAttributes": [
            "model",
            "wattage"
        ]
    },
    "thingTypeMetadata": {
        "deprecated": false,
        "creationDate": 1559772562.498
    }
}
```

For more information, see Thing Types in the *AWS IoT Developers Guide*.

- For API details, see DescribeThingType in *AWS CLI Command Reference*.

`describe-thing`

The following code example shows how to use `describe-thing`.

AWS CLI

To display detailed information about a thing

The following `describe-thing` example display information about a thing (device) that is defined in the AWS IoT registry for your AWS account.

aws iot describe-thing --thing-name "MyLightBulb"

Output:

```
{
```

```
    "defaultClientId": "MyLightBulb",
    "thingName": "MyLightBulb",
    "thingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyLightBulb",
    "thingTypeName": "LightBulb",
    "attributes": {
        "model": "123",
        "wattage": "75"
    },
    "version": 1
}
```

For more information, see How to Manage Things with the Registry in the *AWS IoT Developers Guide*.

- For API details, see DescribeThing in *AWS CLI Command Reference*.

`detach-policy`

The following code example shows how to use `detach-policy`.

AWS CLI

Example 1: To detach an AWS IoT policy from a thing group

The following `detach-policy` example detaches the specified policy from a thing group and, by extension, from all things in that group and any of the group's child groups.

```
aws iot detach-policy \
    --target "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs" \
    --policy-name "MyFirstGroup_Core-policy"
```

This command produces no output.

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

Example 2: To detach an AWS IoT policy from a device certificate

The following `detach-policy` example detaches the TemperatureSensorPolicy policy from a device certificate identified by ARN.

```
aws iot detach-policy \
    --policy-name TemperatureSensorPolicy \
```

```
    --target arn:aws:iot:us-
west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142
```

This command produces no output.

- For API details, see DetachPolicy in *AWS CLI Command Reference*.

`detach-security-profile`

The following code example shows how to use `detach-security-profile`.

AWS CLI

To disassociate a security profile from a target

The following `detach-security-profile` example removes the association between the AWS IoT Device Defender security profile named `Testprofile` and the all registered things target.

```
aws iot detach-security-profile \
    --security-profile-name Testprofile \
    --security-profile-target-arn "arn:aws:iot:us-west-2:123456789012:all/
registered-things"
```

This command produces no output.

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see DetachSecurityProfile in *AWS CLI Command Reference*.

`detach-thing-principal`

The following code example shows how to use `detach-thing-principal`.

AWS CLI

To detach a certificate/principal from a thing

The following `detach-thing-principal` example removes a certificate that represents a principal from the specified thing.

```
aws iot detach-thing-principal \
```

```
    --thing-name "MyLightBulb" \
    --principal "arn:aws:iot:us-
west-2:123456789012:cert/604c48437a57b7d5fc5d137c5be75011c6ee67c9a6943683a1acb4b1626bac36"
```

This command produces no output.

For more information, see How to Manage Things with the Registry in the *AWS IoT Developers Guide*.

- For API details, see DetachThingPrincipal in *AWS CLI Command Reference*.

`disable-topic-rule`

The following code example shows how to use `disable-topic-rule`.

AWS CLI

To disable a topic rule

The following `disable-topic-rule` example disables the specified topic rule.

```
aws iot disable-topic-rule \
    --rule-name "MyPlantPiMoistureAlertRule"
```

This command produces no output.

For more information, see Viewing a rule in the *AWS IoT Developer Guide*.

- For API details, see DisableTopicRule in *AWS CLI Command Reference*.

`enable-topic-rule`

The following code example shows how to use `enable-topic-rule`.

AWS CLI

To enable a topic rule

The following `enable-topic-rule` example enables (or re-enables) the specified topic rule.

```
aws iot enable-topic-rule \
    --rule-name "MyPlantPiMoistureAlertRule"
```

This command produces no output.

For more information, see Viewing a rule in the *AWS IoT Developer Guide*.

- For API details, see EnableTopicRule in *AWS CLI Command Reference*.

`get-behavior-model-training-summaries`

The following code example shows how to use `get-behavior-model-training-summaries`.

AWS CLI

To list a Device Defender's ML Detect Security Profile training model's status

The following `get-behavior-model-training-summaries` example lists model training status for the configured behaviors in the chosen Security Profile. For each behavior, the name, model status, and percentage of datapoints collected are listed.

```
aws iot get-behavior-model-training-summaries \
    --security-profile-name MySecuirtyProfileName
```

Output:

```
{
    "summaries": [
        {
            "securityProfileName": "MySecuirtyProfileName",
            "behaviorName": "Messages_sent_ML_behavior",
            "modelStatus": "PENDING_BUILD",
            "datapointsCollectionPercentage": 0.0
        },
        {
            "securityProfileName": "MySecuirtyProfileName",
            "behaviorName": "Messages_received_ML_behavior",
            "modelStatus": "PENDING_BUILD",
            "datapointsCollectionPercentage": 0.0
        },
        {
            "securityProfileName": "MySecuirtyProfileName",
            "behaviorName": "Authorization_failures_ML_behavior",
            "modelStatus": "PENDING_BUILD",
            "datapointsCollectionPercentage": 0.0
        },
```

```
        {
            "securityProfileName": "MySecuirtyProfileName",
            "behaviorName": "Message_size_ML_behavior",
            "modelStatus": "PENDING_BUILD",
            "datapointsCollectionPercentage": 0.0
        },
        {
            "securityProfileName": "MySecuirtyProfileName",
            "behaviorName": "Connection_attempts_ML_behavior",
            "modelStatus": "PENDING_BUILD",
            "datapointsCollectionPercentage": 0.0
        },
        {
            "securityProfileName": "MySPNoALerts",
            "behaviorName": "Disconnects_ML_behavior",
            "modelStatus": "PENDING_BUILD",
            "datapointsCollectionPercentage": 0.0
        }
    ]
}
```

For more information, see GetBehaviorModelTrainingSummaries (Detect Commands) in the *AWS IoT Developer Guide*.

- For API details, see GetBehaviorModelTrainingSummaries in *AWS CLI Command Reference*.

`get-cardinality`

The following code example shows how to use `get-cardinality`.

AWS CLI

To return the approximate count of unique values that match the query

The following `get-cardinality` example returns the number of racks that have temperature sensors reporting abnormal temperature values. To set up the example, you can use the following setup script to create 10 things representing 10 temperature sensors. Each new thing has 3 attributes.

```
# Bash script. If in other shells, type `bash` before running
Temperatures=(70 71 72 73 74 75 47 97 98 99)
Racks=(Rack1 Rack1 Rack2 Rack2 Rack3 Rack4 Rack5 Rack6 Rack6 Rack6)
```

```
IsNormal=(true true true true true false false false false false)
for ((i=0; i<10 ; i++))
do
  thing=$(aws iot create-thing --thing-name "TempSensor$i" --attribute-payload
 attributes="{temperature=${Temperatures[i]},rackId=${Racks[i]},stateNormal=
${IsNormal[i]}}")
  aws iot describe-thing --thing-name "TempSensor$i"
done
```

Example output of the setup script:

```
{
    "version": 1,
    "thingName": "TempSensor0",
    "defaultClientId": "TempSensor0",
    "attributes": {
        "rackId": "Rack1",
        "stateNormal": "true",
        "temperature": "70"
    },
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/TempSensor0",
    "thingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

The following `get-cardinality` example queries the 10 sensors created by the setup script and returns the number of racks that have temperature sensors reporting abnormal temperature values. If the temperature value is below 60 or above 80, the temperature sensor is in an abnormal state.

```
aws iot get-cardinality \
    --aggregation-field "attributes.rackId" \
    --query-string "thingName:TempSensor* AND attributes.stateNormal:false"
```

Output:

```
{
    "cardinality": 2
}
```

For more information, see Querying for aggregate data in the *AWS IoT Core Developer Guide*.

- For API details, see GetCardinality in *AWS CLI Command Reference*.

`get-effective-policies`

The following code example shows how to use `get-effective-policies`.

AWS CLI

To list the policies that effect a thing

The following `get-effective-policies` example lists the policies that effect the specified thing, including policies attached to any groups to which it belongs.

```
aws iot get-effective-policies \
    --thing-name TemperatureSensor-001 \
    --principal arn:aws:iot:us-
west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142
```

Output:

```
{
    "effectivePolicies": [
        {
            "policyName": "TemperatureSensorPolicy",
            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
TemperatureSensorPolicy",
            "policyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":
[{\"Effect\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Receive\"],\"Resource
\":[\"arn:aws:iot:us-west-2:123456789012:topic/topic_1\",\"arn:aws:iot:us-
west-2:123456789012:topic/topic_2\"]},{\"Effect\":\"Allow\",\"Action\":
[\"iot:Subscribe\"],\"Resource\":[\"arn:aws:iot:us-west-2:123456789012:topicfilter/
topic_1\",\"arn:aws:iot:us-west-2:123456789012:topicfilter/topic_2\"]},{\"Effect
\":\"Allow\",\"Action\":[\"iot:Connect\"],\"Resource\":[\"arn:aws:iot:us-
west-2:123456789012:client/basicPubSub\"]}]}"
        }
    ]
}
```

For more information, see Get Effective Policies for a Thing in the *AWS IoT Developers Guide*.

- For API details, see GetEffectivePolicies in *AWS CLI Command Reference*.

`get-indexing-configuration`

The following code example shows how to use `get-indexing-configuration`.

AWS CLI

To get the thing indexing configuration

The following `get-indexing-configuration` example gets the current configuration data for AWS IoT fleet indexing.

```
aws iot get-indexing-configuration
```

Output:

```
{
    "thingIndexingConfiguration": {
        "thingIndexingMode": "OFF",
        "thingConnectivityIndexingMode": "OFF"
    },
    "thingGroupIndexingConfiguration": {
        "thingGroupIndexingMode": "OFF"
    }
}
```

For more information, see Managing Thing Indexing in the *AWS IoT Developers Guide*.

- For API details, see GetIndexingConfiguration in *AWS CLI Command Reference*.

`get-job-document`

The following code example shows how to use `get-job-document`.

AWS CLI

To retrieve the document for a job

The following `get-job-document` example displays details about the document for the job whose ID is `example-job-01`.

```
aws iot get-job-document \
    --job-id "example-job-01"
```

Output:

```
{
```

```
    "document": "\n{\n    \"operation\":\"customJob\",\n    \"otherInfo\":
\"someValue\"\n}\n"
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see GetJobDocument in *AWS CLI Command Reference*.

`get-logging-options`

The following code example shows how to use `get-logging-options`.

AWS CLI

To get the logging options

The following `get-logging-options` example gets the current logging options for your AWS account.

```
aws iot get-logging-options
```

Output:

```
{
    "roleArn": "arn:aws:iam::123456789012:role/service-role/iotLoggingRole",
    "logLevel": "ERROR"
}
```

For more information, see Configure AWS IoT logging in the *AWS IoT Core Developer Guide*.

- For API details, see GetLoggingOptions in *AWS CLI Command Reference*.

`get-ota-update`

The following code example shows how to use `get-ota-update`.

AWS CLI

To retrieve information about an OTA Update

The following `get-ota-update` example displays details about the specified OTA Update.

```
aws iot get-ota-update \
```

```
    --ota-update-id ota12345
```

Output:

```
{
    "otaUpdateInfo": {
        "otaUpdateId": "ota12345",
        "otaUpdateArn": "arn:aws:iot:us-west-2:123456789012:otaupdate/itsaupdate",
        "creationDate": "2019-05-14T19:46:55.995000+00:00",
        "lastModifiedDate": "2019-05-14T19:46:55.995000+00:00",
        "description": "A critical update needed right away.",
        "targets": [
            "device1",
            "device2",
            "device3",
            "device4"
        ],
        "targetSelection": "SNAPSHOT",
        "protocols": ["HTTP"],
        "awsJobExecutionsRolloutConfig": {
            "maximumPerMinute": 10
        },
        "otaUpdateFiles": [
            {
                "fileName": "firmware.bin",
                "fileLocation": {
                    "stream": {
                        "streamId": "004",
                        "fileId": 123
                    }
                },
                "codeSigning": {
                    "awsSignerJobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
                }
            }
        ],
        "otaUpdateStatus": "CREATE_COMPLETE",
        "awsIotJobId": "job54321",
        "awsIotJobArn": "arn:aws:iot:us-west-2:123456789012:job/job54321",
        "errorInfo": {
        }
    }
}
```

For more information, see FreeRTOS Over-the-Air Updates in the *FreeRTOS User Guide*.

- For API details, see GetOtaUpdate in *AWS CLI Command Reference*.

`get-percentiles`

The following code example shows how to use `get-percentiles`.

AWS CLI

To group the aggregated values that match the query into percentile groupings

The following `get-percentiles` example groups the temperature values reported by temperature sensors into percentile groupings. To set up the example, you can use the following setup script to create 10 things representing 10 temperature sensors. Each new thing has 1 attribute.

```
# Bash script. If in other shells, type `bash` before running
Temperatures=(70 71 72 73 74 75 47 97 98 99)
for ((i=0; i<10 ; i++))
do
    thing=$(aws iot create-thing --thing-name "TempSensor$i" --attribute-payload
 attributes="{temperature=${Temperatures[i]}}")
    aws iot describe-thing --thing-name "TempSensor$i"
done
```

Example output of the setup script:

```
{
    "version": 1,
    "thingName": "TempSensor0",
    "defaultClientId": "TempSensor0",
    "attributes": {
        "temperature": "70"
    },
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/TempSensor0",
    "thingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

The following `get-percentiles` example queries the 10 sensors created by the setup script and returns a value for each percentile group specified. The percentile group "10" contains the aggregated field value that occurs in approximately 10 percent of the values that match the

query. In the following output, {"percent": 10.0, "value": 67.7} means approximately 10.0% of the temperature values are below 67.7.

```
aws iot get-percentiles \
    --aggregation-field "attributes.temperature" \
    --query-string "thingName:TempSensor*" \
    --percents 10 25 50 75 90
```

Output:

```
{
    "percentiles": [
        {
            "percent": 10.0,
            "value": 67.7
        },
        {
            "percent": 25.0,
            "value": 71.25
        },
        {
            "percent": 50.0,
            "value": 73.5
        },
        {
            "percent": 75.0,
            "value": 91.5
        },
        {
            "percent": 90.0,
            "value": 98.1
        }
    ]
}
```

For more information, see Querying for Aggregate Data in the *AWS IoT Developer Guide*.

- For API details, see GetPercentiles in *AWS CLI Command Reference*.

`get-policy-version`

The following code example shows how to use `get-policy-version`.

AWS CLI

To get information about a specific version of a policy

The following `get-policy-version` example gets information about the first version of the specified policy.

```
aws iot get-policy-version \
    --policy-name UpdateDeviceCertPolicy \
    --policy-version-id "1"
```

Output:

```
{
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/UpdateDeviceCertPolicy",
    "policyName": "UpdateDeviceCertPolicy",
    "policyDocument": "{ \"Version\": \"2012-10-17\", \"Statement\": [ { \"Effect\":
 \"Allow\", \"Action\":  \"iot:UpdateCertificate\", \"Resource\": \"*\" } ] }",
    "policyVersionId": "1",
    "isDefaultVersion": false,
    "creationDate": 1559925941.924,
    "lastModifiedDate": 1559926175.458,
    "generationId":
 "5066f1b6712ce9d2a1e56399771649a272d6a921762fead080e24fe52f24e042"
}
```

For more information, see AWS IoT Policies in the *AWS IoT Developers Guide*.

- For API details, see GetPolicyVersion in *AWS CLI Command Reference*.

`get-policy`

The following code example shows how to use `get-policy`.

AWS CLI

To get information about the default version of a policy

The following `get-policy` example retrieves information about the default version of the specified policy.

```
aws iot get-policy \
```

```
    --policy-name UpdateDeviceCertPolicy
```

Output:

```
{
    "policyName": "UpdateDeviceCertPolicy",
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/UpdateDeviceCertPolicy",
    "policyDocument": "{ \"Version\": \"2012-10-17\", \"Statement\": [ { \"Effect\":
 \"Allow\", \"Action\":  \"iot:UpdateCertificate\", \"Resource\": \"*\" } ] }",
    "defaultVersionId": "2",
    "creationDate": 1559925941.924,
    "lastModifiedDate": 1559925941.924,
    "generationId":
 "5066f1b6712ce9d2a1e56399771649a272d6a921762fead080e24fe52f24e042"
}
```

For more information, see AWS IoT Policies in the *AWS IoT Developers Guide*.

- For API details, see GetPolicy in *AWS CLI Command Reference*.

`get-registration-code`

The following code example shows how to use `get-registration-code`.

AWS CLI

To get your AWS account-specific registration code

The following `get-registration-code` example retrieves your AWS account-specific registration code.

```
aws iot get-registration-code
```

Output:

```
{
    "registrationCode":
 "15c51ae5e36ba59ba77042df1115862076bea4bd15841c838fcb68d5010a614c"
}
```

For more information, see Use Your Own Certificate in the *AWS IoT Developer Guide*.

- For API details, see GetRegistrationCode in *AWS CLI Command Reference*.

`get-statistics`

The following code example shows how to use `get-statistics`.

AWS CLI

To search the device index for aggregate data

The following `get-statistics` example returns the number of things that have a property called `connectivity.connected` set to `false` (that is, the number of devices that are not connected) in their device shadow.

```
aws iot get-statistics \
    --index-name AWS_Things \
    --query-string "connectivity.connected:false"
```

Output:

```
{
    "statistics": {
        "count": 6
    }
}
```

For more information, see Getting Statistics About Your Device Fleet in the *AWS IoT Developer Guide*.

- For API details, see GetStatistics in *AWS CLI Command Reference*.

`get-topic-rule-destination`

The following code example shows how to use `get-topic-rule-destination`.

AWS CLI

To get a topic rule destination

The following `get-topic-rule-destination` example gets information about a topic rule destination.

```
aws iot get-topic-rule-destination \
```

```
    --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "topicRuleDestination": {
        "arn": "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "status": "DISABLED",
        "httpUrlProperties": {
            "confirmationUrl": "https://example.com"
        }
    }
}
```

For more information, see HTTP action destinations in the *AWS IoT Developer Guide*.

- For API details, see GetTopicRuleDestination in *AWS CLI Command Reference*.

`get-topic-rule`

The following code example shows how to use `get-topic-rule`.

AWS CLI

To get information about a rule

The following `get-topic-rule` example gets information about the specified rule.

```
aws iot get-topic-rule \
    --rule-name MyRPiLowMoistureAlertRule
```

Output:

```
{
    "ruleArn": "arn:aws:iot:us-west-2:123456789012:rule/MyRPiLowMoistureAlertRule",
    "rule": {
        "ruleName": "MyRPiLowMoistureAlertRule",
        "sql": "SELECT * FROM '$aws/things/MyRPi/shadow/update/accepted' WHERE
 state.reported.moisture = 'low'\n                    ",
        "description": "Sends an alert whenever soil moisture level readings are too
 low.",
```

```
        "createdAt": 1558624363.0,
        "actions": [
            {
                "sns": {
                    "targetArn": "arn:aws:sns:us-
west-2:123456789012:MyRPiLowMoistureTopic",
                    "roleArn": "arn:aws:iam::123456789012:role/service-role/
MyRPiLowMoistureTopicRole",
                    "messageFormat": "RAW"
                }
            }
        ],
        "ruleDisabled": false,
        "awsIotSqlVersion": "2016-03-23"
    }
}
```

For more information, see Viewing a rule in the *AWS IoT Developers Guide*.

- For API details, see GetTopicRule in *AWS CLI Command Reference*.

`get-v2-logging-options`

The following code example shows how to use `get-v2-logging-options`.

AWS CLI

To list the current logging options

The following `get-v2-logging-options` example lists the current logging options for AWS IoT.

```
aws iot get-v2-logging-options
```

Output:

```
{
    "roleArn": "arn:aws:iam::123456789012:role/service-role/iotLoggingRole",
    "defaultLogLevel": "WARN",
    "disableAllLogs": false
}
```

For more information, see Configure AWS IoT logging in the *AWS IoT Core Developer Guide*.

- For API details, see GetV2LoggingOptions in *AWS CLI Command Reference*.

`list-active-violations`

The following code example shows how to use `list-active-violations`.

AWS CLI

To list the active violations

The following `list-active-violations` example lists all violations for the specified security profile.

```
aws iot list-active-violations \
    --security-profile-name Testprofile
```

Output:

```
{
    "activeViolations": [
        {
            "violationId": "174db59167fa474c80a652ad1583fd44",
            "thingName": "iotconsole-1560269126751-1",
            "securityProfileName": "Testprofile",
            "behavior": {
                "name": "Authorization",

            "violationStartTime": 1560276600.0
        }
    ]
}
```

For more information, see Detect in the *AWS IoT Device Defender Developer Guide*.

- For API details, see ListActiveViolations in *AWS CLI Command Reference*.

`list-attached-policies`

The following code example shows how to use `list-attached-policies`.

AWS CLI

Example 1: To list the policies attached to a group

The following `list-attached-policies` example lists the policies that are attached to the specified group.

```
aws iot list-attached-policies \
```

```
    --target "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs"
```

Output:

```
{
    "policies": [
        {
            "policyName": "UpdateDeviceCertPolicy",
            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
UpdateDeviceCertPolicy"
        }
    ]
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

Example 2: To list the policies attached to a device certificate

The following `list-attached-policies` example lists the AWS IoT policies attached to the device certificate. The certificate is identified by its ARN.

```
aws iot list-attached-policies \
    --target arn:aws:iot:us-
west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142
```

Output:

```
{
    "policies": [
        {
            "policyName": "TemperatureSensorPolicy",
            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
TemperatureSensorPolicy"
        }
    ]
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see ListAttachedPolicies in *AWS CLI Command Reference*.

`list-audit-findings`

The following code example shows how to use `list-audit-findings`.

AWS CLI

Example 1: To list all findings from an audit

The following `list-audit-findings` example lists all findings from an AWS IoT Device Defender audit with a specified task ID.

```
aws iot list-audit-findings \
    --task-id a3aea009955e501a31b764abe1bebd3d
```

Output:

```
{
    "findings": []
}
```

Example 2: To list findings for an audit check type

The following `list-audit-findings` example shows findings from AWS IoT Device Defender audits that ran between June 5, 2019 and June 19, 2019 in which devices are sharing a device certificate. When you specify a check name, you must provide a start and end time.

```
aws iot list-audit-findings \
    --check-name DEVICE_CERTIFICATE_SHARED_CHECK \
    --start-time 1559747125 \
    --end-time 1560962028
```

Output:

```
{
    "findings": [
        {
            "taskId": "eeef61068b0eb03c456d746c5a26ee04",
            "checkName": "DEVICE_CERTIFICATE_SHARED_CHECK",
            "taskStartTime": 1560161017.172,
            "findingTime": 1560161017.592,

```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see ListAuditFindings in *AWS CLI Command Reference*.

`list-audit-mitigation-actions-executions`

The following code example shows how to use `list-audit-mitigation-actions-executions`.

AWS CLI

To list the details of an audit mitigation action execution

The following `list-audit-mitigation-actions-executions` example lists the details for the mitigation action task with the specified `taskId` and for the specified finding. An audit mitigation action task applies a mitigation action to one or more findings from an AWS IoT Device Defender audit.

```
aws iot list-audit-mitigation-actions-executions \
    --task-id myActionsTaskId \
    --finding-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "actionsExecutions": [
        {
            "taskId": "myActionsTaskId",
            "findingId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "actionName": "ResetPolicyVersionAction",
            "actionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "status": "COMPLETED",
            "startTime": "2019-12-10T15:19:13.279000-08:00",
            "endTime": "2019-12-10T15:19:13.337000-08:00"
        }
    ]
}
```

For more information, see ListAuditMitigationActionsExecutions (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see ListAuditMitigationActionsExecutions in *AWS CLI Command Reference*.

`list-audit-mitigation-actions-tasks`

The following code example shows how to use `list-audit-mitigation-actions-tasks`.

AWS CLI

To list audit mitigation action tasks

The following `list-audit-mitigation-actions-tasks` example lists the mitigation actions that were applied to findings within the specified time period.

```
aws iot list-audit-mitigation-actions-tasks \
```

```
    --start-time 1594157400 \
    --end-time 1594157430
```

Output:

```
{
    "tasks": [
        {
                "taskId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
                "startTime": "2020-07-07T14:30:15.172000-07:00",
            "taskStatus": "COMPLETED"
        }
    ]
}
```

For more information, see ListAuditMitigationActionsTasks (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see ListAuditMitigationActionsTasks in *AWS CLI Command Reference*.

`list-audit-suppressions`

The following code example shows how to use `list-audit-suppressions`.

AWS CLI

To list all audit finding suppressions

The following `list-audit-suppressions` example lists all active audit finding suppressions.

```
aws iot list-audit-suppressions
```

Output:

```
{
    "suppressions": [
        {
        "checkName": "DEVICE_CERTIFICATE_EXPIRING_CHECK",
            "resourceIdentifier": {
                "deviceCertificateId": "c7691e<shortened>"
            },
        "expirationDate": 1597881600.0,
```

```
        "suppressIndefinitely": false
        }
    ]
}
```

For more information, see Audit finding suppressions in the *AWS IoT Developers Guide*.

- For API details, see ListAuditSuppressions in *AWS CLI Command Reference*.

`list-audit-tasks`

The following code example shows how to use `list-audit-tasks`.

AWS CLI

To list all findings from an audit

The following `list-audit-tasks` example lists the audit tasks that ran between June 5, 2019 and June 12, 2019.

```
aws iot list-audit-tasks \
    --start-time 1559747125 \
    --end-time 1560357228
```

Output:

```
{
    "tasks": [
        {
            "taskId": "a3aea009955e501a31b764abe1bebd3d",
            "taskStatus": "COMPLETED",
            "taskType": "ON_DEMAND_AUDIT_TASK"
        },
        {
            "taskId": "f76b4b5102b632cd9ae38a279c266da1",
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        },
        {
            "taskId": "51d9967d9f9ff4d26529505f6d2c444a",
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        },
```

```
        {
            "taskId": "eeef61068b0eb03c456d746c5a26ee04",
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        },
        {
            "taskId": "041c49557b7c7b04c079a49514b55589",
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        },
        {
            "taskId": "82c7f2afac1562d18a4560be73998acc",
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        },
        {
            "taskId": "bade6b5efd2e1b1569822f6021b39cf5",
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        },
        {
            "taskId": "c23f6233ba2d35879c4bb2810fb5ffd6",
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        },
        {
            "taskId": "ac9086b7222a2f5e2e17bb6fd30b3aeb",
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        }
    ]
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see ListAuditTasks in *AWS CLI Command Reference*.

`list-authorizers`

The following code example shows how to use `list-authorizers`.

AWS CLI

To list your custom authorizer

The following `list-authorizers` example lists the custom authorizers in your AWS account.

```
aws iot list-authorizers
```

Output:

```
{
    "authorizers": [
        {
            "authorizerName": "CustomAuthorizer",
            "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer"
        },
        {
            "authorizerName": "CustomAuthorizer2",
            "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer2"
        },
        {
            "authorizerName": "CustomAuthorizer3",
            "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer3"
        }
    ]
}
```

For more information, see Custom authentication and authorization in the *AWS IoT Core Developer Guide*.

- For API details, see ListAuthorizers in *AWS CLI Command Reference*.

`list-billing-groups`

The following code example shows how to use `list-billing-groups`.

AWS CLI

To list the billing groups for your AWS account and region

The following `list-billing-groups` example lists all billing groups that are defined for your AWS account and AWS Region.

```
aws iot list-billing-groups
```

Output:

```
{
    "billingGroups": [
        {
            "groupName": "GroupOne",
            "groupArn": "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne"
        }
    ]
}
```

For more information, see Billing Groups in the *AWS IoT Developers Guide*.

- For API details, see ListBillingGroups in *AWS CLI Command Reference*.

`list-ca-certificates`

The following code example shows how to use `list-ca-certificates`.

AWS CLI

To list the CA certificates registered in your AWS account

The following `list-ca-certificates` example lists the CA certificates registered in your AWS account.

```
aws iot list-ca-certificates
```

Output:

```
{
    "certificates": [
        {
            "certificateArn": "arn:aws:iot:us-west-2:123456789012:cacert/
f4efed62c0142f16af278166f61962501165c4f053629520742646005 8cd1467",
            "certificateId":
 "f4efed62c0142f16af278166f61962501165c4f053629520742646005 8cd1467",
            "status": "INACTIVE",
```

```
            "creationDate": 1569365372.053
        }
    ]
}
```

For more information, see Use Your Own Certificate in the *AWS IoT Developer Guide*.

- For API details, see ListCaCertificates in *AWS CLI Command Reference*.

`list-certificates-by-ca`

The following code example shows how to use `list-certificates-by-ca`.

AWS CLI

To list all device certificates signed with a CA certificate

The following `list-certificates-by-ca` example lists all device certificates in your AWS account that are signed with the specified CA certificate.

```
aws iot list-certificates-by-ca \
    --ca-certificate-
id f4efed62c0142f16af278166f61962501165c4f053629520742646005 8cd1467
```

Output:

```
{
    "certificates": [
        {
            "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
            "certificateId":
 "488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
            "status": "ACTIVE",
            "creationDate": 1569363250.557
        }
    ]
}
```

For more information, see Manage your CA certificates in the *AWS IoT Core Developer Guide*.

- For API details, see ListCertificatesByCa in *AWS CLI Command Reference*.

`list-certificates`

The following code example shows how to use `list-certificates`.

AWS CLI

Example 1: To list the certificates registered in your AWS account

The following `list-certificates` example lists all certificates registered in your account. If you have more than the default paging limit of 25, you can use the `nextMarker` response value from this command and supply it to the next command to get the next batch of results. Repeat until `nextMarker` returns without a value.

```
aws iot list-certificates
```

Output:

```
{
    "certificates": [
        {
            "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/604c48437a57b7d5fc5d137c5be75011c6ee67c9a6943683a1acb4b1626bac36",
            "certificateId":
 "604c48437a57b7d5fc5d137c5be75011c6ee67c9a6943683a1acb4b1626bac36",
            "status": "ACTIVE",
            "creationDate": 1556810537.617
        },
        {
            "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/262a1ac8a7d8aa72f6e96e365480f7313aa9db74b8339ec65d34dc3074e1c31e",

            "status": "ACTIVE",
            "creationDate": 1541022751.983
        }
    ]
}
```

For more information, see X.509 client certificates in the *AWS IoT Core Developer Guide*.

- For API details, see ListCertificates in *AWS CLI Command Reference*.

`list-custom-metrics`

The following code example shows how to use `list-custom-metrics`.

AWS CLI

To list your custom metrics

The following `list-custom-metrics` example lists all of your custom metrics.

```
aws iot list-custom-metrics
```

Output:

```
{
    "metricNames": [
        "batteryPercentage"
    ]
}
```

For more information, see Custom metrics in the *AWS IoT Core Developer Guide*.

- For API details, see ListCustomMetrics in *AWS CLI Command Reference*.

`list-dimensions`

The following code example shows how to use `list-dimensions`.

AWS CLI

To list the dimensions for your AWS account

The following `list-dimensions` example lists all AWS IoT Device Defender dimensions that are defined in your AWS account.

```
aws iot list-dimensions
```

Output:

```
{
    "dimensionNames": [
        "TopicFilterForAuthMessages",
        "TopicFilterForActivityMessages"
    ]
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see ListDimensions in *AWS CLI Command Reference*.

`list-domain-configurations`

The following code example shows how to use `list-domain-configurations`.

AWS CLI

To list domain configurations

The following `list-domain-configurations` example lists the domain configurations in your AWS account that have the specified service type.

```
aws iot list-domain-configurations \
    --service-type "DATA"
```

Output:

```
{
    "domainConfigurations":
    [
        {
            "domainConfigurationName": "additionalDataDomain",
            "domainConfigurationArn": "arn:aws:iot:us-
west-2:123456789012:domainconfiguration/additionalDataDomain/dikMh",
            "serviceType": "DATA"
        },

        {
            "domainConfigurationName": "iot:Jobs",
            "domainConfigurationArn": "arn:aws:iot:us-
west-2:123456789012:domainconfiguration/iot:Jobs",
            "serviceType": "JOBS"
        },
        {
            "domainConfigurationName": "iot:Data-ATS",
            "domainConfigurationArn": "arn:aws:iot:us-
west-2:123456789012:domainconfiguration/iot:Data-ATS",
            "serviceType": "DATA"
        },
        {
            "domainConfigurationName": "iot:CredentialProvider",
            "domainConfigurationArn": "arn:aws:iot:us-
west-2:123456789012:domainconfiguration/iot:CredentialProvider",
            "serviceType": "CREDENTIAL_PROVIDER"
        }
    ]
}
```

For more information, see Configurable Endpoints in the *AWS IoT Developer Guide*.

- For API details, see ListDomainConfigurations in *AWS CLI Command Reference*.

`list-indices`

The following code example shows how to use `list-indices`.

AWS CLI

To list the configured search indices

The following `list-indices` example lists all configured search indices in your AWS account. If you have not enabled thing indexing, you might not have any indices.

```
aws iot list-indices
```

Output:

```
{
    "indexNames": [
        "AWS_Things"
    ]
}
```

For more information, see Managing Thing Indexing in the *AWS IoT Developer Guide*.

- For API details, see ListIndices in *AWS CLI Command Reference*.

`list-job-executions-for-job`

The following code example shows how to use `list-job-executions-for-job`.

AWS CLI

To list the jobs in your AWS account

The following `list-job-executions-for-job` example lists all job executions for a job in your AWS account, specified by the jobId.

```
aws iot list-job-executions-for-job \
    --job-id my-ota-job
```

Output:

```
{
    "executionSummaries": [
        {
            "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/my_thing",
            "jobExecutionSummary": {
                "status": "QUEUED",
                "queuedAt": "2022-03-07T15:58:42.195000-08:00",
                "lastUpdatedAt": "2022-03-07T15:58:42.195000-08:00",
                "executionNumber": 1,
                "retryAttempt": 0
            }
        }
    ]
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see ListJobExecutionsForJob in *AWS CLI Command Reference*.

`list-job-executions-for-thing`

The following code example shows how to use `list-job-executions-for-thing`.

AWS CLI

To list the jobs that were executed for a thing

The following `list-job-executions-for-thing` example lists all jobs that were executed for the thing named `MyRaspberryPi`.

```
aws iot list-job-executions-for-thing \
    --thing-name "MyRaspberryPi"
```

Output:

```
{
    "executionSummaries": [
        {
            "jobId": "example-job-01",
            "jobExecutionSummary": {
```

```
                "status": "QUEUED",
                "queuedAt": 1560787023.636,
                "lastUpdatedAt": 1560787023.636,
                "executionNumber": 1
            }
        }
    ]
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see ListJobExecutionsForThing in *AWS CLI Command Reference*.

`list-jobs`

The following code example shows how to use `list-jobs`.

AWS CLI

To list the jobs in your AWS account

The following `list-jobs` example lists all jobs in your AWS account, sorted by the job status.

```
aws iot list-jobs
```

Output:

```
{
    "jobs": [
        {
            "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-01",
            "jobId": "example-job-01",
            "targetSelection": "SNAPSHOT",
            "status": "IN_PROGRESS",
            "createdAt": 1560787022.733,
            "lastUpdatedAt": 1560787026.294
        }
    ]
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see ListJobs in *AWS CLI Command Reference*.

`list-mitigation-actions`

The following code example shows how to use `list-mitigation-actions`.

AWS CLI

To list all defined mitigation actions

The following `list-mitigation-actions` example lists all defined mitigation actions for your AWS account and Region. For each action, the name, ARN, and creation date are listed.

```
aws iot list-mitigation-actions
```

Output:

```
{
    "actionIdentifiers": [
        {
            "actionName": "DeactivateCACertAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
DeactivateCACertAction",
            "creationDate": "2019-12-10T11:12:47.574000-08:00"
        },
        {
            "actionName": "ResetPolicyVersionAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
ResetPolicyVersionAction",
            "creationDate": "2019-12-10T11:11:48.920000-08:00"
        },
        {
            "actionName": "PublishFindingToSNSAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
PublishFindingToSNSAction",
            "creationDate": "2019-12-10T11:10:49.546000-08:00"
        },
        {
            "actionName": "AddThingsToQuarantineGroupAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
AddThingsToQuarantineGroupAction",
            "creationDate": "2019-12-10T11:09:35.999000-08:00"
        },
        {
            "actionName": "UpdateDeviceCertAction",
```

```
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
UpdateDeviceCertAction",
            "creationDate": "2019-12-10T11:08:44.263000-08:00"
        },
        {
            "actionName": "SampleMitigationAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
SampleMitigationAction",
            "creationDate": "2019-12-10T11:03:41.840000-08:00"
        }
    ]
}
```

For more information, see ListMitigationActions (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see ListMitigationActions in *AWS CLI Command Reference*.

`list-ota-updates`

The following code example shows how to use `list-ota-updates`.

AWS CLI

To list OTA Updates for the account

The following `list-ota-updates` example lists the available OTA updates.

```
aws iot list-ota-updates
```

Output:

```
{
    "otaUpdates": [
        {
            "otaUpdateId": "itsaupdate",
            "otaUpdateArn": "arn:aws:iot:us-west-2:123456789012:otaupdate/
itsaupdate",
            "creationDate": 1557863215.995
        }
    ]
}
```

For more information, see FreeRTOS Over-the-Air Updates in the *FreeRTOS User Guide*.

- For API details, see ListOtaUpdates in *AWS CLI Command Reference*.

`list-outgoing-certificates`

The following code example shows how to use `list-outgoing-certificates`.

AWS CLI

To list certificates being transferred to a different AWS account

The following `list-outgoing-certificates` example lists all device certificates that are in the process of being transferred to a different AWS account using the `transfer-certificate` command.

```
aws iot list-outgoing-certificates
```

Output:

```
{
    "outgoingCertificates": [
        {
            "certificateArn": "arn:aws:iot:us-
west-2:123456789111:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
            "certificateId":
 "488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
            "transferredTo": "123456789111",
            "transferDate": 1569427780.441,
            "creationDate": 1569363250.557
        }
    ]
}
```

For more information, see Transfer a certificate to another account in the *AWS IoT Core Developer Guide*.

- For API details, see ListOutgoingCertificates in *AWS CLI Command Reference*.

`list-policies`

The following code example shows how to use `list-policies`.

AWS CLI

To list the policies defined in your AWS account

The following `list-policies` example lists all policies defined in your AWS account.

```
aws iot list-policies
```

Output:

```
{
    "policies": [
        {
            "policyName": "UpdateDeviceCertPolicy",
            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
UpdateDeviceCertPolicy"
        },
        {
            "policyName": "PlantIoTPolicy",
            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/PlantIoTPolicy"
        },
        {
            "policyName": "MyPiGroup_Core-policy",
            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/MyPiGroup_Core-
policy"
        }
    ]
}
```

For more information, see AWS IoT Policies in the *AWS IoT Developers Guide*.

- For API details, see ListPolicies in *AWS CLI Command Reference*.

`list-policy-versions`

The following code example shows how to use `list-policy-versions`.

AWS CLI

Example 1: To see all versions of a policy

The following `list-policy-versions` example lists all versions of the specified policy and their creation dates.

```
aws iot list-policy-versions \
    --policy-name LightBulbPolicy
```

Output:

```
{
    "policyVersions": [
        {
            "versionId": "2",
            "isDefaultVersion": true,
            "createDate": 1559925941.924
        },
        {
            "versionId": "1",
            "isDefaultVersion": false,
            "createDate": 1559925941.924
        }
    ]
}
```

For more information, see AWS IoT Policies in the *AWS IoT Developers Guide*.

- For API details, see ListPolicyVersions in *AWS CLI Command Reference*.

`list-principal-things`

The following code example shows how to use `list-principal-things`.

AWS CLI

To list the things attached with a principal

The following `list-principal-things` example lists the things attached to the principal specified by an ARN.

```
aws iot list-principal-things \
    --principal arn:aws:iot:us-
west-2:123456789012:cert/2e1eb273792174ec2b9bf4e9b37e6c6c692345499506002a351597670552 78e8
```

Output:

```
{
    "things": [
        "DeskLamp",
        "TableLamp"
    ]
}
```

For more information, see Attach a thing or policy to a client certificate in the *AWS IoT Core Developer Guide*.

- For API details, see ListPrincipalThings in *AWS CLI Command Reference*.

`list-provisioning-template-versions`

The following code example shows how to use `list-provisioning-template-versions`.

AWS CLI

To list provisioning template versions

The following `list-provisioning-template-versions` example lists the available versions of the specified provisioning template.

```
aws iot list-provisioning-template-versions \
    --template-name "widget-template"
```

Output:

```
{
    "versions": [
        {
            "versionId": 1,
            "creationDate": 1574800471.339,
            "isDefaultVersion": true
        },
        {
            "versionId": 2,
            "creationDate": 1574801192.317,
            "isDefaultVersion": false
        }
    ]
```

```
}
```

For more information, see AWS IoT Secure Tunneling in the *AWS IoT Core Developer Guide*.

- For API details, see ListProvisioningTemplateVersions in *AWS CLI Command Reference*.

`list-provisioning-templates`

The following code example shows how to use `list-provisioning-templates`.

AWS CLI

To list provisioning templates

The following `list-provisioning-templates` example lists all of the provisioning templates in your AWS account.

```
aws iot list-provisioning-templates
```

Output:

```
{
    "templates": [
        {
            "templateArn": "arn:aws:iot:us-west-2:123456789012:provisioningtemplate/
widget-template",
            "templateName": "widget-template",
            "description": "A provisioning template for widgets",
            "creationDate": 1574800471.367,
            "lastModifiedDate": 1574801192.324,
            "enabled": false
        }
    ]
}
```

For more information, see AWS IoT Secure Tunneling in the *AWS IoT Core Developer Guide*.

- For API details, see ListProvisioningTemplates in *AWS CLI Command Reference*.

`list-role-aliases`

The following code example shows how to use `list-role-aliases`.

AWS CLI

To list the AWS IoT role aliases in your AWS account

The following `list-role-aliases` example lists the AWS IoT role aliases in your AWS account.

```
aws iot list-role-aliases
```

Output:

```
{
    "roleAliases": [
        "ResidentAlias",
        "ElectricianAlias"
    ]
}
```

For more information, see Authorizing direct calls to AWS services using AWS IoT Core credential provider in the *AWS IoT Core Developer Guide*.

- For API details, see ListRoleAliases in *AWS CLI Command Reference*.

`list-scheduled-audits`

The following code example shows how to use `list-scheduled-audits`.

AWS CLI

To list the scheduled audits for your AWS account

The following `list-scheduled-audits` example lists any audits scheduled for your AWS account.

```
aws iot list-scheduled-audits
```

Output:

```
{
    "scheduledAudits": [
        {
            "scheduledAuditName": "AWSIoTDeviceDefenderDailyAudit",
```

```
            "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/
AWSIoTDeviceDefenderDailyAudit",
            "frequency": "DAILY"
        },
        {
            "scheduledAuditName": "AWSDeviceDefenderWeeklyAudit",
            "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/
AWSDeviceDefenderWeeklyAudit",
            "frequency": "WEEKLY",
            "dayOfWeek": "SUN"
        }
    ]
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see ListScheduledAudits in *AWS CLI Command Reference*.

`list-security-profiles-for-target`

The following code example shows how to use `list-security-profiles-for-target`.

AWS CLI

To list the security profiles attached to a target

The following `list-security-profiles-for-target` example lists the AWS IoT Device Defender security profiles that are attached to unregistered devices.

```
aws iot list-security-profiles-for-target  \
    --security-profile-target-arn "arn:aws:iot:us-west-2:123456789012:all/
unregistered-things"
```

Output:

```
{
    "securityProfileTargetMappings": [
        {
            "securityProfileIdentifier": {
                "name": "Testprofile",
                "arn": "arn:aws:iot:us-west-2:123456789012:securityprofile/
Testprofile"
            },
```

```
            "target": {
                "arn": "arn:aws:iot:us-west-2:123456789012:all/unregistered-things"
            }
        }
    ]
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see ListSecurityProfilesForTarget in *AWS CLI Command Reference*.

`list-security-profiles`

The following code example shows how to use `list-security-profiles`.

AWS CLI

To list the security profiles for your AWS account

The following `list-security-profiles` example lists all AWS IoT Device Defender security profiles that are defined in your AWS account.

```
aws iot list-security-profiles
```

Output:

```
{
    "securityProfileIdentifiers": [
        {
            "name": "Testprofile",
            "arn": "arn:aws:iot:us-west-2:123456789012:securityprofile/Testprofile"
        }
    ]
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see ListSecurityProfiles in *AWS CLI Command Reference*.

`list-streams`

The following code example shows how to use `list-streams`.

AWS CLI

To list the streams in the account

The following `list-streams` example lists all of the streams in your AWS account.

```
aws iot list-streams
```

Output:

```
{
    "streams": [
        {
            "streamId": "stream12345",
            "streamArn": "arn:aws:iot:us-west-2:123456789012:stream/stream12345",
            "streamVersion": 1,
            "description": "This stream is used for Amazon FreeRTOS OTA Update
 12345."
        },
        {
            "streamId": "stream54321",
            "streamArn": "arn:aws:iot:us-west-2:123456789012:stream/stream54321",
            "streamVersion": 1,
            "description": "This stream is used for Amazon FreeRTOS OTA Update
 54321."
        }
    ]
}
```

For more information, see MQTT-based file delivery in the *AWS IoT Core Developer Guide*.

- For API details, see ListStreams in *AWS CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To display the tags and their values associated with a resource

The following `list-tags-for-resource` example displays the tags and values associated with the thing group `LightBulbs`.

```
aws iot list-tags-for-resource \
    --resource-arn "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs"
```

Output:

```
{
    "tags": [
        {
            "Key": "Assembly",
            "Value": "Fact1NW"
        },
        {
            "Key": "MyTag",
            "Value": "777"
        }
    ]
}
```

For more information, see Tagging Your AWS IoT Resources in the *AWS IoT Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

`list-targets-for-policy`

The following code example shows how to use `list-targets-for-policy`.

AWS CLI

To list the principals associated with an AWS IoT policy
