```

**LABELPOSITION.CS**

```

public ActionResult Demo()
{
    List<Step> iconLabel = new List<Step>();
    iconLabel.Add(new Step { Label = "Cart", IconCss = "sf-icon-cart" });
    iconLabel.Add(new Step { Label = "Delivery Address", IconCss = "sf-icon-transport" });
    iconLabel.Add(new Step { Label = "Payment", IconCss = "sf-icon-payment" });
    iconLabel.Add(new Step { Label = "Confirmation", IconCss = "sf-icon-success" });

    ViewBag.IconLabel = iconLabel;

    return View();
}

```

**Indicator type**

In indicator type, the Stepper displays steps with only the step indicators by setting the [StepType](#) property as **Indicator**.

**CSHTML**

```

@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.StepperSteps).StepType(StepType.Indicator).Render()
@Html.EJS().Stepper("textStepper").Steps(ViewBag.TextOnly).StepType(StepType.Indicator).Render()

```

**INDICATOR.CS**

```

public ActionResult Demo()
{
    List<Step> textOnly = new List<Step>();
    textOnly.Add(new Step { Text = "1" });
    textOnly.Add(new Step { Text = "2" });
    textOnly.Add(new Step { Text = "3" });
    textOnly.Add(new Step { Text = "4" });
    List<Step> defaultSteps = new List<Step>();
    defaultSteps.Add(new Step { });
    defaultSteps.Add(new Step { });
    defaultSteps.Add(new Step { });
    defaultSteps.Add(new Step { });

    ViewBag.TextOnly = textOnly;
    ViewBag.StepperSteps = defaultSteps;
}

```

```
return View();
}
```

## Orientation in ASP.NET MVC Stepper control

The Stepper control supports the display of steps in both horizontal and vertical orientations by using the [Orientation](#) property.

### Horizontal

In horizontal orientation, the steps are displayed in a side-by-side manner by setting the [Orientation](#) property to **Horizontal**. By default, the steps are displayed in the horizontal orientation.

### CSHTML

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.IconOnly).Orientation(StepperOrientation.Horizontal).Render()
<style>

### VERTICAL.CS

```
public ActionResult Demo()
{
    List<Step> iconOnly = new List<Step>();
    iconOnly.Add(new Step { IconCss = "sf-icon-cart" });
    iconOnly.Add(new Step { IconCss = "sf-icon-transport" });
    iconOnly.Add(new Step { IconCss = "sf-icon-payment" });
    iconOnly.Add(new Step { IconCss = "sf-icon-success" });
    ViewBag.IconOnly = iconOnly;

    return View();
}
```

### Linear flow in ASP.NET MVC Stepper control

The Stepper control enables users to progress sequentially through each step, ensuring navigation from one step to the next in a linear way by setting the [Linear](#) property to `true`. The default value is `false` allowing navigation between any steps and vice versa.

The example demonstrates the functionality of both linear and non-linear flow in the Stepper.

#### CSHTML

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.IconLabel).Linear(true).Render(
)
<style>

public ActionResult Demo()
{
    List<Step> iconLabel = new List<Step>();
    iconLabel.Add(new Step { Label = "Cart", IconCss = "sf-icon-cart" });
    iconLabel.Add(new Step { Label = "Delivery Address", IconCss = "sf-icon-transport" });
    iconLabel.Add(new Step { Label = "Payment", IconCss = "sf-icon-payment" });
    iconLabel.Add(new Step { Label = "Confirmation", IconCss = "sf-icon-success" });

    ViewBag.IconLabel = iconLabel;

    return View();
}

```

### Steps validation in ASP.NET MVC Stepper control

The Stepper control allows you to set the validation state for each step, displaying either a success or error icon. You can define the success state of a step by setting the [IsValid](#) property to `true`. If set to `false`, the step will display an error state. By default, the [IsValid](#) property is `null`.

Based on the [StepType](#), the validation state icon will be displayed either as an indicator or as part of the step label/text.

return View();
}

```

### Template in ASP.NET MVC Stepper control

The Stepper control allows you to customize the default appearance and content of each step, creating a personalized experience for the user. You can use the [Template](#) property to set the template content for the steps.

The [StepModel](#) and current step index are passed as **Step** and **CurrentStep** properties in the template context for customization.

#### CSHTML

```

@using Syncfusion.EJ2.Navigations
<div class="default-stepper-section">

@Html.EJS().Stepper("stepperTemplate").Steps(ViewBag.IconLabel).ActiveStep(1)
.Template("#template").Render()
</div>
<script id="template" type="text/x-jsrender">
    <div class="template-content">
        <span class="{step.iconCss}"></span> <br>
        <span class="e-label">{step.label}</span>
    </div>
</script>
<style>
    .template-content {
        background: #fff;
        width: 65px;
    }
    /* Stepper progressbar customization */
    .e-stepper .e-stepper-progressbar {
        height: 3px;
        top: 25px;
    }
    .e-stepper .e-stepper-progressbar .e-progressbar-value {
        background-color: #27d96d;
    }
    /* Stepper status customization */
    #stepperTemplate .e-step-completed * {

### TEMPLATE.CS

```

public ActionResult Demo()
{
    List<Step> iconLabel = new List<Step>();
    iconLabel.Add(new Step { Label = "PowerPoint", IconCss = "sf-icon-
powerpoint" });
    iconLabel.Add(new Step { Label = "Presentation", IconCss = "sf-icon-
projector" });
    iconLabel.Add(new Step { Label = "Backup", IconCss = "sf-icon-
onedrive" });

    ViewBag.IconLabel = iconLabel;

    return View();
}

```

### Tooltip in ASP.NET MVC Stepper control

The Stepper control supports tooltip to show additional information in the steps by setting the [ShowTooltip](#) property to `true`.

The tooltip appears when the user hovers over the step, providing the information such as the label or text. By default, the `ShowTooltip` property is `false`.

### CSHTML

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.IconLabel).ShowTooltip(true).Render()
<style>

## TOOLTIP.CS

```

public ActionResult Demo()
{
    List<Step> iconLabel = new List<Step>();
    iconLabel.Add(new Step { Label = "Cart", IconCss = "sf-icon-cart" });
    iconLabel.Add(new Step { Label = "Delivery Address", IconCss = "sf-icon-transport" });
    iconLabel.Add(new Step { Label = "Payment", IconCss = "sf-icon-payment" });
    iconLabel.Add(new Step { Label = "Confirmation", IconCss = "sf-icon-success" });
}

```

```

        ViewBag.IconLabel = iconLabel;

        return View();
    }

```

### Tooltip template

You can use the [TooltipTemplate](#) property to specify a custom template for the tooltips, providing detailed information about the steps.

When hovering over the step, the current step model is passed in the template context, allowing you to include dynamic information about the step.

### CSHTML

```

@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.TextLabelIcon).ShowTooltip(true)
.TooltipTemplate("#tooltip-template").Render()
<script id="tooltip-template" type="text/x-jsrender">
    <span class="template-content">
        <span class="stepper-icon" ${value.iconCss}></span>
        <span class="step-label">${value.text}</span>
    </span>
</script>

### TOOLTIPTEMPLATE.CS

```

public ActionResult Demo()
{
    List<Step> textLabelIcon = new List<Step>();
    textLabelIcon.Add(new Step { Text = "Review your cart items", Label =
"Cart", IconCss = "sf-icon-cart" });
    textLabelIcon.Add(new Step { Text = "Enter your delivery address", Label =
"Delivery Address", IconCss = "sf-icon-transport" });
    textLabelIcon.Add(new Step { Text = "Complete your purchase securely",
Label = "Payment", IconCss = "sf-icon-payment" });
    textLabelIcon.Add(new Step { Text = "Verify your order details", Label =
"Confirmation", IconCss = "sf-icon-success" });

    ViewBag.TextLabelIcon = textLabelIcon;

    return View();
}

```

### Animation in ASP.NET MVC Stepper control

The Stepper progress state can be animated, smoothly transitioning from one step to another. You can customize the animation's [Duration](#) and [Delay](#), by using the [Animation](#) property.

You can disable the animation by setting the [Enable](#) property to `false`. By default, the value is `true`.

| Fields | Type | Description |

|-----|-----|-----|

| [Duration](#) | **number** | Specifies the duration of the animated transition for each step. The default value is **2000** milliseconds. |

| [Delay](#) | **number** | Specifies the delay to initiate the animated transition for each step in milliseconds. The default value is **0**. |

The example demonstrates the animation **Duration** and **Delay** settings for the Stepper.

### CSHTML

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.default).Animation(ViewBag.animation).Render()
```

### ANIMATION.CS

```
public ActionResult Demo()
{
    List<Step> defaultStepper = new List<Step>();
    defaultStepper.Add(new Step { });
    defaultStepper.Add(new Step { });
    defaultStepper.Add(new Step { });
    defaultStepper.Add(new Step { });
    defaultStepper.Add(new Step { });
    var animationSettings = new StepperAnimationSettings { Enable = true,
    Duration = 2000, Delay = 500 };
    ViewBag.default = defaultStepper;
    ViewBag.animation = animationSettings;
    return View();
}
```

## Globalization in ASP.NET MVC Stepper control

### Localization

The Localization library allows you to localize the default text content of the Stepper. You can change the static text content used for the **Optional** property to other cultures (Arabic, Deutsch, French, etc.) by defining the **Locale** value and its translation object.

| Locale key | en-US (default) |

|-----|-----|

| optional | Optional |

In this example, the **French** culture is set to Stepper and the default text is updated with the content defined by the locale key.

### CSHTML

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.IconLabel).Locale("fr-BE").Render()
<script>
    ej.base.L10n.load({
        'fr-BE': {
```

```

        'stepper': {
            'optional': "facultatif"
        }
    });
</script>

</style>

```

## RTL.CS

```

public ActionResult Demo()
{
    List<Step> iconText = new List<Step>();
    iconText.Add(new Step { Text = "Cart", IconCss = "sf-icon-cart" });
    iconText.Add(new Step { Text = "Delivery Address", IconCss = "sf-icon-transport" });
    iconText.Add(new Step { Text = "Payment", IconCss = "sf-icon-payment" });
    iconText.Add(new Step { Text = "Confirmation", IconCss = "sf-icon-success" });

    ViewBag.IconText = iconText;

    return View();
}

```

## Accessibility in ASP.NET MVC Stepper control

Accessibility is achieved in the Stepper control through WAI-ARIA standard and keyboard navigations. The Stepper control can be effectively accessed through assistive technologies such as screen readers.

### Keyboard interaction

The Stepper control is interactive with the below keyboard shortcuts.

#### | Keyboard shortcuts | Actions |

| --- | --- |

| Up Arrow | Focuses the previous step in a vertical Stepper. |

| Down Arrow | Focuses the next step in a vertical Stepper. |

| Left Arrow | Focuses the previous step in a horizontal Stepper. |

| Right Arrow | Focuses the next step in a horizontal Stepper. |

| Home | Focuses on the first step of the Stepper. |

| End | Focuses on the last step of the Stepper. |

| Enter / Space | Activates the currently focused step. |

### ARIA attribute

The following ARIA attributes are used in Stepper control based on its state.

| Properties           | Functionality   |
|----------------------|---|
| -----                | -----   |
| <b>aria-label</b>    | Attribute provide a descriptive text that labels the interactive element for accessibility. |
| <b>aria-current</b>  | Attribute denotes the currently active step in the Stepper.                                 |
| <b>aria-disabled</b> | Indicates when the step is disabled and cannot be interacted.                               |

### Events

This section describes the Stepper events that will be triggered when an appropriate actions are performed. The following events are available in the Stepper control.

#### Created

The Stepper control triggers the [Created](#) event when the control rendering is completed.

#### CSHTML

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.DefaultStepper).Created("function(args) { createdEvent() }").Render()
<script>
    function createdEvent() {
        // your required action here..
    }
</script>
```

#### CREATED.CS

```
public ActionResult Demo()
{
    List<Step> defaultStepper = new List<Step>();
    defaultStepper.Add(new Step { });
    defaultStepper.Add(new Step { });
    defaultStepper.Add(new Step { });
    defaultStepper.Add(new Step { });
    defaultStepper.Add(new Step { });
    ViewBag.DefaultStepper = defaultStepper;
    return View();
}
```

#### StepChanged

The Stepper control triggers the [StepChanged](#) event after the active step is changed.

#### CSHTML

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.DefaultStepper).StepChanged("function(args) { stepChangedEvent(args) }").Render()
<script>
    function stepChangedEvent(args) {
        alert("Step Changed from "+args.previousStep + " to " +
args.activeStep)
```

```
}
</script>
```

### STEPCHANGED.CS

```
public ActionResult Demo()
{
    List<Step> defaultStepper = new List<Step>();
    defaultStepper.Add(new Step { });
    defaultStepper.Add(new Step { });
    defaultStepper.Add(new Step { });
    defaultStepper.Add(new Step { });
    defaultStepper.Add(new Step { });
    ViewBag.DefaultStepper = defaultStepper;
    return View();
}
```

### StepChanging

The Stepper control triggers the [StepChanging](#) event before the active step change.

### CSHTML

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.DefaultStepper).StepChanging("function(args) { stepChangingEvent(args) }").Render()
<script>
    function stepChangingEvent(args) {
        alert("Step Changing from "+args.previousStep + " to " +
args.activeStep)
    }
</script>
```

### STEPCHANGING.CS

```
public ActionResult Demo()
{
    List<Step> defaultStepper = new List<Step>();
    defaultStepper.Add(new Step { });
    defaultStepper.Add(new Step { });
    defaultStepper.Add(new Step { });
    defaultStepper.Add(new Step { });
    defaultStepper.Add(new Step { });
    ViewBag.DefaultStepper = defaultStepper;
    return View();
}
```

### StepClick

The Stepper control triggers the [StepClick](#) event when the step is clicked.

### CSHTML

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.DefaultStepper).StepClick("function(args) { stepClickEvent(args) }").Render()
<script>
```

```
function stepClickEvent(args) {
    // your required action here..
}
</script>
```

**STEPCLICK.CS**

```
public ActionResult Demo()
{
    List<Step> defaultStepper = new List<Step>();
    defaultStepper.Add(new Step { });
    defaultStepper.Add(new Step { });
    defaultStepper.Add(new Step { });
    defaultStepper.Add(new Step { });
    defaultStepper.Add(new Step { });
    ViewBag.DefaultStepper = defaultStepper;
    return View();
}
```

**BeforeStepRender**

The Stepper control triggers the [BeforeStepRender](#) event before rendering each step.

**CSHTML**

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.DefaultStepper).BeforeStepRender(
    "function(args) { beforeStepRenderEvent(args) }").Render()
<script>
    function beforeStepRenderEvent(args) {
        // your required action here..
    }
</script>
```

**BEFORESTEPRENDER.CS**

```
public ActionResult Demo()
{
    List<Step> defaultStepper = new List<Step>();
    defaultStepper.Add(new Step { });
    defaultStepper.Add(new Step { });
    defaultStepper.Add(new Step { });
    defaultStepper.Add(new Step { });
    defaultStepper.Add(new Step { });
    ViewBag.DefaultStepper = defaultStepper;
    return View();
}
```

**Stock Chart**

## Getting Started with ASP.NET MVC Stock Chart Control

## Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

#### PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](https://nuget.org). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

<namespaces>

<add namespace="Syncfusion.EJ2"/>

</namespaces>

Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

#### ~/ \_LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC

controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

#### Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

#### ~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

#### Add ASP.NET MVC Stock Chart control

Now, add the Syncfusion ASP.NET MVC Stock Chart control in `~/Views/Home/Index.cshtml` page.

#### CSHTML

```
@(Html.EJS().StockChart("container").Load("load").Series(sr => { sr.Add();
}).Render())
```

#### Populate Stock Chart With Data

This section explains how to plot below JSON data to the Stock Chart.

Add a series object to the chart by using [Series](#) property and then set the JSON data to [DataSource](#) property.

Since the JSON contains category data, set the [valueType](#) for horizontal axis to Category. By default, the axis valueType is Numeric.

#### CSHTML

```
@(Html.EJS().StockChart("container").Load("stockload")
    .Series(sr =>
    {
        sr.Name("Apple").Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle)
        .XName("x").High("high").Low("low").Open("open").Close("close").Add();
    })
    .Render())
<script src="~/Scripts/chart/financial-data.js"></script>
<script>
    var data = chartData;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
    }
</script>
```

Press **Ctrl+F5** (Windows) or **⌘+F5** (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Stock Chart control will be rendered in the default web browser.

**Note:** [View Sample in GitHub.](#)

<!-- markdownlint-disable MD036 -->

## Working with Data

Chart can visualise data bound from local or remote data.

### Local Data

You can bind a simple JSON data to the chart using [DataSource](#) property in series.

### CSHTML

```
<ejs-stockchart id="stockchart" title="AAPL Stock Price">
  <e-stockchart-series-collection>
    <e-stockchart-series type='Candle' dataSource="data"> </e-
stockchart-series>
  </e-stockchart-series-collection>
</ejs-stockchart>
<script>
var data = [
  { date: new Date('2012-04-02'), open: 85.9757, high: 90.6657, low:
85.7685, close: 90.5257, volume: 660187068 },
  { date: new Date('2012-04-09'), open: 89.4471, high: 92, low:
86.2157, close: 86.4614, volume: 912634864 },
  { date: new Date('2012-04-16'), open: 87.1514, high: 88.6071, low:
81.4885, close: 81.8543, volume: 1221746066 },
  { date: new Date('2012-04-23'), open: 81.5157, high: 88.2857, low:
79.2857, close: 86.1428, volume: 965935749 },
```

```

    { date: new Date('2012-04-30'), open: 85.4, high: 85.4857, low:
80.7385, close: 80.75, volume: 615249365 },
    { date: new Date('2012-05-07'), open: 80.2143, high: 82.2685, low:
79.8185, close: 80.9585, volume: 541742692 },
    { date: new Date('2012-05-14'), open: 80.3671, high: 81.0728, low:
74.5971, close: 75.7685, volume: 708126233 },
    { date: new Date('2012-05-21'), open: 76.3571, high: 82.3571, low:
76.2928, close: 80.3271, volume: 682076215 },
    { date: new Date('2012-05-28'), open: 81.5571, high: 83.0714, low:
80.0743, close: 80.1414, volume: 480059584 },
    { date: new Date('2012-06-04'), open: 80.2143, high: 82.9405, low:
78.3571, close: 82.9028, volume: 517577005 },
  ]
</script>

```

### LOCAL-DATA.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}

```

See Also

- [Series Types](#)

### Stock Chart Dimensions

Size for Container

Chart can render to its container size. You can set the size via inline or CSS as demonstrated below.

### CSHTML

```

<ejs-stockchart id="stockchart" load="stockload" title="AAPL
Stock Price" width="650" height="350">
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' xName="x"> </e-
stockchart-series>
    </e-stockchart-series-collection>
</ejs-stockchart>
</div>
<script src="~/financial-data.js"></script>
<script>
    var data = chartData;

```

```
function stockload(args) {
    args.stockChart.series[0].dataSource = data;
}
</script>
```

### SIZE.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}
```

### Size for Stock Chart

You can also set size for chart directly through [Width](#) and [Height](#) properties.

<!-- markdownlint-disable MD036 -->

### In Pixel

<!-- markdownlint-disable MD036 -->

You can set the size of chart in pixel as demonstrated below.

### CSHTML

```
<ejs-stockchart id="stockchart" load="stockload" title="AAPL
Stock Price" width="650px" height="350px">
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' xName="x"> </e-
stockchart-series>
    </e-stockchart-series-collection>
</ejs-stockchart>
<script src="~financial-data.js"></script>
<script>
    var data = chartData;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
    }
</script>
```

### PIXEL.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
```

```
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}
```

### In Percentage

By setting value in percentage, chart gets its dimension with respect to its container. For example, when the height is '50%', chart renders to half of the container height.

### CSHTML

```
<ejs-stockchart id="stockchart" load="stockload" title="AAPL
Stock Price" width="80%" height="90%">
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' xName="x"> </e-
stockchart-series>
    </e-stockchart-series-collection>
</ejs-stockchart>
<script src="~/financial-data.js"></script>
<script>
    var data = chartData;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
    }
</script>
```

### PERCENTAGE.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}
```

**Note:** When you do not specify the size, it takes 450px as the height and window size as its width.

## Axis types

### DateTime axis

DateTime axis uses date time scale and displays the date time values as axis labels in the specified format. To use DateTime axis, set the [ValueType](#) of axis to `DateTime`.

#### CSHTML

```
<ejs-stockchart id="stockchart" load="stockload" title="AAPL
Stock Price">
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' xName="x"> </e-
stockchart-series>
    </e-stockchart-series-collection>
    <e-stockchart-primaryxaxis valueType="DateTime">
    </e-stockchart-primaryxaxis>
</ejs-stockchart>
<script src="~/financial-data.js"></script>

<script>
    var data = chartData;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
    }
</script>
```

#### DATETIME.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}
```

### DateTimeCategory axis

DateTimeCategory axis in the stock chart is used to display only business days. To use DateTimeCategory axis, set the [ValueType](#) of axis to `DateTimeCategory`.

#### CSHTML

```
<ejs-stockchart id="stockchart" load="stockload" title="AAPL Stock Price">
    <e-stockchart-series-collection>
        <e-stockchart-series type='Line' xName="x" yName="y"> </e-
stockchart-series>
    </e-stockchart-series-collection>
    <e-stockchart-primaryxaxis valueType="DateTimeCategory">
```

```

    <e-majorgridlines width="0"></e-majorgridlines>
    <e-crosshairtooltip enable="true"></e-crosshairtooltip>
</e-stockchart-primaryxaxis>
    <e-stockchart-crosshairsettings enable="true"></e-stockchart-
crosshairsettings>
    <e-stockchart-tooltipsettings enable="true" header="AAPL Stock
Price"></e-stockchart-tooltipsettings>
</ejs-stockchart>
<script>
    let datetimeCategoryData = [
        { x: new Date(2021, 1, 11) }, { x: new Date(2021, 1, 12) }, { x: new
Date(2021, 1, 13) }, { x: new Date(2021, 1, 14) }, { x: new Date(2021, 1,
15) },
        { x: new Date(2021, 1, 19) }, { x: new Date(2021, 1, 20) }, { x: new
Date(2021, 1, 21) }, { x: new Date(2021, 1, 22) }, { x: new Date(2021, 3, 1)
},
        { x: new Date(2021, 3, 2) }, { x: new Date(2021, 4, 1) }, { x: new
Date(2021, 4, 5) }, { x: new Date(2021, 4, 6) }, { x: new Date(2021, 4, 7)
},
        { x: new Date(2021, 4, 11) }, { x: new Date(2021, 4, 13) }, { x: new
Date(2021, 4, 15) }, { x: new Date(2021, 4, 16) }, { x: new Date(2021, 4,
17) },
        { x: new Date(2021, 4, 18) }, { x: new Date(2021, 4, 20) }, { x: new
Date(2021, 4, 21) }, { x: new Date(2021, 4, 23) }, { x: new Date(2021, 4,
25) },
        { x: new Date(2021, 5, 1) }, { x: new Date(2021, 5, 2) }, { x: new
Date(2021, 5, 6) }, { x: new Date(2021, 5, 7) }, { x: new Date(2021, 5, 8)
},
        { x: new Date(2021, 5, 11) }, { x: new Date(2021, 5, 15) }, { x: new
Date(2021, 5, 18) }, { x: new Date(2021, 5, 20) }, { x: new Date(2021, 5,
25) },
        { x: new Date(2021, 6, 1) }, { x: new Date(2021, 6, 2) }, { x: new
Date(2021, 6, 3) }, { x: new Date(2021, 6, 4) }, { x: new Date(2021, 6, 5)
},
        { x: new Date(2021, 6, 10) }, { x: new Date(2021, 6, 11) }, { x: new
Date(2021, 6, 12) }, { x: new Date(2021, 6, 13) }, { x: new Date(2021, 6,
15) },
        { x: new Date(2021, 6, 16) }, { x: new Date(2021, 6, 17) }, { x: new
Date(2021, 6, 18) }, { x: new Date(2021, 6, 19) }, { x: new Date(2021, 6,
20) }
    ]
    function stockload(args) {
        let series2 = [];
        let point2;
        for (var i = 0; i < 46; i++) {
            point2 = {
                x: datetimeCategoryData[i].x,
                y: getRandomInRange(120, 130),
                high: getRandomInRange(88, 92),
                low: getRandomInRange(76, 86),
                open: getRandomInRange(75, 85),
                close: getRandomInRange(85, 90),
                volume: getRandomInRange(660187068, 965935749)
            };
            series2.push(point2);
        }
        args.stockChart.series[0].dataSource = series2;
    }

```

```

    }
    function getRandomInRange(min, max) {
        const randomDecimal = Math.random();
        const randomValue = randomDecimal * (max - min) + min;
        return randomValue;
    }
</script>

```

### DATETIMECATEGORY.CS

    {
        public IActionResult DateTimeCategory()
        {
            return View();
        }
    }
}

```

### Logarithmic axis

<!-- markdownlint-disable MD033 -->

Logarithmic axis uses logarithmic scale and it is very useful in visualizing data, when it has numerical values in both lower order of magnitude (eg: 10<sup>-6</sup>) and higher order of magnitude (eg: 10<sup>6</sup>). To use Logarithmic axis, set the [ValueType](#) of axis to **Logarithmic**.

- [Axis Customization](#)

**Axis Customization**

<!-- markdownlint-disable MD034 -->

**Axis Crossing**

An axis can be positioned in the chart area using [CrossesAt](#) and [CrossesInAxis](#) properties. The [CrossesAt](#) property specifies the values (datetime, numeric, or logarithmic) at which the axis line has to be intersected with the vertical axis or vice-versa, and the [CrossesInAxis](#) property specifies the axis name with which the axis line has to be crossed.

**CSHTML**

```

<ejs-stockchart id="stockchart" load="stockload">
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' xName="x"> </e-stockchart-
series>
    </e-stockchart-series-collection>
    <e-stockchart-primaryxaxis crossesAt="160"></e-stockchart-
primaryxaxis>
</ejs-stockchart>
<script src="~/financial-data.js"></script>

    {
        public IActionResult Default()
        {
            return View();
        }
    }
}
```

### Grid Lines Customization

You can customize the **Width**, **Color** and **DashArray** of the minor and major grid lines, using [MajorGridLines](#) and [MinorGridLines](#) properties in the axis.

**CSHTML**

```

<ejs-stockchart id="stockchart" load="stockload" title="AAPL
Stock Price">
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' xName="x"> </e-
stockchart-series>
    </e-stockchart-series-collection>
    <e-stockchart-primaryxaxis>
        <e-majorgridlines color="blue" width="1"></e-
majorgridlines>
        <e-minorgridlines color="red" width="0"></e-
minorgridlines>
    </e-stockchart-primaryxaxis>
    <e-stockchart-primaryyaxis>
        <e-majorgridlines color="green" width="1"></e-
majorgridlines>
        <e-minorgridlines color="red" width="0"></e-
minorgridlines>
    </e-stockchart-primaryyaxis>
</ejs-stockchart>
</div>
<script src="~/financial-data.js"></script>
<script>
    var data = chartData;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
    }
</script>

```

**GRID.CS**

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}

```

**Multiple Axis**

In addition to primary X and Y axis, we can add n number of axis to the chart. Series can be associated with this [Axis] (<https://help.syncfusion.com/cr/aspnetcore-js2/Syncfusion.EJ2.Charts.StockChartAxis.html>), by mapping with axis's unique name.

**CSHTML**

```

<ejs-stockchart id="stockchart" load="chartLoad" title="Multiple
Series">
  <e-chart-axes>
    <e-chart-axis rowIndex="0" name="yAxis"></e-chart-axis>
  </e-chart-axes>
  <e-stockchart-series-collection>
    <e-stockchart-series type='Column' xName='x'
yAxisName='close' name='Apple' >
    </e-stockchart-series>
    <e-stockchart-series type='Line' xName='x' yName='close'
yAxisName='yAxis' name='Google' ></e-stockchart-series>
  </e-stockchart-series-collection>
  <e-stockchart-primaryxaxis valueType="DateTime">
    <e-majorgridlines width="0"></e-majorgridlines>
  </e-stockchart-primaryxaxis>
</ejs-stockchart>
<script src="~/goog.js"></script>
<script src="~/googl.js"></script>
<script>
  var data1 = goog;
  var data2 = googl;
  function chartLoad(args) {
    args.stockChart.series[0].dataSource = data1;
    args.stockChart.series[1].dataSource = data2;
  }
</script>

```

## MULTIPLE.CS

```

public ActionResult Index()
{
    List<MultipleAxesChartData> chartData = new
List<MultipleAxesChartData>
    {
        new MultipleAxesChartData { x = "Sun", y = 35, y1 = 30 },
        new MultipleAxesChartData { x = "Mon", y = 40, y1 = 28 },
        new MultipleAxesChartData { x = "Tue", y = 80, y1 = 29 },
        new MultipleAxesChartData { x = "Wed", y = 70, y1 = 30 },
        new MultipleAxesChartData { x = "Thu", y = 65, y1 = 33 },
        new MultipleAxesChartData { x = "Fri", y = 55, y1 = 32 },
        new MultipleAxesChartData { x = "Sat", y = 50, y1 = 34 }
    };
    ViewBag.dataSource = chartData;
    return View();
}

public class MultipleAxesChartData
{
    public string x;
    public double y;
    public double y1;
}

```

## Inversed Axis

<!-- markdownlint-disable MD033 -->

When an axis is inversed, highest value of the axis comes closer to origin and vice versa. To place an axis in inversed manner set this property [IsInversed](#) to true.

### CSHTML

```
<ejs-stockchart id="stockchart" load="stockload" title="AAPL
Stock Price">
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' xName="x"> </e-
stockchart-series>
    </e-stockchart-series-collection>
    <e-stockchart-primaryxaxis isInversed="true">
    </e-stockchart-primaryxaxis>
    <e-stockchart-primaryyaxis isInversed="true">
    </e-stockchart-primaryyaxis>
</ejs-stockchart>
<script src="~/scripts/chart/financial-data.js"></script>
<script>
    var data = chartData;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
    }
</script>
```

### INVERSED.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}
```

### Opposed Position

<!-- markdownlint-disable MD012 -->

To place an axis opposite from its original position, set [OpposedPosition](#) property of the axis to true.

<!-- markdownlint-disable MD012 -->

### CSHTML

```
<ejs-stockchart id="stockchart" load="stockload" title="AAPL
Stock Price">
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' xName="x"> </e-
stockchart-series>
    </e-stockchart-series-collection>
```

```

        <e-stockchart-primaryxaxis opposedPosition="true">
        </e-stockchart-primaryxaxis>
    </ejs-stockchart>
</script>
<script src="~/scripts/chart/financial-data.js"></script>
<script>
    var data = chartData;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
    }
</script>

```

### OPPOSED.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}

```

## Stock Chart Series Types

Essential JS 2 StockChart Stock Chart supports 6 major types of series namely **Line**, **Spline**, **Hilo**, **HiloOpenClose**, **Hollow Candle** and **Candle** . By using the series dropdown button you can navigate between the above listed series types.

<!-- markdownlint-disable MD036 -->

### Line

To render a line series, use series **Type** as **Line**.

### Candle

To render a candle series, use series **Type** as **Candle** .

### HollowCandle

To render a hollowcandle series, use series **Type** as **Candle** and set **EnableSolidCandle** as false.

### Spline

To render a spline series, use series **Type** as **Spline**.

### Hilo

To render a hilo series, use series **Type** as **Hilo** .

### HiloOpenClose

To render a hiloOpenClose series, use series [Type](#) as `HiloOpenClose`.

### CSHTML

```
<ejs-stockchart id="stockchart" load="stockload" title="AAPL
Stock Price" indicatorType="@ (new List<Object>() { })" exportType="@ (new
List<Object>() { })" trendlineType="@ (new List<Object>() { })">
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' xName="x"> </e-
stockchart-series>
    </e-stockchart-series-collection>
</ejs-stockchart>

<script src="~/financial-data.js"></script>
<script>
    var data = chartData;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
    }
</script>
```

### CANDLE.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}
```

## Trendlines

Trendlines are used to show the direction and speed of price.

Stock Chart supports 6 types of trendlines namely

`Linear`, `Exponential`, `Logarithmic`, `Polynomial`, `Power`, `Moving Average`. By using trendline dropdown button you can add or remove the required trendline type.

### Linear

A linear trendline is a best fit straight line that is used with simpler data sets. To render a linear trendline, use trendline [Type](#) as `Linear`.

### Exponential

An exponential trendline is a curved line that is most useful when data values rise or fall at increasingly higher rates. You cannot create an exponential trendline, if your data contains zero or negative values.

To render a exponential trendline, use trendline [Type](#) as `Exponential`.

### Logarithmic

A logarithmic trendline is a best-fit curved line that is most useful when the rate of change in the data increases or decreases quickly and then levels out. A logarithmic trendline can use negative and/or positive values.

To render a logarithmic trendline, use trendline [Type](#) as **Logarithmic**.

### Polynomial

A polynomial trendline is a curved line that is used when data fluctuates.

To render a polynomial trendline, use trendline [Type](#) as **Polynomial**.

**PolynomialOrder** used to define the polynomial value.

### Power

A power trendline is a curved line that is best used with data sets that compare measurements that increase at a specific rate.

To render a power trendline, use trendline [Type](#) as **Power**.

### Moving Average

A moving average trendline smoothen out fluctuations in data to show a pattern or trend more clearly.

To render a moving average trendline, use trendline [Type](#) as **MovingAverage**.

**Period** property defines the period to find the moving average.

### CSHTML

```
<ejs-stockchart id="stockchart" load="stockload" title="AAPL
Stock Price" seriesType="@ (new List<Object>() { })" exportType="@ (new

        }
    }
}

```

<!-- markdownlint-disable MD036 -->

## Technical Indicators

A technical indicator is a mathematical calculation based on historic price, volume or open interest information that aims to forecast financial market direction.

Stock Chart supports 10 types of technical indicators namely Accumulation Distribution, ATR, EMA, SMA, TMA, Momentum, MACD, RSI, Stochastic, Bollinger Band. By using indicator dropdown box you can add and remove the required indicators types.

### Accumulation Distribution

Accumulation Distribution combines price and volume to show how money may be flowing into or out of stock.

To render a Accumulation Distribution Indicator, use indicator [Type](#) as AccumulationDistribution.

To calculate the signal line [Volume](#) field is additionally added with DataSource.

### Average True Range (ATR)

ATR measures the stock volatility by comparing the current value with the previous value.

To render a Average True Range (ATR) Indicator, use indicator [Type](#) as Atr .

### Exponential Moving Average (EMA)

Moving average Indicators are used to define the direction of the trend. To render a EMA Indicator, use indicator [Type](#) as Ema .

### Momentum

Momentum shows the speed at which the price of the stock is changing. To render a Momentum indicator, use indicator [Type](#) as Momentum. Momentum indicator will be represented by two lines (upperLine, signalLine). In momentum indicator the upperBand value is always renders at the value 100.

### Moving Average Convergence Divergence (MACD)

MACD is based on the difference between two EMA's. To render a MACD Indicator, use indicator [Type](#) as Macd .MACD indicator will be represented by MACD line, signal line, MACD histogram. MACD histogram is used to differentiate MACD line and signal line.

### Relative Strength Index (RSI)

RSI shows how strongly a stock is moving in its current direction. To render a RSI Indicator, use indicator [Type](#) as Rsi. RSI indicator will be represented by three lines (upperBand, lowerBand, signalLine). The upperBand and lowerBand values are customized by [OverBought](#) and [OverSold](#) properties of indicator and the signalLine is calculated by RSI formula.

### Simple Moving Average (SMA)

Moving average Indicators are used to define the direction of the trend. To render a SMA Indicator, use indicator [Type](#) as Sma .

### Stochastic

It shows how a stock is, when compared to previous state. To render a Stochastic indicator, use indicator [Type](#) as Stochastic.

Stochastic indicator will be represented by four lines (upperLine, lowerLine, periodLine, signalLine).

In stochastic indicator the upperBand value and lowerBand value is customized by [OverBought](#) and [OverSold](#) properties of indicators and the periodLine and signalLine is render based on stochastic formula.

### Triangular Moving Average (TMA)

Moving average Indicators are used to define the direction of the trend. To render a TMA Indicator, use indicator [Type](#) as `Tma` .

### Bollinger Band

<!-- markdownlint-disable MD034 -->

A Stock Chart overlay that shows the upper and lower limits of normal price movements based on the standard deviation of prices.

To render a Bollinger Band, use indicator [Type](#) as `BollingerBand`. Bollinger band will be represented by three lines (upperLine, lowerLine, signalLine). (<https://help.syncfusion.com/cr/aspnetcore-js2/Syncfusion.EJ2.Charts.StockChartStockChartIndicator.html#SyncfusionEJ2ChartsStockChartStockChartIndicatorType>) and [StandardDeviations](#) is 2.

### CSHTML

        }
    }
}
```

```
}
}
```

## Tooltip

<!-- markdownlint-disable MD036 -->

Stock Chart will display details about the points through tooltip, when the mouse is moved over the point.

### Default tooltip

By default, tooltip is not visible. Enable the tooltip by setting [Enable](#) property to true .

### CSHTML

```
<ejs-stockchart id="stockchart" load="stockload" title="AAPL
Stock Price">
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' xName="x"> </e-
stockchart-series>
    </e-stockchart-series-collection>
    <e-stockchart-tooltipsettings enable="true"></e-stockchart-
tooltipsettings>
</ejs-stockchart>
<script src="~/financial-data.js"></script>
<script>
    var data = chartData;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
    }
</script>
```

### TOOLTIP.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}
```

<!-- markdownlint-disable MD013 -->

### Format the tooltip

<!-- markdownlint-disable MD013 -->

By default, tooltip shows information of x and y value in points. In addition to that, you can show more information in tooltip. For example the format `${series.name} ${point.x}` shows series name and point x value.

### CSHTML

```
<ejs-stockchart id="stockchart" load="stockload" title="AAPL
Stock Price">
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' xName="x"> </e-
stockchart-series>
    </e-stockchart-series-collection>
    <e-stockchart-tooltipsettings enable="true"
header="Unemployment" format="<b>${point.x} : ${point.y}</b>"></e-
stockchart-tooltipsettings>
</ejs-stockchart>
</div>
<script src="~/scripts/chart/financial-data.js"></script>
<script>
    var data = chartData;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
    }
</script>
```

### FORMAT.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}
```

### Position the tooltip

By default, the tooltip is positioned at the left side of the stock chart. You can move the tooltip along with the mouse by setting **Nearest** to the [Position](#) property.

### CSHTML

```
<ejs-stockchart id="stockchart" load="stockload" title="AAPL Stock Price">
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' xName="x"> </e-stockchart-series>
    </e-stockchart-series-collection>
    <e-stockchart-tooltipsettings enable="true" shared="true"
position="Nearest"></e-stockchart-tooltipsettings>
```

```

</ejs-stockchart>
</div>
<script src="stock-chart/stockchart-
feature/position/financialdata.js"></script>
<script>
    var data = chartData;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
    }
</script>

```

## POSITION.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}

```

## Customize the appearance of the tooltip

The [Fill](#) and [Border](#) properties are used to customize the background color and border of the tooltip respectively. The [TextStyle](#) property in the tooltip is used to customize the font of the tooltip text.

## CSHTML

```

<ejs-stockchart id="stockchart" load="stockload" title="AAPL Stock Price">
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' xName="x"> </e-
stockchart-series>
    </e-stockchart-series-collection>
    <e-stockchart-tooltipsettings enable="true"
format="{point.x} : {point.y}" fill="#7bb4eb">
    </e-stockchart-tooltipsettings>
</ejs-stockchart>
<script src="~/scripts/chart/financial-data.js"></script>
<script>
    var data = chartData;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
        args.stockChart.tooltip = {
            border: {
                width: 2,
                color: 'grey'
            }
        };
    }

```

```
}
</script>
```

### CUSTOMTOOLTIP.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}
```

### Add Crosshair

Crosshair has a vertical and horizontal line to view the value of the axis at mouse or touch position.

Crosshair lines can be enabled by using [Enable](#) property in the **Crosshair**.

### CSHTML

```
<ejs-stockchart id="stockchart" load="stockload" title="AAPL
Stock Price">
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' xName="x"> </e-
stockchart-series>
    </e-stockchart-series-collection>
    <e-stockchart-crosshairsettings enable="true"></e-
stockchart-crosshairsettings>
</ejs-stockchart>
<script src="~/scripts/chart/financial-data.js"></script>
<script>
    var data = chartData;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
    }
</script>
```

### CROSSHAIR.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
```

```

    {
        public IActionResult Default()
        {
            return View();
        }
    }
}

```

### Tooltip for axis

Tooltip label for an axis can be enabled by using [Enable](#) property of `CrosshairTooltip` in the corresponding axis.

### CSHTML

```

<ejs-stockchart id="stockchart" load="stockload" title="AAPL
Stock Price">
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' xName="x"> </e-
stockchart-series>
    </e-stockchart-series-collection>
    <e-stockchart-primaryxaxis>
        <e-majorgridlines color="transparent"></e-
majorgridlines>
        <e-crosshairtooltip enable="true"></e-crosshairtooltip>
    </e-stockchart-primaryxaxis>
    <e-stockchart-primaryyaxis>
        <e-linestyle color="transparent"></e-linestyle>
        <e-majorticklines color="transparent" width="0"></e-
majorticklines>
        <e-crosshairtooltip enable="true"></e-crosshairtooltip>
    </e-stockchart-primaryyaxis>
    <e-stockchart-crosshairsettings enable="true"></e-stockchart-
crosshairsettings>
</ejs-stockchart>
<script src="~/scripts/chart/financial-data.js"></script>
<script>
    var data = chartData;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
    }
</script>

```

### AXIS-TOOLTIP.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}

```

```

    }
}
}

```

### Customization

The [Fill](#) and [TextStyle](#) property of the [CrosshairTooltip](#) is used to customize the background color and font style of the crosshair label respectively. Color and width of the crosshair line can be customized by using the [Line](#) property in the crosshair.

### CSHTML

```

<ejs-stockchart id="stockchart" load="stockload" title="AAPL
Stock Price">
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' xName="x"> </e-
stockchart-series>
    </e-stockchart-series-collection>
</ejs-stockchart>
<script src="~/scripts/chart/financial-data.js"></script>
<script>
    var data = chartData;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
        args.stockChart.crosshair = { enable: true, line: { width: 2,
color: 'green' } };
        args.stockChart.primaryYAxis = {
            lineStyle: { color: 'transparent' },
            majorTickLines: { color: 'transparent', width: 0 },
            crosshairTooltip: { enable: true, fill: 'green' }
        };
        args.stockChart.primaryXAxis = {
            majorGridLines: { color: 'transparent' },
            crosshairTooltip: { enable: true, fill: 'green' }
        };
    }
</script>

```

### CUSTOM.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}

```

### Add Trackball

Trackball is used to track a data point closest to the mouse or touch position. Trackball marker indicates the closest point and trackball tooltip displays the information about the point.

Trackball can be enabled by setting the [Enable](#) property of the crosshair to true and [Shared](#) property in **Tooltip** to true in chart.

### CSHTML

```
<ejs-chart id="container" width="60%" load="window.onload">
    <e-chart-crosshairsettings enable="true" lineType="Vertical">
    </e-chart-crosshairsettings>
    <e-chart-tooltipsettings enable="true" shared="true"
format="{series.name} : {point.x} : {point.y}">
    </e-chart-tooltipsettings>
    <e-chart-primaryxaxis valueType="DateTime"></e-chart-primaryxaxis>
    <e-series-collection>
        <e-series dataSource="ViewBag.dataSource" xName="xValue"
yName="yValue" type="@Syncfusion.EJ2.Charts.ChartSeriesType.Line"></e-
series>
        <e-series dataSource="ViewBag.dataSource" xName="xValue"
yName="yValue1" type="@Syncfusion.EJ2.Charts.ChartSeriesType.Line"></e-
series>
        <e-series dataSource="ViewBag.dataSource" xName="xValue"
yName="yValue2" type="@Syncfusion.EJ2.Charts.ChartSeriesType.Line"></e-
series>
    </e-series-collection>
</ejs-chart>
```

### TRACKBALL.CS

```
public ActionResult Index()
{
    List<TrackballChartData> chartData = new
List<TrackballChartData>
    {
        new TrackballChartData { xValue = new DateTime(2000, 2, 11),
yValue = 14, yValue1 = 39, yValue2 = 60 },
        new TrackballChartData { xValue = new DateTime(2000, 9, 4),
yValue = 20, yValue1 = 30, yValue2 = 55 },
        new TrackballChartData { xValue = new DateTime(2001, 2, 11),
yValue = 25, yValue1 = 28, yValue2 = 48 },
        new TrackballChartData { xValue = new DateTime(2001, 9, 16),
yValue = 21, yValue1 = 35, yValue2 = 57 },
        new TrackballChartData { xValue = new DateTime(2002, 2, 7),
yValue = 13, yValue1 = 39, yValue2 = 62 },
        new TrackballChartData { xValue = new DateTime(2002, 9, 7),
yValue = 18, yValue1 = 41, yValue2 = 64 },
        new TrackballChartData { xValue = new DateTime(2003, 2, 11),
yValue = 24, yValue1 = 45, yValue2 = 57 },
        new TrackballChartData { xValue = new DateTime(2003, 9, 14),
yValue = 23, yValue1 = 48, yValue2 = 53 },
        new TrackballChartData { xValue = new DateTime(2004, 2, 6),
yValue = 19, yValue1 = 54, yValue2 = 63 },
        new TrackballChartData { xValue = new DateTime(2004, 9, 6),
yValue = 31, yValue1 = 55, yValue2 = 50 },
    }
```

```

        new TrackballChartData { xValue = new DateTime(2005, 2, 11),
yValue = 39, yValue1 = 57, yValue2 = 66 },
        new TrackballChartData { xValue = new DateTime(2005, 9, 11),
yValue = 50, yValue1 = 60, yValue2 = 65 },
        new TrackballChartData { xValue = new DateTime(2006, 2, 11),
yValue = 24, yValue1 = 60, yValue2 = 79 },
    };
    ViewBag.dataSource = chartData;
    return View();
}
public class TrackballChartData
{
    public DateTime xValue;
    public double yValue;
    public double yValue1;
    public double yValue2;
}

```

## Legend

Legend provides information about the series rendered in the Stock Chart. Legend can be added to a Stock Chart by enabling the [Visible](#) option in the [LegendSettings](#).

### Position and Alignment

By using the [Position](#) property, legend can be placed at **Left**, **Right**, **Top**, **Bottom** or **Custom** of the Stock Chart. The legend is positioned at the bottom of the Stock Chart, by default.

## CSHTML

```

<ejs-stockchart id="stockchart" load="chartLoad" indicatorType="new
string[0]" trendlineType="new string[0]" title="Unemployment Rates 1975-
2010">
    <e-stockchart-primaryxaxis valueType="DateTime">
    </e-stockchart-primaryxaxis>
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' name='China'>
        </e-stockchart-series>
    </e-stockchart-series-collection>
    <e-stockchart-tooltipssettings enable="true"></e-stockchart-
tooltipssettings>
    <e-stockchart-legendsettings visible="true" position="Top"></e-
stockchart-legendsettings>
</ejs-stockchart>
<script src="~/datasource.js"></script>
<script>
    var data = chartData;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
    }
</script>

```

## POSITION.CS

```

using System;
using System.Collections.Generic;
using System.Linq;

```

```
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}
```

[Custom](#) position is used to position the legend anywhere in the Stock Chart using x, y coordinates.

### CSHTML

```
<ejs-stockchart id="stockchart" load="chartLoad" indicatorType="new
string[0]" trendlineType="new string[0]" title="Unemployment Rates 1975-
2010">
    <e-stockchart-primaryxaxis valueType="DateTime">
    </e-stockchart-primaryxaxis>
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' name='China'>
        </e-stockchart-series>
    </e-stockchart-series-collection>
    <e-stockchart-tooltipsettings enable="true"></e-stockchart-
tooltipsettings>
    <e-stockchart-legendsettings visible="true" position="Custom">
        <e-stockchartlegendsettings-location x="200" y="20"></e-
stockchartlegendsettings-location>
    </e-stockchart-legendsettings>
</ejs-stockchart>

<script src="~/datasource.js"></script>
<script>
    var data = chartData;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
    }
</script>
```

### CUSTOM.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}
```

```

    }
  }
}

```

### Legend Alignment

The legend can be align as **Center**, **Far** or **Near** to the Stock Chart using [Alignment](#) property.

### CSHTML

```

<ejs-stockchart id="stockchart" load="chartLoad" indicatorType="new
string[0]" trendlineType="new string[0]" title="Unemployment Rates 1975-
2010">
  <e-stockchart-primaryxaxis valueType="DateTime">
  </e-stockchart-primaryxaxis>
  <e-stockchart-series-collection>
    <e-stockchart-series type='Candle' name='China'>
    </e-stockchart-series>
  </e-stockchart-series-collection>
  <e-stockchart-tooltipsettings enable="true"></e-stockchart-
tooltipsettings>
  <e-stockchart-legendsettings visible="true" position="Bottom"
alignment="Near">
  </e-stockchart-legendsettings>
</ejs-stockchart>

<script src="~/datasource.js"></script>
<script>
  var data = chartData;
  function stockload(args) {
    args.stockChart.series[0].dataSource = data;
  }
</script>

```

### ALIGNMENT.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}

```

### Customization

To change the legend icon shape, [LegendShape](#) property in the [Series](#) can be used. By default legend icon shape is **SeriesType**.

**CSHTML**

```

<ejs-stockchart id="stockchart" load="chartLoad" indicatorType="new
string[0]" trendlineType="new string[0]" title="Unemployment Rates 1975-
2010">
    <e-stockchart-primaryxaxis valueType="DateTime">
    </e-stockchart-primaryxaxis>
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' name='China'
legendShape="Pentagon">
        </e-stockchart-series>
    </e-stockchart-series-collection>
    <e-stockchart-tooltipssettings enable="true"></e-stockchart-
tooltipssettings>
    <e-stockchart-legendsettings visible="true">
    </e-stockchart-legendsettings>
</ejs-stockchart>

<script src="~/datasource.js"></script>
<script>
    var data = chartData;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
    }
</script>

```

**CUSTOMIZATION.CS**

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}

```

**Legend Size**

By default, legend takes 20% - 25% of the Stock Chart's height horizontally, when it is placed on top or bottom position and 20% - 25% of the width vertically, while placing on left or right position of the Stock Chart. The default legend size can be changed by using the [Width](#) and [Height](#) property of the **LegendSettings**.

**CSHTML**

```

<ejs-stockchart id="stockchart" load="chartLoad" indicatorType="new
string[0]" trendlineType="new string[0]" title="Unemployment Rates 1975-
2010">

```

```

<e-stockchart-primaryxaxis valueType="DateTime">
</e-stockchart-primaryxaxis>
<e-stockchart-series-collection>
    <e-stockchart-series type='Candle' name='China'>
    </e-stockchart-series>
</e-stockchart-series-collection>
<e-stockchart-tooltipsettings enable="true"></e-stockchart-
tooltipsettings>
<e-stockchart-legendsettings visible="true" width="500" height="50">
    <e-stockchartlegendsettings-border width="1" color="pink"></e-
stockchartlegendsettings-border>
</e-stockchart-legendsettings>
</ejs-stockchart>

<script src="~/datasource.js"></script>
<script>
    var data = chartData;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
    }
</script>

```

### SIZE.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}

```

### Legend Item Size

The size of the legend items can customized by using the [ShapeHeight](#) and [ShapeWidth](#) property.

### CSHTML

```

<ejs-stockchart id="stockchart" load="chartLoad" indicatorType="new
string[0]" trendlineType="new string[0]" title="Unemployment Rates 1975-
2010">
    <e-stockchart-primaryxaxis valueType="DateTime">
    </e-stockchart-primaryxaxis>
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' name='China'>
        </e-stockchart-series>
    </e-stockchart-series-collection>
    <e-stockchart-tooltipsettings enable="true"></e-stockchart-
tooltipsettings>

```

```

    <e-stockchart-legendsettings visible="true" shapeHeight="15"
shapeWidth="15">
    </e-stockchart-legendsettings>
</ejs-stockchart>

<script src="~/datasource.js"></script>
<script>
    var data = chartData;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
    }
</script>

```

### ITEM-SIZE.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}

```

### Collapsing Legend Item

By default, series name will be displayed as legend. To skip the legend for a particular series, empty string to the series name can be given.

### CSHTML

```

<ejs-stockchart id="stockchart" load="chartLoad" indicatorType="new
string[0]" trendlineType="new string[0]" title="Unemployment Rates 1975-
2010">
    <e-stockchart-primaryxaxis valueType="DateTime">
    </e-stockchart-primaryxaxis>
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle'>
        </e-stockchart-series>
    </e-stockchart-series-collection>
    <e-stockchart-tooltipssettings enable="true"></e-stockchart-

### COLLAPSING.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}
```

### Legend Title

The title for legend can be set using [Title](#) property in [LegendSettings](#). Customize the [FontStyle](#), [Size](#), [FontWeight](#), [Color](#), [TextAlignment](#), [FontFamily](#), [Opacity](#) and [TextOverflow](#) of legend title. [TitlePosition](#) is used to set the legend position in [Top](#), [Left](#) and [Right](#) position. [MaximumTitleWidth](#) is used to set the width of the legend title. By default, it will be 100px.

### CSHTML

```

        }
    }
}
```

## Period selector

The period selector allows to select a range with specified periods. By default the period selector is enabled in stock chart.

## Periods

<!-- markdownlint-disable MD034 -->

Periods is an array of objects that allows users to specify the range of [Periods]

([https://help.syncfusion.com/cr/aspnetcore-](https://help.syncfusion.com/cr/aspnetcore-js2/Syncfusion.EJ2.Charts.StockChart.html#SyncfusionEJ2ChartsStockChartPeriods)

[js2/Syncfusion.EJ2.Charts.StockChart.html#SyncfusionEJ2ChartsStockChartPeriods](https://help.syncfusion.com/cr/aspnetcore-js2/Syncfusion.EJ2.Charts.StockChart.html#SyncfusionEJ2ChartsStockChartPeriods)). The **Interval** property specifies the count value of the button, and the **Text** property specifies the text to be displayed on button. The **IntervalType** property allows users to customize the intervals of the buttons. The **IntervalType** property supports the following interval types:

- Auto
- Years
- Quarter
- Months
- Weeks
- Days
- Hours
- Minutes
- Seconds

## CSHTML

```
<ejs-stockchart id="stockchart" load="stockload" title="AAPL
Stock Price" exportType="new List<Object>() { }" seriesType="new
```

```

List<Object>() { }" indicatorType="new List<Object>() { }"
trendlineType="new List<Object>() { }">

    <e-stockchart-crosshairsettings enable="true">
    </e-stockchart-crosshairsettings>
</ejs-stockchart>
<script>
    var series1 = [];
    var point1;
    var value = 80;
    var i;
    for (i = 1; i < 500; i++) {
        if (Math.random() > .5) {
            value += Math.random();
        } else {
            value -= Math.random();
        }
        point1 = { x: new Date(2000, 1, 1, 0, i), y: value.toFixed(1) };
        series1.push(point1);
    }
    var data = series1;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
    }
</script>

```

**PERIOD.CS**

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;

```

```
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}
```

Visibility of period selector

The [EnablePeriodSelector](#) property allows users to toggle the visibility of period selector.

### CSHTML

```
<ejs-stockchart id="stockchart" load="stockload" title="AAPL
Stock Price" enablePeriodSelector="false">
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' xName="x"> </e-
stockchart-series>
    </e-stockchart-series-collection>
</ejs-stockchart>
<script src="~/scripts/chart/financial-data.js"></script>
<script>
    var data = chartData;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
    }
</script>
```

### VISIBILITYPERIOD.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}
```

Range selector

The period selector allows to select a range with specified periods. By default the period selector is enabled in stock chart.

## Selecting Range

The left and right thumb of RangeNavigator are used to indicate the selected range in the large collection of data. Following are the ways you can select a range.

- By dragging the thumbs.
- By tapping on the labels.
- By setting the start and end through Date Range button.

Following code example shows the [EnableSelector](#) property allows users to toggle the visibility of enable selector.

### CSHTML

```
<ejs-stockchart id="stockchart" load="stockload" title="AAPL
Stock Price" enableSelector="false">
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' xName="x"> </e-
stockchart-series>
    </e-stockchart-series-collection>
</ejs-stockchart>

<script src="~/scripts/chart/financial-data.js"></script>
<script>
    var data = chartData;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
    }
</script>
```

### RANGE.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}
```

## Print and Export

The rendered stock chart can be exported to JPEG, PNG, SVG, or PDF format using the export dropdown button in the period selector toolbar. You can choose the required format using the export dropdown button in stock-chart.

The rendered stock chart can be printed directly using print button in period selector toolbar.

**CSHTML**

```

<ejs-stockchart id="stockchart" load="stockload" title="AAPL
Stock Price">
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' xName="x"> </e-
stockchart-series>
    </e-stockchart-series-collection>
    <e-stockchart-primaryxaxis>
        <e-majorgridlines color="transparent"></e-
majorgridlines>
    </e-stockchart-primaryxaxis>
    <e-stockchart-primaryyaxis>
        <e-linestyle color="transparent"></e-linestyle>
        <e-majorticklines color="transparent" width="0"></e-
majorticklines>
    </e-stockchart-primaryyaxis>
</ejs-stockchart>
<script src="~/scripts/chart/financial-data.js"></script>
<script>
    var data = chartData;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
    }
</script>

```

**PRINT.CS**

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}

```

Disable Export and print

To empty the value of `ExportType` for to disable the Export button.

**CSHTML**

```

<ejs-stockchart id="stockchart" load="stockload" title="AAPL
Stock Price" exportType="new List<Object>() { }">
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' xName="x"> </e-
stockchart-series>
    </e-stockchart-series-collection>
    <e-stockchart-primaryxaxis>

```

```

        <e-majorgridlines color="transparent"></e-
majorgridlines>
        </e-stockchart-primaryxaxis>
        <e-stockchart-primaryyaxis>

            <e-majorticklines color="transparent" width="0"></e-
majorticklines>
            </e-stockchart-primaryyaxis>
        </ejs-stockchart>
    </div>
    <script src="~/scripts/chart/financial-data.js"></script>
    <script>
        var data = chartData;
        function stockload(args) {
            args.stockChart.series[0].dataSource = data;
        }
    </script>

```

### DISABLE.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}

```

## Appearance

### Stock Chart Title

Stock Chart can be given a title using [Title](#) property, to show the information about the data plotted.

### CSHTML

```

    <ejs-stockchart id="stockchart" load="stockload" title="AAPL
    Stock Price">
        <e-stockchart-series-collection>
            <e-stockchart-series type='Candle' xName="x"> </e-
stockchart-series>
        </e-stockchart-series-collection>
        <e-stockchart-titlestyle fontFamily="Arial"
fontStyle="italic" fontWeight="regular" size="20px" color="#E27F2D"></e-
stockchart-titlestyle>
    </ejs-stockchart>
    <script src="~/financial-data.js"></script>
    <script>
        var data = chartData;

```

```
function stockload(args) {
    args.stockChart.series[0].dataSource = data;
}
</script>
```

### TITLE.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}
```

<!-- markdownlint-disable MD036 -->

### Title Customizations

The `TextStyle` property of chart title provides options to customize the `Size`, `Color`, `FontFamily`, `FontWeight`, `FontStyle`, `Opacity`, `TextAlignment` and `TextOverflow`.

### CSHTML

```
<ejs-stockchart id="stockchart" load="stockload" title="AAPL
Stock Price">
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' xName="x"> </e-
stockchart-series>
    </e-stockchart-series-collection>
    <e-stockchart-titlestyle fontFamily="Arial"
fontStyle="italic" fontWeight="regular" size="20px" color="#E27F2D"
textOverflow="Wrap"></e-stockchart-titlestyle>
</ejs-stockchart>
<script src="~/scripts/chart/financial-data.js"></script>
<script>
    var data = chartData;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
    }
</script>
```

### TITLEWRAP.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
```

```
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}
```

### Stock Chart Theme

Changing theme will affect background color, gridlines, tooltip colors and appearance.

[Theme](#) property of Stock chart is shipped with several built-in themes such as Material, Fabric, Bootstrap, HighContrastLight, MaterialDark, FabricDark, FabricDark, HighContrast and BootstrapDark.

### CSHTML

```
<ejs-stockchart id="stockchart" load="stockload" title="AAPL
Stock Price" theme="Highcontrast">
    <e-stockchart-series-collection>
        <e-stockchart-series type='Candle' xName="x"> </e-
stockchart-series>
    </e-stockchart-series-collection>
</ejs-stockchart>
<script src="~/financial-data.js"></script>
<script>
    var data = chartData;
    function stockload(args) {
        args.stockChart.series[0].dataSource = data;
    }
</script>
```

### THEME.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}
```

## STOCKEVENTS.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller
    {
        public IActionResult Default()
        {
            return View();
        }
    }
}

```

```
}

```

### Stock Events for individual series

By default, stock events will be showed for all series. Now, you can set the stock events for particular series using `SeriesIndexes` property.

### CSHTML

```
<ejs-stockchart id="stockchartspline" load="chartLoad" seriesType="series"
indicatorType="indicator" trendlineType="trendline" title="AAPL Stock
Price">
    <e-stockchart-series-collection>
        <e-stockchart-series type='Spline' xName='x'
yName="high"> </e-stockchart-series>
        <e-stockchart-series type='Spline' xName='x'
yName="low"> </e-stockchart-series>
        <e-stockchart-series type='Spline' xName='x'
yName="open"> </e-stockchart-series>
    </e-stockchart-series-collection>
    <e-stockchart-crosshairsettings enable="true"></e-
stockchart-crosshairsettings>

        args.stockChart.series[0].dataSource = data;
    }
</script>

```

## STOCK-EVENTS-2.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
    public partial class StockChartController : Controller

```

```

    {
        public IActionResult Default()
        {
            return View();
        }
    }
}

```

### Accessibility in ASP.NET MVC Stock chart component

The Stock chart component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Stock chart component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

### WAI-ARIA attributes

The Stock chart component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Stock chart component:

- `img` (role)
- `button` (role)
- `region` (role)
- `aria-label` (attribute)
- `aria-hidden` (attribute)
- `aria-pressed` (attribute)

### Keyboard interaction

The Stock chart component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Stock chart component.

| **Press** | **To do this** |

| --- | --- |

| **Alt + J** | Moves the focus to the Stock chart element. |

| **Tab** | Moves the focus to the next element in the Stock chart. |

| **Shift + Tab** | Moves the focus to the previous element in the Stock chart. |

| **Down Arrow** | Moves the focus to the data point left side from the selected point. |

| **Up Arrow** | Moves the focus to the data point right side from the selected point. |

| **ESC** | Cancel the tooltip for the data point. |

| **Ctrl + P** | Prints the Stock chart. |

### Ensuring accessibility

The Stock chart component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Stock chart component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Stock chart component with accessibility tools.

## Switch

### Getting Started with ASP.NET MVC Switch Control

#### Prerequisites

#### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

#### **PACKAGE MANAGER**

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

```
<namespaces>
```

```
<add namespace="Syncfusion.EJ2"/>
```

```
</namespaces>
```

,

#### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

#### **~/ LAYOUT.CSHTML**

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
```

```
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

#### Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

#### ~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

#### Add ASP.NET MVC Switch control

Now, add the Syncfusion ASP.NET MVC Switch control in `~/Views/Home/Index.cshtml` page.

#### CSHTML

```
@Html.EJS().Switch("default").Render()
```

Press **Ctrl+F5** (Windows) or **⌘+F5** (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Switch control will be rendered in the default web browser.

#### Set text on Switch

This section explains how to set [OnLabel](#) and [OffLabel](#) texts on Switch. In the following example, `onLabel` is set as `ON` and `offLabel` is set as `OFF`.

#### CSHTML

```
@Html.EJS().Switch("default").OnLabel("ON").OffLabel("OFF").Render()
```

**Note:** Switch does not have text support for material themes, and does not support long custom text.

**Note:** [View Sample in GitHub](#).

See also

- [How to customize the switch appearance](#)

## Accessibility in Switch Button Controls

The Switch component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Switch component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

### WAI-ARIA attributes

The Switch component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Switch component:

| Attributes | Purpose |

| --- | --- |

| **role** | Indicates the switch component. |

| **aria-disabled** | Indicates that the element is perceivable but disabled, so it is not editable or otherwise operable. |

### Keyboard interaction

The Switch component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Switch component.

| Press | To do this |

| --- | --- |

| **Space** | When the switch has focus, pressing the Space key changes the state of the switch. |

### Ensuring accessibility

The Switch component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Switch component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Switch component with accessibility tools.

See also

- [Accessibility in Syncfusion ASP.NET Core controls](#)

### Styles and Appearances

To modify the Switch appearance, you need to override the default CSS of Switch component. Find the list of CSS classes and its corresponding section in Switch. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

CSS Class | Purpose of Class

| .e-switch-wrapper .e-switch-inner | To customize the line of the switch in off mode

| .e-switch-wrapper .e-switch-handle | To customize the handle of the switch in off mode

| .e-switch-wrapper:not(.e-switch-disabled):hover .e-switch-handle:not(.e-switch-active) | To customize the handle of the switch in off mode when hover

| .e-switch-wrapper:not(.e-switch-disabled):hover .e-switch-inner:not(.e-switch-active) | To customize the line of the switch in off mode when hover

| .e-switch-wrapper .e-switch-handle.e-switch-active | To customize the handle of the switch in on mode

| .e-switch-wrapper .e-switch-on | To customize the line of the switch in on mode

|.e-switch-wrapper:hover .e-switch-handle.e-switch-active|To customize the handle of the switch in on mode when hover

|.e-switch-wrapper:hover .e-switch-inner.e-switch-active .e-switch-on|To customize the line of the switch in on mode when hover

## How To

### Change Size

The different Switch sizes available are default and small. To reduce the size of default Switch to small, set the [cssClass](#) property to `e-small`.

### CSHTML

```
<div id='container'>
  <table class='size'>
    <tr>
      <td class='lSize'>Small</td>
      <td>
        <ejs-switch id="switch1" cssClass="e-small"></ejs-switch>
      </td>
    </tr>
    <tr>
      <td class='lSize'>Default</td>
      <td>
        <ejs-switch id="switch2"></ejs-switch>
      </td>
    </tr>
  </table>
</div>
<style>
.size tr td {
  padding: 10px;
}
.size .lSize {
  font-family: "Roboto", "Segoe UI", "GeezaPro", "DejaVu Serif", "sans-serif";
  font-size: 13px;
  cursor: pointer;
  user-select: none;
}
</style>
```

### DEFAULT.CS

```
public ActionResult Default()
{
    return View();
}
```

### Customize the appearance of a Switch

You can customize the appearance of the Switch component using the CSS rules. Define your own CSS rules according to your requirement and assign the class name to the [cssClass](#) property.

*Customize Switch bar and handle*

Switch bar and handle can be customized as per requirement using CSS rules. Switch bar and handle customized using `cssClass` property. In the following sample, the `border-radius` CSS property for `e-switch-inner` and `e-switch-handle` elements was changed border radius circle to square shape.

**CSHTML**

```
<style src="https://cdn.syncfusion.com/ej2/fabric.css"
type="text/css"></style>
<ul>
  <li>
    <ejs-switch id="switch1" cssClass="square"></ejs-switch>
  </li>
  <li>
    <ejs-switch id="switch2" cssClass="custom-switch"></ejs-switch>
  </li>
  <li>
    <ejs-switch id="switch3" cssClass="handle-text"></ejs-switch>
  </li>
</ul>
<style>
  /* Square Switch */
  .e-switch-wrapper.square .e-switch-inner,
  .e-switch-wrapper.square .e-switch-handle {
    border-radius: 0;
  }
  li {
    list-style: none;
    padding: 10px;
  }
  /* Customize Handle and Bar Switch */
  .e-switch-wrapper.custom-switch {
    width: 50px;
    height: 24px;
  }
  .e-switch-wrapper.custom-switch .e-switch-handle {
    width: 20px;
    height: 16px;
  }
  .e-switch-wrapper.custom-switch .e-switch-inner,
  .e-switch-wrapper.custom-switch .e-switch-handle {
    border-radius: 0;
  }
  .e-switch-wrapper.custom-switch .e-switch-handle.e-switch-active {
    left: 42px;
  }
  /* Customize Handle and Bar Switch */
  .e-switch-wrapper.handle-text {
    width: 58px;
    height: 24px;
  }
  .e-switch-wrapper.handle-text .e-switch-handle {
    width: 26px;
    height: 20px;
    left: 2px;
    background-color: #fff;
  }
</style>
```

```

    }
    .e-switch-wrapper.handle-text .e-switch-inner,
    .e-switch-wrapper.handle-text .e-switch-handle {
        border-radius: 0;
    }
    .e-switch-wrapper.handle-text .e-switch-handle.e-switch-active {
        left: 46px;
    }
    .e-switch-wrapper.handle-text .e-switch-inner.e-switch-active,
    .e-switch-wrapper.handle-text:hover .e-switch-inner.e-switch-active .e-
switch-on {
        background-color: #4d841d;
        border-color: #4d841d;
    }
    .e-switch-wrapper.handle-text .e-switch-inner,
    .e-switch-wrapper.handle-text .e-switch-off {
        background-color: #e3165b;
        border-color: #e3165b;
    }
    .e-switch-wrapper.handle-text .e-switch-inner:after,
    .e-switch-wrapper.handle-text .e-switch-inner:before {
        font-size: 10px;
        position: absolute;
        line-height: 21px;
        font-family: "Helvetica", sans-serif;
        z-index: 1;
        height: 100%;
        transition: all 200ms cubic-bezier(0.445, 0.05, 0.55, 0.95);
    }
    .e-switch-wrapper.handle-text .e-switch-inner:before {
        content: "OFF";
        color: #e3165b;
        left: 3px;
    }
    .e-switch-wrapper.handle-text .e-switch-inner:after {
        content: "ON";
        right: 5px;
        color: #fff;
    }
    .e-switch-wrapper.handle-text .e-switch-inner.e-switch-active:before {
        color: #fff;
    }
    .e-switch-wrapper.handle-text .e-switch-inner.e-switch-active:after {
        color: #4d841d;
    }
}
</style>

```

### DEFAULT.CS

```

public ActionResult Default()
{
    return View();
}

```

*Color the Switch*

Switch colors can be customized as per the requirement using CSS rules. Switch bar and handle colors customized using `cssClass` property. In the following sample, the `e-switch-inner` and `e-switch-off` elements background and border colors were changed from default colors.

**CSHTML**

```
<style src="https://cdn.syncfusion.com/ej2/bootstrap.css"
type="text/css"></style>
<ul>
  <li>
    <ejs-switch id="switch1" cssClass="bar-color"></ejs-switch>
  </li>
  <li>
    <ejs-switch id="switch2" cssClass="handle-color"></ejs-switch>
  </li>
  <li>
    <ejs-switch id="switch3" cssClass="custom-iOS"></ejs-switch>
  </li>
</ul>
<style>
  /* Custom color Switch */
  .e-switch-wrapper.bar-color .e-switch-inner.e-switch-active,
  .e-switch-wrapper.bar-color:hover .e-switch-inner.e-switch-active .e-
switch-on {
    background-color: #4d841d;
    border-color: #4d841d;
  }
  li {
    list-style:none;
  }
  .e-switch-wrapper.bar-color .e-switch-inner,
  .e-switch-wrapper.bar-color .e-switch-off {
    background-color: #e3165b;
    border-color: #e3165b;
  }
  .e-switch-wrapper.bar-color .e-switch-handle {
    background-color: #fff;
  }
  /* handle color Switch */
  .e-switch-wrapper.handle-color .e-switch-handle {
    background-color: #e3165b;
  }
  .e-switch-wrapper.handle-color .e-switch-handle.e-switch-active {
    background-color: #4d841d
  }
  .e-switch-wrapper.handle-color .e-switch-inner.e-switch-active,
  .e-switch-wrapper.handle-color:hover .e-switch-inner.e-switch-active .e-
switch-on {
    background-color: #fff;
    border-color: #ccc;
  }
  .e-switch-wrapper.handle-color .e-switch-inner,
  .e-switch-wrapper.handle-color .e-switch-off {
    background-color: #fff;
    border-color: #ccc;
  }
}
```

```

/* iOS Switch */
.e-switch-wrapper.custom-iOS .e-switch-inner.e-switch-active,
.e-switch-wrapper.custom-iOS:hover .e-switch-inner.e-switch-active .e-
switch-on {
  background-color: #3df865;
  border-color: #3df665;
}
.e-switch-wrapper.custom-iOS {
  width: 42px;
  height: 24px;
}
.e-switch-wrapper.custom-iOS .e-switch-handle {
  width: 20px;
  height: 20px;
}
.e-switch-wrapper.custom-iOS .e-switch-handle.e-switch-active {
  margin-left: -22px;
}
</style>

```

### DEFAULT.CS

```

public ActionResult Default()
{
    return View();
}

```

### Enable ripple for Switch label

By default, label with ripple effect is not available in Switch. You can achieve this using `rippleMouseHandler` method. The following example illustrates how to enable ripple effect for labels in Switch component.

### CSHTML

```

<div id='container'>
  <table class='size'>
    <tr>
      <td><label for='switch1'>USB Tethering</label></td>
      <td>
        <ejs-switch id="switch1"></ejs-switch>
      </td>
    </tr>
  </table>
</div>
<script>
  ej.base.enableRipple(true)
  // Function to handle ripple effect for Switch with label.
  document.querySelector('label').addEventListener('mouseup',
  rippleHandler);
  document.querySelector('label').addEventListener('mousedown',
  rippleHandler);
  function rippleHandler(e) {
    var rippleSpan =
    this.parentElement.nextElementSibling.querySelector('.e-ripple-container');
    if (rippleSpan) {

```

```

        ejs.buttons.rippleMouseHandler(e, rippleSpan);
    }
}
</script>
<style>

    .size td {
        padding: 10px;
        font-family: "Roboto", "Segoe UI", "GeezaPro", "DejaVu Serif",
"sans-serif";
        font-size: 13px;
    }
    .size td label {
        cursor: pointer;
        user-select: none;
    }
</style>

```

**DEFAULT.CS**

```

public ActionResult Default()
{
    return View();
}

```

**Enable RTL**

Switch component has RTL support. This can be achieved by setting [enableRtl](#) as `true`.

The following example illustrates how to enable right-to-left support in Switch component.

**CSHTML**

```
<ejs-switch id="default" enableRtl="true"></ejs-switch>
```

**DEFAULT.CS**

```

public ActionResult Default()
{
    return View();
}

```

**Set disabled state**

Switch can be disabled by setting the [disabled](#) property to `true`.

The following example illustrates how to disable support in Switch component.

**CSHTML**

```
<ejs-switch id="default" disabled="true"></ejs-switch>
```

**DEFAULT.CS**

```

public ActionResult Default()
{

```

```
return View();
}
```

### Submit name and value in form

The name attribute of the Switch is used to group Switches. When the Switches are grouped in form, the checked items value attribute will post to the server on form submit. The disabled and unchecked Switch values will not be sent to the server on form submit.

In the following code snippet, USB and Wi-Fi in the checked state, and Bluetooth is in disabled state. Values that are in checked state only be sent on form submit.

### CSHTML

```
<div id='container'>
<form>
  <table class='size'>
    <tr>
      <td class='lSize'>USB</td>
      <td>
        <ejs-switch id="switch1" checked="true"></ejs-switch>
      </td>
    </tr>
    <tr>
      <td class='lSize'>Wi-Fi</td>
      <td>
        <ejs-switch id="switch2" checked="true"></ejs-switch>
      </td>
    </tr>
    <tr>
      <td class='lSize'>Bluetooth</td>
      <td>
        <ejs-switch id="switch3" disabled="true"></ejs-switch>
      </td>
    </tr>
    <tr>
      <td>
        <ejs-button id="btnElement" ></ejs-button>
      </td>
    </tr>
  </table>
</form>
</div>
<style>
button {
  margin: 20px 0 0 5px;
}
.size tr td {
  padding: 10px;
}
.size .lSize {
  font-family: "Roboto", "Segoe UI", "GeezaPro", "DejaVu Serif", "sans-serif";
  font-size: 13px;
}
.size .lSize label {
  user-select: none;
}
```

```
}  
</style>
```

### DEFAULT.CS

```
public ActionResult Default()  
{  
    return View();  
}
```

## Tabs

### Getting Started with ASP.NET MVC Tab Control

#### Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add ASP.NET MVC controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

### PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](https://nuget.org). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

```
<namespaces>
```

```
<add namespace="Syncfusion.EJ2"/>
```

```
</namespaces>
```

,

### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the `<head>` of `~/Pages/Shared/_Layout.cshtml` file as follows,

#### ~/ \_LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

### Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

#### ~/ \_LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

### Add ASP.NET MVC Tab control

Now, add the Syncfusion ASP.NET MVC Tab control in `~/Views/Home/Index.cshtml` page.

#### CSHTML

```
@using Syncfusion.EJ2.Navigations;
@ (Html.EJS().Tab("ej2Tab")
    .Items(new List<TabItem> {
        new TabItem { Header = ViewBag.headerText0, Content = "Twitter is an
online social networking service that enables users to send and read short
140-character messages called tweets. Registered users can read and post
tweets, but those who are unregistered can only read them. Users access
Twitter through the website interface, SMS or mobile device app Twitter Inc.
is based in San Francisco and has more than 25 offices around the world.
Twitter was created in March 2006 by Jack Dorsey, Evan Williams, Biz Stone,
and Noah Glass and launched in July 2006. The service rapidly gained
worldwide popularity, with more than 100 million users posting 340 million
tweets a day in 2012.The service also handled 1.6 billion search queries per
day." },
        new TabItem { Header = ViewBag.headerText1, Content = "Facebook is
an online social networking service headquartered in Menlo Park, California.
Its website was launched on February 4, 2004, by Mark Zuckerberg with his
```

Harvard College roommates and fellow students Eduardo Saverin, Andrew McCollum, Dustin Moskovitz and Chris Hughes. The founders had initially limited the website's membership to Harvard students, but later expanded it to colleges in the Boston area, the Ivy League, and Stanford University. It gradually added support for students at various other universities and later to high-school students." },

```
new TabItem { Header = ViewBag.headerText2, Content = "WhatsApp
Messenger is a proprietary cross-platform instant messaging client for
smartphones that operates under a subscription business model. It uses the
Internet to send text messages, images, video, user location and audio media
messages to other users using standard cellular mobile numbers. As of
February 2016, WhatsApp had a user base of up to one billion,[10] making it
the most globally popular messaging application. WhatsApp Inc., based in
Mountain View, California, was acquired by Facebook Inc. on February 19,
2014, for approximately US$19.3 billion." }
```

```
    })
    .HeightAdjustMode(HeightStyles.Auto)
    .OverflowMode(OverflowMode.Popup)
    .Render()
}
```

```
<style>
```

```
#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.e-content .e-item {
    font-size: 12px;
    margin: 10px;
    text-align: justify;
}
.container {
    min-width: 350px;
    max-width: 500px;
    margin: 0 auto;
}
```

```
</style>
```

## HOMECONTROLLER.CS

```
public ActionResult Index()
{
    ViewBag.headerText0 = new TabHeader { Text = "Twitter" };
    ViewBag.headerText1 = new TabHeader { Text = "Facebook" };
    ViewBag.headerText2 = new TabHeader { Text = "Whatsapp" };
    return View();
}
```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Tab control will be rendered in the default web browser.

Twitter      Facebook      Whatsapp

Twitter is an online social networking service that enables users to send and read short 140-character messages called tweets. Registered users can read and post tweets, but those who are unregistered can only read them. Users access Twitter through the website interface, SMS or mobile device app. Twitter Inc. is based in San Francisco and has more than 25 offices around the world. Twitter was created in March 2006 by Jack Dorsey, Evan Williams, Biz Stone, and Noah Glass and launched in July 2006. The service rapidly gained worldwide popularity, with more than 100 million users posting 340 million tweets a day in 2012. The service also handled 1.6 billion search queries per day.

Initialize the Tab using JSON items collection

The Tab can be rendered by defining a JSON array. The item is rendered with [header](#) text and [content](#) for each Tab.

#### CSHTML

```
@using Syncfusion.EJ2.Navigations;
@model List<TabTabItem>
@Html.EJS().Tab("ej2Tab").Items(Model).Render()

<style>
    .e-content .e-item {
        font-size: 12px;
        margin: 10px;
        text-align: justify;
    }
</style>
```

#### HOMECONTROLLER.CS

```
public ActionResult Index()
{
    List<TabTabItem> items = new List<TabTabItem>();
    items.Add(new TabTabItem { Header = new TabHeader { Text = "Twitter" },
    Content = "Twitter is an online social networking service that enables users to send and read short 140-character messages called 'tweets'. Registered users can read and post tweets, but those who are unregistered can only read them. Users access Twitter through the website interface, SMS or mobile device app. Twitter Inc. is based in San Francisco and has more than 25 offices around the world. Twitter was created in March 2006 by Jack Dorsey, Evan Williams, Biz Stone, and Noah Glass and launched in July 2006. The service rapidly gained worldwide popularity, with more than 100 million users posting 340 million tweets a day in 2012. The service also handled 1.6 billion search queries per day." });
    items.Add(new TabTabItem { Header = new TabHeader { Text = "Facebook" },
    Content = "Facebook is an online social networking service headquartered in Menlo Park, California. Its website was launched on February 4, 2004, by Mark Zuckerberg with his Harvard College roommates and fellow students Eduardo Saverin, Andrew McCollum, Dustin Moskovitz and Chris Hughes. The
```

```

founders had initially limited the website's membership to Harvard students,
but later expanded it to colleges in the Boston area, the Ivy League, and
Stanford University. It gradually added support for students at various
other universities and later to high-school students." });
items.Add(new TabBarItem { Header = new TabHeader { Text = "Whatsapp" },
Content = "WhatsApp Messenger is a proprietary cross-platform instant
messaging client for smartphones that operates under a subscription business
model. It uses the Internet to send text messages, images, video, user
location and audio media messages to other users using standard cellular
mobile numbers. As of February 2016, WhatsApp had a user base of up to one
billion,[10] making it the most globally popular messaging application.
WhatsApp Inc., based in Mountain View, California, was acquired by Facebook
Inc. on February 19, 2014, for approximately US$19.3 billion." });
return View(items);
}

```

### Initialize the Tab using HTML elements

The Tab control can be rendered based on the given HTML element using `id` as `target`. Header section must be enclosed with in a wrapper element using `e-tab-header` class and corresponding content must be mapped with `e-content` class.

You need to follow the below structure of HTML elements to render the Tab,

```
`html
```

```
<div id='ej2Tab'> --> Root Tab element
```

```
<div class="e-tab-header"> --> Tab header
```

```
<div> --> Header Item
```

```
</div>
```

```
</div>
```

```
<div class="e-content"> --> Tab content
```

```
<div> --> Content Item
```

```
</div>
```

```
</div>
```

```
</div>
```

```
,
```

- Add the HTML template data with its `id` attribute and add it in your `index.cshtml` file to initialize the Tab.

### CSHTML

```

<div id="ej2Tab">
  <div class="e-tab-header">
    <div>Twitter </div>
    <div>Facebook </div>
    <div>WhatsApp </div>
  </div>

```

```

<div class="e-content">
  <div>
    Twitter is an online social networking service that enables
    users to send and read short 140-character messages called 'tweets'.
    Registered users can read and post tweets, but those who are unregistered
    can only read them. Users access Twitter through the website interface, SMS
    or mobile device app Twitter Inc. is based in San Francisco and has more
    than 25 offices around the world. Twitter was created in March 2006 by Jack
    Dorsey, Evan Williams, Biz Stone, and Noah Glass and launched in July 2006.
    The service rapidly gained worldwide popularity, with more than 100 million
    users posting 340 million tweets a day in 2012.The service also handled 1.6
    billion search queries per day.
  </div>
  <div>
    Facebook is an online social networking service headquartered in
    Menlo Park, California. Its website was launched on February 4, 2004, by
    Mark Zuckerberg with his Harvard College roommates and fellow students
    Eduardo Saverin, Andrew McCollum, Dustin Moskovitz and Chris Hughes.The
    founders had initially limited the website's membership to Harvard students,
    but later expanded it to colleges in the Boston area, the Ivy League, and
    Stanford University. It gradually added support for students at various
    other universities and later to high-school students.
  </div>
  <div>
    WhatsApp Messenger is a proprietary cross-platform instant
    messaging client for smartphones that operates under a subscription business
    model. It uses the Internet to send text messages, images, video, user
    location and audio media messages to other users using standard cellular
    mobile numbers. As of February 2016, WhatsApp had a user base of up to one
    billion,[10] making it the most globally popular messaging application.
    WhatsApp Inc., based in Mountain View, California, was acquired by Facebook
    Inc. on February 19, 2014, for approximately US$19.3 billion.
  </div>
</div>
</div>
<style>
  .e-content .e-item {
    font-size: 12px;
    padding: 10px;
    text-align: justify;
  }
</style>
<script type="text/javascript">
  var tabObj = new ej.navigations.Tab({
    heightAdjustMode: "Auto"
  });
  tabObj.appendTo('#ej2Tab');
</script>

```

**Note:** [View Sample in GitHub.](#)

- [How to load tab with DataSource](#)

## Responsive Modes

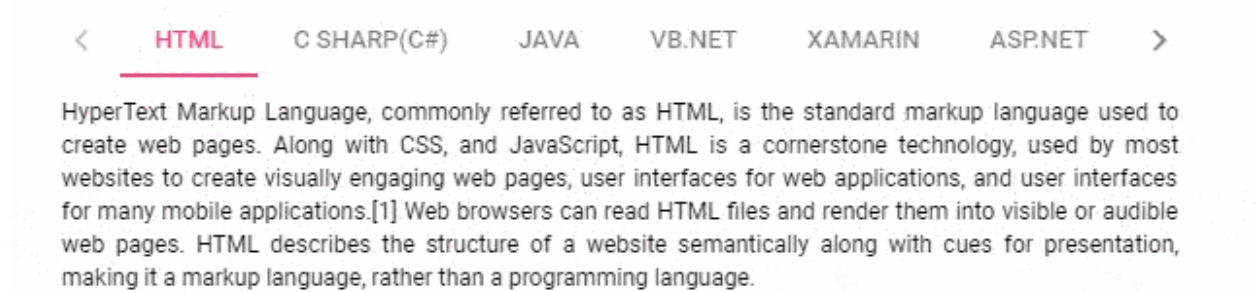

The following section explains about rendering Tab when its width exceeds the viewable area or particularly in a given width. The available modes are as follows:

- Scrollable
- Popup

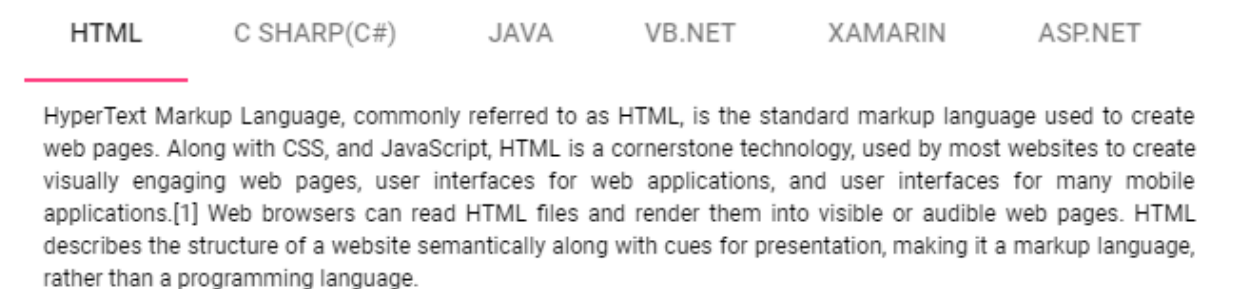

### Scrollable

The default overflow mode is Scrollable. Scrollable display mode supports displaying the Tab header items in a single line with horizontal scrolling enabled, when the item overflows to the available space.

- The right and left navigation arrow is added at the start and end of the Tab header through which user can navigate towards overflowed items of the Tab header.
- You can also see the overflowed items using touch and swipe action on the header and content section.
- By default, navigation icon in the left direction is disabled, you can see the overflowed items by moving in the right direction.
- By clicking the arrow or by holding the arrow continuously, you can see the overflowed items.

- In devices the navigation icons are not available. You can touch and swipe to see the overflowed items of the Tab header.

### CSHTML

```
@using Syncfusion.EJ2.Navigations;
```

```
@{
    var content0 = "HyperText Markup Language, commonly referred to as HTML,
is the standard markup language used to create web " +
    "pages. Along with CSS, and JavaScript, HTML is a cornerstone
technology, used by most websites to create visually " +
    "engaging web pages, user interfaces for web applications, and
user interfaces for many mobile applications.[1] Web " +
    "browsers can read HTML files and render them into visible or
audible web pages. HTML describes the structure of a " +
    "website semantically along with cues for presentation, making
it a markup language, rather than a programming language.";
    var content1 = "C# is intended to be a simple, modern, general-purpose,
object-oriented programming language. Its development " +
    "team is led by Anders Hejlsberg. The most recent version is C#
5.0, which was released on August 15, 2012.";
    var content2 = "Java is a set of computer software and specifications
developed by Sun Microsystems, later acquired by Oracle " +
    "Corporation, that provides a system for developing application
software and deploying it in a cross-platform computing " +
    "environment. Java is used in a wide variety of computing
platforms from embedded devices and mobile phones to " +
    "enterprise servers and supercomputers. While less common, Java
applets run in secure, sandboxed environments to "+
    "provide many features of native applications and can be
embedded in HTML pages.";
    var content3 = "The command-line compiler, VBC.EXE, is installed as part
of the freeware .NET Framework SDK. Mono also " +
    "includes a command-line VB.NET compiler. The most recent
version is VB 2012, which was released on August 15, 2012.";
    var content4 = "Xamarin is a San Francisco, California based software
company created in May 2011[3] by the engineers that " +
    "created Mono,[4] Mono for Android and MonoTouch that are cross-
platform implementations of the Common Language " +
    "Infrastructure (CLI) and Common Language Specifications (often
called Microsoft .NET). With a C#-shared codebase, " +
    "developers can use Xamarin tools to write native Android, iOS,
and Windows apps with native user interfaces and share " +
    "code across multiple platforms.[5] Xamarin has over 1 million
developers in more than 120 countries around the World " +
    "as of May 2015.";
    var content5 = "ASP.NET is an open-source server-side web application
framework designed for web development to produce " +
    "dynamic web pages. It was developed by Microsoft to allow
programmers to build dynamic web sites, web applications " +
    "and web services. It was first released in January 2002 with
version 1.0 of the .NET Framework, and is the successor " +
    "to Microsoft Active Server Pages (ASP) technology. ASP.NET is
built on the Common Language Runtime (CLR), allowing " +
    "programmers to write ASP.NET code using any supported .NET
language. The ASP.NET SOAP extension framework allows " +
    "ASP.NET components to process SOAP messages.";
    var content6 = "The ASP.NET MVC is a web application framework developed
by Microsoft, which implements the " +
    "model-view-controller (MVC) pattern. It is open-source
software, apart from the ASP.NET Web Forms component which is " +
    "proprietary. In the later versions of ASP.NET, ASP.NET MVC,
ASP.NET Web API, and ASP.NET Web Pages (a platform using " +
```

```

        "only Razor pages) will merge into a unified MVC 6.The project
        is called ASP.NET vNext.";
        var content7 = "JavaScript (JS) is an interpreted computer programming
        language. It was originally implemented as part of " +
        "web browsers so that client-side scripts could interact with
        the user, control the browser, communicate " +
        "asynchronously, and alter the document content that was
        displayed.[5] More recently, however, it has become common in " +
        "both game development and the creation of desktop
        applications.";
    }

### SCROLLABLE.CS

```

public ActionResult Index()
{

```

```
ViewBag.headerText0 = new TabHeader { Text = "HTML" };
ViewBag.headerText1 = new TabHeader { Text = "C Sharp(C#)" };
ViewBag.headerText2 = new TabHeader { Text = "Java" };
ViewBag.headerText3 = new TabHeader { Text = "VB.Net" };
ViewBag.headerText4 = new TabHeader { Text = "Xamarin" };
ViewBag.headerText5 = new TabHeader { Text = "ASP.NET" };
ViewBag.headerText6 = new TabHeader { Text = "ASP.NET MVC" };
ViewBag.headerText7 = new TabHeader { Text = "JavaScript" };
return View();
}
```

## Popup

The Popup is the another type of `overflowMode` in which the Tab container holds the items that can be placed within the available space. The rest of the overflowing items for which there is no space to fit within the viewing area are moved to overflow popup container.

- The items placed in popup can be viewed by opening the popup with the help of drop-down icon given at the end of the Tab header.
- If the popup height exceeds the height of the visible area, you can scroll through the popup items and select one.

HTML      C SHARP(C#)      JAVA      VB.NET      XAMARIN      ▼

HyperText Markup Language, commonly referred to as HTML, is the standard markup language used to create web pages. Along with CSS, and JavaScript, HTML is a cornerstone technology, used by most websites to create visually engaging web pages, user interfaces for web applications, and user interfaces for many mobile applications.[1] Web browsers can read HTML files and render them into visible or audible web pages. HTML describes the structure of a website semantically along with cues for presentation, making it a markup language, rather than a programming language.

## Header

This section explains about modifying the style of Tab header, and configuring its icons and positions.

## Styles

You can customize header styles by adding predefined classes in the Tab root element. The pre-defined CSS class names are as follows:

- **e-fill:** The Selected Tab header background is set as solid fill.
- **e-background:** Tab header has a solid fill background, and the selected header has a highlighted border.
- **e-background e-accent:** Tab header has a solid fill background, and the selected header has a highlighted border with accent color.

**Note:** If the above custom style classes are not included in the root element, the default style is applied to the Tab items.

    tabObj.element.classList.remove('e-fill');
    tabObj.element.classList.remove('e-background');
    tabObj.element.classList.remove('e-accent');
}
</script>

```

## STYLES.CS

```

public ActionResult Index()
{
    ViewBag.headerText0 = new TabHeader { Text = "Twitter" };
    ViewBag.headerText1 = new TabHeader { Text = "Facebook" };
    ViewBag.headerText2 = new TabHeader { Text = "Whatsapp" };
    ViewBag.stylesData = new string[] { "Default", "Fill", "Background",
    "Accent" };
    return View();
}

```

## Icon positions

You can customize the position of the Tab header icons using the icon position property. This property depends on the header items icon CSS property. By default, Tab header icon is placed on left position. The position values are as follows:

- **Left:** Icon is placed on the left of the Tab header item.
- **Right:** Icon is placed on the right of the Tab header item.
- **Top:** Icon is placed on the top of the Tab header item.
- **Bottom:** Icon is placed on the bottom of the Tab header item.

}

```

Output be like the below.

## Icon Positions

left

TWITTER

FACEBOOK

WHATSAPP

Twitter is an online social networking service that enables users to send and read short 140-character messages called tweets. Registered users can read and post tweets, but those who are unregistered can only read them. Users access Twitter through the website interface, SMS or mobile device app. Twitter Inc. is based in San Francisco and has more than 25 offices around the world. Twitter was created in March 2006 by Jack Dorsey, Evan Williams, Biz Stone, and Noah Glass and launched in July 2006. The service rapidly gained worldwide popularity, with more than 100 million users posting 340 million tweets a day in 2012. The service also handled 1.6 billion search queries per day.

- [How to customize selected tab styles](#)

## Orientation

This section explains about modifying the position and modes of Tab header.

It allows placing the header section inside the Tab component at different positions by using the `headerPlacement` property. The available positions are as follows:

- **Top:** Tab header items can be arranged horizontally, and their content can be placed after the header.
- **Bottom:** Tab header items can be arranged horizontally, and their content can be placed before the header.
- **Left:** Tab header items can be arranged vertically, and their content can be placed after the header.
- **Right:** Tab header items can be arranged vertically, and their content can be placed before the header.

It is also adaptable to the available space when the tab items exceed the view space. You can customize the modes by using `overflowMode` property. The available modes are as follows:

- Scrollable
- Popup

Output be like the below.

## Localization

Localization library allows to localize the default text content of Tab. In Tab, The close button's tooltip text alone will be localize based on culture.

| Locale key | en-US (default) |

|-----|-----|

| closeButtonTitle | Close |

## Loading translations

To load translation object in an application use `load` function of `L10n` class.

In the below sample, `French` culture is set to Tab and change the close button's tooltip text.

## LOCALIZATION.CS

```
public ActionResult Index()
{
    ViewBag.headerText0 = new TabHeader { Text = "HTML" };
    ViewBag.headerText1 = new TabHeader { Text = "C Sharp (C#)" };
    ViewBag.headerText2 = new TabHeader { Text = "Java" };
    return View();
}
```

## Drag and drop items

The Tab component allows you to drag and drop any item by setting [allowDragAndDrop](#) to **true**. Items can be reordered to any place by dragging and dropping them onto the desired location.

- If you need to prevent dragging action for a particular item, the [onDragStart](#) event can be used which will trigger when the item drag is started. If you need to prevent dropping action for a particular item, the [dragged](#) event can be used which will trigger when the drag action is stopped.
- The [dragArea](#) defines the area in which the draggable element movement will be occurring. Outside that area will be restricted for the draggable element movement.
- The [onDragStart](#) event will be triggered before dragging the item from Tab.
- The [dragging](#) event will be triggered when the Tab item is being dragged.
- The [dragged](#) event will be triggered when the Tab item is dropped on the target element successfully.

In the following sample, the [allowDragAndDrop](#) property is enabled.

### DRAGANDDROP.CS

```

public ActionResult Index()
{
    ViewBag.headerTextOne = new TabHeader { Text = "India" };
    ViewBag.headerTextTwo = new TabHeader { Text = "Australia" };
    ViewBag.headerTextThree = new TabHeader { Text = "USA" };
    ViewBag.headerTextFour = new TabHeader { Text = "France" };
    return View();
}

```

Output be like the below.

### Drag and drop item between tabs

It is possible to drag and drop the tab items between two tabs, by manually saving those dropped items as new tab item data through the `addTab` method of Tab and removing the dragged item through the `removeTab` method of Tab.

In this example, we have used the tab control as an external source, and the item from the tab component is dragged and dropped onto another Tab. Therefore, it is necessary to use the `onDragStart` and `dragged` event of the Tab component, where we can form an event object and save it using the `addTab` method of the Tab and remove the dragged item through `removeTab` method of Tab using the dragged item index.

### Drag and drop items from external source

It is possible to drag and drop the items from any of the external sources into the Tab, by manually saving those dropped items as new item data through the `addTab` method of Tab and removing the dragged node through the `removeNodes` method of Treeview.

In this example, we have used the tree view control as an external source, and the child nodes from the tree view component are dragged and dropped onto the Tab. Therefore, it is necessary to use the `nodeDragStop` event of the Treeview component, where we can form an event object and save it using the `addTab` method of the Tab and remove the dragged node through the `removeNodes` method of Treeview.

return View();
}
```

Output be like the below.

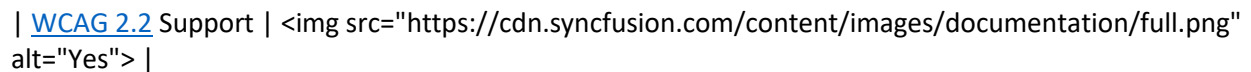

## Accessibility ASP.NET MVC Tab control

The Tab control followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Tab control is outlined below.

| Accessibility Criteria | Compatibility |

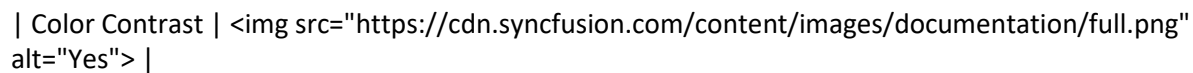

| -- | -- |

| [WCAG 2.2](#) Support |  alt="Yes" > |

| [Section 508](#) Support |  alt="Yes" > |

| Screen Reader Support |  alt="Yes" > |

| Right-To-Left Support |  alt="Yes" > |

| Color Contrast |  alt="Yes" > |

```
| Mobile Device Support |  |
| Keyboard Navigation Support |  |
| Accessibility Checker Validation |  |
| Axe-core Accessibility Validation |  |
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>
<div> - All
features of the control meet the requirement.</div>
<div> - Some features of the control do not meet the requirement.</div>
<div> - The control does not meet the requirement.</div>
```

#### ARIA attributes

Tab control is designed by considering [WAI-ARIA](#) standard. Tab is supported with ARIA Accessibility which is accessible by on-screen readers, and other assistive technology devices.

The following list of attributes are added in the Tab.

#### | Roles and Attributes | Functionalities |

| --- | --- |

| tablist | Attribute is set to the Tab header element that describes actual role of the element. |

| tab | Attribute is set to the Tab items element to indicates an interactive element inside a **tablist** that, when activated, displays its associated **tabpanel**. |

| tabpanel | Attribute is set to the Tab content that describes the role for viewing the active content. |

| aria-orientation | Attribute is set to the Tab header element indicates the Tab header orientation. Default value of this attribute is horizontal. |

| aria-selected | Attribute set to the Tab items to indicates the selection state for Tab items. Active Tab is set to true for this attribute. |

| aria-labelledby | Attribute is set to the Tab content element to indicates the associated Tab header for the content. |

| aria-controls | Attribute is set to the Tab items element to indicates the associated **tabpanel** for the header. |

| aria-haspopup | Attribute is set to the Popup element to indicates the popup mode in the Tab. The default value of this attribute is false. If popup mode is enabled, the attribute value is set to true. |

| aria-disabled | Attribute set to the Tab items to It indicates the disabled state of the Tab. |

### Keyboard interaction

By default, keyboard navigation is enabled. This control implements keyboard navigation support by following the WAI-ARIA practices. Once focused on the active Tab element, you can use the following key combination for interacting with the Tab.

| Key            | Description  |
|----------------|--|
| Left           | Moves focus to the previous Tab. If focus is on the first Tab, the focus will not move to any Tab.   |
| Right          | Moves focus to the next Tab. If focus is on the last Tab element, the focus will not move to any Tab.  |
| Enter or Space | Selects the Tab if it is not selected. Opens the popup dropdown icon if it is focussed. Select the Tab item as active when popup item is focussed. |
| Esc(Escape)    | Closes the popup if popup is in opened state.  |
| Down or Up     | When the popup is open and focused, it will move to previous/next Tab items of the popup in the vertical direction.                                |
| Home           | Moves focus to the first Tab.  |
| End            | Moves focus to the last Tab.   |
| Shift + F10    | If popup mode is enabled, it opens the popup when the Tab is focused.  |
| Delete         | Deletes the Tab, if close button is enabled in Tab header.   |
| Tab            | To Move focus through the interactive elements.  |
| Shift + Tab    | To Move focus through the interactive elements.  |

### Ensuring accessibility

The Tab control accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Tab control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Tab control with accessibility tools.

- [Accessibility in Syncfusion components](#)

### CSS Structure

The following content provides the exact CSS structure that can be used to modify the control's appearance based on user preference.

#### Customizing Tab

Use the following CSS to customize the Tab.

```
`CSS
```

```
.e-tab {  
border: 5px solid rgb(173, 255, 47);  
}
```

```
,
```

#### Customizing the Tab items

Use the following CSS to customize the header items of Tab.

```
`CSS
```

```
.e-tab .e-tab-header .e-toolbar-items {  
background: #9faed8;  
border: 2px solid blue;  
}
```

```
,
```

Use the following CSS to customize the content items of Tab.

```
`CSS
```

```
.e-tab .e-content .e-item {  
color: #a78515;  
font-size: 14px;  
}
```

```
,
```

#### Customizing Tab's header

Use the following CSS to customize the header of Tab control.

```
`CSS
```

```
.e-tab .e-tab-header {  
background: #badfba !important;  
}
```

```
,
```

#### Customizing Tab's header icon

Use the following CSS to customize the header item icon of Tab control.

```
`CSS
```

```
.e-tab .e-tab-header .e-toolbar-item .e-tab-icon {  
color: #badfba !important;  
}  
`
```

### Customizing Tab's content

Use the following CSS to customize the content of Tab control.

```
`CSS  
.e-tab .e-content {  
background: #d1f6d1 !important;  
}  
`
```

### Customizing the hover state of Tab control

Use the following CSS to customize the tab item when hovering.

```
`CSS  
.e-tab .e-tab-header .e-toolbar-item .e-tab-wrap:hover {  
background: #d1f6d1 !important;  
}  
`
```

Use the following CSS to customize the tab item popup icon when hovering.

```
`CSS  
.e-tab .e-tab-header .e-hor-nav .e-popup-up-icon:hover,  
.e-tab .e-tab-header .e-hor-nav .e-popup-down-icon:hover {  
background: #d1f6d1 !important;  
}  
`
```

### Customizing selected item of Tab control

Use the following CSS to customize the selected tab item.

```
`CSS  
.e-tab .e-tab-header .e-toolbar-item.e-active {  
background: #d1f4d1;  
}  
`
```

Use the following CSS to customize the selected tab item text and icon.

```
`CSS
```

```
.e-tab .e-tab-header .e-toolbar-item.e-active .e-tab-text,
.e-tab .e-tab-header .e-toolbar-item.e-active .e-tab-icon {
color: green !important;
}
`
```

## How To

### Load content through Ajax

The Tab supports to load external contents through AJAX library. Refer to the following steps.

- Import the Ajax module from ej2-base and initialize with URL path.
- Get the data from Ajax Success event, then initialize the Tab with retrieved external path data.

## CSHTML

```
@using Syncfusion.EJ2.Navigations;
<ejs-tab id="MainTab" created="Created">
</ejs-tab>
<style>
    #container {
        visibility: hidden;
    }
    #loader {
        color: #008cff;
        height: 40px;
        left: 45%;
        position: absolute;
        top: 45%;
        width: 30%;
    }
    .e-content .e-item {
        font-size: 12px;
        margin: 10px;
        text-align: justify;
    }
</style>
<script>
    function Created() {
        var TabObj = document.getElementById("MainTab").ej2_instances[0];
        var ajax = new ej.base.Ajax('./network.html', 'GET', true);
        ajax.send().then();
        ajax.onSuccess = function (data) {
            TabObj.addTab([ { header: { 'text': 'Twitter' } }, content: data
        ]], 0);
        }
    }
</script>
```

## AJAX.CS

```
public IActionResult Index()
{
```

```

    return View();
}

```

## Prevent content swipe selection

### CSHTML

```

@using Syncfusion.EJ2.Navigations;
@{
    var content0 = "Twitter is an online social networking service that  

    enables users to send and read short 140-character" +  

    "messages called 'tweets'.Registered users can read and  

    post tweets, but those who are unregistered can only read" +  

    "them.Users access Twitter through the website interface,  

    SMS or mobile device app Twitter Inc. is based in San" +  

    "Francisco and has more than 25 offices around the  

    world.Twitter was created in March 2006 by Jack Dorsey," +  

    "Evan Williams, Biz Stone, and Noah Glass and launched in  

    July 2006. The service rapidly gained worldwide popularity," +  

    "with more than 100 million users posting 340 million  

    tweets a day in 2012.The service also handled 1.6 billion" +  

    "search queries per day.";
    var content1 = "Facebook is an online social networking service  

    headquartered in Menlo Park, California. Its website was" +  

    "launched on February 4, 2004, by Mark Zuckerberg with  

    his Harvard College roommates and fellow students Eduardo" +  

    "Saverin, Andrew McCollum, Dustin Moskovitz and Chris  

    Hughes.The founders had initially limited the websites" +  

    "membership to Harvard students, but later expanded it to  

    colleges in the Boston area, the Ivy League, and Stanford" +  

    "University.It gradually added support for students at  

    various other universities and later to high-school students.";
    var content2 = "WhatsApp Messenger is a proprietary cross-platform  

    instant messaging client for smartphones that operates" +  

    "under a subscription business model.It uses the Internet  

    to send text messages, images, video, user location and" +  

    "audio media messages to other users using standard  

    cellular mobile numbers.As of February 2016, WhatsApp had a user" +  

    "base of up to one billion,[10] making it the most  

    globally popular messaging application.WhatsApp Inc., based in" +  

    "Mountain View, California, was acquired by Facebook  

    Inc.on February 19, 2014, for approximately US$19.3 billion.";
}
<ejs-tab id="ej2Tab" selecting="tabSelecting">
    <e-tab-tabitems>
        <e-tab-tabitem header="ViewBag.headerTextOne"
content="@content0"></e-tab-tabitem>
        <e-tab-tabitem header="ViewBag.headerTextTwo"
content="@content1"></e-tab-tabitem>
        <e-tab-tabitem header="ViewBag.headerTextThree"
content="@content2"></e-tab-tabitem>
    </e-tab-tabitems>
</ejs-tab>
<style>
    .e-content .e-item {
        font-size: 12px;
        padding: 10px;
    }

```

```

        text-align: justify;
    }
    .container {
        min-width: 350px;
        max-width: 500px;
        margin: 0 auto;
    }
</style>
<script type="text/javascript">
    function tabSelecting(e) {
        if (e.isSwiped) {
            e.cancel = true;
        }
    }
</script>

```

### SWIPE.CS

```

public ActionResult Index()
{
    ViewBag.headerTextOne = new TabHeader { Text = "Twitter" };
    ViewBag.headerTextTwo = new TabHeader { Text = "Facebook" };
    ViewBag.headerTextThree = new TabHeader { Text = "Whatsapp" };
    return View();
}

```

### Customize selected tab styles

You can customize the Tab style by overriding its header and active tab CSS classes. Define HTML string for adding animation and customizing the Tab header and pass it to [text](#) property. Now you can override the style using custom CSS classes added to the Tab elements.

### CSHTML

```

### **CUSTOMIZE.CS**

```

public ActionResult Index()
{
    ViewBag.headerTextOne = new TabHeader { Text = "<div id=\"template-wrap\"><div class='e-image e-andrew'></div><div class='e-title fade-in'>Andrew</div></div>" };
    ViewBag.headerTextTwo = new TabHeader { Text = "<div id=\"template-wrap\"><div class='e-image e-margaret'></div><div class='e-title fade-in'>Margaret</div></div>" };
}

```

```
ViewBag.headerTextThree = new TabHeader { Text = "<div id=\"template-  
wrap\"><div class='e-image e-janet'></div><div class='e-title fade-  
in'>Janet</div></div>" };  
return View();  
}
```

Output be like the below.

### Create wizard using Tab

In the below Wizard sample, each Tab is integrated with required components to complete the reservation. Each field is provided with validation for all mandatory option to proceed to next tabs. Using Tab item's template property the components are added into content.

Create the following contents for each tab in the wizard.

#### 1. Search tab:

Created with [DropDownList] to select the source, destination and type of ticket. A [DatePicker] for choosing the date of journey.

#### 2. Train tab:

Based on the selected start and end point, populated Grid with random list of available seats and train list. Initially define the columns and row selected event for validating, after the source and destination chosen update the [dataSource] for the Grid.

#### 3. Passenger tab:

A table with Textbox, Numeric, DropDownList for adding passenger name, age, gender and preferred berth/seat. Add validation on entering passenger details to proceed.

#### 4. Payment tab:

Calculate the ticket cost based on location, passenger count and ticket type. Generate data for Grid with passenger details, train number and ticket cost summary.

You can go back on each tab using buttons available in it and tabs are disabled to navigate through tab header click actions. Once you end the wizard all the data get cleared and wizard goes back to starting tab.

### Load tab with DataSource

In the below demo, Data is fetched from an OData service using DataManager. The result data is formatted as a JSON object with header and content fields, which is set to items property of Tab.

#### CSHTML

```
@using Syncfusion.EJ2.Navigations;
<div id="ej2Tab"></div>
<style>
    #container {
        visibility: hidden;
    }
    #loader {
        color: #008cff;
        height: 40px;
        left: 45%;
        position: absolute;
        top: 45%;
        width: 30%;
    }
    .e-content .e-item {
        font-size: 12px;
        margin: 10px;
        text-align: justify;
    }
    .container {
        min-width: 350px;
        max-width: 500px;
        margin: 0 auto;
    }
</style>
<script type="text/javascript">
    ej.base.enableRipple(true);
    var itemsData = [];
    var mapping = { header: 'FirstName', content: 'Notes' };
    const SERVICE_URI =
'https://js.syncfusion.com/ejServices/Wcf/Northwind.svc/Employees';
    new ej.data.DataManager({ url: SERVICE_URI, adaptor: new
ej.data.ODataAdaptor })
        .executeQuery(new ej.data.Query().range(1, 4)).then((e) => {
            var result = e.result;
            for (var i = 0; i < result.length; i++) {
                itemsData.push({ header: { text: result[i][mapping.header]
}, content: result[i][mapping.content] });
            }
            //Initialize Tab component
            var tabObj = new ej.navigations.Tab({
                items: itemsData
            });
            //Render initialized Tab component
            tabObj.appendTo('#ej2Tab');
        });
</script>
```

**DATA.CS**

```
public ActionResult Index()
{
    return View();
}
```

**Add nested Tabs**

Tab supports to render the nested level of Tabs by using `content` property. You can add the nested Tab element inside the parent Tab `content` property. To render the nested Tab, initialize the component using the id of Tab from a selected event handler.

**CSHTML**

```
@using Syncfusion.EJ2.Navigations;
<ejs-tab id="ej2Tab" selected="handleSelectEvent"
created="handleCreatedEvent">
    <e-tab-tabitems>
        <e-tab-tabitem header="ViewBag.headerTextOne" content="<div
id='usa_tab'></div>"></e-tab-tabitem>
        <e-tab-tabitem header="ViewBag.headerTextTwo" content="<div
id='france_tab'></div>"></e-tab-tabitem>
        <e-tab-tabitem header="ViewBag.headerTextThree" content="<div
id='australia_tab'></div>"></e-tab-tabitem>
    </e-tab-tabitems>
</ejs-tab>
<style>
    #container {
        visibility: hidden;
    }
    #loader {
        color: #008cff;
        height: 40px;
        left: 45%;
        position: absolute;
        top: 45%;
        width: 30%;
    }
    .e-content .e-item {
        font-size: 12px;
        margin: 10px;
        text-align: justify;
    }

```

## NESTED.CS

```

public ActionResult Index()
{
    ViewBag.headerTextOne = new TabHeader { Text = "USA" };
    ViewBag.headerTextTwo = new TabHeader { Text = "France" };
    ViewBag.headerTextThree = new TabHeader { Text = "Australia" };
    return View();
}

```

## Set state persistence of the Tab Control

State persistence allows the Tab to retain the current modal value in the browser cookies for state maintenance. This action is handled through the enablePersistence property which is set to false by default. When it is set to true, some of the Tab component model values will be retained even after refreshing the page.

The following sample demonstrates how to set state persistence of the Tab component.

## CSHTML

```

@using Syncfusion.EJ2.Navigations;
@{
    var content0 = "Twitter is an online social networking service that
enables users to send and read short 140-character" +

```

```

    return View();
}

```

Output be like the below.

TWITTER      **FACEBOOK**      WHATSAPP

Facebook is an online social networking service headquartered in Menlo Park, California. Its website was launched on February 4, 2004, by Mark Zuckerberg with his Harvard College roommates and fellow students Eduardo Saverin, Andrew McCollum, Dustin Moskovitz and Chris Hughes. The founders had initially limited the website's membership to Harvard students, but later expanded it to colleges in the Boston area, the Ivy League, and Stanford University. It gradually added support for students at various other universities and later to high-school students.

### Set custom animation

Tab supports custom animations for both previous and next actions from the provided animation option of **Animation** library. The animation property also allows you to set easing, duration, and various other effects.

Default animation is given as **SlideLeftIn** for previous tab animation and **SlideRightIn** for next tab animation. You can also disable the animation by setting the animation effect as **None**. Also, use the following CSS to disable indicator animation for animation effect as **None**.

`CSS

```
.e-tab .e-tab-header:not(.e-vertical) .e-indicator, .e-tab .e-tab-header.e-vertical .e-indicator {
transition: none;
}
```

The sample demonstrates some types of animation that suits Tab. You can check all the animation effects here.

## STYLES.CSS

```
public ActionResult Index()
```

```
{
    ViewBag.headerText0 = new TabHeader { Text = "Twitter" };
    ViewBag.headerText1 = new TabHeader { Text = "Facebook" };
    ViewBag.headerText2 = new TabHeader { Text = "WhatsApp" };
    ViewBag.animationData = new string[] { "SlideLeftIn", "SlideRightIn",
    "FadeIn", "FadeOut", "FadeZoomIn", "FadeZoomOut", "ZoomIn", "ZoomOut",
    "None" };
    return View();
}
```

Output be like the below.

### Load Tab items dynamically

Tabs can be added dynamically by passing array of items and index value to the addTab method.

In the following demo, you can add the tab content by clicking the +. Enter the new Tab heading and content details in the available text boxes, click 'Add Tab' button to pass the details as an array and here last index is calculated to append the new tab at the end.

### CSHTML

```
@using Syncfusion.EJ2.Navigations;
<div id="tab1_content" style="display: none">
    <ul>
        <li>Click on the "+" header to add dynamic tab items. </li>
        <li>It displays input elements to get the new tab information. </li>
        <li>Add details and click the "Add Tab" button to open the newly
added tab.</li>
    </ul>
</div>
<div id="form-container" style="display: none">

        // Required tab item object formed by using textbox inputs
        var item = { header: { text: title }, content:
ej.base.createElement('pre', { innerHTML: content.replace(/\n/g, '<br>\n')
}).outerHTML };
        totalItems = document.querySelectorAll('#ej2Tab .e-toolbar-
item').length;
        // Item object and the index argument passed into the addTab method
        to add a new tab
        tabObj.addTab([item], totalItems - 1);
    }
</script>

```

## DYNAMIC.CS

```

public ActionResult Index()
{
    ViewBag.headerTextOne = new TabHeader { Text = "USA" };
    ViewBag.headerTextTwo = new TabHeader { IconCss = "e-add-icon" };
    return View();
}

```

## Create collapsible Tabs

You can achieve collapse and expand functionality in Tab by adding/removing a custom CSS class in the click event handler for each tab.

- Define a CSS class to set the style property display as none. Here 'collapse' class is added to the content element for hiding it.
- Bind the `select` event for Tab to collapse the initially selected Tab item and bind custom click handler for the Tab headers.
- In the event handler, add and remove 'collapse' class to hide and show the corresponding Tab content.

```

### COLLAPSIBLE.CS

```

public ActionResult Index()
{
    ViewBag.headerTextOne = new TabHeader { Text = "Twitter" };
    ViewBag.headerTextTwo = new TabHeader { Text = "Facebook" };
    ViewBag.headerTextThree = new TabHeader { Text = "WhatsApp" };
    return View();
}

```

### Customize Tab content height

You can change the Tab content height by using the `heightAdjustMode` property. By default, the Tab content `heightAdjustMode` property is set to `Content` value.

- **None:** Each tab content height is set based on the Tab height. This value is used only the tab component having the `height` property.
- **Auto:** Each tab content height will take the maximum height of all other tabs content.
- **Content:** Each tab content height is set based on their own content.
- **Fill:** Each tab content height is set based on the full height of Tabs parent element.

    return View();
}

```

Output be like the below.

### How to customize Tab scrollStep

Tab supports to customize the scrolling distance when you click the left and right side navigation icons. we can customize **ScrollStep** property for scrolling distance. Refer to the following code example.

By using Tab scrollStep property, pass a required value to customize tab scrollStep.

    </e-tab-tabitems>
</ejs-tab>

```

**STYLES.CSS**

```
public ActionResult Index()
{
    ViewBag.headerText0 = new TabHeader { Text = "HTML" };
    ViewBag.headerText1 = new TabHeader { Text = "C Sharp (C#)" };
    ViewBag.headerText2 = new TabHeader { Text = "Java" };
    ViewBag.headerText3 = new TabHeader { Text = "VB.Net" };
    ViewBag.headerText4 = new TabHeader { Text = "Xamarin" };
    ViewBag.headerText5 = new TabHeader { Text = "ASP.NET" };
    ViewBag.headerText6 = new TabHeader { Text = "ASP.NET MVC" };
    ViewBag.headerText7 = new TabHeader { Text = "JavaScript" };
    return View();
}
```

**Populate Tab items and their content through ViewBag**

For the Tab control, the tab items can be rendered in the controller and can be returned as ViewBag to bind as items. You can also map the content to other contents using the mapping id in controller to return as ViewBag. Refer to the below sample, which takes [chart](#), [grid](#), [calender](#) as its content through viewBag content id mapped in view.

**CSHTML**

```
@using Syncfusion.EJ2.Navigations;
<div class="info">
    Tab content loaded from ViewBag
</div>
<div id="Content1" style="display: none">
    <ejs-chart id="ej2chart" width="100%" height="100%">
        <e-series-collection>
            <e-series type="@Syncfusion.EJ2.Charts.ChartSeriesType.Line"
xName="x" yName="yValue" dataSource="@ViewBag.datasource" name="Gold"
width="2">
                <e-series-marker visible="true"/>
            </e-series>
        </e-series-collection>
        <e-chart-primaryxaxis interval="1"
valueType="@Syncfusion.EJ2.Charts.ValueType.Category" title="Olympic Medal
Counts - RIO" />
    </ejs-chart>
</div>
<div id="Content2" style="display: none">
    <ejs-grid id="ej2grid" allowPaging="true">
        <e-data-manager

</div>
<ejs-tab id="ej2Tab" items="@ViewBag.items"></ejs-tab>

```

### VIEWBAG.CS

```

public ActionResult Index()
{
    List<TabTabItem> tabItems = new List<TabTabItem>();
    tabItems.Add(new TabTabItem { Header = new TabHeader { Text = "Chart" },
Content = "#Content1" });
    tabItems.Add(new TabTabItem { Header = new TabHeader { Text = "Grid" },
Content = "#Content2" });
    tabItems.Add(new TabTabItem { Header = new TabHeader { Text = "Calender"
}, Content = "#Content3" });
    ViewBag.items = tabItems;
    //chart data
    List<ColumnChartData> chartData = new List<ColumnChartData>
    {
        new ColumnChartData { x= "USA", yValue= 46 },
        new ColumnChartData { x= "GBR", yValue= 27 },
        new ColumnChartData { x= "CHN", yValue= 26 }
    };
    ViewBag.dataSource = chartData;
    return View();
}
public class ColumnChartData
{
    public string x;
    public double yValue;
}

```

Output be like the below.

#### Render the Tab items using content template

You can bind any data in Tab items, by simply using the content template property in ASP.NET Tab.

In the below demo, the tab items are given as [chart](#), [grid](#), [calender](#) using the content template. In the content template you can give the header using `e-tab-header` and content using `e-content` class.

#### CSHTML

```
@using Syncfusion.EJ2.Navigations;
<div class="info">
    Content Template
</div>
<br /><br />
<ejs-tab id="ej2Tab">
    <e-tab-tabitems>
        <e-tab-tabitem>
            <e-content-template>
                <div>
                    <div class="e-tab-header">
                        <div>Grid</div>
                        <div>Chart</div>
                        <div>Calendar</div>
                    </div>
                    <div class="e-content">
```

```

        <div>
            <ejs-grid id="ej2grid" height="400px"
allowPaging="true">
                <e-data-manager

### Load the content as partial view to Tab

Since Tab is a Navigation control, it doesn't have support to load any content directly or using any DataAdapter. But it is provided with the items support. So to load the content as partial view, you would need to make use of the AJAX or EJ2 Datamanager as described in our [How-To](#) section help document.

In the below demo, we have explained on how to create the Tab items dynamically and then to load the other Syncfusion controls in it from partial views.

### CSHTML

```
<ejs-tab id="MainTab" created="Created" selecting="Selecting">
  <e-tab-tabitems>
    <e-tab-tabitem header="ViewBag.headerText0" content="<br/><div
id='GridOrder1'></div>"></e-tab-tabitem>
    <e-tab-tabitem header="ViewBag.headerText1" content="<br/><div
id='GridOrder2'></div>"></e-tab-tabitem>
  </e-tab-tabitems>
</ejs-tab>
<script>
  function Created() {
    var ajax = new ej.base.Ajax('@Url.Action("PartialView1", "Home")',
'GET', true);
    ajax.send().then();
    ajax.onSuccess = function (data) {
      $("#GridOrder1").html(data);
    }
  }
  function Selecting(e) {
    if (e.selectingIndex != 0){
      var ajax = new ej.base.Ajax('@Url.Action("PartialView2",
"Home")', 'GET', true);
      ajax.send().then();
      ajax.onSuccess = function (data) {
        $("#GridOrder2").html(data);
      }
    }
  }
}
```

```

</script>
//Code in the PartialView1
<h2>Grid</h2>
<ejs-grid id="Grid1" height="250" allowPaging="true">
  <e-grid-pageSettings pageCount="3"></e-grid-pageSettings>
  <e-data-manager url="https://ej2services.syncfusion.com/production/web-
services/api/Orders" crossdomain="true" adaptor="WebApiAdaptor"></e-data-
manager>
  <e-grid-columns>
    <e-grid-column field="OrderID" headerText="Order ID"

## PARTIALVIEW.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers
{
    public partial class TabController : Controller
    {
        // GET: //
    }
}

```

```

public IActionResult DefaultFunctionalities()
{
    ViewBag.headerText0 = new TabHeader { Text = "Grid1" };
    ViewBag.headerText1 = new TabHeader { Text = "Grid2" };
    return View();
}
public ActionResult PartialView1()
{
    return PartialView();
}
public ActionResult PartialView2()
{
    return PartialView();
}
}
}

```

Output be like the below.

GRID1 GRID2

Grid

| Order ID | Customer ID | Employee ID | Freight | Ship Country |

### How to prevent reorder active tab while selecting inside popup

We can able to prevent the changing of the active tab item on resizing the browser when overflow mode is popup by using the `reorderActiveTab` property. By default, the active Tab should be reordered when we click the tab items from the popup. If we set `false` to `reorderActiveTab` property the active tab item from the popup will not be reordered and an active item is highlighted inside the popup. The following code example depicts to prevent the reorder active tab item inside the popup.

#### CSHTML

```
@using Syncfusion.EJ2
@{
    var content0 = "HyperText Markup Language, commonly referred to as HTML,
is the standard markup language used to create web" +
        "pages.Along with CSS, and JavaScript, HTML is a
cornerstone technology, used by most websites to create visually" +
        "engaging web pages, user interfaces for web
applications, and user interfaces for many mobile applications.[1] Web" +
        "browsers can read HTML files and render them into

```

### How to find whether the tab is selected programmatically or user interaction

We can able to find the tab selection whether it is selected by user interaction or programmatically way in the `selecting` and `selected` event argument with the field of `isInteracted`. When the user changes the tab through click actions it will return true otherwise, it will return false. The following code example depicts to find the tab selecting the state in selecting and selected events.

    }
}

```

### Enabling tab key navigation in Tabs

The **TabIndex** property of a Tab item is used to enable tab key navigation for that particular item. When a positive value is assigned to the **TabIndex** property, it allows the user to switch focus to the next or previous tab item using the Tab or Shift+Tab keys. By default, the user can only switch between tab items using the arrow keys.

If the **TabIndex** value is set to 0 for all tab items, the tab will switch based on the order of the elements on the page. This means that if the tab items are listed in a specific order on the page, the user will be able to navigate through them using the Tab key in that same order.

To use the **TabIndex** property, you can assign a positive value to the property of each tab item that you want to enable tab key navigation. For example:

### CSHTML

```

@using Syncfusion.EJ2.Navigations;
@{
    var content0 = "HyperText Markup Language, commonly referred to as HTML,
is the standard markup language used to create web " +
        "pages. Along with CSS, and JavaScript, HTML is a cornerstone
technology, used by most websites to create visually " +
        "engaging web pages, user interfaces for web applications, and
user interfaces for many mobile applications.[1] Web " +
        "browsers can read HTML files and render them into visible or
audible web pages. HTML describes the structure of a " +
        "website semantically along with cues for presentation, making
it a markup language, rather than a programming language.";
    var content1 = "C# is intended to be a simple, modern, general-purpose,
object-oriented programming language. Its development " +
        "team is led by Anders Hejlsberg. The most recent version is C#
5.0, which was released on August 15, 2012.";
    var content2 = "Java is a set of computer software and specifications
developed by Sun Microsystems, later acquired by Oracle " +
        "Corporation, that provides a system for developing application
software and deploying it in a cross-platform computing " +
        "environment. Java is used in a wide variety of computing
platforms from embedded devices and mobile phones to " +
        "enterprise servers and supercomputers. While less common, Java
applets run in secure, sandboxed environments to " +

```

```

        "provide many features of native applications and can be
        embedded in HTML pages.";
        var content3 = "The command-line compiler, VBC.EXE, is installed as part
        of the freeware .NET Framework SDK. Mono also " +
        "includes a command-line VB.NET compiler. The most recent
        version is VB 2012, which was released on August 15, 2012.";
        var content4 = "Xamarin is a San Francisco, California based software
        company created in May 2011[3] by the engineers that " +
        "created Mono,[4] Mono for Android and MonoTouch that are cross-
        platform implementations of the Common Language " +
        "Infrastructure (CLI) and Common Language Specifications (often
        called Microsoft .NET). With a C#-shared codebase, " +
        "developers can use Xamarin tools to write native Android, iOS,
        and Windows apps with native user interfaces and share " +
        "code across multiple platforms.[5] Xamarin has over 1 million
        developers in more than 120 countries around the World " +
        "as of May 2015.";
        var content5 = "ASP.NET is an open-source server-side web application
        framework designed for web development to produce " +
        "dynamic web pages. It was developed by Microsoft to allow
        programmers to build dynamic web sites, web applications " +
        "and web services. It was first released in January 2002 with
        version 1.0 of the .NET Framework, and is the successor " +
        "to Microsoft Active Server Pages (ASP) technology. ASP.NET is
        built on the Common Language Runtime (CLR), allowing " +
        "programmers to write ASP.NET code using any supported .NET
        language. The ASP.NET SOAP extension framework allows " +
        "ASP.NET components to process SOAP messages.";
        var content6 = "The ASP.NET MVC is a web application framework developed
        by Microsoft, which implements the " +
        "model-view-controller (MVC) pattern. It is open-source
        software, apart from the ASP.NET Web Forms component which is " +
        "proprietary. In the later versions of ASP.NET, ASP.NET MVC,
        ASP.NET Web API, and ASP.NET Web Pages (a platform using " +
        "only Razor pages) will merge into a unified MVC 6.The project
        is called ASP.NET vNext.";
        var content7 = "JavaScript (JS) is an interpreted computer programming
        language. It was originally implemented as part of " +
        "web browsers so that client-side scripts could interact with
        the user, control the browser, communicate " +
        "asynchronously, and alter the document content that was
        displayed.[5] More recently, however, it has become common in " +
        "both game development and the creation of desktop
        applications.";
    }
}
<ej-tab id="ej2Tab" width="500px" heightAdjustMode="Auto"
overflowMode="Scrollable">
    <e-tab-tabitems>
        <e-tab-tabitem header="ViewBag.headerText0" content="@content0"
tabIndex= 0></e-tab-tabitem>
        <e-tab-tabitem header="ViewBag.headerText1" content="@content1"
tabIndex = 0></e-tab-tabitem>
        <e-tab-tabitem header="ViewBag.headerText2" content="@content2"
tabIndex = 0></e-tab-tabitem>
        <e-tab-tabitem header="ViewBag.headerText3" content="@content3"
tabIndex = 0></e-tab-tabitem>
    </e-tab-tabitems>

```

```

        <e-tab-tabitem header="ViewBag.headerText4" content="@content4"
tabIndex = 0></e-tab-tabitem>
        <e-tab-tabitem header="ViewBag.headerText5" content="@content5"
tabIndex = 0></e-tab-tabitem>
        <e-tab-tabitem header="ViewBag.headerText6" content="@content6"
tabIndex = 0></e-tab-tabitem>
        <e-tab-tabitem header="ViewBag.headerText7" content="@content7"
tabIndex = 0></e-tab-tabitem>
    </e-tab-tabitems>
</ejs-tab>
<style>
    #container {
        visibility: hidden;
        max-width: 650px;
    }
    #loader {
        color: #008cff;
        height: 40px;
        left: 45%;
        position: absolute;
        top: 45%;
        width: 30%;
    }
    .e-content .e-item {
        font-size: 12px;
        margin: 10px;
        text-align: justify;
    }
</style>

```

### TABKEYNAVIGATION.CS

```

public ActionResult Index()
{
    ViewBag.headerText0 = new TabHeader { Text = "HTML" };
    ViewBag.headerText1 = new TabHeader { Text = "C Sharp(C#)" };
    ViewBag.headerText2 = new TabHeader { Text = "Java" };
    ViewBag.headerText3 = new TabHeader { Text = "VB.Net" };
    ViewBag.headerText4 = new TabHeader { Text = "Xamarin" };
    ViewBag.headerText5 = new TabHeader { Text = "ASP.NET" };
    ViewBag.headerText6 = new TabHeader { Text = "ASP.NET MVC" };
    ViewBag.headerText7 = new TabHeader { Text = "JavaScript" };
    return View();
}

```

With this code, the user will be able to switch between the tab items using the Tab and Shift+Tab keys, in the order specified by the `TabIndex` values.

It's important to note that the `TabIndex` property only affects the ability to navigate between tab items using the Tab key. The user will still be able to use the arrow keys to switch between tab items, regardless of the value of the `TabIndex` property.

### Migration from Essential JS 1

This article describes the API migration process of Tab component from Essential JS 1 to Essential JS 2.

## Accessibility

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Keyboard Navigation | **Property:** *AllowKeyboardNavigation* <br /><br />

@Html.EJ().Tab("ejTab").AllowKeyboardNavigation(true).Render() <br /> | **Not Applicable** |

| Localization | **Not Applicable** | **Property:** *Locale* <br /><br /> @Html.EJS().Tab("ej2Tab").Locale("en-US").Render() <br /> |

| RTL | **Property:** *EnableRTL* <br /><br /> @Html.EJ().Tab("ejTab").EnableRTL(true).Render() <br /> | **Property:** *EnableRtl* <br /><br /> @Html.EJS().Tab("ej2Tab").EnableRtl(true).Render() <br /> |

## AjaxSettings

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Default | **Property:** *AjaxSettings* <br /><br /> @Html.EJ().Tab("ejTab").AjaxSettings ajax => { <br /> &#160; ajax.Type("GET"); <br /> }.Render() <br /> | **Not Applicable** |

| Asynchronous | **Property:** *AjaxSettings.Async* <br /><br /> @Html.EJ().Tab("ejTab").AjaxSettings ajax => { <br /> &#160; ajax.Async(true); <br /> }.Render() <br /> | **Not Applicable** |

| Browser Cache | **Property:** *AjaxSettings.Cache* <br /><br /> @Html.EJ().Tab("ejTab").AjaxSettings ajax => { <br /> &#160; ajax.Cache(false); <br /> }.Render() <br /> | **Not Applicable** |

| Request type | **Property:** *AjaxSettings.ContentType* <br /><br /> @Html.EJ().Tab("ejTab").AjaxSettings ajax => { <br /> &#160; ajax.ContentType("html"); <br /> }.Render() <br /> | **Not Applicable** |

| Data | **Property:** *AjaxSettings.Data* <br /><br /> @Html.EJ().Tab("ejTab").AjaxSettings ajax => { <br /> &#160; ajax.Data(""); <br /> }.Render() <br /> | **Not Applicable** |

| Response type | **Property:** *AjaxSettings.DataType* <br /><br /> @Html.EJ().Tab("ejTab").AjaxSettings ajax => { <br /> &#160; ajax.DataType("html"); <br /> }.Render() <br /> | **Not Applicable** |

| HTTP request type | **Property:** *AjaxSettings.Type* <br /><br /> @Html.EJ().Tab("ejTab").AjaxSettings ajax => { <br /> &#160; ajax.Type("GET"); <br /> }.Render() <br /> | **Not Applicable** |

| AjaxBeforeLoad | **Event:** *AjaxBeforeLoad* <br /><br /> @Html.EJ().Tab("ejTab").ClientSideEvents(e => e.AjaxBeforeLoad("onAjaxBeforeLoad")).Render() <br /> | **Not Applicable** |

| AjaxError | **Event:** *AjaxError* <br /><br /> @Html.EJ().Tab("ejTab").ClientSideEvents(e => e.AjaxError("onAjaxError")).Render() <br /> | **Not Applicable** |

| AjaxLoad | **Event:** *AjaxLoad* <br /><br /> @Html.EJ().Tab("ejTab").ClientSideEvents(e => e.AjaxLoad("onAjaxLoad")).Render() <br /> | **Not Applicable** |

| AjaxSuccess | **Event:** *AjaxSuccess* <br /><br /> @Html.EJ().Tab("ejTab").ClientSideEvents(e => e.AjaxSuccess("onAjaxSuccess")).Render() <br /> | **Not Applicable** |

## Animation

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Default | **Not Applicable** | **Property:** *Animation* <br /><br />  
@Html.EJS().Tab("ej2Tab").Animation(anim => { <br /> &#160; anim.Previous("");.Next(""); <br />  
}).Render() <br /> |

| EnableAnimation | **Property:** *EnableAnimation* <br /><br />  
@Html.EJ().Tab("ej2Tab").EnableAnimation(false).Render() <br /> | **Not Applicable** |

| Previous animation | **Not Applicable** | **Property:** *Animation.Prev* <br /><br />  
@Html.EJS().Tab("ej2Tab").Animation(anim => { <br /> &#160; anim.Previous(new  
List<TabTabActionSettings>() { <br /> &#160; &#160; new TabTabActionSettings() { Effect =  
"SlideRight" } <br /> &#160; }); <br /> }).Render() <br /> |

| Next animation | **Not Applicable** | **Property:** *Animation.Next* <br /><br />  
@Html.EJS().Tab("ej2Tab").Animation(anim => { <br /> &#160; anim.Next(new  
List<TabTabActionSettings>() { <br /> &#160; &#160; new TabTabActionSettings() { Effect = "SlideLeft"  
} <br /> &#160; }); <br /> }).Render() <br /> |

| Duration <br /> [prev / next] | **Not Applicable** | **Property:** *Animation.Next.Duration* <br /><br />  
@Html.EJS().Tab("ej2Tab").Animation(anim => { <br /> &#160; anim.Next(new  
List<TabTabActionSettings>() { <br /> &#160; &#160; new TabTabActionSettings() { Duration = 400 }  
<br /> &#160; }); <br /> }).Render() <br /> |

| Easing <br /> [prev / next] | **Not Applicable** | **Property:** *Animation.Next.Easing* <br /><br />  
@Html.EJS().Tab("ej2Tab").Animation(anim => { <br /> &#160; anim.Next(new  
List<TabTabActionSettings>() { <br /> &#160; &#160; new TabTabActionSettings() { Easing = "ease-in"  
} <br /> &#160; }); <br /> }).Render() <br /> |

| Effect <br /> [prev / next] | **Not Applicable** | **Property:** *Animation.Next.Effect* <br /><br />  
@Html.EJS().Tab("ej2Tab").Animation(anim => { <br /> &#160; anim.Next(new  
List<TabTabActionSettings>() { <br /> &#160; &#160; new TabTabActionSettings() { Effect =  
"SlideRight" } <br /> &#160; }); <br /> }).Render() <br /> |

## Header

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Header position | **Property:** *HeaderPosition* <br /><br />  
@Html.EJ().Tab("ej2Tab").HeaderPosition(HeaderPosition.Top).Render() <br /> | **Property:**  
*HeaderPlacement* <br /><br />  
@Html.EJS().Tab("ej2Tab").HeaderPlacement(Syncfusion.EJ2.Navigations.HeaderPosition.Bottom).Render()  
() <br /> |

| Header size | **Property:** *HeaderSize* <br /><br /> @Html.EJ().Tab("ej2Tab").HeaderSize("50px").Render()  
<br /> | **Not Applicable** |

| OverflowModes | **Not Applicable** | **Property:** *OverflowMode* <br /><br />  
@Html.EJS().Tab("ej2Tab").OverflowMode(Syncfusion.EJ2.Navigations.OverflowMode.Popup).Render()  
<br /> |

| TabScroll | **Property:** *EnableTabScroll* <br /><br />  
@Html.EJ().Tab("ej2Tab").EnableTabScroll(false).Render() <br /> | **Not Applicable** |

## Items

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Default | **Not Applicable** | **Property:** *Items* `<br /><br /> @Html.EJS().Tab("ej2Tab").Items(item => {  
<br /> &#160; item.Header(h => { h.Text("Tab1"); }).Content("contents").Add(); <br /> }).Render() <br />` |

| Content | **Not Applicable** | **Property:** *Items[0].Content* `<br /><br />  
@Html.EJS().Tab("ej2Tab").Items(item => { <br /> &#160; item.Content("contents").Add(); <br />  
}).Render() <br />` |

| Custom Class | **Not Applicable** | **Property:** *Items[0].CssClass* `<br /><br />  
@Html.EJS().Tab("ej2Tab").Items(item => { <br /> &#160; item.CssClass("customClass").Add(); <br />  
}).Render() <br />` |

| Header | **Not Applicable** | **Property:** *Items[0].Header* `<br /><br />  
@Html.EJS().Tab("ej2Tab").Items(item => { <br /> &#160; item.Header(h => { h.Text("Tab1"); }).Add();  
<br /> }).Render() <br />` |

| Icon class | **Not Applicable** | **Property:** *Items[0].Header.IconCss* `<br /><br />  
@Html.EJS().Tab("ej2Tab").Items(item => { <br /> &#160; item.Header(h => { h.IconCss("e-icon");  
}).Add(); <br /> }).Render() <br />` |

| Icon position | **Not Applicable** | **Property:** *Items[0].Header.IconPosition* `<br /><br />  
@Html.EJS().Tab("ej2Tab").Items(item => { <br /> &#160; item.Header(h => { h.IconPosition("Left");  
}).Add(); <br /> }).Render() <br />` |

| Header text | **Not Applicable** | **Property:** *Items[0].Header.Text* `<br /><br />  
@Html.EJS().Tab("ej2Tab").Items(item => { <br /> &#160; item.Header(h => { h.Text("Tab1"); }).Add();  
<br /> }).Render() <br />` |

| Get items length | **Method:** *getItemsCount()* `<br /><br /> var tabObj = $("#tab").data("ejTab"); <br />  
tabObj.getItemsCount(); <br />` | **Not Applicable** |

| Add Items | **Method:** *addItem(url, displayLabel, index, cssClass, id)* `<br /><br /> var tabObj =  
$("#tab").data("ejTab"); <br /> tabObj.addItem("#new", "New Item", 3, "myClass", "newItem"); <br />` |  
**Method:** *addTab(items, index)* `<br /><br /> var tab =  
document.getElementById('ej2Tab').ej2_instances[0]; <br /> tab.addTab([ { <br /> &#160; header: { text:  
'Tab1' }, <br /> &#160; content: 'contents' } ], 1 <br /> ); <br />` |

| BeforeAdd | **Not Applicable** | **Event:** *Adding* `<br /><br />  
@Html.EJS().Tab("ej2Tab").Adding("onAdding").Render() <br />` |

| AfterAdd | **Event:** *ItemAdd* `<br /><br /> @Html.EJ().Tab("ejTab").ClientSideEvents(e =>  
e.ItemAdd("itemAdd")).Render() <br />` | **Event:** *Added* `<br /><br />  
@Html.EJS().Tab("ej2Tab").Added("onAdded").Render() <br />` |

| Remove item | **Method:** *removeItem(index)* `<br /><br /> var tabObj = $("#tab").data("ejTab"); <br />  
tabObj.removeItem(1); <br />` | **Method:** *removeTab(index)* `<br /><br /> var tab =  
document.getElementById('ej2Tab').ej2_instances[0]; <br /> tab.removeTab(1); <br />` |

| BeforeRemove | **Event:** *BeforeItemRemove* <br /><br /> @Html.EJ().Tab("ejTab").ClientSideEvents(e => e.BeforeItemRemove("beforeItemRemove")).Render() <br /> }; <br /> | **Event:** *Removing* <br /><br /> @Html.EJS().Tab("ej2Tab").Removing("onRemoving").Render() <br /> |

| AfterRemove | **Event:** *ItemRemove* <br /><br /> @Html.EJ().Tab("ejTab").ClientSideEvents(e => e.ItemRemove("itemRemove")).Render() <br /> | **Event:** *Removed* <br /><br /> @Html.EJS().Tab("ej2Tab").Removed("onRemoved").Render() <br /> |

| SelectedItemIndex | **Property:** *SelectedItemIndex* <br /><br /> @Html.EJ().Tab("ejTab").SelectedItemIndex("1").Render() <br /> | **Property:** *SelectedItem* <br /><br /> @Html.EJS().Tab("ej2Tab").SelectedItem("0").Render() <br /> |

| Select item | **Not Applicable** | **Method:** *select(index)* <br /><br /> var tab = document.getElementById('ej2Tab').ej2\_instances[0]; <br /> tab.select(1); <br /> |

| BeforeActive | **Event:** *BeforeActive* <br /><br /> @Html.EJ().Tab("ejTab").ClientSideEvents(e => e.BeforeActive("beforeActive")).Render() <br /> | **Event:** *Selecting* <br /><br /> @Html.EJS().Tab("ej2Tab").Selecting("onSelecting").Render() <br /> |

| AfterActive | **Event:** *ItemActive* <br /><br /> @Html.EJ().Tab("ejTab").ClientSideEvents(e => e.ItemActive("itemActive")).Render() <br /> | **Event:** *Selected* <br /><br /> @Html.EJS().Tab("ej2Tab").Selected("onSelected").Render() <br /> |

| Disable items | **Property:** *DisabledItemIndex* <br /><br /> @Html.EJ().Tab("ejTab").DisabledItemIndex(new List<int>() { 0, 1 }).Render() <br /> | **Not Applicable** |

| Enable items | **Property:** *EnabledItemIndex* <br /><br /> @Html.EJ().Tab("ejTab").EnabledItemIndex(new List<int>() { 0, 1 }).Render() <br /> | **Not Applicable** |

| Enable/Disable item | **Not Applicable** | **Property:** *Items[0].Disabled* <br /><br /> @Html.EJS().Tab("ej2Tab").Items(item => { <br /> &#160; item.Disabled(true).Add(); <br /> }).Render() <br /> |

| Hide items | **Property:** *HiddenItemIndex* <br /><br /> @Html.EJ().Tab("ejTab").HiddenItemIndex(new List<int>() { 0, 1 }).Render() <br /> | **Not Applicable** |

| Hide item | **Method:** *hideItem(index)* <br /><br /> var tabObj = \$("#tab").data("ejTab"); <br /> tabObj.hideItem(1); <br /> | **Method:** *hideTab(index, true)* <br /><br /> var tab = document.getElementById('ej2Tab').ej2\_instances[0]; <br /> tab.hideTab(1, true); <br /> |

e.Destroy("onDestroy")).Render() <br /> | Event: Destroyed <br /><br />
@Html.EJS().Tab("ej2Tab").Destroyed("onDestroyed").Render() <br /> |
```

## TextBox

### Getting Started with ASP.NET MVC TextBox Control

#### Prerequisites

#### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

#### **PACKAGE MANAGER**

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
,
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
,
```

### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the `<head>` of `~/Pages/Shared/_Layout.cshtml` file as follows,

#### ~/ \_LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

### Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

#### ~/ \_LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

### Add ASP.NET MVC TextBox control

Now, add the Syncfusion ASP.NET MVC TextBox control in `~/Views/Home/Index.cshtml` page.

#### CSHTML

```
<div class="control-section">
    <div class="control_wrapper textbox-control-section">
        @Html.EJS().TextBox("firstname").Placeholder("First Name").Render()
    </div>
</div>
```

Press **Ctrl+F5** (Windows) or **⌘+F5** (macOS) to run the app. Then, the Syncfusion ASP.NET MVC TextBox control will be rendered in the default web browser.

First Name

---

### Adding icons to the TextBox

You can create a TextBox with icon as a group by creating the parent div element with the class `e-input-group` and add the icon element as span with the class `e-input-group-icon`. For detailed information, refer to the [Groups](#) section.

### CSHTML

```
<div class="control-section">
  <div class="control_wrapper textbox-control-section">
    <div class="e-input-group">
      <input class="e-input" name='input' type="text"
placeholder="Enter Date" />
      <span class="e-input-group-icon e-input-popup-date"></span>
    </div>
  </div>
</div>
<script>
  ej.base.enableRipple(true);
  var inputObject = {};
  var input = document.querySelectorAll('.e-input-group .e-input, .e-float-
input.e-input-group input');
  var inputIcon = document.querySelectorAll('.e-input-group-icon');
  var focusFn = function (index) {
    return function () {
      getParentNode(input[index]).classList.add('e-input-focus');
    };
  };
  var blurFn = function (index) {
    return function () {
      getParentNode(input[index]).classList.remove('e-input-focus');
    };
  };
  var mouseupFn = function () {
    var ele = this; setTimeout(function () {
      ele.classList.remove('e-input-btn-ripple');
    }, 500);
  };
  for (var i = 0; i < input.length; i++) {
    input[i].addEventListener('focus', focusFn(i));
    input[i].addEventListener('blur', blurFn(i));
  }
  for (var j = 0; j < inputIcon.length; j++) {
    inputIcon[j].addEventListener('mousedown', function () {
      this.classList.add('e-input-btn-ripple');
    });
    inputIcon[j].addEventListener('mouseup', mouseupFn);
  }
  function getParentNode(element) {
    var parentNode = element.parentNode;
    if (parentNode.classList.contains('e-input-in-wrap')) {
      return parentNode.parentNode;
    }
    return parentNode;
  }
</script>
<style>
  .e-input-group-icon:before {
```

```

        font-family: e-icons;
    }
    .e-input-group .e-input-group-icon.e-input-popup-date { /* csslint
allow: adjoining-classes */
        font-size: 16px;
    }
    .e-input-group-icon.e-input-popup-date:before { /* csslint allow:
adjoining-classes */
        content: "□";
    }
    .e-input-group-icon.e-input-up:before { /* csslint allow: adjoining-
classes */
        content: '\e85e';
    }
}
</style>

```

### Floating label

The floating label TextBox floats the label above the TextBox after focusing, or filled with value in the TextBox. You can create the floating label TextBox by using the [FloatLabelType](#) property.

#### CSHTML

```

<div class="control-section">
    <div class="control_wrapper textbox-control-section">
        @Html.EJS().TextBox("firstname").Placeholder("First
Name").FloatLabelType(Syncfusion.EJ2.Inputs.FloatLabelType.Auto).Render()
    </div>
</div>

```

First Name

**Note:** [View Sample in GitHub.](#)

See also

- [How to render TextBox programmatically](#)
- [How to add floating label to TextBox programmatically](#)

### Groups

The following section explains you the steps required to create TextBox with **icon** and **floating label**.

#### TextBox:

- Create a parent div element with the class **e-input-group**
- Place input element with the class **e-input** inside the parent div element.

`html

```
<div class="e-input-group">
```

```
<input class="e-input" name='input' type="text" placeholder="Enter Date"/>
</div>
```

#### Floating label:

- Add the `e-float-input` class to the parent div element.
- Remove the `e-input` class and add `required` attribute to the input element.
- Place the span element with class `e-float-line` after the input element.
- Place the label element with class `e-float-text` after the above created span element. When you focus or filled with value in the TextBox, the label floats above the TextBox.

**Note:** Creating the Floating label TextBox, you have to set the `required` attribute to the Input element to achieve the floating label functionality which is used for validating the value existence in TextBox. If you want to render the Floating label TextBox without `required` attribute then refer to the [Floating label without required attribute](#) section.

```
`html
<div class="e-float-input e-input-group">
<input type="text" required/>
<span class="e-float-line"></span>
<label class="e-float-text">Enter Name </label>
</div>
```

And refer to the following sections to add the icons to the TextBox.

#### With icon and floating label

Create an icon element as a span with the class `e-input-group-icon`, and the user can place the icon in either side of TextBox by adding the created icon element before/after the input.

For the floating label enabled TextBox add the icon element as first or last element inside the TextBox wrapper, and based on the element position it will act as prefix or suffix icon.

#### CSHTML

```
<div class="control-section">
  <div class="control_wrapper accordion-control-section">
    <h4> TextBox with icons </h4>
    <div class="e-input-group">
      <input class="e-input" type="text" placeholder="Enter Date" />
      <span class="e-input-group-icon e-input-popup-date"></span>
    </div>
    <div class="e-input-group e-float-icon-left">
      <span class="e-input-group-icon e-input-date"></span>
      <div class="e-input-in-wrap">
        <input class="e-input" type="text" placeholder="Enter Date"
      />
      </div>
```

```

        </div>
        <div class="e-input-group e-float-icon-left">
            <span class="e-input-group-icon e-input-date"></span>
            <div class="e-input-in-wrap">
                <input class="e-input" type="text" placeholder="Enter Date"
/>
                <span class="e-input-group-icon e-input-down"></span>
            </div>
        </div>
</h4> Floating label with icons </h4>
<div class="e-float-input e-input-group">
    <input required type="text" />
    <span class="e-float-line"></span>
    <label class="e-float-text"> Enter Date </label>
    <span class="e-input-group-icon e-input-popup-date"></span>
</div>
<div class="e-float-input e-input-group e-float-icon-left">
    <span class="e-input-group-icon e-input-date"></span>
    <div class="e-input-in-wrap">
        <input required type="text" />
        <span class="e-float-line"></span>
        <label class="e-float-text"> Enter Date </label>
    </div>
</div>
<div class="e-float-input e-input-group e-float-icon-left">
    <span class="e-input-group-icon e-input-date"></span>
    <div class="e-input-in-wrap">
        <input required type="text" />
        <span class="e-float-line"></span>
        <label class="e-float-text"> Enter Date </label>
        <span class="e-input-group-icon e-input-down"></span>
    </div>
</div>
</div>
</div>
<script>
    ej.base.enableRipple(true);
    var inputObject = {};
    var input = document.querySelectorAll('.e-input-group .e-input, .e-float-
input.e-input-group input');
    var inputIcon = document.querySelectorAll('.e-input-group-icon');
    var focusFn = function (index) {
        return function () {
            parentNode(input[index]).classList.add('e-input-focus');
        };
    };
    var blurFn = function (index) {
        return function () {
            parentNode(input[index]).classList.remove('e-input-focus');
        };
    };
    var mouseupFn = function () {
        var ele = this; setTimeout(function () {
            ele.classList.remove('e-input-btn-ripple');
        }, 500);
    };
    for (var i = 0; i < input.length; i++) {
        input[i].addEventListener('focus', focusFn(i));
    }
</script>

```

```

        input[i].addEventListener('blur', blurFn(i));
    }
    for (var j = 0; j < inputIcon.length; j++) {
        inputIcon[j].addEventListener('mousedown', function () {
            this.classList.add('e-input-btn-ripple');
        });
        inputIcon[j].addEventListener('mouseup', mouseupFn);
    }
    function getParentNode(element) {
        var parentNode = element.parentNode;
        if (parentNode.classList.contains('e-input-in-wrap')) {
            return parentNode.parentNode;
        }
        return parentNode;
    }
</script>
<style>
    .e-input-group-icon:before {
        font-family: e-icons;
    }
    .e-input-group .e-input-group-icon.e-input-popup-date { /* csslint
allow: adjoining-classes */
        font-size: 16px;
    }
    .e-input-group.e-small .e-input-group-icon.e-input-popup-date { /*
csslint allow: adjoining-classes */
        font-size: 14px;
    }
    .e-input-group-icon.e-input-popup-date:before { /* csslint allow:
adjoining-classes */
        content: "□";
    }
    .e-input-group-icon.e-input-down:before { /* csslint allow: adjoining-
classes */
        content: "□";
    }
    .e-input-group-icon.e-input-date:before { /* csslint allow: adjoining-
classes */
        content: "□";
    }
</style>

```

### ICON.CS

```

public ActionResult Index()
{
    return View();
}

```

Output be like the below.

## TextBox with icons

Enter Date 

 Enter Date

 Enter Date 

### With clear button and floating label

The clear button is added to the input for clearing the value given in the TextBox.

It is shown only when the input field has a value, otherwise not shown.

You can add the clear button to the TextBox by enabling `showClearButton` API.

### CSHTML

```
<div class="control-section">
  <div class="control_wrapper accordion-control-section">
    <h4> TextBox with clear button </h4>
    <ejs-textbox id="firstname" placeholder="First Name"
showClearButton="true" floatLabelType="Never"></ejs-textbox>
    <h4> Floating TextBox with clear button </h4>
    <ejs-textbox id="lastname" placeholder="Last Name"
showClearButton="true" floatLabelType="Auto"></ejs-textbox>
  </div>
</div>
```

### CLEAR.CS

```
public ActionResult Index()
{
    return View();
}
```

Output be like the below.

### TextBox with clear button

John ×

### Floating TextBox with clear button

Enter Name

John ×

#### Floating label without required attribute

You can render the **Floating label TextBox** without **required** attribute by manually float the label above of the TextBox using input events. You can manually float the label above of the TextBox by adding the below list of classes to the floating label element. The classes are:

Class Name | Description

e-label-top | Floats the label above of the TextBox.

e-label-bottom | Label to be placed as placeholder for the TextBox.

#### CSHTML

```
<div class="control-section">
  <div class="control_wrapper accordion-control-section">
    <div class="e-float-input">
      <input type="text" id='inpt1' />
      <span class="e-float-line"></span>
      <label class="e-float-text"> Enter Value </label>
    </div>
  </div>
</div>
<script>
  ej.base.enableRipple(true);
  /* To get the Input element */
  var inputElement = document.getElementById('inpt1');
  /* Update the label position based on Input value */
  updateLabelState(inputElement.value,
inputElement.parentElement.querySelector('.e-float-text'));
  inputElement.addEventListener("focus", function () {
    var label = this.parentElement.querySelector('.e-float-text');
    label.classList.add('e-label-bottom');
    label.classList.remove('e-label-top');
  });
  inputElement.addEventListener("blur", function () {
    updateLabelState(this.value, this.parentElement.querySelector('.e-
float-text'));
  });
  inputElement.addEventListener("input", function () {
```

```

        updateLabelState(this.value, this.parentElement.querySelector('.e-
float-text'));
    });
    /* Update the label position based on Input value */
    /* e-label-top - Floats the label above of the TextBox */
    /* e-label-bottom - Label to be placed as placeholder for the TextBox */
    function updateLabelState(value, label) {
        if (value) {
            label.classList.add('e-label-top');
            label.classList.remove('e-label-bottom');
        } else {
            label.classList.add('e-label-bottom');
            label.classList.remove('e-label-top');
        }
    }
</script>
<style>
    .control-section {
        box-sizing: border-box;
        margin: 0 auto;
        padding: 20px 10px;
        width: 260px;
    }
</style>

```

### FLOATING.CS

```

public ActionResult Index()
{
    return View();
}

```

### Multi-line input with floating label

Add the HTML `textarea` element with the `e-input` class to create default multi-line input.

Add the floating label support to the `multi-line input` by creating the floating label structure as defined in the initial section.

### CSHTML

```

<div class="control-section">
    <div class="control_wrapper accordion-control-section">
        <textarea class="e-input"> Address </textarea>
        <div class="e-float-input">
            <textarea required></textarea>
            <span class="e-float-line"></span>
            <label class="e-float-text"> Address </label>
        </div>
    </div>
</div>
<script>
    ej.base.enableRipple(true);
    // To get the all input fields and its container.
    var inputElement = document.querySelectorAll('.e-input-group .e-
input, .e-float-input.e-input-group input');

```

```
// Add 'e-input-focus' class to the input for achive ripple effect when
// focus on the input field.
for (var i = 0; i < inputElement.length; i++) {
    inputElement[i].addEventListener('focus', function () {
        var parentElement = this.parentNode;
        if (parentElement.classList.contains('e-input-in-wrap')) {
            parentElement.parentNode.classList.add('e-input-focus');
        } else {
            this.parentNode.classList.add('e-input-focus');
        }
    });
    inputElement[i].addEventListener('blur', function () {
        var parentElement = this.parentNode;
        if (parentElement.classList.contains('e-input-in-wrap')) {
            parentElement.parentNode.classList.remove('e-input-focus');
        } else {
            this.parentNode.classList.remove('e-input-focus');
        }
    });
}
</script>
```

## MULTILINE.CS

```
public ActionResult Index()
{
    return View();
}
```

- [Change the color of the TextBox based on its value](#)

## Sizing

You can render the TextBox in two different sizes.

Property | Description

Normal | By default, the TextBox is rendered with normal size.

Small | You need to add `e-small` class to the input element, or else add to the input container.

## CSHTML

```
<div class="control-section">
    <div class="control_wrapper accordion-control-section">
        <h4> Normal Size </h4>
        <div class="e-input-group">
            <input class="e-input" type="text" placeholder="Enter Name" />
        </div>
        <div class="e-float-input">
            <input type='text' required />
            <span class="e-float-line"></span>
        </div>
    </div>
</div>
```

```

        <label class="e-float-text">Enter Name</label>
    </div>
    <div class="e-input-group">
        <input class="e-input" type="text" placeholder="Enter Date" />
        <span class="e-input-group-icon e-input-popup-date"></span>
    </div>
    <h4> Small Size </h4>
    <div class="e-input-group e-small">
        <input class="e-input" type="text" placeholder="Enter Name" />
    </div>
    <div class="e-float-input e-small">
        <input type="text" required />
        <span class="e-float-line"></span>
        <label class="e-float-text">Enter Name</label>
    </div>
    <div class="e-input-group e-small">
        <input class="e-input" type="text" placeholder="Enter Date" />
        <span class="e-input-group-icon e-input-popup-date"></span>
    </div>
</div>
<script>
    ej.base.enableRipple(true);
    // To get the all input fields and its container.
    var inputElement = document.querySelectorAll('.e-input-group .e-
input, .e-float-input.e-input-group input');
    // Add 'e-input-focus' class to the input for achive ripple effect when
focus on the input field.
    for (var i = 0; i < inputElement.length; i++) {
        inputElement[i].addEventListener("focus", function () {
            var parentElement = this.parentNode;
            if (parentElement.classList.contains('e-input-in-wrap')) {
                parentElement.parentNode.classList.add('e-input-focus');
            } else {
                this.parentNode.classList.add('e-input-focus');
            }
        });
        inputElement[i].addEventListener("blur", function () {
            var parentElement = this.parentNode;
            if (parentElement.classList.contains('e-input-in-wrap')) {
                parentElement.parentNode.classList.remove('e-input-focus');
            } else {
                this.parentNode.classList.remove('e-input-focus');
            }
        });
    }
    // Add 'e-input-btn-ripple' class to the icon element for achive ripple
effect when click on the icon.
    var inputIcon = document.querySelectorAll('.e-input-group-icon');
    for (var i = 0; i < inputIcon.length; i++) {
        inputIcon[i].addEventListener('mousedown', function () {
            this.classList.add('e-input-btn-ripple');
        });
        inputIcon[i].addEventListener('mouseup', function () {
            var element = this;
            setTimeout(function () {
                element.classList.remove('e-input-btn-ripple');
            }, 100);
        });
    }
</script>

```

```

    }, 500);
  });
}
</script>
<style>
.e-input-group-icon:before {
  font-family: e-icons;
}
.e-input-group .e-input-group-icon.e-input-popup-date { /* csslint
allow: adjoining-classes */
  font-size: 16px;
}
.e-input-group.e-small .e-input-group-icon.e-input-popup-date { /*
csslint allow: adjoining-classes */
  font-size: 14px;
}
.e-input-group-icon.e-input-popup-date:before { /* csslint allow:
adjoining-classes */
  content: "□";
}
</style>

```

### SIZING.CS

```

public ActionResult Index()
{
    return View();
}

```

### Validation

The TextBox supports three types of validation styles namely **error**, **warning**, and **success**. These states are enabled by adding corresponding classes **.e-error**, **.e-warning**, or **.e-success** to the input parent element.

### CSHTML

```

<div class="control-section">
  <div class="control_wrapper accordion-control-section">
    <div class="e-input-group e-warning">
      <input class="e-input" type="text" placeholder="Input with
warning" />
    </div>
    <div class="e-input-group e-error">
      <input class="e-input" type="text" placeholder="Input with
error" />
    </div>
    <div class="e-input-group e-success">
      <input class="e-input" type="text" placeholder="Input with
success" />
    </div>
  </div>
</div>
<script>
  ej.base.enableRipple(true);
  // To get the all input fields and its container.

```

```

    var inputElement = document.querySelectorAll('.e-input-group .e-
input,.e-float-input.e-input-group input');
    // Add 'e-input-focus' class to the input for achive ripple effect when
    focus on the input field.
    for (var i = 0; i < inputElement.length; i++) {
        inputElement[i].addEventListener("focus", function () {
            var parentElement = this.parentNode;
            if (parentElement.classList.contains('e-input-in-wrap')) {
                parentElement.parentNode.classList.add('e-input-focus');
            } else {
                this.parentNode.classList.add('e-input-focus');
            }
        });
        inputElement[i].addEventListener("blur", function () {
            var parentElement = this.parentNode;
            if (parentElement.classList.contains('e-input-in-wrap')) {
                parentElement.parentNode.classList.remove('e-input-focus');
            } else {
                this.parentNode.classList.remove('e-input-focus');
            }
        });
    }
    // Add 'e-input-btn-ripple' class to the icon element for achive ripple
    effect when click on the icon.
    var inputIcon = document.querySelectorAll('.e-input-group-icon');
    for (var i = 0; i < inputIcon.length; i++) {
        inputIcon[i].addEventListener('mousedown', function () {
            this.classList.add('e-input-btn-ripple');
        });
        inputIcon[i].addEventListener('mouseup', function () {
            var element = this;
            setTimeout(function () {
                element.classList.remove('e-input-btn-ripple');
            }, 500);
        });
    }
}
</script>

```

## VALIDATION.CS

```

public ActionResult Index()
{
    return View();
}

```

Output be like the below.

Input with warning

Input with error

Input with success

## Multiline TextBox

This feature allows the textbox to accept one or more lines of text like address, description, comments, and more.

### Create multiline textbox

You can convert the default textbox into the multiline textbox by setting the [multiline](#) API value as true or pass HTML5 textarea as element to the textbox.

**Note:** The multiline textbox allows you to resize it in vertical direction alone.

### CSHTML

```
<div class="multiline">
    <ejs-textbox multiline="true" placeholder="Enter your address"
value="Mr. Dodsworth Dodsworth, System Analyst, Studio 103"
id="default"></ejs-textbox>
</div>
<style>
    .multiline{
        margin-top: 60px;
        width: 20%;
    }
</style>
```

### TEXTAREA.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes
{
    public partial class TextBoxController : Controller
    {
        public IActionResult DefaultFunctionalities()
        {

```

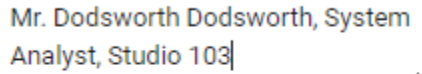

```

        return View();
    }
}

```

Output be like the below.

### Implementing floating label

You can achieve the floating label behavior in the multiline textbox by setting [floatLabelType](#) as 'Auto'. The placeholder text act as floating label to the multiline textbox. You can provide the placeholder text to the multiline textbox either by using the [placeholder](#) property or placeholder attribute.

### CSHTML

```

<label>Float label type as auto</label>
<div class="multiline">
    <ejs-textbox multiline="true" floatLabelType="Auto" placeholder="Enter
your address" id="multiline-auto"></ejs-textbox>
</div>
<label>Float label type as always</label>
<div class="multiline">
    <ejs-textbox multiline="true" floatLabelType="Always" placeholder="Enter
your address" id="multiline-always"></ejs-textbox>
</div>
<label>Float label type as never</label>
<div class="multiline">
    <ejs-textbox multiline="true" floatLabelType="Never" placeholder="Enter
your address" id="multiline-never"></ejs-textbox>
</div>
<style>
    .multiline {
        margin-top: 10px;
        width: 20%;
    }
</style>

```

### FLOAT.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes
{
    public partial class TextBoxController : Controller
    {

```

```

        public IActionResult DefaultFunctionalities()
        {
            return View();
        }
    }
}

```

Output be like the below.

### Float label type auto

Enter your address

---

### Float label type always

Enter your address

---

### Float label type never

Mr. Dodsworth Dodsworth, System  
Analyst, Studio 103

---

## Auto resizing

By default, you can manually resize the multiline textbox. But you can also create an **auto resizing** multiline textbox with both the initial and dynamic value change. It can be done by calculating the height of the textarea in the created event for initial value update and in the input event for dynamic value update of the auto resize multiline textbox, as explained in the following code sample.

### CSHTML

```

<div class="multiline">
    <ejs-textbox id="default" multiline="true" placeholder="Enter your
address" value="Mr. Dodsworth Dodsworth, System Analyst, Studio 103"
floatLabelType="Auto" id="default" created="createHandler"
input="inputHandler"></ejs-textbox>
</div>
<script>
    function createHandler(args) {
        var textareaObj = document.getElementById("default")
        textareaObj.ej2_instances[0].addAttributes({rows: 1});
        this.respectiveElement.style.height = "auto";
        this.respectiveElement.style.height =
        (this.respectiveElement.scrollHeight) + "px";
    }
}

```

```
function inputHandler(args) {
    this.respectiveElement.style.height = "auto";
    this.respectiveElement.style.height =
    (this.respectiveElement.scrollHeight) + "px";
}
</script>
<style>
    .multiline {
        margin-top: 60px;
        width: 20%;
    }
</style>
```

### AUTO-RESIZE.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes
{
    public partial class TextBoxController : Controller
    {
        public IActionResult DefaultFunctionalities()
        {
            return View();
        }
    }
}
```

### Disable resizing

By default, the multiline textbox is rendered with resizable. You can disable the resize of the multiline textbox by applying the following CSS styles.

`CSS

```
textarea.e-input,
.e-float-input textarea,
.e-float-input.e-control-wrapper textarea,
.e-input-group textarea,
.e-input-group.e-control-wrapper textarea {
    resize: none;
}
```

### CSHTML

```
<div class="multiline">
    <ejs-textbox multiline="true" placeholder="Enter your address"
    floatLabelType="Auto" id="disable" ></ejs-textbox>
```

```
</div>
<style>
    .multiline {
        margin-top: 60px;
        width: 20%;
    }
    textarea.e-input,
    .e-float-input textarea,
    .e-float-input.e-control-wrapper textarea,
    .e-input-group textarea,
    .e-input-group.e-control-wrapper textarea{
        resize: none;
    }
</style>
```

### DISABLE.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes
{
    public partial class TextBoxController : Controller
    {
        public IActionResult DefaultFunctionalities()
        {
            return View();
        }
    }
}
```

Output be like the below.

Enter your address

---

### Limit the text length

By default, the text length of the multiline textbox is unlimited. You can limit the text length by setting the `maxLength` attribute using the `addAttributes` method.

### CSHTML

```
<label>Add max length attribute through inline</label>
<div class="multiline">
    <ejs-textbox multiline="true" floatLabelType="Auto" placeholder="Enter
your address" id="length" maxlength="15"></ejs-textbox>
</div>
<label>Add maxlength attribute through addAttributes method</label>
```

```

<div class="multiline">
  <ejs-textbox multiline="true" floatLabelType="Auto" placeholder="Enter
your address" id="attr"></ejs-textbox>
</div>
<ejs-button id="primarybtn" content="Add max length"></ejs-button>
<script>
  document.getElementById("primarybtn").addEventListener('click', function
() {
    var textareaObj = document.getElementById("attr");
    textareaObj.ej2_instances[0].addAttributes({ maxlength: 15 });
  })
</script>
<style>
  .multiline {
    margin-top: 10px;
    width: 20%;
  }
</style>

```

### MAXLENGTH.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes
{
    public partial class TextBoxController : Controller
    {
        public IActionResult DefaultFunctionalities()
        {
            return View();
        }
    }
}

```

### Count characters

You can show the number of characters entered inside the textarea by calculating the character count in the input event of multiline textbox. The character count is updated while entering or deleting any character inside the textarea. The character count shows how many characters can be entered or left to be entered.

### CSHTML

```

<div class="multiline">
  <ejs-textbox multiline="true" maxlength="25" placeholder="Enter your
address" floatLabelType="Auto" id="default" input="inputHandler"></ejs-
textbox>
</div>
<div id="numbercount"></div>
<script>
  function inputHandler(args) {
    let word, addresscountRem, addressCount;
    word = this.respectiveElement.value;

```

```

        addressCount = word.length;
        addresscountRem = document.getElementById('numbercount');
        addresscountRem.textContent = addressCount + "/25";
    }
</script>
<style>
    .multiline {
        margin-top: 60px;
        width: 20%;
    }
    #numbercount{
        margin-left: 190px;
    }
</style>

```

### COUNT.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes
{
    public partial class TextBoxController : Controller
    {
        public IActionResult DefaultFunctionalities()
        {
            return View();
        }
    }
}

```

Output be like the below.

Enter your address

Mr. Dodsworth

### Accessibility in ASP.NET MVC Textbox component

The Textbox component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Textbox component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) |  |

| [Section 508 Support](#) |  |

| [Screen Reader Support](#) |  |

| [Right-To-Left Support](#) |  |

| [Color Contrast](#) |  |

| [Mobile Device Support](#) |  |

| [Keyboard Navigation Support](#) |  |

| [Accessibility Checker Validation](#) |  |

| [Axe-core Accessibility Validation](#) |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

### WAI-ARIA attributes

The Textbox is characterized with complete ARIA Accessibility support that helps to access through the on-screen readers and other assistive technology devices. This component is designed with the reference of the guidelines document given in [WAI ARAI Accessibility practices](#).

The Textbox uses the `textbox` role and following ARIA properties for its element based on its state.

| **Property** | **Functionality** |

| --- | --- |

| aria-placeholder | The `aria-placeholder` is a short hint to help the users with data entry when the Textbox has no value. |

| aria-labelledby | The `aria-labelledby` property indicates the floating label element of the Textbox. |

### Ensuring accessibility

The Textbox component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Textbox component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Textbox component with accessibility tools.

See also

- [Accessibility in Syncfusion ASP.NET MVC components](#)

### Style and appearance in TextBox Component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

#### Customizing the appearance of TextBox wrapper element

Use the following CSS to customize the appearance of wrapper element.

```
`css
```

```
/ To specify height and font size /
```

```
.e-input:not(:valid), .e-input:valid, .e-float-input.e-control-wrapper input:not(:valid), .e-float-input.e-control-wrapper input:valid, .e-float-input input:not(:valid), .e-float-input input:valid, .e-input-group input:not(:valid), .e-input-group input:valid, .e-input-group.e-control-wrapper input:not(:valid), .e-input-group.e-control-wrapper input:valid, .e-float-input.e-control-wrapper textarea:not(:valid), .e-float-input.e-control-wrapper textarea:valid, .e-float-input textarea:not(:valid), .e-float-input textarea:valid, .e-input-group.e-control-wrapper textarea:not(:valid), .e-input-group.e-control-wrapper textarea:valid, .e-input-group textarea:not(:valid), .e-input-group textarea:valid {
```

```
font-size: 30px;
```

```
height: 40px;
```

```
}
```

```
,
```

#### Customizing the TextBox placeholder

Use the following CSS to customize the TextBox placeholder

```
`css
```

```
/ To specify font size and color /
```

```
.e-float-input.e-control-wrapper:not(.e-error) input:valid ~ label.e-float-text, .e-float-input.e-control-wrapper:not(.e-error) input ~ label.e-label-top.e-float-text {
```

```
color: pink;
```

```
font-size: 15px;
```

```
}
,
```

## How To

Set the rounded corner

Render the TextBox with **rounded corner** by adding the **e-corner** class to the input parent element.

### CSHTML

```
<div class="control-section">
  <div class="control_wrapper accordion-control-section">
    <div class="e-input-group e-corner">
      <input class="e-input" type="text" placeholder="Enter Date" />
      <span class="e-input-group-icon e-input-popup-date"></span>
    </div>
    <div class="e-float-input e-input-group e-corner">
      <input type="text" required />
      <span class="e-float-line"> </span>
      <label class="e-float-text">Enter Date </label>
      <span class="e-input-group-icon e-input-popup-date"></span>
    </div>
  </div>
</div>
<script>
  ej.base.enableRipple(true);
  // To get the all input fields and its container.
  var inputElement = document.querySelectorAll('.e-input-group .e-
input, .e-float-input.e-input-group input');
  // Add 'e-input-focus' class to the input for achive ripple effect when
  focus on the input field.
  for (var i = 0; i < inputElement.length; i++) {
    inputElement[i].addEventListener("focus", function () {
      var parentElement = this.parentNode;
      if (parentElement.classList.contains('e-input-in-wrap')) {
        parentElement.parentNode.classList.add('e-input-focus');
      } else {
        this.parentNode.classList.add('e-input-focus');
      }
    });
    inputElement[i].addEventListener("blur", function () {
      var parentElement = this.parentNode;
      if (parentElement.classList.contains('e-input-in-wrap')) {
        parentElement.parentNode.classList.remove('e-input-focus');
      } else {
        this.parentNode.classList.remove('e-input-focus');
      }
    });
  }
  // Add 'e-input-btn-ripple' class to the icon element for achive ripple
  effect when click on the icon.
  var inputIcon = document.querySelectorAll('.e-input-group-icon');
  for (var i = 0; i < inputIcon.length; i++) {
    inputIcon[i].addEventListener('mousedown', function () {
      this.classList.add('e-input-btn-ripple');
    });
    inputIcon[i].addEventListener('mouseup', function () {
```

```

        var element = this;
        setTimeout(function () {
            element.classList.remove('e-input-btn-ripple');
        }, 500);
    });
}
</script>
<style>
    .e-input-group.e-corner{
        border-radius: 4px;
    }
</style>

```

### ROUNDED-CORNER.CS

```

public ActionResult Index()
{
    return View();
}

```

Set the disabled state

Disable the TextBox by adding the `e-disabled` to the input parent element and set `disabled` attribute to the input element.

### CSHTML

```

<div class="control-section">
    <div class="control_wrapper accordion-control-section">
        <input class="e-input" type="text" placeholder="Enter Name" disabled
    />

        <div class="e-float-input e-disabled">
            <input type='text' required disabled />
            <span class="e-float-line"></span>
            <label class="e-float-text">Enter Name</label>
        </div>
    </div>
</div>
<script>
    ej.base.enableRipple(true);
    // To get the all input fields and its container.
    var inputElement = document.querySelectorAll('.e-input-group .e-
input, .e-float-input.e-input-group input');
    // Add 'e-input-focus' class to the input for achive ripple effect when
    focus on the input field.
    for (var i = 0; i < inputElement.length; i++) {
        inputElement[i].addEventListener('focus', function () {
            var parentElement = this.parentNode;
            if (parentElement.classList.contains('e-input-in-wrap')) {
                parentElement.parentNode.classList.add('e-input-focus');
            } else {
                this.parentNode.classList.add('e-input-focus');
            }
        });
        inputElement[i].addEventListener('blur', function () {
            var parentElement = this.parentNode;

```

```

        if (parentElement.classList.contains('e-input-in-wrap')) {
            parentElement.parentNode.classList.remove('e-input-focus');
        } else {
            this.parentNode.classList.remove('e-input-focus');
        }
    });
}
</script>

```

### DISABLED.CS

```

public ActionResult Index()
{
    return View();
}

```

### Set the read-only TextBox

You can make the TextBox as **read-only** by setting the **readonly** attribute to the input element.

### CSHTML

```

<div class="control-section">
    <div class="control_wrapper accordion-control-section">
        <input class="e-input" type="text" placeholder="Enter Name"
value="John" readonly />
        <div class="e-float-input">
            <input type="text" required readonly value="John" />
            <span class="e-float-line"></span>
            <label class="e-float-text e-label-top">Enter Name</label>
        </div>
    </div>
</div>
<script>
    ej.base.enableRipple(true);
    // To get the all input fields and its container.
    var inputElement = document.querySelectorAll('.e-input-group .e-
input, .e-float-input.e-input-group input');
    // Add 'e-input-focus' class to the input for achive ripple effect when
focus on the input field.
    for (var i = 0; i < inputElement.length; i++) {
        inputElement[i].addEventListener('focus', function () {
            this.parentNode.classList.add('e-input-focus');
        });
        inputElement[i].addEventListener('blur', function () {
            this.parentNode.classList.remove('e-input-focus');
        });
    }
</script>

```

### READ-ONLY.CS

```

public ActionResult Index()
{
    return View();
}

```

## Add TextBox programmatically

- Create a TypeScript file and import the `Input` modules from `ej2-inputs` library as shown below.

```
import {Input} from '@syncfusion/ej2-inputs';
```

- Pass the `HTML Input` element as parameter to the `createInput` method.
- You can also add the `icons` on the input by passing `buttons` property value with the class name `e-input-group-icon` as parameter to the `createInput` method.

## CSHTML

```
<div class="control_wrapper accordion-control-section">
  <div id="input-container">
    </div>
  </div>
<script>
  ej.base.enableRipple(true);
  var element = document.createElement('input');
  document.getElementById('input-container').appendChild(element);
  new ej.inputs.Input.createInput({
    element: element,
    properties: {
      placeholder: 'Enter Name'
    }
  });
  var element2 = document.createElement('input');
  document.getElementById('input-container').appendChild(element2);
  new ej.inputs.Input.createInput({
    element: element2,
    buttons: ['e-input-group-icon e-input-down'],
    properties: {
      placeholder: 'Enter Value'
    }
  });
  // To get the all input fields and its container.
  var inputElement = document.querySelectorAll('.e-input-group .e-input, .e-float-input.e-input-group input');
  // Add 'e-input-focus' class to the input for achive ripple effect when focus on the input field.
  for (var i = 0; i < inputElement.length; i++) {
    inputElement[i].addEventListener("focus", function () {
      this.parentNode.classList.add('e-input-focus')
    });
    inputElement[i].addEventListener("blur", function () {
      this.parentNode.classList.remove('e-input-focus')
    });
  }
  // Add 'e-input-btn-ripple' class to the icon element for achive ripple effect when click on the icon.
  var inputIcon = document.querySelectorAll('.e-input-group-icon');
```

```

    for (var i = 0; i < inputIcon.length; i++) {
        inputIcon[i].addEventListener('mousedown', function () {
            this.classList.add('e-input-btn-ripple');
        });
        inputIcon[i].addEventListener('mouseup', function () {
            var element = this;
            setTimeout(function () {
                element.classList.remove('e-input-btn-ripple');
            }, 500);
        });
    }
</script>
<style>
    .e-input-group-icon:before {
        font-family: e-icons;
    }
    .e-input-group-icon.e-input-down:before { /* csslint allow: adjoining-
classes */
        content: "□";
    }
</style>

```

## TEXTBOX.CS

```

public ActionResult Index()
{
    return View();
}

```

### Add floating label to TextBox programmatically

The **Floating Label TextBox** floats label above the TextBox after focusing, or entering a value in the TextBox.

Floating label supports the types of actions as given below.

| Type   | Description   |
|--------|---|
| Auto   | The floating label will float above the input after focusing, or entering a value in the input. |
| Always | The floating label will always float above the input.   |
| Never  | By default, never float the label in the input when the placeholder is available.               |

- Create a TypeScript file and import the **Input** modules from **ej2-inputs** library as shown below.

```
import {Input} from '@syncfusion/ej2-inputs';
```

```
,
```

- Pass the **HTML Input** element and **floatLabelType** property as **Auto** to the **createInput** method.
- Set the **placeholder** value to the input element via **element attribute** or pass the parameter to the **createInput** method.

The watermark label will be updated based on the specified placeholder value of the Floating Label TextBox.

- You can add the icons on the input by passing buttons property value with the class name e-input-group-icon as parameter to the createInput method.

### CSHTML

```
<div class="control-section">
  <div class="control_wrapper accordion-control-section">
    <div id="input-container-1">
      <h4> FloatLabelType as Auto </h4>
    </div>
    <div id="input-container-2">
      <h4> FloatLabelType as Always </h4>
    </div>
    <div id="input-container-3">
      <h4> FloatLabelType as Never </h4>
    </div>
    <div id="input-container-4">
      <h4> Float label input with icons </h4>
    </div>
  </div>
</div>
<script>
  ej.base.enableRipple(true);
  var inputObj;
  var element = document.createElement('input');
  document.getElementById('input-container-1').appendChild(element);
  new ej.inputs.Input.createInput({
    element: element,
    floatLabelType: "Auto",
    properties:{
      placeholder: 'Enter Name'
    }
  });
  var element2 = document.createElement('input');
  document.getElementById('input-container-2').appendChild(element2);
  new ej.inputs.Input.createInput({
    element: element2,
    floatLabelType: "Always",
    properties:{
      placeholder: 'Enter Name'
    }
  });
  var element3 = document.createElement('input');
  document.getElementById('input-container-3').appendChild(element3);
  new ej.inputs.Input.createInput({
    element: element3,
    floatLabelType: "Never",
    properties:{
      placeholder: 'Enter Name'
    }
  });
  var element4 = document.createElement('input');
```

```
document.getElementById('input-container-4').appendChild(element4);
new ej.inputs.Input.createInput({
  element: element4,
  floatLabelType: "Auto",
  buttons: ['e-input-group-icon e-input-down'],
  properties: {
    placeholder: 'Enter Name'
  }
});
</script>
<style>
  .e-input-group-icon:before {
    font-family: e-icons;
  }
  .e-input-group-icon.e-input-down:before { /* csslint allow: adjoining-
classes */
    content: "□";
  }
  #input-container-03 .e-input-group { /* csslint allow: adjoining-
classes */
    margin: 30px 0;
  }
  #input-container-03 .e-float-input { /* csslint allow: adjoining-classes
*/
    margin: 30px 0;
  }
</style>
```

### FLOATING-LABEL.CS

```
public ActionResult Index()
{
    return View();
}
```

### Change the floating label color of the TextBox

You can change the floating label color of the TextBox for both **success** and **warning** validation states by applying the following CSS styles.

`CSS

*/ For Success state /*

```
.e-float-input.e-success label.e-float-text,
.e-float-input.e-success input:focus ~ label.e-float-text,
.e-float-input.e-success input:valid ~ label.e-float-text {
color: #22b24b;
}
```

*/ For Warning state /*

```
.e-float-input.e-warning label.e-float-text,
```

```
.e-float-input.e-warning input:focus ~ label.e-float-text,
.e-float-input.e-warning input:valid ~ label.e-float-text {
color: #ffca1c;
}
`
```

## CSHTML

```
<div class="control-section">
  <div class="control_wrapper accordion-control-section">
    <div class="e-float-input e-input-group e-success">
      <input type='text' required />
      <span class="e-float-line"></span>
      <label class="e-float-text">Success</label>
    </div>
    <div class="e-float-input e-input-group e-warning">
      <input type='text' required />
      <span class="e-float-line"></span>
      <label class="e-float-text">Warning</label>
    </div>
  </div>
</div>
<script>
  ej.base.enableRipple(true);
  // To get the all input fields and its container.
  var inputElement = document.querySelectorAll('.e-input-group .e-
input, .e-float-input.e-input-group input');
  // Add 'e-input-focus' class to the input for achive ripple effect when
  focus on the input field.
  for (var i = 0; i < inputElement.length; i++) {
    inputElement[i].addEventListener('focus', function () {
      var parentElement = this.parentNode;
      if (parentElement.classList.contains('e-input-in-wrap')) {
        parentElement.parentNode.classList.add('e-input-focus');
      } else {
        this.parentNode.classList.add('e-input-focus');
      }
    });
    inputElement[i].addEventListener('blur', function () {
      var parentElement = this.parentNode;
      if (parentElement.classList.contains('e-input-in-wrap')) {
        parentElement.parentNode.classList.remove('e-input-focus');
      } else {
        this.parentNode.classList.remove('e-input-focus');
      }
    });
  }
</script>
<style>
  /* For Success state */
  .e-float-input.e-success label.e-float-text,
  .e-float-input.e-success input:focus ~ label.e-float-text,
  .e-float-input.e-success input:valid ~ label.e-float-text {
    color: #22b24b;
  }
```

```

    }
    /* For Warning state */
    .e-float-input.e-warning label.e-float-text,
    .e-float-input.e-warning input:focus ~ label.e-float-text,
    .e-float-input.e-warning input:valid ~ label.e-float-text {
        color: #ffca1c;
    }
</style>

```

### VALIDATION-STATE.CS

```

public ActionResult Index()
{
    return View();
}

```

Output be like the below.

Change the color of the TextBox based on its value

You can change the color of the TextBox by validating its value using regular expression in the `keyup` event for predicting the numeric values as demonstrated in the following code sample.

### CSHTML

```

<div class='wrap'>
    <label>Normal Input</label>
    <div class="e-input-group">
        <input class="e-input" type="text" placeholder="Enter numeric
values" onkeyup="onKeyUp(this)" />
    </div>
    <label> Floating Input </label>
    <div class="e-float-input">
        <input type="text" onkeyup="onKeyUp(this)" required />
        <span class="e-float-line"> </span>
        <label class="e-float-text">Enter numeric values</label>
    </div>
</div>
<script>
    ej.base.enableRipple(true);
    // To get the all input fields and its container.
    var inputElement = document.querySelectorAll('.e-input-group .e-
input, .e-float-input.e-input-group input');
    // Add 'e-input-focus' class to the input for achive ripple effect when
focus on the input field.

```

```

    for (var i = 0; i < inputElement.length; i++) {
        inputElement[i].addEventListener('focus', function () {
            var parentElement = this.parentNode;
            if (parentElement.classList.contains('e-input-in-wrap')) {
                parentElement.parentNode.classList.add('e-input-focus');
            } else {
                this.parentNode.classList.add('e-input-focus');
            }
        });
        inputElement[i].addEventListener('blur', function () {
            var parentElement = this.parentNode;
            if (parentElement.classList.contains('e-input-in-wrap')) {
                parentElement.parentNode.classList.remove('e-input-focus');
            } else {
                this.parentNode.classList.remove('e-input-focus');
            }
        });
    }
    function onKeyUp(e) {
        let str = e.value.match(/^[0-9]+$/);
        if (!((str && str.length > 0)) && e.value.length) {
            e.parentElement.classList.add('e-error');
        } else {
            e.parentElement.classList.remove('e-error');
        }
    }
}
</script>
<style>
    .e-input-group.e-error .e-input { /* csslint allow: adjoining-classes */
        color: #f44336;
    }
    .e-float-input.e-error input { /* csslint allow: adjoining-classes */
        color: #f44336;
    }
    .wrap label { /* csslint allow: adjoining-classes */
        font-weight: bold;
    }
</style>

```

## TEXT-COLOR.CS

```

public ActionResult Index()
{
    return View();
}

```

Output be like the below.

### Normal Input

Content

### Floating Input

Enter numeric values

#### Add floating label to read-only textbox

You can achieve floating label for read-only textboxes by adding/removing `e-label-top` and `e-label-bottom` classes to the label element

In this sample, click the update value button to fill the read-only textbox with value and float a label.

#### CSHTML

```
<div class="control-section">
  <div class="control_wrapper accordion-control-section">
    <div class="e-float-input">
      <input class="e-input myField" id="myText" name="readonlyAttr"
type="text" readOnly>
      <span class="e-float-line"></span>
      <label class="e-float-text">Enter value</label>
    </div>
    <ejs-button class="e-btn update_value" id='valuebtn' content="Set
value"></ejs-button>
    <ejs-button class="e-btn remove_value" id='removebtn'
content="Remove value"></ejs-button>
  </div>
</div>
<script>
  ej.base.enableRipple(true);
  document.getElementById('valuebtn').onclick = () => {
    (document.getElementsByClassName('myField')[0]).value = '10';
    checkFloatingLabel('myText')
  }
  document.getElementById('removebtn').onclick = () => {
    (document.getElementsByClassName('myField')[0]).value = '';
    checkFloatingLabel('myText')
  }
  function checkFloatingLabel(id) {
    var inputElement = document.getElementById(id);
    var labelElement = inputElement.parentElement.querySelector('.e-
float-text');
    if (inputElement.value !== '') {
      labelElement.classList.remove('e-label-bottom');
      labelElement.classList.add('e-label-top');
    } else {
      labelElement.classList.remove('e-label-top');
      labelElement.classList.add('e-label-bottom');
    }
  }
}
```

```
var inputField = document.getElementById('myText');
</script>
<style>
    .wrap {
        box-sizing: border-box;
        margin: 0 auto;
        padding: 20px 10px;
        width: 260px;
    }
    .update_value, .remove_value {
        margin-top: 20px;
    }
    .remove_value {
        margin-left: 10px;
    }
</style>
```

### FLOAT-READ-ONLY.CS

```
public ActionResult Index()
{
    return View();
}
```

### Customize the textbox background-color and text-color

You can customize the textbox styles such as background-color, text-color and border-color by overriding its default styles.

**Note:** To change the styles of the **floating label**, you must override the style to the input element.

### CSHTML

```
<div class="control-section">
    <div class="wrap">
        <div class="e-input-group">
            <input class="e-input" type="text" placeholder="First Name" />
        </div>
        <div class="e-float-input">
            <input type="text" required />
            <span class="e-float-line"></span>
            <label class="e-float-text">Last Name</label>
        </div>
    </div>
</div>
<script>
    ej.base.enableRipple(true);
    // To get the all input fields and its container.
    var inputElement = document.querySelectorAll('.e-input-group .e-
input, .e-float-input.e-input-group input');
    // Add 'e-input-focus' class to the input for achive ripple effect when
    focus on the input field.
    for (var i = 0; i < inputElement.length; i++) {
        inputElement[i].addEventListener('focus', function () {
            this.parentNode.classList.add('e-input-focus');
        });
    }
</script>
```

```

        inputElement[i].addEventListener('blur', function () {
            this.parentNode.classList.remove('e-input-focus');
        });
    }
</script>
<style>
    .wrap {
        box-sizing: border-box;
        margin: 0 auto;
        padding: 20px 10px;
        width: 260px;
    }

    .wrap label { /* csslint allow: adjoining-classes */
        font-weight: bold;
    }

    .wrap .e-float-input { /* csslint allow: adjoining-classes */
        margin: 30px 0;
    }

    .wrap .e-input-group { /* csslint allow: adjoining-classes */
        margin: 25px 0;
    }

    /* To change the background-color and text-color for textbox */
    .e-input-group,
    .e-float-input,
    .e-float-input.e-input-group { /* csslint allow: adjoining-classes */
        background: yellow;
        color: green;
    }

    /* To change the border-color of the textbox */
    .e-input-group:not(.e-success):not(.e-warning):not(.e-error):not(.e-
float-icon-left),
    .e-input-group:hover:not(.e-success):not(.e-warning):not(.e-
error):not(.e-float-icon-left) { /* csslint allow: adjoining-classes */
        border-color: #0800ff;
    }

    /* To change the border-color of the floating-label textbox */
    .e-float-input input,
    .e-float-input:hover:not(.e-input-group):not(.e-success):not(.e-
warning):not(.e-error):not(.e-disabled) input:not([disabled]) { /* csslint
allow: adjoining-classes */
        border-color: #0800ff;
    }
</style>

```

### TEXTBOX-CUSTOMIZE.CS

```

public ActionResult Index()
{
    return View();
}

```

## TimePicker

### Getting Started with ASP.NET MVC TimePicker Control

#### Prerequisites

##### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

#### PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

```
<namespaces>
```

```
<add namespace="Syncfusion.EJ2"/>
```

```
</namespaces>
```

,

#### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

#### **~/ LAYOUT.CSHTML**

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
```

```
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

#### Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

#### ~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

#### Add ASP.NET MVC TimePicker control

Now, add the Syncfusion ASP.NET MVC TimePicker control in `~/Views/Home/Index.cshtml` page.

#### CSHTML

```
@Html.EJS().TimePicker("timepicker").Render()
```

Press **Ctrl+F5** (Windows) or **⌘+F5** (macOS) to run the app. Then, the Syncfusion ASP.NET MVC TimePicker control will be rendered in the default web browser.

#### Setting the value within min and max time

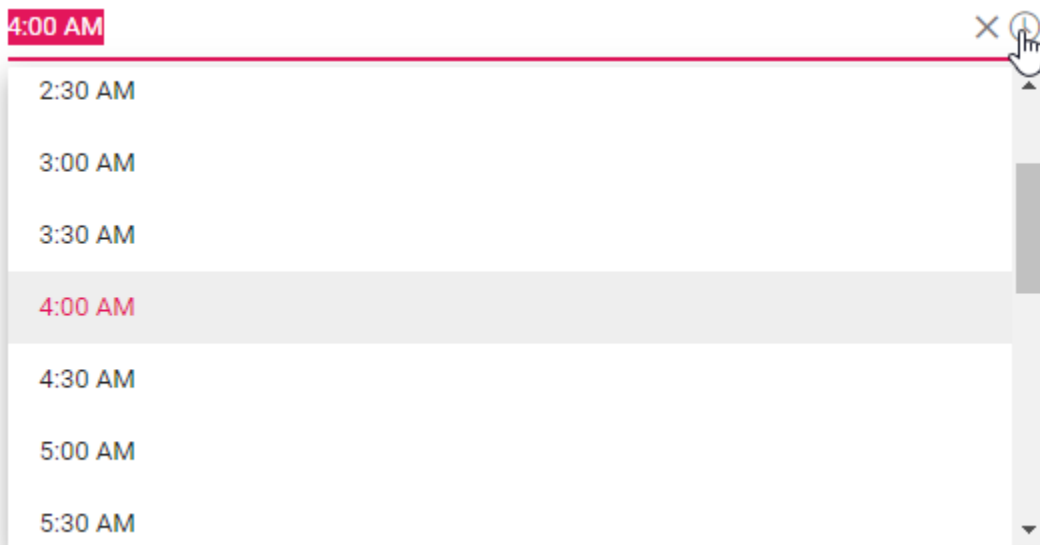

The following example demonstrates how to set the value, min and max time on initializing the TimePicker. The TimePicker allows you to select the time value within a range from `1:00 AM` to `11:00 AM`.

**CSHTML**

```
@Html.EJS().TimePicker("timepicker").Value(ViewBag.value).Min(ViewBag.minVal).Max(ViewBag.maxVal).Render()
```

**HOMECONTROLLER.CS**

```
public ActionResult Index()
{
    ViewBag.minVal = new DateTime(2022, 05, 07, 1, 00, 00);
    ViewBag.maxVal = new DateTime(2022, 05, 07, 11, 00, 00);
    ViewBag.value = new DateTime(2022, 05, 07, 4, 00, 00);
    return View();
}
```

**Setting the time format**

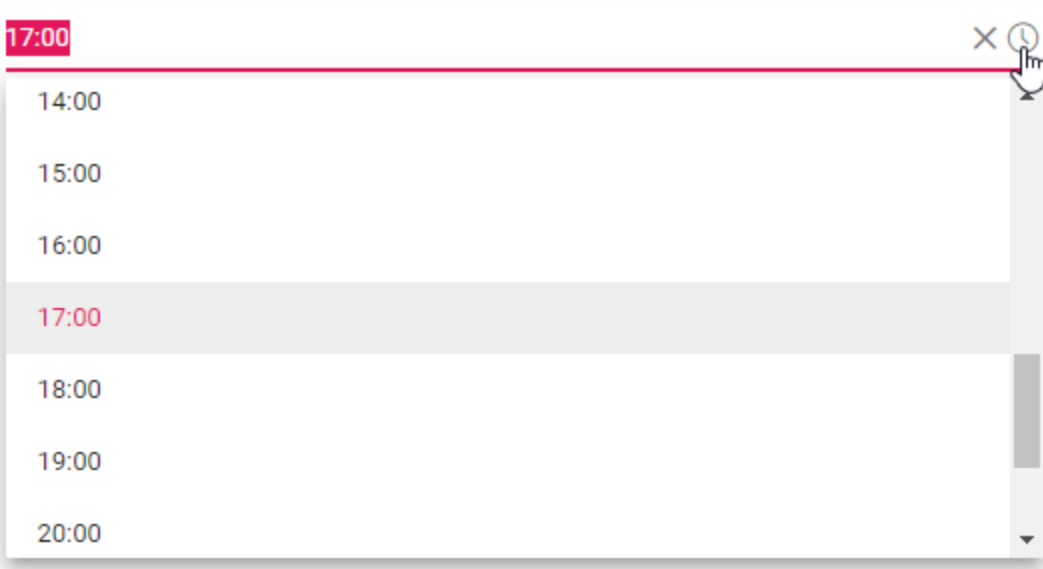

Time formats is a way of representing the time value in different string format in textbox and popup list. By default, the TimePicker's format is based on the culture. You can also customize the format by using the [Format](#) property. To know more about the time format standards, refer to the [Date and Time Format](#) section.

The following example demonstrates the TimePicker control in 24 hours format with 60 minutes interval. The time interval is set to 60 minutes by using the [Step](#) property.

**CSHTML**

```
@Html.EJS().TimePicker("timepicker").Value(DateTime.Now).Format("HH:mm").Step(60).Render()
```

**Note:** [View Sample in GitHub.](#)

See also

- [Render TimePicker with min and max time](#)
- [How to achieve validation with TimePicker](#)
- [Render TimePicker with specific culture](#)
- [How to get and set value in TimePickerFor](#)

## Time Range

TimePicker provides an option to select a time value within a specified range by using the [min](#) and [max](#) properties. The min value should always be lesser than the max value.

When the min and max properties are configured and the selected time value is out-of-range or invalid, then the model value will be set to **out of range** time value or **null** respectively with highlighted **error** class to indicates the time is out of range or invalid.

The value property depends on the min/max with respect to [strictMode](#) property.

The following example allows you to select a time value within a range of **9:00 AM** to **11:30 AM**.

### CSHTML

```
<ejs-timepicker id="timepicker" value="@ViewBag.value" min="@ViewBag.minVal"
max="@ViewBag.maxVal"></ejs-timepicker>
```

### TIMERANGE.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers
{
```

```

public class HomeController: Controller
{
    public ActionResult DefaultFunctionalities()
    {
        ViewBag.minVal= new DateTime(2017,08,03, 09,00,00);
        ViewBag.maxVal = new DateTime(2017,08,03, 11,30,00);
        ViewBag.value = new DateTime(2017,08,03, 11,00,00);
        return View();
    }
}

```

**Note:** If the value of `min` or `max` property is changed through code behind you have to update the `value` property to set within the range.

#### Time Range customization using two TimePicker components

Here, two TimePicker components are used to select the start and end time. The below sample illustrates the appointment time selection scenario with the start and end time option.

Before the start time selection, the end time TimePicker is in disable state. When the start time is selected, then you will be able to select the end time or else, need to select the entire business hours 9:00 to 18:00 from the Business Hours option. Once the options are checked, both the TimePicker components goes to readonly state.

#### CSHTML

```

<div class=" control-section">
    <div class="timepicker-section">
        <div id="wrapper">
            <div class="tabs-wrap">
                <div class="wrap">
                    <ejs-timepicker id="start" created="onStartCreate"
placeholder="Start Time" change="onEnableEndTime"></ejs-timepicker>
                </div>
            </div>
            <div class="tabs-wrap">
                <div class="wrap">
                    <ejs-timepicker id="end" created="onEndCreate"
placeholder="End Time" enabled="false"></ejs-timepicker>
                </div>
            </div>
            <div class="tabs-wrap">
                <div class="wrap">
                    <ejs-checkbox id="dayRange" label="Business Hours"
change="changeTime"></ejs-checkbox>
                </div>
            </div>
        </div>
    </div>
</div>
<script>
    document.addEventListener('DOMContentLoaded', function () {
        isStartTimeChange = true;
        endInput = document.getElementById('end');
    });

```

```

function onEnableEndTime(args) {
    /*Enables end time if start time is selected*/
    if (isStartTimeChange) {
        endTime.enabled = true;
        endTime.value = null;
        endInput.value = '';
        value = new Date(+args.value);
        value.setMinutes(value.getMinutes() + endTime.step);
        endTime.min = value;
    } else {
        isStartTimeChange = true;
    }
}

function changeTime() {
    /*To determine whether we have selected business hours or not*/
    let element = document.getElementById('dayRange');
    isStartTimeChange = false;
    if (element.checked) {
        /*Business hours*/
        startTime.value = new Date('9/6/2017 9:00');
        endTime.enabled = true;
        endTime.value = new Date('9/6/2017 18:00');
        startTime.readonly = true;
        endTime.readonly = true;
    } else {
        endTime.value = null;
        startTime.value = null;
        endInput.value = '';
        startTime.readonly = false;
        endTime.readonly = false;
        endTime.enabled = false;
    }
}

function onStartCreate() {
    startTime = document.getElementById('start').ej2_instances[0];
}

function onEndCreate() {
    endTime = document.getElementById('end').ej2_instances[0];
}
</script>

```

### TIMERANGE-CUSTOMIZATION.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers
{
    public class HomeController: Controller
    {
        public ActionResult DefaultFunctionalities()
        {
            return View();
        }
    }
}

```

```
}
}
```

### Enable the Masked Input

TimePicker has `enableMask` property that provides the option to enable the built-in date masking support.

#### CSHTML

```
<ejs-timepicker id="datepicker" enableMask="true"></ejs-timepicker>
```

The mask pattern is defined based on the provided time format to the component. If the format is not specified, the mask pattern is formed based on the default format of the current culture.

| **Keys** | **Actions** |

| --- | --- |

| Up / Down arrows | To increment and decrement the selected portion of the time. |

| Left / Right arrows and Tab | To navigate the selection from one portion to next portion |

The following example demonstrates default and custom format of TimePicker component with mask.

#### CSHTML

```
<div class="control-section">
    <div class="control_wrapper">
        <div class="pane">
            <div class="tabs-wrap">
                <div class="wrap">
                    // Specifies the masked TimePicker without format
property.
                    <ejs-timepicker id="datepicker"
enableMask="true"></ejs-timepicker>
                </div>
            </div>
            <div class="tabs-wrap">
                <div class="wrap">
                    // Specifies the masked TimePicker with format
property.
                    <ejs-timepicker id="format" enableMask="true"
format="M/d/yyyy"></ejs-timepicker>
                </div>
            </div>
        </div>
    </div>
</div>
```

#### DATE-FORMAT.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
```

```
namespace EJ2CoreSampleBrowser.Controllers
{
    public class HomeController : Controller
    {
        public ActionResult Sample()
        {
            return View();
        }
    }
}
```

### Configure Mask Placeholder

You can change mask placeholder value through property `maskPlaceholder`. By default , it takes the full name of time co-ordinates such as `hour`, `minute` and `second`.

While changing to a culture other than `English`, ensure that locale text for the concerned culture is loaded through load method of `L10n` class for mask placeholder values like below.

//load the locale object to set the localized mask placeholder value

```
L10n.load({
    'de': {
        'timepicker': { hour: 'Stunde' ,minute: 'Minute', second:'Sekunde' }
    }
});
`
```

The following example demonstrates default and customized mask placeholder value.

### CSHTML

```
@{
    var maskPlaceholderValue = new
    Syncfusion.EJ2.Calendars.TimePickerMaskPlaceholder { Hour="h", Minute="m",
    Second="s" };
}
<div class="control-section">
    <div class="control_wrapper">
        <div class="pane">
            <div class="tabs-wrap">
                <div class="wrap">
                    // Specifies the masked TimePicker without mask
placeholder.
                    <ejs-timepicker id="timepicker"
enableMask="true"></ejs-timepicker>
                </div>
            </div>
            <div class="tabs-wrap">
                <div class="wrap">
                    // Specifies the masked TimePicker with mask
placeholder.
                    <ejs-timepicker id="format" enableMask="true"
maskPlaceholder = "@maskPlaceholderValue" ></ejs-timepicker>
```

```

        </div>
    </div>
</div>
</div>

```

### MASK-PLACEHOLDER.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers
{
    public class HomeController : Controller
    {
        public ActionResult Sample()
        {
            return View();
        }
    }
}

```

## Globalization

Globalization is the combination of internalization and localization. You can adapt the component to various languages by parsing and formatting the date or number [internationalization](#) and also add culture specific customization and translation to the text [localization](#).

By default, TimePicker time format and meridian names are specific to the **American English** culture. It utilizes the [Essential JavaScript 2 Internationalization](#) package to parse and format the date object based on the culture by using the official [UNICODE CLDR](#) JSON data. It provides the `loadCldr` method to load culture specific CLDR JSON data.

- Set the culture by using the [locale](#) property.

To go with the different culture other than **English**, follow the below steps.

- Install the **CLDR-Data** package by using the below command (it installs the CLDR JSON data). To know more about CLDR-Data refer the [CLDR-Data](#) link.

,

```
npm install cldr-data --save
```

,

Once the package installed, you can find the culture specific JSON data under the location `/node_modules/cldr-data`.

In ASP.NET MVC refer the culture files directly from `/node_modules/cldr-data` location.

```
function loadCultureFiles(name) {
```

```

var files = ['ca-gregorian.json', 'numbers.json', 'timeZoneNames.json'];
var loader = ej.base.loadCldr;
var loadCulture = function (prop) {
var val, ajax;

ajax = new ej.base.Ajax(location.origin + location.pathname + '/../node_modules/cldr-data/main/' +
name + '/' + files[prop], 'GET', false);

ajax.onSuccess = function (value) {
val = value;
};

ajax.send();

loader(JSON.parse(val));
};

for (var prop = 0; prop < files.length; prop++) {
loadCulture(prop);
}
}
`

```

- Before changing to a culture other than **English**, ensure that locale text for the concerned culture is loaded through **load** method of **L10n** class.

```

var L10n = ej.base.L10n;
L10n.load({
'de': {
'timepicker': { placeholder: 'Wählen Sie Zeit' }
}
});
`

```

The following example demonstrates the TimePicker in **German** culture.

#### CSHTML

```

<ejs-timepicker id="timepicker" placeholder="Select Time"></ejs-timepicker>
<script>
    document.addEventListener('DOMContentLoaded', function () {
        timepicker = document.getElementById('timepicker').ej2_instances[0];
        var L10n = ej.base.L10n;
        L10n.load({
            'de': {
                'timepicker': { placeholder: 'Wählen Sie Zeit' }
            }
        });
    });
</script>

```

```

    });
    loadCultureFiles("de");
    timepicker.locale = "de";
});
function loadCultureFiles(name) {
    var files = ['ca-gregorian.json', 'numbers.json',
'timeZoneNames.json'];
    var loader = ej.base.loadCldr;
    var loadCulture = function (prop) {
        var val, ajax;
        if (name === 'ar' && prop === files.length - 1) {
            ajax = new ej.base.Ajax(location.origin + location.pathname
+ '/../../scripts/cldr-data/supplemental/' + files[prop], 'GET', false);
        } else {
            ajax = new ej.base.Ajax(location.origin + location.pathname
+ '/../../scripts/cldr-data/main/' + name + '/' + files[prop], 'GET',
false);
        }
        ajax.onSuccess = function (value) {
            val = value;
        };
        ajax.send();
        loader(JSON.parse(val));
    };
    for (var prop = 0; prop < files.length; prop++) {
        loadCulture(prop);
    }
}
</script>

```

## GLOBALIZATION.CS

### Right-To-Left

The TimePicker supports RTL (right-to-left) functionality for languages like Arabic and Hebrew to displays the text in the right-to-left direction. Use [enableRtl](#) property to set the RTL direction.

The following code example demonstrates the TimePicker component in **Arabic** culture. It also explains how to set localized text to the placeholder using [L10n.load](#) method.

The following example demonstrates TimePicker in **Arabic** culture with right-to-left direction.

### CSHTML

```

<ejs-timepicker id="timepicker" placeHolder="Select a time"
enableRtl=true></ejs-timepicker>
<script>
    document.addEventListener('DOMContentLoaded', function () {
        timepicker = document.getElementById('timepicker').ej2_instances[0];
        var L10n = ej.base.L10n;
        L10n.load({
            'ar': {
                'timepicker': { placeholder: 'حدد الوقت' }
            }
        });
    });
</script>

```

```

    }
    });
    loadCultureFiles("ar");
    timepicker.locale = "ar";
  });
  function loadCultureFiles(name) {
    var files = ['ca-gregorian.json', 'numbers.json',
'timeZoneNames.json'];
    if (name === 'ar') {
      files.push('numberingSystems.json');
    }
    var loader = ej.base.loadCldr;
    var loadCulture = function (prop) {
      var val, ajax;
      if (name === 'ar' && prop === files.length - 1) {
        ajax = new ej.base.Ajax(location.origin + location.pathname
+ '/../../scripts/cldr-data/supplemental/' + files[prop], 'GET', false);
      } else {
        ajax = new ej.base.Ajax(location.origin + location.pathname
+ '/../../scripts/cldr-data/main/' + name + '/' + files[prop], 'GET',
false);
      }
      ajax.onSuccess = function (value) {
        val = value;
      };
      ajax.send();
      loader(JSON.parse(val));
    };
    for (var prop = 0; prop < files.length; prop++) {
      loadCulture(prop);
    }
  }
</script>

```

## RTL.CS

## Strict mode in TimePicker Control

The [strictMode](#) is an act that allows you to enter only valid time value within the specified min/max range in the textbox. If the time value is invalid, the control value sets to the previous value. If the time value is out of range, the control sets the time value to min/max value.

The following example demonstrates the TimePicker in `strictMode` with min/max range of 10:00 AM to 4:00 PM . It allows you to enter only valid time within the specified range. If you enter the out-of-range value like 8:00 PM, the value sets to the max time 4:00 PM as the value 8:00 PM is greater than max value of 4:00 PM. If you enter invalid time value like 9:00 tt, the value sets to the previous value.

## CSHTML

```

<ejs-timepicker id="timepicker" value="@ViewBag.value" min="@ViewBag.minVal"
max="@ViewBag.maxVal" strictMode=true></ejs-timepicker>

```

**STRICTMODE.CS**

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers
{
    public class HomeController: Controller
    {
        public ActionResult DefaultFunctionalities()
        {
            ViewBag.minVal= new DateTime(2017,08,03, 10,00,00);
            ViewBag.maxVal = new DateTime(2017,08,03, 16,00,00);
            ViewBag.value = new DateTime(2017,08,03, 03,00,00);
            return View();
        }
    }
}

```

By default, the TimePicker act in strictMode **false** state, that allows to enter the invalid or out-of-range time in textbox.

If the time is out-of-range or invalid, then the model value will be set to **out of range** time value or **null** respectively with highlighted **error** class to indicates the time is out of range or invalid.

The following example demonstrates the **strictMode** as **false**. Here, it allows to enter the valid or invalid value in textbox. If you are entering the out-of-range or invalid time value, then the model value will be set to **out of range** time value or **null** respectively with highlighted **error** class to indicates the time is out of range or invalid.

**CSHTML**

```

<ejs-timepicker id="timepicker" value="@ViewBag.value" min="@ViewBag.minVal"
max="@ViewBag.maxVal"></ejs-timepicker>

```

**NORMALMODE.CS**

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers
{
    public class HomeController: Controller
    {
        public ActionResult DefaultFunctionalities()
        {
            ViewBag.minVal= new DateTime(2017,08,03, 10,00,00);
            ViewBag.maxVal = new DateTime(2017,08,03, 16,00,00);
            ViewBag.value = new DateTime(2017,08,03, 3,00,00);
            return View();
        }
    }
}

```

```

    }
  }
}

```

**Note:** If the value of `min` or `max` property is changed through code behind, update the `value` property to set within the range.

## Accessibility

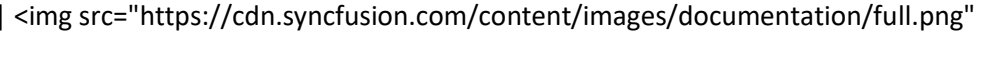

The web accessibility makes web applications and its content more accessible to people with disabilities without any barriers. It especially it tracks the dynamic value changes and DOM changes.

The TimePicker component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the TimePicker component is outlined below.

| Accessibility Criteria | Compatibility |

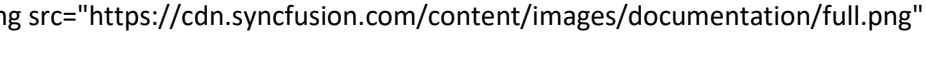

| -- | -- |

| [WCAG 2.2 Support](#) |  alt="Yes"> |

| [Section 508 Support](#) |  alt="Yes"> |

| [Screen Reader Support](#) |  alt="Yes"> |

| [Right-To-Left Support](#) |  alt="Yes"> |

| [Color Contrast](#) |  alt="Yes"> |

| [Mobile Device Support](#) |  alt="Yes"> |

| [Keyboard Navigation Support](#) |  alt="Yes"> |

| [Accessibility Checker Validation](#) |  alt="Yes"> |

| [Axe-core Accessibility Validation](#) |  alt="Yes"> |

<style>

```
.post .post-content img {
```

```
display: inline-block;
```

```
margin: 0.5em 0;
```

```
}
```

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

### WAI-ARIA attributes

The TimePicker control has covered the [WAI-ARIA](#) specifications with the following list of WAI-ARIA attributes: `aria-haspopup`, `aria-selected`, `aria-disabled`, `aria-activedescendant`, `aria-expanded`, `aria-owns`, and `aria-autocomplete`.

Here in TimePicker, the `combobox` plays the role of input element, and the `listbox` plays the role of popup element.

- **Aria-haspopup:** Provides the information about whether this element display a pop-up window or not.
- **Aria-selected:** Indicates the current selected value of the TimePicker control.
- **Aria-disabled:** Indicates disabled state of the TimePicker control.
- **Aria-expanded:** Indicates the expanded state of the popup.
- **Aria-autocomplete:** Indicates whether user input completion suggestions are provided or not.
- **Aria-owns:** Attribute that creates a parent/child relationship between two DOM element in the accessibility layer.
- **Aria-activedescendent:** Attribute that helps in managing the current active child of the TimePicker control.
- **Role:** Attribute that gives assistive technology information for handling each element in a widget.

### Keyboard Interaction

Keyboard accessibility is one of the most important aspects of web accessibility. Disabled people like blind and those who have motor disabilities or birth defects use keyboard shortcuts more than the mouse.

The TimePicker control has built-in keyboard accessibility support by following the [WAI-ARIA practices](#).

**Note:** It supports the following list of shortcut keys to interact with the TimePicker control.

| **Press** | **To do this** |

| --- | --- |

| **Upper Arrow** | **Navigate and select the previous item.** |

| **Down Arrow** | **Navigate and select the next item.** |

| **Left Arrow** | **Move the cursor towards arrow key pressed direction.** |

| **Right Arrow** | **Move the cursor towards arrow key pressed direction.** |

| **Home** | **Navigate and select the first item.** |

| **End** | **Navigate and select the last item.** |

| Enter | Select the currently focused item and close the popup. |

| Alt + Upper Arrow | Close the popup. |

| Alt + Down Arrow | Open the popup. |

| Esc | Close the popup. |

In the below sample use the **alt+t** keys to focus the TimePicker control.

#### CSHTML

```
<script>
    document.onkeyup = function (e) {
        var timepicker =
document.getElementById('timepicker').ej2_instances[0];
        if (e.altKey && e.keyCode === 84 /* t */) {
            // press alt+t to focus the control by calling public method.
            timepicker.focusIn(e);
        }
    };
</script>
<ejs-timepicker id="timepicker" placeholder="Select a time"></ejs-
timepicker>
```

#### ACCESSIBILITY.CS

#### Ensuring accessibility

The TimePicker component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the TimePicker component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the TimePicker component with accessibility tools.

See also

- [Accessibility in Syncfusion ASP.NET MVC components](#)

#### Style and appearance in TimePicker Component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

#### Customizing the appearance of TimePicker wrapper element

Use the following CSS to customize the appearance of wrapper element.

```
`css
```

*/ To specify height and font size /*

```
.e-input-group input.e-input, .e-input-group.e-control-wrapper input.e-input, .e-input-group textarea.e-
input, .e-input-group.e-control-wrapper textarea.e-input {
```

```
font-size: 20px;
height: 40px;
}
```

### Customizing the TimePicker icon element

Use the following CSS to customize the TimePicker icon element

```
`css
/ To specify background color and font size /
.e-time-wrapper .e-time-icon.e-icons, *.e-control-wrapper.e-time-wrapper .e-time-icon.e-icons {
font-size: 20px;
background-color: beige;
}
```

### Customizing the TimePicker popup

Use the following CSS to customize the TimePicker popup

```
`css
/ To specify height /
.e-timepicker.e-popup {
height: 100px;
}
```

### Customizing the TimePicker popup content

Use the following CSS to customize the TimePicker popup content

```
`css
/ To specify height /
.e-timepicker.e-popup .e-list-parent.e-ul li.e-list-item {
background-color: beige;
font-size: 20px;
}
```

### Full screen mode support in mobiles and tablets

The TimePicker full-screen mode feature enables users to view the popup element in full-screen mode on mobile devices with improved visibility and a better user experience. It is important to mention that this feature is exclusively available for mobile and tablet devices in both landscape and portrait

orientations. To activate the full screen mode within the TimePicker, simply set the [FullScreenMode](#) API value to `true`. This action will extend the popup element to occupy the entire screen on mobile devices.

**Default Sample**

12:00 AM

## How To

### CSS customization

TimePicker allows you to customize the textbox and popup list appearance to suit your application by using [cssClass](#) property.

The below sample demonstrates customization of text appearance in a textbox, popup button, and popup list along with hover and active state by using `e-custom-style` class. Following is the list of available classes used to customize the entire TimePicker component.

| Class Name                                  | Description  |
|---|--|
| ---   | ---  |
| <code>e-time-wrapper</code>                 | Applied to TimePicker wrapper element.                 |
| <code>e-timepicker</code>                   | Applied to input element and TimePicker popup element. |
| <code>e-time-wrapper.e-timepicker</code>    | Applied to input element only.                         |
| <code>e-input-group-icon.e-time-icon</code> | Applied to popup button.                               |
| <code>e-float-text</code>                   | Applied to floating label text element.                |
| <code>e-popup</code>                        | Applied to popup element.                              |
| <code>e-timepicker.e-popup</code>           | Applied to TimePicker popup element only.              |
| <code>e-list-parent</code>                  | Applied to popup UL element.                           |
| <code>e-timepicker.e-list-parent</code>     | Applied to TimePicker popup UL element only.           |
| <code>e-list-item</code>                    | Applied to LI elements.                                |
| <code>e-hover</code>                        | Applied to LI element hovering time.                   |
| <code>e-active</code>                       | Applied to active LI element.                          |

### CSHTML

```
<ejs-timepicker id="timepicker" placeholder="Select a time" cssClass="e-
custom-style"></ejs-timepicker>
<style>
    /*customize the input element text color*/
    .e-time-wrapper.e-custom-style #element { /* csslint allow: adjoining-
classes */
        display: block;
        color: blue;
    }
    /*customize the floating label and popup button text color*/
    .e-time-wrapper.e-custom-style .e-float-text.e-label-bottom, /* csslint
allow: adjoining-classes */
    .e-time-wrapper.e-custom-style .e-input-group-icon.e-time-icon.e-icons {
/* csslint allow: adjoining-classes */
        color: blue;
    }
    /*customize the input element text selection*/
    .e-time-wrapper.e-custom-style.e-input-group::before, /* csslint allow:
adjoining-classes */
    .e-time-wrapper.e-custom-style.e-input-group::after, /* csslint allow:
adjoining-classes */
```

```

.e-time-wrapper.e-custom-style.e-input-group .e-timepicker::selection {
/* csslint allow: adjoining-classes */
    background: blue;
}
.e-timepicker.e-popup.e-custom-style .e-list-parent.e-ul, /* csslint
allow: adjoining-classes */
.e-timepicker.e-popup.e-custom-style .e-list-parent.e-ul .e-list-item {
/* csslint allow: adjoining-classes */
    background-color: #c0ebff;
}
/*customize the list item hover color*/
.e-timepicker.e-popup.e-custom-style .e-list-parent.e-ul .e-list-item.e-
hover, /* csslint allow: adjoining-classes */
.e-timepicker.e-popup.e-custom-style .e-list-parent.e-ul .e-list-item.e-
active.e-hover { /* csslint allow: adjoining-classes */
    background-color: blue;
    color: #fff;
}
/*customize the active element text color*/
.e-timepicker.e-popup.e-custom-style .e-list-parent.e-ul .e-list-item.e-
active { /* csslint allow: adjoining-classes */
    color: #333;
    background-color: #fff;
}
}
</style>

```

## CSS.CSS

### Client side validation using FormValidator

To achieve client side validation in a TimePicker component, use [Essential JavaScript 2 FormValidator](#). It provides an option to customize feedback error messages to the corresponding fields for taking action and resolving the issue.

In the following example, the required field validation is implemented by mapping the name attribute value to the rules property. It validates the TimePicker component and displays the validation message when the textbox value is empty during form post back or focus out.

## CSHTML

```

<form id="form-element" class="form-vertical">
    <div class="form-group">
        <div class="col-sm-6">
            <ejs-timepicker id="formTest" value="@ViewBag.value"
cssClass="form-control"></ejs-timepicker>
        </div>
    </div>
</form>

<script>
    document.addEventListener('DOMContentLoaded', function () {
        var options = {
            rules: {

```

```

//must specify the name attribute value in rules
section
    'formTest': { required: true }
    },
    customPlacement: (inputElement, errorElement) => {
        //to place the error message in custom position
        //inputElement - target element where the error text
will be appended
        //errorElement - error text which will be displayed.

        inputElement.parentElement.parentElement.appendChild(errorElement);
    }
};
var formObject = new ej.inputs.FormValidator('#form-element',
options);
});
</script>

```

### VALIDATION.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers
{
    public class HomeController: Controller
    {
        public ActionResult DefaultFunctionalities()
        {
            ViewBag.value = DateTime.Now;
            return View();
        }
    }
}

```

### Render TimePickerFor

The TimePickerFor component can be rendered by passing a value from the model. The selected date value can be retrieved during form submission using the post method at the server end.

The following sample demonstrates how to retrieve the value in the controller by rendering the TimePickerFor component.

### CSHTML

```

@model EJ2CoreSampleBrowser.Controllers.TimePicker
<form method="post">
    <ejs-timepicker id="timepickerFor" ej-for="@Model.value"></ejs-
timepicker>
    <div id="errorMessage">
        <span asp-validation-for="value"></span>
    </div>
    <div id="submitButton">

```

```

        <ejs-button id="submitButton" content="Submit"></ejs-button>
    </div>
</form>

```

### TIMEPICKERFOR.CS

```

using System;
using System.Collections.Generic;
using System.ComponentModel.DataAnnotations;
namespace EJ2CoreSampleBrowser.Controllers
{
    public class TimePicker
    {
        [Required(ErrorMessage = "Please enter the value")]
        public DateTime? value { get; set; }
    }
    public class HomeController : Controller
    {
        TimePicker TimePickerValue = new TimePicker();
        public ActionResult Index()
        {
            TimePickerValue.value = new DateTime(2020, 03, 03, 10, 00, 00);
            return View(TimePickerValue);
        }
        [HttpPost]
        public ActionResult Index(TimePicker model)
        {
            //posted value is obtained from the model
            TimePickerValue.value = model.value;
            return View(TimePickerValue);
        }
    }
}

```

Selected value will be retrieved as below.

```

public class HomeController : Controller
{
    TimePicker TimePickerValue = new TimePicker();
    0 references
    public ActionResult Index()
    {
        TimePickerValue.value = new DateTime(2020, 03, 03, 10, 00, 00);
        return View(TimePickerValue);
    }
    [HttpPost]
    0 references
    public ActionResult Index(TimePicker model)
    {
        //posted value is obtained from the model
        ▶ TimePickerValue.value = model.value;
        return View(TimePickerValue);
    }
}

```

model.value | {10/22/2021 10:00:00 AM}

## Toast

### Getting Started with ASP.NET MVC Toast Control

#### Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

#### PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](https://www.nuget.org). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

```
<namespaces>
```

```
<add namespace="Syncfusion.EJ2"/>
```

```
</namespaces>
```

,

#### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

#### ~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
```

```
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

#### ~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

Add ASP.NET MVC Toast control

Now, add the Syncfusion ASP.NET MVC Toast control in `~/Views/Home/Index.cshtml` page.

#### CSHTML

```
@Html.EJS().Toast("element").Title("Matt sent you a friend
request").Content("You have a new friend request yet to accept").Render()
<script type="text/javascript">
    setTimeout(() => {
        var toastObj = document.getElementById('element').ej2_instances[0];
        toastObj.target = document.body;
        toastObj.show();
    }, 1000);
</script>
```

Press **Ctrl+F5** (Windows) or **⌘+F5** (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Toast control will be rendered in the default web browser.

**Note:** [View Sample in GitHub](#).

- [How to prevent duplicate toast display](#)
- [How to show different types of toast](#)

## Configuring Options

This section explains the steps required to customize the appearance of the toast using built-in APIs.

### Title and content template

Toast can be created with the notification message. The message contains [Title](#) and [Content](#) of the toasts. The title and contents are adaptable in any resolution.

**Note:** The Title or Content property can be given as HTML element/element ID to a string that can be displayed as a toast.

### CSHTML

```
<div class="control-section" style="width:400px;margin:0 auto;">
  <ejs-toast id="element" title="Matt sent you a friend request"
  content="You have a new friend request yet to accept"></ejs-toast>
  <ejs-button id="button" content="Show Toast" cssClass="e-btn"></ejs-
  button>
</div>
<script type="text/javascript">
  setTimeout(
    () => {
      var toastObj =
document.getElementById('element').ej2_instances[0];
      toastObj.target = document.body;
      toastObj.show();
    }, 1000);
    document.getElementById("button").addEventListener('click', function ()
  {
    var toastObj = document.getElementById('element').ej2_instances[0];
    toastObj.show();
  });
</script>
```

### CONTROLLER.CS

```
public class HomeController : Controller
{
    public ActionResult Index()
    {
        return View();
    }
}
```

### Specifying custom target

By default, the toast can be rendered in the document body. You can change the target position for toast rendering using the [Target](#) property. Based on the target, the [Position](#) will be updated.

### Close button

By default, the [ShowCloseButton](#) is not enabled. You can enable it by setting the true value. Before expiring the toast, you can use this button to close or destroy toasts manually.

### Progress bar

By default, the [ShowProgressBar](#) is not enabled. If it is enabled, it can visually indicate how long to get toast expires. Based on the [TimeOut](#) property, progress bar will appear.

### Progress bar direction

By default, the [ProgressDirection](#) is set to "Rtl" and it will appear from right to left direction. You can change the progressDirection to "Ltr" to make it appear from left to right direction.

### Newest on top

By default, the newly created toasts will append next with existing toasts. You can change the sequence like inserting before the toast by enabling the [NewestOnTop](#).

Here, the following sample demonstrates the combination of the [Target](#), [ShowCloseButton](#), [ShowProgressBar](#), and [NewestOnTop](#) properties in toast.

### CSHTML

```
<div class="control-section" style="width:400px;margin:0 auto;">
  <ejs-toast id="element" title="File Downloading" showCloseButton="true"
target="#toast_target" newestOnTop="true" showProgressBar="true"
progressDirection="Ltr">
    <e-toast-position X="Center"></e-toast-position>
    <e-content-template>
      <div class='progress'><span style='width: 80%'></span></div>
    </e-content-template>
  </ejs-toast>
  <ejs-button id="button" content="Show Toast" cssClass="e-btn"></ejs-
button>
</div>
<script type="text/javascript">
  setTimeout(
    () => {
      var toastObj =
document.getElementById('element').ej2_instances[0];
      toastObj.target = document.body;
      toastObj.show();
    }, 1000);
  document.getElementById("button").addEventListener('click', function ()
{
    var toastObj = document.getElementById('element').ej2_instances[0];
    toastObj.show();
  });
</script>
<style>
.e-toast-message {
  width: 100%;
}
.progress {
  height: 20px;
  position: relative;
  margin: 20px 0 20px 0;
  background: #555;
  -moz-border-radius: 25px;
  -webkit-border-radius: 25px;
  border-radius: 25px;
  box-shadow: inset 0 -1px 1px rgba(255, 255, 255, 0.3);
}
```

```
}
.progress span {
    background-color: #f0a3a3;
    background-image: -webkit-gradient(linear, left top, left bottom,
color-stop(0, #f0a3a3), color-stop(1, #f42323));
    display: block;
    height: 100%;
    border-radius: 10px;
    width: 50%;
    position: relative;
    overflow: hidden;
}
.progress span::after {
    background-image: -webkit-gradient(linear, 0 0, 100% 100%, color-
stop(.25, rgba(255, 255, 255, .2)), color-stop(.25, transparent), color-
stop(.5, transparent), color-stop(.5, rgba(255, 255, 255, .2)), color-
stop(.75, rgba(255, 255, 255, .2)), color-stop(.75, transparent),
to(transparent));
    content: "";
    position: absolute;
    top: 0;
    left: 0;
    bottom: 0;
    right: 0;
    background-size: 50px 50px;
    -webkit-animation: moveAnimate 2s linear infinite;
    overflow: hidden;
}
@@-webkit-keyframes moveAnimate {
    0% {
        background-position: 0 0;
    }
    100% {
        background-position: 50px 50px;
    }
}
</style>
```

### CONTROLLER.CS

```
public class HomeController : Controller
{
    public ActionResult Index()
    {
        return View();
    }
}
```

Output be like the below.

### Width and height

The dimensions of the toast can be set using the [Width](#) and [Height](#) properties. This will individually set all toasts. You can create different custom dimension toasts.

By default, the toast can be rendered with '300px' width with 'auto' height.

**Note:** In mobile devices, the default width of the toast gets '100%' width of the page.

When you set toast width as '100%', the toast occupies full width and will be displayed at the top or bottom based on the position **Y** property.

Both the width and height properties allow setting pixels/numbers/percentage. The number value is considered as pixels.

### CSHTML

```
<div style="width:400px;margin:0 auto;">
  <ejs-toast id="element" title="Matt sent you a friend request"
  content="You have a new friend request yet to accept" width="400"
  height="150">
    <e-toast-position X="Center" Y="Bottom"></e-toast-position>
  </ejs-toast>
  <div class='row' style="padding-top: 20px" id="toast_pos_target">
    <table>
      <tr>
        <td>
          <div style='padding:25px 0 0 0;'>
            <ejs-radiobutton id="topAlign" label="Top"
            name="toast" value="Target" change="checkboxChange"></ejs-radiobutton>
          </div>
        </td>
        <td>
          <div style='padding:25px 0 0 0;'>
            <ejs-radiobutton id="bottomAlign" label="Bottom"
            name="toast" value="Global" change="checkboxChange1" checked="true"></ejs-
            radiobutton>
          </div>
        </td>
      </tr>
      <tr>
        <td>
          <div style='padding:25px 0 0 0;'>
            <ejs-checkbox id="fullWidth" label="100% Width"
            change="onChange"></ejs-checkbox>
          </div>
        </td>
      </tr>
    </table>
  </div>
</div>
```

```

        </tr>
    </table>
</div>
<ejs-button id="show_toast" content="Show Toast" cssClass="e-btn"></ejs-
button>
</div>
<script type="text/javascript">
    setTimeout(
        () => {
            var toastObj =
document.getElementById('element').ej2_instances[0];
            toastObj.target = document.body;
            toastObj.show();
        }, 1000);
    document.getElementById("show_toast").addEventListener('click', function
() {
        var toastObj = document.getElementById('element').ej2_instances[0];
        toastObj.show();
    });
    var timeDelay = 1000;
    function checkboxChange(e) {
        var toastObj = document.getElementById('element').ej2_instances[0];
        if (e.event.target.checked) {
            toastObj.position.Y = "Top";
            toastObj.hide();
            toastShow(timeDelay);

        var toastObj = document.getElementById('element').ej2_instances[0];
        if (e.event.target.checked) {
            toastObj.position.Y = "Bottom";
            toastObj.hide();
            toastShow(timeDelay);
        }
    }
    function toastShow(timeOutDelay) {
        setTimeout(
            () => {
                var toastObj =
document.getElementById('element').ej2_instances[0];
                toastObj.show();
            }, timeOutDelay);
    }
    function onChange(e) {
        var toastObj = document.getElementById('element').ej2_instances[0];
        if (e.checked) {
            toastObj.hide();
            toastObj.width = "100%";
            toastObj.title = "";
            toastObj.content = "<div class='e-custom'>Take a look at our
next generation <b>Javascript</b> <a
href='https://ej2.syncfusion.com/home/index.html' target='_blank'>LEARN
MORE</a></div>";
            toastShow(timeDelay);
        } else {
            toastObj.hide();

```

```

        toastObj.width = 300;
        toastObj.title = 'Matt sent you a friend request',
        toastObj.content = 'You have a new friend request yet to
accept',
        toastShow(timeDelay);
    }
}
</script>

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        return View();
    }
}

```

## See Also

- [Prevent duplicate toasts](#)
- [Customize the progress bar](#)

## Positions

The toast position can be updated based on predefined positions or customizable positions. The predefined position combinations are updated in the **X** and **Y** [Position](#) properties.

### Predefined

#### X Positions

- Left
- Center
- Right

#### Y Positions

- Top
- Bottom

**Note:** In multiple toast display, the new toast position will not be updated on dynamic change of property values until the old toast messages removed.

<br/> The toast occupies full width when you set the width to '100%', so the X positions will not affect the changes when the width is '100%'.

### Custom

Custom **X** and **Y** positions can be given as pixels/numbers/percentage. The number value is considered as pixels based on the top and left values updated in the toast.

## CSHTML

## Action Buttons

You can include action buttons to the toast control by adding the [Buttons](#) property. The collection of Syncfusion ASP.NET MVC button models can be bound to the `model` property inside the `Buttons` property. You can also include the click event callback function for each button.

### CSHTML

```
<div class="control-section" style="width:400px;margin:0 auto;">
    <ejs-toast id="element" extendedTimeout="20000"
buttons="@ViewBag.ToastButtons" width="300" height="150">
        <e-toast-position X="Right" Y="Bottom"></e-toast-position>
        <e-toast-buttonmodelprops>
            <e-toast-buttonmodelprop click="btnClick"
model="ViewBag.ToastButtons1">
                </e-toast-buttonmodelprop>
            <e-toast-buttonmodelprop model="ViewBag.ToastButtons2">
                </e-toast-buttonmodelprop>
            </e-toast-buttonmodelprops>
        <e-content-template>
            <p><img alt='Laura' class='toast-img'
src='https://ej2.syncfusion.com/demos/src/toast/resource/laura.png' /><span
class="name">Anjolie Stokes</span></p>
            <div class="content">
                <p>Thanks for update!</p>
            </div>
        </e-content-template>
    </ejs-toast>
    <ejs-button id="show_toast" content="Show Toast" cssClass="e-btn"></ejs-
button>
</div>
<script type="text/javascript">
    setTimeout(function () {
        var toastObj = document.getElementById('element').ej2_instances[0];
        toastObj.target = document.body;
        toastObj.show();
    }, 1000);
    document.getElementById("show_toast").addEventListener('click', function
() {
        var toastObj = document.getElementById('element').ej2_instances[0];
        toastObj.show();
    });
    function btnClick(e) {
        var toastEle = ej.base.closest(e.target, '.e-toast');
        var toastObj = document.getElementById('element').ej2_instances[0];
        toastObj.hide(toastEle);
    }
</script>
<style>
    .toast-img {
        width: 40px;
```

```

        height: 40px;
    }
    .name {
        padding-left: 20px;
        font-size: 17px;
        font-weight: 500;
    }
    .content {
        padding-left: 60px;
        font-size: 12px;
    }
}
</style>

```

### CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.ToastButtons1 = new DefaultButtonModel() { content =
        "Ignore" };
        ViewBag.ToastButtons2 = new DefaultButtonModel() { content = "reply"
    };
        return View();
    }
    public class DefaultButtonModel
    {
        public string content { get; set; }
    }
}

```

Output be like the below.

See Also

- [How to add dynamic template](#)

### Time out

The toast can be expired based on the [TimeOut](#) property. The toast can live till the time out reaches without user interaction, a time out value is considered as a millisecond.

- The [TimeOut](#) delay can be visually represented using [Progress Bar](#).
- The [ExtendedTimeOut](#) property determines how long the toast should be displayed after a user hovers over it.

**Note:** You can terminate the process by using the [ShowCloseButton](#) property for destroying the toast at any time.

### CSHTML

```
<div style="width:400px;margin:0 auto;">
  <div class="e-float-input"><input class="e-input" id="toast_input_index"
required="" value="0"><span class="e-float-line"></span><label class="e-
float-text">Enter timeOut</label></div>
  <ejs-toast id="element" width="300" height="150">
    <e-toast-position X="Right" Y="Bottom"></e-toast-position>
    <e-toast-buttonmodelprops>
      <e-toast-buttonmodelprop model="ViewBag.ToastButtons1">
        </e-toast-buttonmodelprop>
      <e-toast-buttonmodelprop model="ViewBag.ToastButtons2">
        </e-toast-buttonmodelprop>
    </e-toast-buttonmodelprops>
    <e-content-template>
      <p><img alt='Laura' class='toast-img'
src='https://ej2.syncfusion.com/demos/src/toast/resource/laura.png' /><span
class="name">Anjolie Stokes</span></p>
      <div class="content">
        <p>Thanks for update!</p>
      </div>
    </e-content-template>
  </ejs-toast>
  <ejs-button id="show_toast" content="Show Toast" cssClass="e-btn"></ejs-
button>
</div>
<script type="text/javascript">
  setTimeout(
    () => {
      var toastObj =
document.getElementById('element').ej2_instances[0];
      toastObj.target = document.body;
      toastObj.show();
    }, 1000);
  document.getElementById("show_toast").addEventListener('click', function
() {
    var toastObj = document.getElementById('element').ej2_instances[0];
    var value =
parseInt(document.getElementById('toast_input_index').value)
    toastObj.show({ timeOut: value });
  });
</script>
<style>
  .toast-img {
    width: 40px;
    height: 40px;
  }
  .name {
    padding-left: 20px;
    font-size: 17px;
    font-weight: 500;
  }
  .content {
    padding-left: 60px;
```

```
font-size: 12px;
}
</style>
```

### CONTROLLER.CS

```
public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.ToastButtons1 = new DefaultButtonModel() { content =
"Ignore" };
        ViewBag.ToastButtons2 = new DefaultButtonModel() { content = "reply"
};
        return View();
    }
    public class DefaultButtonModel
    {
        public string content { get; set; }
    }
}
```

### Static toast

You can prevent auto hiding in a toast as visible like static by setting zero (0) value in the [TimeOut](#) Property.

### CSHTML

```
<div class="control-section" style="width:400px;margin:0 auto;">
    <ejs-toast id="element" title="Matt sent you a friend request"
content="You have a new friend request yet to accept" showCloseButton="true"
timeOut="0">
        <e-toast-position X="Right"></e-toast-position>
    </ejs-toast>
    <ejs-button id="show_toast" content="Show Toast" cssClass="e-btn"></ejs-
button>
</div>
<script type="text/javascript">
    setTimeout(
        () => {
            var toastObj =
document.getElementById('element').ej2_instances[0];
            toastObj.target = document.body;
            toastObj.show();
        }, 1000);
    document.getElementById("show_toast").addEventListener('click', function
() {
        var toastObj = document.getElementById('element').ej2_instances[0];
        toastObj.show();
    });
</script>
```

### CONTROLLER.CS

```
public class HomeController : Controller
```

```
{
    public ActionResult Index()
    {
        return View();
    }
}
```

## Template

The [Template](#) property can be given as the **HTML element**; this can be either a **string** or **query selector**.

The HTML element tag can be given as a string for the Template property.

template: "<div>Toast Content</div>"

,

The Template property allows getting the template content using the query **selector**. Here, the element 'ID' attribute is specified in the template.

template: "#Template"

,

## CSHTML

```
<div style="width:400px;margin:0 auto;">
    <div id="template_toast">
        <ejs-toast id="element" extendedTimeout="0" timeOut="120000">
            <e-toast-position X="Right" Y="Bottom"></e-toast-position>
        </ejs-toast>
        <ejs-button id="show_toast" content="Show Toast" cssClass="e-
btn"></ejs-button>
    </div>
    <br /><br />
    <div id='result'></div>

## Animations

The toast control supports custom animations for both shows and hide actions from the provided [Animation](#) option of the `Animation` library.

The default animation is given as `FadeIn` for showing the toast and `FadeOut` for hiding the toast.

The following sample demonstrates some types of animations that suit toast. You can check all the animation effects [here](#).

### CSHTML

```
<div id="default" style="padding-bottom:75px;">
  <div class='row'> <ejs-button id="show_toast" content="Show Toast"
cssClass="e-btn"></ejs-button> </div>
  <div class='row'>
    <div class="col-md-6">
      <label> Show Animation </label>
    </div>
    <div class="col-md-6">
      <ejs-dropdownlist id="showAnimation" dataSource="@ViewBag.data"
placeholder="Select a animate type" index="0" popupHeight="200px"
change="valueChange">
        <e-dropdownlist-fields text="Value" value="Id"></e-
dropdownlist-fields>
      </ejs-dropdownlist>
    </div>
  </div>
  <div class='row'>
    <div class="col-md-6">
      <label> Hide Animation </label>
    </div>
    <div class="col-md-6">
      <ejs-dropdownlist id="hideAnimation" dataSource="@ViewBag.data"
index="0" placeholder="Select a animate type" change="valueChange1">
        <e-dropdownlist-fields text="Value" value="Id"></e-
dropdownlist-fields>
      </ejs-dropdownlist>
    </div>
  </div>
  <ejs-toast id="element" title="Matt sent you a friend request"
content="You have a new friend request yet to accept">
    <e-toast-position X="Right" Y="Bottom"></e-toast-position>
    <e-toast-animationsettings>
      <e-toast-animationsettingsshow effect="SlideRightIn"

In" },
Out" },
new Animation { Id = "ZoomIn", Value = "Zoom In" },
new Animation { Id = "ZoomOut", Value = "Zoom Out" }
    };
    return animation;
}
}
}

```

## Toast Utility Services

The Toast component provides a built-in utility function to render the toast with minimal code. The utility function will render the toast without the need of rendering the container element in the DOM where the toast is appended. So that, the toast can now be rendered on the go. The following are the option to render the toast using the utility function.

### Show Toast with predefined types

The Toast component support 4 types of predefined toast with essential colors for various situations which can be shown using the `ToastUtility.show` by just defining the type of the toast without defining any class names. The following options are used as an argument on calling the utility function for predefined types:

| Options              | Description  |
|----------------------|--|
| <code>content</code> | Specifies the content that can be displayed on the Toast.  |
| <code>type</code>    | Specifies the type of the predefined Toasts. The 4 types of predefined toasts are <code>Information</code> , <code>Success</code> , <code>Error</code> , <code>Warning</code>  |
| <code>timeOut</code> | Specifies the Toast display time duration on the page in milliseconds. Once the time expires, Toast message will be removed. Setting 0 as a time out value displays the Toast on the page until the user closes it manually. |

**CSHTML**

```

<div class="control-section" style="width:400px;margin:0 auto;">
    <div class="row">
        <ejs-button id="info_toast" content="Info Toast" cssClass="e-btn e-
control e-info"></ejs-button>
        <ejs-button id="success_toast" content="Success Toast" cssClass="e-
btn e-control e-success"></ejs-button>
        <ejs-button id="warning_toast" content="Warning Toast" cssClass="e-
btn e-control e-warning"></ejs-button>
        <ejs-button id="danger_toast" content="Danger Toast" cssClass="e-btn
e-control e-danger"></ejs-button>
    </div>
    <br/>
    <div class="row" style="text-align: center;">
        <ejs-button id="hide_toast" content="Hide All" cssClass="e-
btn"></ejs-button>
    </div>
</div>
<script type="text/javascript">
    var toastObj;
    document.getElementById("info_toast").addEventListener('click', function
() {
        toastObj = ej.notifications.ToastUtility.show('Please read the
comments carefully', 'Information', 20000);
    });
    document.getElementById("success_toast").addEventListener('click',
function () {
        toastObj = ej.notifications.ToastUtility.show('Your message has
been sent successfully', 'Success', 20000);
    });
    document.getElementById("warning_toast").addEventListener('click',
function () {
        toastObj = ej.notifications.ToastUtility.show('There was a problem
with your network connection', 'Warning', 20000);
    });
    document.getElementById("danger_toast").addEventListener('click',
function () {
        toastObj = ej.notifications.ToastUtility.show('A problem has been
occurred while submitting the data', 'Error', 20000);
    });
    document.getElementById("hide_toast").addEventListener('click', function
() {
        toastObj.hide('All');
    });
</script>

```

**CONTROLLER.CS**

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        return View();
    }
}

```

### Show Toast with ToastModel

The utility function can be called using the [ToastModel](#) as argument to show the toast where all the properties in the `ToastModel` like any events, position, close icon, action buttons, etc. can be used in the `ToastUtility.show`.

#### CSHTML

```
<div class="control-section" style="width:400px;margin:0 auto;">
  <ejs-button id="show_toast" content="Show Toast" cssClass="e-btn"></ejs-
button>
</div>
<script type="text/javascript">
  var toastObj;
  document.getElementById("show_toast").addEventListener('click', function
() {
    toastObj = ej.notifications.ToastUtility.show({
      title: 'Toast Title',
      content: 'Toast is shown using the utility function with
ToastModel',
      timeOut: 20000,
      position: { X: 'Right', Y: 'Bottom' }
      showCloseButton: true,
      click: toastClick,
      buttons: [{
        model: { content: 'Close' }, click: toastClose
      }]
    });

    function toastClick() {
      console.log('Toast click event triggered');
    }
    function toastClose() {
      toastObj.hide();
    }
  }
</script>
```

#### CONTROLLER.CS

```
public class HomeController : Controller
{
    public ActionResult Index()
    {
        return View();
    }
}
```

### CSS structures

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

### Customizing the toast title

Use the following CSS to customize the default toast's content properties like font-family, font-size and color.

```
`CSS  
  
/ To change color, font family and font size /  
  
.e-toast-container .e-toast .e-toast-message .e-toast-title {  
  color: red;  
  font-size: 18px;  
  font-weight: bold;  
}  
`
```

### Customizing the toast content

Use the following CSS to customize the default toast's content properties like font-family, font-size and color.

```
`CSS  
  
/ To change color, font family and font size /  
  
.e-toast-container .e-toast .e-toast-message .e-toast-content {  
  color: aqua;  
  font-size: 13px;  
  font-weight: normal;  
}  
`
```

### Customizing the toast icon

Use the following CSS to customize the default toast icon color.

```
`CSS  
  
/ To change icon color /  
  
.e-toast-container .e-toast .e-toast-icon {  
  color: yellow;  
}  
`
```

### Customizing the toast background

Use the following CSS to customize the default toast's background color.

```
`CSS  
  
/ To change background color /  
  
.e-toast-container .e-toast {
```

```
background-color: navy;
}
`
```

## Accessibility

The Toast control has been designed with [WAI-ARIA](#) specifications in mind by applying the prompt WAI-ARIA roles, states, and properties with the keyboard support. It helps users who use assistive WAI-ARIA accessibility support, which is achieved using attributes.

It provides information about the elements in a document for assistive technology.

The Toast control implements the keyboard navigation support by using the following [WAI-ARIA practices](#) and is tested in major screen readers.

The Toast component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Toast component is outlined below.

| Accessibility Criteria  | Compatibility |
|---|---------------|
| --  | --            |
| <a href="#">WCAG 2.2 Support</a>    alt="Yes" >                    |               |
| <a href="#">Section 508 Support</a>    alt="Yes" >               |               |
| <a href="#">Screen Reader Support</a>    alt="Yes" >             |               |
| <a href="#">Right-To-Left Support</a>    alt="Yes" >             |               |
| <a href="#">Color Contrast</a>    alt="Yes" >                    |               |
| <a href="#">Mobile Device Support</a>    alt="Yes" >             |               |
| <a href="#">Keyboard Navigation Support</a>    alt="No" >        |               |
| <a href="#">Accessibility Checker Validation</a>    alt="Yes" >  |               |
| <a href="#">Axe-core Accessibility Validation</a>    alt="Yes" > |               |

```
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
```

```

}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

```

### WAI-ARIA attributes

<!-- markdownlint-disable MD033 -->

| Class | Description |

| ----- | ----- |

| role | <b>alert:</b><br/> &#160;&#160;&#160;&#160;&#160;&#160; Identifies the element as a container when alert content will be added or updated. |

### CSHTML

```

<ejs-toast id="element" title="Matt sent you a friend request" content="You
have a new friend request yet to accept"></ejs-toast>
<script type="text/javascript">
    setTimeout(
        () => {
            var toastObj =
document.getElementById('element').ej2_instances[0];
            toastObj.target = document.body;
            toastObj.show();
        }, 1000);

</script>

```

### CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        return View();
    }
}

```

### Ensuring accessibility

The Toast component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Toast component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Toast component with accessibility tools.

- [Accessibility in Syncfusion ASP.NET MVC components](#)

## How To

### Prevent duplicate toast display

You can prevent identical same toast displaying in a screen by the event function and terminate the toast displaying process by setting the cancel event property in the [BeforeOpen](#) event.

The following sample demonstrates preventing duplicate title toast element displaying with custom code blocks.

### CSHTML

```
<div class="control-section" style="width:400px;margin:0 auto;">
    <ejs-toast id="element" title="Sample Toast Title" content="Sample Toast
content" beforeOpen="onBeforeOpen" close="onClose" created="onCreate">
        <e-toast-position X="Center"></e-toast-position>
    </ejs-toast>
    <ejs-button id="showToast" content="Show Toast" cssClass="e-btn"></ejs-
button>
</div>
<script type="text/javascript">
    var toasts = [
        { title: 'Warning !', content: 'There was a problem with your
network connection.', isOpen: false },
        { title: 'Success !', content: 'Your message has been sent
successfully.', isOpen: false },
        { title: 'Error !', content: 'A problem has been occurred while
submitting your data.', isOpen: false }
    ];
    var toastFlag = 0;
    setTimeout(
        () => {
            var toastObj =
document.getElementById('element').ej2_instances[0];
            toastObj.target = document.body;
            toastObj.show(toasts[toastFlag]);
            ++toastFlag;
        }, 1000);
    function onBeforeOpen(e) {
        if (preventDuplicate(e)) {
            e.cancel = true;
        }
    }
    function preventDuplicate(e) {
        for (var i = 0; i < toasts.length; i++) {
            if (toasts[i].title === e.options.title && !toasts[i].isOpen) {
                toasts[i].isOpen = true;
                return false;
            }
        }
        return true;
    }
    function onCreate() {
```

```

        toastObj.show(toasts[toastFlag]);
        ++toastFlag;
    }
    function onClose(e) {
        for (var i= 0; i < toasts.length; i++) {
            if (toasts[i].title === e.options.title) {
                toasts[i].isOpen = false;
            }
        }
    }
    document.getElementById("showToast").addEventListener('click', function
    () {
        var toastObj = document.getElementById('element').ej2_instances[0];
        toastObj.show(toasts[toastFlag]);
        ++toastFlag;
        if (toastFlag === (toasts.length)) {
            toastFlag = 0;
        }
    });
</script>

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        return View();
    }
}

```

### Restrict the maximum toast to show

You can restrict the maximum toast count by using the event callback function and terminate the toast displaying process by setting the cancel event property in the [BeforeOpen](#) event.

The following sample demonstrates restricting toast displaying up to 3. You can restrict by your own count with custom code blocks.

## CSHTML

```

<div class="control-section" style="width:400px;margin:0 auto;">
    <ejs-toast id="element" title="Sample Toast Title" content="Sample Toast
content" beforeOpen="onBeforeOpen">
        <e-toast-position X="Center"></e-toast-position>
    </ejs-toast>
    <ejs-button id="showToast" content="Show Toast" cssClass="e-btn"></ejs-
button>
</div>
<script type="text/javascript">
    var toasts = [
        { title: 'Warning !', content: 'There was a problem with your
network connection.' },
        { title: 'Success !', content: 'Your message has been sent
successfully.' },

```

```

        { title: 'Error !', content: 'A problem has been occurred while
submitting your data.' },
        { title: 'Information !', content: 'Please read the comments
carefully.' }
    ];
    var maxCount = 3;
    var toastFlag = 0;
    setTimeout(
        () => {
            var toastObj =
document.getElementById('element').ej2_instances[0];
            toastObj.target = document.body;
            toastObj.show(toasts[toastFlag]);
            ++toastFlag;
        }, 1000);
    function onBeforeOpen(e) {
        var toastObj = document.getElementById('element').ej2_instances[0];
        if (maxCount === toastObj.element.childElementCount) {
            e.cancel = true;
        } else {
            e.cancel = false;
        }
    }
    document.getElementById("showToast").addEventListener('click', function
    () {
        var toastObj = document.getElementById('element').ej2_instances[0];
        toastObj.show(toasts[toastFlag]);
        ++toastFlag;
        if (toastFlag === (toasts.length)) {
            toastFlag = 0;
        }
    });
</script>

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        return View();
    }
}

```

## Customize progress bar theme and sizing

By default, the progress bar appears based on the theme stylings and dimensions. You can customize the progress bar stylings using custom CSS or event functions.

The following sample demonstrates customizing the progress bar stylings using the [BeforeOpen](#) event.

## CSHTML

```

<div style="width:400px;margin:0 auto;">
    <ejs-toast id="element" title="Matt sent you a friend request"
content="You have a new friend request yet to accept"
beforeOpen="onBeforeOpen" showProgressBar="true">

```

```

        <e-toast-position X="Right" Y="Bottom"></e-toast-position>
    </ejs-toast>
    <div class="row">
        <ejs-button id="show_toast" content="Show Toast" cssClass="e-
btn"></ejs-button>
    </div>
    <div class="row" style="padding-top: 20px">
        <div class="e-float-input">
            <input class="e-input" id="progressHeight" name="Digits"
value="4" required>
            <span class="e-float-line"></span>
            <label class="e-float-text" for="Digits">Progress Bar
Height</label>
        </div>
    </div>
    <div class="row" style="padding-top: 20px">
        <div class="col-md-6">
            <label> Progress Bar Color </label>
        </div>
        <div class="col-md-6">
            <ejs-dropdownlist id="Progress" dataSource="@ViewBag.data"
placeholder="Select a animate type" index="0" popupHeight="150px"
change="valueChange">
                <e-dropdownlist-fields text="Value" value="Id"></e-
dropdownlist-fields>
            </ejs-dropdownlist>
        </div>
    </div>
</div>
<script type="text/javascript">
    setTimeout(
        () => {
            var toastObj =
document.getElementById('element').ej2_instances[0];
            toastObj.target = document.body;
            toastObj.show();
        }, 200);
    function onBeforeOpen(e) {
        var progress = e.element.querySelector('.e-toast-progress');
        progress.style.height =
document.getElementById('progressHeight').value + 'px';
        var listObjprogressColor =
document.getElementById('Progress').ej2_instances[0];
        progress.style.backgroundColor = listObjprogressColor.value;
    }
    function valueChange(e) {
        var toastObj = document.getElementById('element').ej2_instances[0];
        var listObjprogressColor =
document.getElementById('Progress').ej2_instances[0];
        var progressEles = toastObj.element.querySelectorAll('.e-toast-
progress');
        progressEles.forEach((ele) => {
            ele.style.backgroundColor = listObjprogressColor.value;
        })
    }
    document.getElementById("show_toast").addEventListener('click', function
() {

```

```

        var toastObj = document.getElementById('element').ej2_instances[0];
        toastObj.show();
    });
</script>

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.data = new Color().Colors();
        return View();
    }
    public class Color
    {
        public string Value { get; set; }
        public string Id { get; set; }
        public List<Color> Colors()
        {
            List<Color> color = new List<Color>();
            position.Add(new Color { Id = "red", Value = "Red" });
            position.Add(new Color { Id = "cyan", Value = "Cyan" });
            position.Add(new Color { Id = "blue", Value = "Blue" });
            position.Add(new Color { Id = "yellow", Value = "Yellow" });
            position.Add(new Color { Id = "pink", Value = "Pink" });
            return color;
        }
    }
}

```

## Play an audio before open the toast

The following sample demonstrates how to play an audio in background while opening the toast by including audio play codes into the [BeforeOpen](#) event function.

**Note:** To stop the audio after displaying the toast, use the [Open](#) event in toast. For further customization, check the Toast Events APIs.

## CSHTML

```

<div class="control-section" style="width:400px;margin:0 auto;">
    <ejs-toast id="element" title="Matt sent you a friend request"
    content="You have a new friend request yet to accept"
    beforeOpen="onBeforeOpen">
        <e-toast-position X="Right" Y="Bottom"></e-toast-position>
    </ejs-toast>
    <div class="row">
        <ejs-button id="show_toast" content="Show Toast" cssClass="e-
        btn"></ejs-button>
    </div>
</div>
<script type="text/javascript">
    setTimeout(
        () => {

```

```

        var toastObj =
document.getElementById('element').ej2_instances[0];
        toastObj.target = document.body;
        toastObj.show();
    }, 1000);
    function onBeforeOpen(e) {
        let audio = new
Audio('https://drive.google.com/uc?export=download&id=1M95VOptolcQ4FQHzNBaLf
0WFQglrtWi7');
        audio.play();
    }
    document.getElementById("show_toast").addEventListener('click', function
() {
        var toastObj = document.getElementById('element').ej2_instances[0];
        toastObj.show();
    });
</script>

```

### CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        return View();
    }
}

```

### Show different types of toast

The Syncfusion ASP.NET Core toast has the following predefined styles that can be defined using the [CssClass](#) property for achieving different types of toast:

| Class           | Description                     |
|-----------------|---------------------------------|
| -----           | -----                           |
| e-toast-success | Represents a positive toast     |
| e-toast-info    | Represents an informative toast |
| e-toast-warning | Represents a toast with caution |
| e-toast-danger  | Represents a negative toast     |

### CSHTML

```

<div style="width:400px;margin:0 auto;">
    <ejs-toast id="element">
        <e-toast-position X="Right" Y="Bottom"></e-toast-position>
    </ejs-toast>
    <div class="row">
        <ejs-button id="showToast" content="Show Types" cssClass="e-
btn"></ejs-button>
    </div>
</div>
<script type="text/javascript">
    var toasts = [

```

```

    { title: 'Warning !', content: 'There was a problem with your
network connection.', cssClass: 'e-toast-warning' },
    { title: 'Success !', content: 'Your message has been sent
successfully.', cssClass: 'e-toast-success' },
    { title: 'Error !', content: 'A problem has been occurred while
submitting your data.', cssClass: 'e-toast-danger' },
    { title: 'Information !', content: 'Please read the comments
carefully.', cssClass: 'e-toast-info' }]];
    var toastFlag = 0;
    setTimeout(
        () => {
            var toastObj =
document.getElementById('element').ej2_instances[0];
            toastObj.target = document.body;
            toastObj.show(toasts[toastFlag]);
            ++toastFlag;
        }, 200);
    document.getElementById("showToast").addEventListener('click', function
() {
        var toastObj = document.getElementById('element').ej2_instances[0];
        toastObj.show(toasts[toastFlag]);
        ++toastFlag;
        if (toastFlag === (toasts.length)) {
            toastFlag = 0;
        }
    });
</script>

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        return View();
    }
}

```

### Show multiple toasts in various positions

By default, the positions of the new toasts are only updated after the visible toasts have been destroyed. If You need to display multiple toasts with different positions, initiate another toasts.

The following sample demonstrates adding multiple toasts in different positions.

## CSHTML

```

<div class="control-section" style="width:400px;margin:0 auto;">
    <ejs-toast id="element" title="Warning !" content="There was a problem
with your network connection." click="onClick">
        <e-toast-position X="Right" Y="Bottom"></e-toast-position>
    </ejs-toast>
    <ejs-toast id="element1" title="Success !" content="Your message has
been sent successfully." click="onClick">
        <e-toast-position X="Left" Y="Bottom"></e-toast-position>
    </ejs-toast>
</div>

```

```

<ejs-button id="show_toast" content="Show Right Position Toast"
cssClass="e-btn"></ejs-button>
<ejs-button id="show_toast1" content="Show Left Position Toast"
cssClass="e-btn"></ejs-button>
</div>
</div>
<script type="text/javascript">
    setTimeout(
        () => {
            var toastObj =
document.getElementById('element').ej2_instances[0];
            toastObj.target = document.body;
            toastObj.show();
            var toastObj =
document.getElementById('element1').ej2_instances[0];
            toastObj.target = document.body;
            toastObj.show();
        }, 200);
    document.getElementById("show_toast").addEventListener('click', function
() {
        var toastObj = document.getElementById('element').ej2_instances[0];
        toastObj.show();
    });
    document.getElementById("show_toast1").addEventListener('click',
function () {
        var toastObj = document.getElementById('element1').ej2_instances[0];
        toastObj.show();
    });
    function onClick(e) {
        e.clickToClose = true;
    }
</script>

```

### CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        return View();
    }
}

```

### Close the toast with click/tap

By default, the toasts are expired based on the [TimeOut](#) value. You can customize the toast hiding process with `click/tap` action by setting the event args in the `clicked` callback function with `static Toast`.

### CSHTML

```

<div class="control-section" style="width:400px;margin:0 auto;">
    <ejs-toast id="element" title="Matt sent you a friend request"
content="You have a new friend request yet to accept" timeOut="0"
click="onClick">
        <e-toast-position X="Right" Y="Bottom"></e-toast-position>
    </ejs-toast>
</div>

```

```

</ejs-toast>
<ejs-button id="show_toast" content="Show Toast" cssClass="e-btn"></ejs-
button>
</div>
<script type="text/javascript">
    setTimeout(
        () => {
            var toastObj =
document.getElementById('element').ej2_instances[0];
            toastObj.target = document.body;
            toastObj.show();
        }, 200);
    document.getElementById("show_toast").addEventListener('click', function
() {
        var toastObj = document.getElementById('element').ej2_instances[0];
        toastObj.show();
    });
    function onClick(e) {
        e.clickToClose = true;
    }
</script>

```

### CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        return View();
    }
}

```

### Add dynamic template

Toast supports to change templates dynamically with displaying in multiple toasts. You can change the toast properties while calling in the `show` method.

### CSHTML

```

<div class="control-section" style="width:400px;margin:0 auto;">
    <ejs-toast id="element" click="onClick">
        <e-toast-position X="Right" Y="Bottom"></e-toast-position>
    </ejs-toast>
    <div id='templateToast' style="display: none;color:red"> System affected
by virus !!! </div>
    <ejs-button id="show_toast" content="Show Toast" cssClass="e-btn"></ejs-
button>
</div>
<script type="text/javascript">
    var toastFlag = 0;
    var toasts = [{ template: '2 Mail has received' },
    { template: 'User Guest Logged in' },
    { template: 'Logging in as Guest' },
    { template: 'Ticket has reserved' },
    { template: '#templateToast' }];
    setTimeout(

```

```

        () => {
            var toastObj =
document.getElementById('element').ej2_instances[0];
            toastObj.target = document.body;
            toastObj.show(toasts[toastFlag]);
            ++toastFlag;
        }, 1000);
        document.getElementById("show_toast").addEventListener('click', function
    () {
        var toastObj = document.getElementById('element').ej2_instances[0];
        toastObj.show(toasts[toastFlag]);
        ++toastFlag;
        if (toastFlag === (toasts.length)) {
            toastFlag = 0;
        }
    });
    function onClick(e) {
        e.clickToClose = true;
    }
</script>

```

### CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        return View();
    }
}

```

### Prevent toast close with mobile swipe

You can prevent the toast close with mobile swipe action by setting [BeforeClose](#) argument cancel value to true while argument type as a swipe. The following code shows how to prevent toast close with mobile swipe.

The following sample demonstrates preventing toast close with mobile swipe element displaying with custom code blocks.

### CSHTML

```

<div class="control-section" style="width:400px;margin:0 auto;">
    <ejs-toast id="element" title="Matt sent you a friend request"
content="You have a new friend request yet to accept"
beforeClose="beforeClose"></ejs-toast>
    <ejs-button id="button" content="Show Toast" cssClass="e-btn"></ejs-
button>
</div>
<script type="text/javascript">
    setTimeout(
        () => {
            var toastObj =
document.getElementById('element').ej2_instances[0];
            toastObj.target = document.body;
            toastObj.show();
        }
    );

```

```

    }, 1000);
    document.getElementById("button").addEventListener('click', function ()
    {
        var toastObj = document.getElementById('element').ej2_instances[0];
        toastObj.show();
    });
    function beforeClose(args: ToastBeforeCloseArgs){
        if (args.type === "swipe") {
            args.cancel = true;
        }
    }
}
</script>

```

### CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        return View();
    }
}

```

## ToolBar

### Getting Started with ASP.NET MVC Toolbar Control

#### Prerequisites

#### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

### PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
```

### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

#### ~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

### Register Syncfusion script manager

Also, register the script manager **EJS().ScriptManager()** at the end of **<body>** in the **~/Pages/Shared/\_Layout.cshtml** file as follows.

#### ~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

### Add ASP.NET MVC Toolbar control

Now, add the Syncfusion ASP.NET MVC Toolbar control in **~/Views/Home/Index.cshtml** page.

#### CSHTML

```
@using Syncfusion.EJ2.Navigations;
@(Html.EJS().Toolbar("defaultToolbar")
.Width("600px")
.Items(new List<ToolBarItem> {
```

```

        new ToolbarItem { Text="Cut", PrefixIcon = "e-cut-icon tb-icons",
        TooltipText = "Cut" },
        new ToolbarItem { Text="Copy", PrefixIcon = "e-copy-icon tb-icons",
        TooltipText = "Copy" },
        new ToolbarItem { Text="Paste", PrefixIcon = "e-paste-icon tb-
icons", TooltipText = "Paste" },
        new ToolbarItem { Type = ItemType.Separator },
        new ToolbarItem { Text="Bold", PrefixIcon = "e-bold-icon tb-icons",
        TooltipText = "Bold" },
        new ToolbarItem { Text="Underline", PrefixIcon = "e-underline-icon
tb-icons", TooltipText = "Underline" },
        new ToolbarItem { Text="Italic", PrefixIcon = "e-italic-icon tb-
icons", TooltipText = "Italic" },
        new ToolbarItem { Text="Color Picker", PrefixIcon = "e-color-icon
tb-icons", TooltipText = "Color-Picker" }
    })
    .Render()
)

```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Toolbar control will be rendered in the default web browser.

Cut Copy Paste Bold Underline Italic Color Picker

### Render the Toolbar items using content template

You can bind any HTML elements or other controls in Toolbar items, by simply using the content template property in ASP.NET Toolbar.

In the below demo, the Toolbar items are given as [Button](#), [MaskedTextBox](#), [RadioButton](#), [DropDownList](#) using the content template. In the content template property of Toolbar, you can directly render these controls like below in the code.

### CSHTML

```

@using Syncfusion.EJ2.Navigations;
@using Syncfusion.EJ2.DropDowns;
@model List<string>
@ (Html.EJS().ToolBar("defaultToolbar")
    .ContentTemplate(
        @<div>
            <div>

<div>@Html.EJS().Button("btn").Content("Click").IsPrimary(true).Render() </di
v>

                <div class='separator'> </div>
                <div>@Html.EJS().MaskedTextBox("mask1").Mask("345-678-
4673").Render() </div>
                <div class='separator'> </div>
                <div>@Html.EJS().RadioButton("radio1").Label("Credit/Debit
Card").Name("payment").Value("credit/debit").Render() </div>
                <div class='separator'> </div>
                <div>
                    @Html.EJS().DropDownList("games").Placeholder("Select a
game").PopupHeight("220px").Index(2).DataSource(

```

```

        (IEnumerable<object>)Model).Fields(new
        DropDownListFieldSettings { Text = "Game", Value = "Id" }).Render()
    }
}
</div>
</div>
</div>
)
.Render()
)
<style>
    .separator {
        width: 10px;
    }
</style>

```

### HOMECONTROLLER.CS

```

public ActionResult Index()
{
    List<string> data = new List<string>() { "Badminton", "Basketball",
    "Cricket", "Football", "Golf", "Gymnastics", "Hockey", "Tennis" };
    return View(data);
}

```

**Note:** [View Sample in GitHub.](#)

- [How to add Toggle Button](#)

### Item Configuration in ASP.NET MVC Toolbar control

The Toolbar can be rendered by defining an array of items. Items can be constructed with the following built-in command types or item template.

#### Button

**Button** is the default command type, and it can be rendered by using the **text** property. Properties of the button command type:

| Property   | Description   |
|------------|---|
| text       | The text to be displayed for button.  |
| id         | The ID of the button to be rendered. If the ID is not given, auto ID is generated.  |
| prefixIcon | Defines the class used to specify an icon for the button. The icon is positioned before the text if text is available or the icon alone button is rendered.   |
| suffixIcon | Defines the class used to specify an icon for the button. The icon is positioned after the text if text is available. If both prefixIcon and suffixIcon are specified, only prefixIcon is considered. |

| width | Used to set the width of the button. |

### Separator

The **Separator** type adds a vertical separation between the Toolbar's single/multiple commands.

### CSHTML

```
@using Syncfusion.EJ2.Navigations;
<ejs-toolbar id="defaultToolbar">
  <e-toolbar-items>
    <e-toolbar-item text="Cut"></e-toolbar-item>
    <e-toolbar-item text="Copy"></e-toolbar-item>
    <e-toolbar-item type="Separator"></e-toolbar-item>
    <e-toolbar-item text="Paste"></e-toolbar-item>
    <e-toolbar-item type="Separator"></e-toolbar-item>
    <e-toolbar-item text="Undo"></e-toolbar-item>
    <e-toolbar-item text="Redo"></e-toolbar-item>
  </e-toolbar-items>
</ejs-toolbar>
```

### SEPARATOR.CS

```
public ActionResult Index()
{
    return View();
}
```

**Note:** If **Separator** is added as the first or the last item, it will not be visible.

### Input

The **Input** type is only applicable for adding **template** elements when the **template** property is defined as an **object**. Input type creates an **input element** internally that acts as the container for **Syncfusion** input based components.

Note: Set toolbar item **type** property value as **Input** only for Input components.

### NumericTextBox

- The **NumericTextBox** component can be included by importing the **NumericTextBox** module from ej2-inputs.
- Initialize the **NumericTextBox** in template property, where the Toolbar item type is set as **Input**.
- Related **NumericTextBox** component properties can also be configured as given below.

```
<ejs-numerictextbox format="n2"></ejs-numerictextbox>
```

,

### DropDownList

- The **DropDownList** component can be included by importing the **DropDownList** module from ej2-dropdowns.
- Initialize the **DropDownList** in template property, where the Toolbar item type is set as **Input**.

- Related **DropDownList** component properties can also be configured as given below.

```
<ejs-dropdownlist width="100"></ejs-dropdownlist>
```

,

### RadioButton

- The **RadioButton** component can be included by importing the **RadioButton** module from **ej2-buttons**.
- Initialize the **RadioButton** in template property, where the Toolbar item type is set as **Input**.
- Related **RadioButton** component properties can also be configured as given below.

```
<ejs-radiobutton label="Option 1" name="default"></ejs-radiobutton>
```

,

Output be like the below.

### Enabling tab key navigation in Toolbar

The **tabIndex** property of a Toolbar item is used to enable tab key navigation for the item. By default, the user can switch between items using the arrow keys, but the **tabIndex** property allows you to switch between items using the Tab and Shift+Tab keys as well.

To use the **tabIndex** property, you need to set it for each Toolbar item that you want to enable tab key navigation. The **tabIndex** property should be set to a positive integer value. A value of 0 or a negative value will disable tab key navigation for the item.

For example, to enable tab key navigation for two Toolbar items, you can use the following code:

```
@using Syncfusion.EJ2.Navigations;
```

```
<ejs-toolbar id="defaultToolbar">
```

```
<e-toolbar-items>
```

```
<e-toolbar-item text="Item 1" tabIndex = "1"></e-toolbar-item>
```

```
<e-toolbar-item text="Item 2" tabIndex = "2"></e-toolbar-item>
```

```
</e-toolbar-items>
```

```
</ejs-toolbar>
```

,

With the above code, the user can switch between the two Toolbar items using the Tab and Shift+Tab keys, in addition to using the arrow keys. The items will be navigated in the order specified by the **tabIndex** values.

If you set the **tabIndex** value to 0 for all Toolbar items, tab key navigation will be based on the element order rather than the **tabIndex** values. For example:

```
@using Syncfusion.EJ2.Navigations;

<ejs-toolbar id="defaultToolbar">
  <e-toolbar-items>
    <e-toolbar-item text="Item 1" tabIndex = "0"></e-toolbar-item>
    <e-toolbar-item text="Item 2" tabIndex = "0"></e-toolbar-item>
  </e-toolbar-items>
</ejs-toolbar>
```

In this case, the user can switch between the two Toolbar items using the Tab and Shift+Tab keys, and the items will be navigated in the order in which they appear in the DOM.

Example:

Here is an example of how you can use the `tabIndex` property to enable tab key navigation for a Toolbar component:

#### CSHTML

```
@using Syncfusion.EJ2.Navigations;
<ejs-toolbar id="defaultToolbar">
  <e-toolbar-items>
    <e-toolbar-item text="Cut" tabIndex = 0></e-toolbar-item>
    <e-toolbar-item text="Copy" tabIndex = 0></e-toolbar-item>
    <e-toolbar-item type="Separator" tabIndex = 0></e-toolbar-item>
    <e-toolbar-item text="Paste" tabIndex = 0></e-toolbar-item>
    <e-toolbar-item type="Separator" tabIndex = 0></e-toolbar-item>
    <e-toolbar-item text="Undo" tabIndex = 0></e-toolbar-item>
    <e-toolbar-item text="Redo" tabIndex = 0></e-toolbar-item>
  </e-toolbar-items>
</ejs-toolbar>
```

#### TABKEYNAVIGATION.CS

```
public ActionResult Index()
{
    return View();
}
```

With the above code, the user can switch between the Toolbar items using the Tab and Shift+Tab keys, and the items will be navigated based on the element order.

- [How to set item wise custom template](#)

#### Responsive Mode

This section explains the supported display modes of the Toolbar when the content exceeds the viewing area. Possible modes are:

- Scrollable
- Popup

### Scrollable

The default overflow mode of the Toolbar is **Scrollable**. Scrollable display mode supports display of commands in a single line with horizontal scrolling enabled when commands overflow to available space.

- The right and left navigation arrows are added to the start and end of the Toolbar to navigate to hidden commands.
- You can also see the hidden commands using touch swipe action.
- By default, if navigation icon in the **left** side is disabled, you can see the hidden commands by moving to the **right**.
- By clicking the arrow or by holding the arrow continuously, hidden commands will become visible.
- If device navigation icons are not available, you can touch swipe to see the hidden commands of the Toolbar.

- Once the Toolbar reaches the last or first command, the corresponding navigation icon will be disabled and you can move to the opposite direction.

- You can continuously scroll the Toolbar content by holding the navigation icon.

## CSHTML

```
@using Syncfusion.EJ2.Navigations;
<ejs-toolbar id="defaultToolbar" width="600">
    <e-toolbar-items>
        <e-toolbar-item type="Button" prefixIcon="e-cut-icon"
text="Cut"></e-toolbar-item>
        <e-toolbar-item type="Button" prefixIcon="e-copy-icon"
text="Copy"></e-toolbar-item>
        <e-toolbar-item type="Button" prefixIcon="e-paste-icon"
text="Paste"></e-toolbar-item>
        <e-toolbar-item type="Separator"></e-toolbar-item>
        <e-toolbar-item type="Button" prefixIcon="e-bold-icon"
text="Bold"></e-toolbar-item>
        <e-toolbar-item type="Button" prefixIcon="e-underline-icon"
text="Underline"></e-toolbar-item>
        <e-toolbar-item type="Button" prefixIcon="e-italic-icon"
text="Italic"></e-toolbar-item>
        <e-toolbar-item type="Button" prefixIcon="e-color-icon" text="Color-
Picker"></e-toolbar-item>
        <e-toolbar-item type="Separator"></e-toolbar-item>
        <e-toolbar-item type="Button" prefixIcon="e-ascending-icon" text="A-
Z Sort"></e-toolbar-item>
        <e-toolbar-item type="Button" prefixIcon="e-descending-icon"
text="Z-A Sort"></e-toolbar-item>
        <e-toolbar-item type="Button" prefixIcon="e-clear-icon"
text="Clear"></e-toolbar-item>
    </e-toolbar-items>
</ejs-toolbar>
<style>
    /* Toolbar Styles */
    .e-cut-icon:before {
        content: "\e604"
    }
    .e-copy-icon:before {
        content: "\e70a"
    }
    .e-paste-icon:before {
        content: "\e712"
    }
    .e-color-icon:before {
        content: "\e703";
    }
    .e-bold-icon:before {
        content: "\e339"
    }
    .e-underline-icon:before {
        content: "\e706";
    }
</style>
```

```
}
.e-alignleft-icon:before {
    content: "\e717"
}
.e-alignright-icon:before {
    content: "\e715"
}
.e-aligncenter-icon:before {
    content: "\e704"
}
.e-alignjustify-icon:before {
    content: "\e71b"
}
.e-upload-icon:before {
    content: "\e71e"
}
.e-download-icon:before {
    content: "\e70a"
}
.e-indent-icon:before {
    content: "\e70b"
}
.e-outdent-icon:before {
    content: "\e700"
}
.e-clear-icon:before {
    content: "\e70d"
}
.e-reload-icon:before {
    content: "\e71c"
}
.e-export-icon:before {
    content: "\e720";
}
.e-italic-icon:before {
    content: "\e710"
}
.e-bullets-icon:before {
    content: "\e711";
}
.e-numbering-icon:before {
    content: "\e70e";
}
.e-ascending-icon:before {
    content: "\e70f";
}
.e-descending-icon:before {
    content: "\e707";
}
}
</style>
```

### SCROLLABLE.CS

```
public ActionResult Index()
{
    return View();
}
```

```
}

```

### Popup

**Popup** is another type of **overflowMode** in which the Toolbar container holds the commands that can be placed in the available space. The rest of the overflowing commands that do not fit within the viewing area moves to the overflow popup container.

The commands placed in the popup can be viewed by opening the popup using the drop down icon given at the end of the Toolbar.

**Note:** If the popup content overflows the height of the page, then the rest of the commands will be hidden.

### Priority of commands

Default popup priority is set as **none**, and when the commands of the Toolbar overflow, the ones listed last will be moved to the popup.

You can customize the priority of commands to be displayed on the Toolbar and popup by using the **Overflow** property.

| Property | Description  |
|----------|--|
| Both     | Button text is visible in both <b>Toolbar</b> and <b>Popup</b> . |
| Overflow | Button text is only visible in <b>Popup</b> .                    |
| Toolbar  | Button text is only visible on the <b>Toolbar</b> .              |

In the following code sample, text is only visible in the popup container and not in the Toolbar container.

### CSHTML

```
@using Syncfusion.EJ2.Navigations;
<ejs-toolbar id="defaultToolbar" items="ViewBag.popItems" width="330"
overflowMode="Popup"></ejs-toolbar>
<style>
    /* Toolbar Styles */
    .e-cut-icon:before {
        content: "\e604"
    }
    .e-copy-icon:before {
```

```
        content: "\e70a"
    }
    .e-paste-icon:before {
        content: "\e712"
    }
    .e-color-icon:before {
        content: "\e703";
    }
    .e-bold-icon:before {
        content: "\e339"
    }
    .e-underline-icon:before {
        content: "\e706";
    }
    .e-alignleft-icon:before {
        content: "\e717"
    }
    .e-alignright-icon:before {
        content: "\e715"
    }
    .e-aligncenter-icon:before {
        content: "\e704"
    }
    .e-alignjustify-icon:before {
        content: "\e71b"
    }
    .e-upload-icon:before {
        content: "\e71e"
    }
    .e-download-icon:before {
        content: "\e70a"
    }
    .e-indent-icon:before {
        content: "\e70b"
    }
    .e-outdent-icon:before {
        content: "\e700"
    }
    .e-clear-icon:before {
        content: "\e70d"
    }
    .e-reload-icon:before {
        content: "\e71c"
    }
    .e-export-icon:before {
        content: "\e720";
    }
    .e-italic-icon:before {
        content: "\e710"
    }
    .e-bullets-icon:before {
        content: "\e711";
    }
    .e-numbering-icon:before {
        content: "\e70e";
    }
    .e-ascending-icon:before {
```

```

        content: "\e70f";
    }
    .e-descending-icon:before {
        content: "\e707";
    }
</style>

```

### TEXTBUTTON.CS

```

public ActionResult Index()
{
    List<ToolBarItem> popItems = new List<ToolBarItem>();
    popItems.Add(new ToolBarItem { PrefixIcon = "e-cut-icon", Text = "Cut",
    ShowTextOn = DisplayMode.Overflow, Overflow = OverflowOption.Show });
    popItems.Add(new ToolBarItem { PrefixIcon = "e-copy-icon", Text =
    "Copy", ShowTextOn = DisplayMode.Overflow, Overflow = OverflowOption.Show
    });
    popItems.Add(new ToolBarItem { PrefixIcon = "e-paste-icon", Text =
    "Paste", ShowTextOn = DisplayMode.Overflow, Overflow = OverflowOption.Show
    });
    popItems.Add(new ToolBarItem { Type = ItemType.Separator });
    popItems.Add(new ToolBarItem { PrefixIcon = "e-bold-icon", Text =
    "Bold", ShowTextOn = DisplayMode.Overflow, Overflow = OverflowOption.Show
    });
    popItems.Add(new ToolBarItem { PrefixIcon = "e-underline-icon", Text =
    "Underline", ShowTextOn = DisplayMode.Overflow, Overflow =
    OverflowOption.Show });
    popItems.Add(new ToolBarItem { PrefixIcon = "e-italic-icon", Text =
    "Italic", ShowTextOn = DisplayMode.Overflow, Overflow = OverflowOption.Show
    });
    popItems.Add(new ToolBarItem { PrefixIcon = "e-color-icon", Text =
    "Color-Picker", ShowTextOn = DisplayMode.Overflow, Overflow =
    OverflowOption.Show });
    popItems.Add(new ToolBarItem { Type = ItemType.Separator });
    popItems.Add(new ToolBarItem { PrefixIcon = "e-ascending-icon", Text =
    "A-Z Sort", ShowTextOn = DisplayMode.Overflow, Overflow =
    OverflowOption.Show });
    popItems.Add(new ToolBarItem { PrefixIcon = "e-descending-icon", Text =
    "Z-A Sort", ShowTextOn = DisplayMode.Overflow, Overflow =
    OverflowOption.Show });
    popItems.Add(new ToolBarItem { PrefixIcon = "e-clear-icon", Text =
    "Clear", ShowTextOn = DisplayMode.Overflow, Overflow = OverflowOption.Show
    });
    ViewBag.popItems = popItems;
    return View();
}

```

### Template Configuration

The Toolbar can be rendered by item based collection and by HTML elements. To render it based on the given HTML element, use `id` as the `target` property. To render the Toolbar, follow the below structure of the HTML elements:

```
`html
```

```
<div id='template_toolbar'> --> Root Toolbar Element
```

```
<div> --> Toolbar Items Container
```

```
<div> --> Toolbar Item Element
```

```
</div>
```

```
</div>
```

```
</div>
```

```
,
```

Here, the template ID, `#template_toolbar` is directly appended to the Toolbar.

### CSHTML

```
<div id='template_toolbar'>
  <div>
    <div><button class='e-btn e-tbar-btn'>Cut</button> </div>
    <div><button class='e-btn e-tbar-btn'>Copy</button> </div>
    <div><button class='e-btn e-tbar-btn'>Paste</button> </div>
    <div class='e-separator'> </div>
    <div><button class='e-btn e-tbar-btn'>Bold</button> </div>
    <div><button class='e-btn e-tbar-btn'>Italic</button> </div>
  </div>
</div>
<script type="text/javascript">
  var toolbarObj = new ej.navigations.Toolbar({ });
  toolbarObj.appendTo('#template_toolbar');
</script>
```

### TEMPLATE.CS

```
public ActionResult Index()
{
    return View();
}
```

### Popup customization

Popup is one of the supported responsive modes of the Toolbar. The Toolbar commands, popup mode priority and button text mode customizations are achieved in the item based rendering through property declaration. For more information on popup mode, refer [here](#)

The above behavior can also be achieved with template rendering by defining equivalent class names instead of property declaration.

Equivalent class names listed below are needed to add the Toolbar items' `div` element.

#### Priority

| Class          | Description   |
|----------------|---|
| e-popup-text   | Button text is only visible in the <b>Popup</b> .   |
| e-toolbar-text | Button text is only visible on the <b>Toolbar</b> . |

### CSHTML

```
<div id='template_toolbar'>
```

```

    <div>
      <div class='e-overflow-show e-popup-text'><button class='e-btn e-
tbar-btn'><span class="e-cut-icon e-icons e-btn-icon"></span><div class="e-
tbar-btn-text">Cut</div></button> </div>
      <div class='e-overflow-show e-popup-text'><button class='e-btn e-
tbar-btn'><span class="e-copy-icon e-icons e-btn-icon"></span><div class="e-
tbar-btn-text">Copy</div></button> </div>
      <div class='e-overflow-show e-popup-text'><button class='e-btn e-
tbar-btn'><span class="e-paste-icon e-icons e-btn-icon"></span><div
class="e-tbar-btn-text">Paste</div></button> </div>
      <div class='e-separator'> </div>
      <div class='e-overflow-show e-popup-text'><button class='e-btn e-
tbar-btn'><span class="e-bold-icon e-icons e-btn-icon"></span><div class="e-
tbar-btn-text">Bold</div></button> </div>
      <div class='e-overflow-hide e-popup-text'><button class='e-btn e-
tbar-btn'><span class="e-underline-icon e-icons e-btn-icon"></span><div
class="e-tbar-btn-text">Underline</div></button> </div>
      <div class='e-overflow-show e-popup-text'><button class='e-btn e-
tbar-btn'><span class="e-italic-icon e-icons e-btn-icon"></span><div
class="e-tbar-btn-text">Italic</div></button> </div>
      <div class='e-overflow-show e-popup-text'><button class='e-btn e-
tbar-btn'><span class="e-ascending-icon e-icons e-btn-icon"></span><div
class="e-tbar-btn-text">A-Z Sort</div></button> </div>
      <div class='e-overflow-show e-popup-text'><button class='e-btn e-
tbar-btn'><span class="e-descending-icon e-icons e-btn-icon"></span><div
class="e-tbar-btn-text">Z-A Sort</div></button> </div>
    </div>
  </div>
<style>
  /* Toolbar Styles */
  .e-cut-icon:before {
    content: "\e604"
  }
  .e-copy-icon:before {
    content: "\e70a"
  }
  .e-paste-icon:before {
    content: "\e712"
  }
  .e-color-icon:before {
    content: "\e703";
  }
  .e-bold-icon:before {
    content: "\e339"
  }
  .e-underline-icon:before {
    content: "\e706";
  }
  .e-alignleft-icon:before {
    content: "\e717"
  }
  .e-alignright-icon:before {
    content: "\e715"
  }
  .e-aligncenter-icon:before {
    content: "\e704"
  }
}

```

```
.e-alignjustify-icon:before {
    content: "\e71b"
}
.e-upload-icon:before {
    content: "\e71e"
}
.e-download-icon:before {
    content: "\e70a"
}
.e-indent-icon:before {
    content: "\e70b"
}
.e-outdent-icon:before {
    content: "\e700"
}
.e-clear-icon:before {
    content: "\e70d"
}
.e-reload-icon:before {
    content: "\e71c"
}
.e-export-icon:before {
    content: "\e720";
}
.e-italic-icon:before {
    content: "\e710"
}
.e-bullets-icon:before {
    content: "\e711";
}
.e-numbering-icon:before {
    content: "\e70e";
}
.e-ascending-icon:before {
    content: "\e70f";
}
.e-descending-icon:before {
    content: "\e707";
}
}
</style>
<script type="text/javascript">
    var toolbarObj = new ej.navigations.Toolbar({ width: 300, overflowMode:
    "Popup" });
    toolbarObj.appendTo('#template_toolbar');
</script>
```

### **BUTTONTEXT.CS**

```
public ActionResult Index()
{
    return View();
}
```

### Integrate menu component

You can integrate menu component as toolbar item in Toolbar using content template property. Menu can be populated with items as needed.

#### CSHTML

```
@{
    List<object> menuItems = new List<object>();
    menuItems.Add(new
    {
        text = "Appliances",
        items = new List<object>()
        {
            new {
                text= "Kitchen",
                items = new List<object>()
                {
                    new { text= "Electric Cookers" },
                    new { text= "Coffee Makers" },
                    new { text= "Blenders" },
                    new { text= "Microwave Ovens" }
                }
            },
            new {
                text= "Television",
                items = new List<object>()
                {
                    new { text= "Our Exclusive TVs" },
                    new { text= "Smart TVs" },
                    new { text= "Big Screen TVs" }
                }
            },
            new { text= "Washing Machine" },
            new {
                text= "Refrigerators",
                items = new List<object>()
                {
                    new { text= "Inverter ACs" },
                    new { text= "Split ACs" },
                    new { text= "Window ACs" }
                }
            },
            new { text= "Air Conditioners" },
            new { text= "Water Purifiers" },
            new { text= "Air Purifiers" },
            new { text= "Chimneys" },
            new { text= "Inverters" },
            new { text= "Healthy Living" },
            new { text= "Vacuum Cleaners" },
            new { text= "Room Heaters" },
            new { text= "New Launches" }
        }
    });
    menuItems.Add(new
    {
        text = "Accessories",
        items = new List<object>()
```

```

        {
            new {
                text= "Mobile",
                items = new List<object>()
                {
                    new { text= "Headphones" },
                    new { text= "Batteries" },
                    new { text= "Memory Cards" },
                    new { text= "Power Banks" },
                    new { text= "Mobile Cases" },
                    new { text= "Screen Protectors" },
                    new { text= "Data Cables" },
                    new { text= "Chargers" },
                    new { text= "Selfie Sticks" },
                    new { text= "OTG Cable" }
                }
            },
            new { text= "Laptops" },
            new {
                text= "Desktop PC",
                items = new List<object>()
                {
                    new { text= "Pendrives" },
                    new { text= "External Hard Disks" },
                    new { text= "Monitors" },
                    new { text= "Keyboards" }
                }
            },
            new {
                text= "Camera",
                items = new List<object>()
                {
                    new { text= "Lens" },
                    new { text= "Tripods" }
                }
            }
        }
    });
    menuItems.Add(new
    {
        text = "Fashion",
        items = new List<object>()
        {
            new { text = "Men" },
            new { text = "Women" }
        }
    });
    menuItems.Add(new
    {
        text = "Home & Living",
        items = new List<object>()
        {
            new { text= "Furniture" },
            new { text= "Decor" },
            new { text= "Smart Home Automation" },
            new { text= "Dining & Serving" }
        }
    }

```

```

    });
    menuItems.Add(new
    {
        text = "Entertainment",
        items = new List<object>()
        {
            new { text= "Televisions" },
            new { text= "Home Theatres" },
            new { text= "Gaming Laptops" }
        }
    });
    menuItems.Add(new
    {
        text = "Contact Us",
    });
    menuItems.Add(new
    {
        text = "Help",
    });
}

    </e-toolbar-items>
</ejs-toolbar>

```

### MENUCOMPONENT.CS

```

public ActionResult Index()
{
    return View();
}

```

### Accessibility in ASP.NET MVC Toolbar control

The Toolbar control has been designed, keeping in mind the [WAI-ARIA](#) specifications, and applying the WAI-ARIA roles, states, and properties along with keyboard support for people who use assistive devices. WAI-ARIA accessibility support is achieved through attributes like `aria-label`, and `aria-orientation`. It provides information about elements in a document for assistive technology. The control implements keyboard navigation support by following the [WAI-ARIA practices](#), and has been tested in major screen readers.

The accessibility compliance for the Toolbar control is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the control meet the requirement.</div>

<div> - Some features of the control do not meet the requirement.</div>

<div> - The control does not meet the requirement.</div>

#### ARIA attributes

ToolBar control is designed by considering [WAI-ARIA](#) standard. Toolbar is supported with ARIA Accessibility which is accessible by on-screen readers, and other assistive technology devices. The following list of attributes are added in the Toolbar.

| **Property** | **Functionalities** |

| --- | --- |

| role="toolbar" | Attribute is set to the ToolBar element describes the actual role of the element. |

| **aria-orientation** | Attribute is set to the ToolBar element to indicates the ToolBar orientation. Default value is **horizontal**. |

| **aria-label** | Attribute is set to ToolBar element describes the purpose of the set of toolbar. |

| **aria-expanded** | Attribute is set to the ToolBar Popup element to indicates the expanded state of the popup. |

| **aria-haspopup** | Attribute is set to the popup element to indicates the popup mode of the Toolbar. Default value is false. When popup mode is enabled, attribute value has to be changed to **true**. |

| **aria-disabled** | Attribute set to the ToolBar element to indicates the disabled state of the Toolbar. |

### Keyboard interaction

Keyboard navigation is enabled by default. Possible keys are

| Key         | Description   |
|-------------|---|
| -----       | -----   |
| Left        | Focuses the previous element.   |
| Right       | Focuses the next element.   |
| Enter       | When focused on a ToolBar command, clicking the key triggers the click of Toolbar element. When popup drop-down icon is focused, the popup opens. |
| Esc(Escape) | Closes popup.   |
| Down        | Focuses the next popup element.   |
| Up          | Focuses the previous popup element.   |
| Home        | Moves focus to the first Toolbar.   |
| End         | Moves focus to the last Toolbar.  |
| Tab         | To Move focus through the interactive elements.   |
| Shift + Tab | To Move focus through the interactive elements.   |

### Ensuring accessibility

The Toolbar control accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Toolbar control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Toolbar control with accessibility tools.

### CSS Structure in ASP.NET MVC Toolbar Component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on user preference.

### Customizing Toolbar

Use the following CSS to customize the Toolbar.

```
`CSS
```

```
.e-toolbar {  
border: 5px solid rgb(173, 255, 47);  
}  
`
```

#### Customizing the Toolbar items

Use the following CSS to customize the items of Toolbar.

```
`CSS
```

```
.e-toolbar .e-toolbar-item {  
background: #add8e6;  
border: 1px solid #5a70cc;  
}  
`
```

Use the following CSS to customize the button in the items of Toolbar.

```
`CSS
```

```
.e-toolbar .e-tbar-btn {  
background: #add8e6;  
border: 1px solid #5a70cc;  
}  
`
```

#### Customizing Toolbar's item icon

Use the following CSS to customize the item icon of Toolbar control.

```
`CSS
```

```
.e-toolbar .e-tbar-btn .e-icons {  
background: #185655;  
color: #d7f9d4;  
}  
`
```

#### Customizing the hover state of Toolbar control

Use the following CSS to customize the toolbar item when hovering.

```
`CSS
```

```
.e-toolbar .e-tbar-btn:hover {  
background: #c0e3a1;  
border: 1px solid green;  
}
```

```
}
,
```

### Customizing selected item of Toolbar control

Use the following CSS to customize the selected toolbar item.

`CSS

```
.e-toolbar .e-tbar-btn:focus {
background: #add8e6;
border: 1px solid #5a70cc;
}
```

,

### How To

#### Set command customization

The `htmlAttributes` property of the Toolbar item is used to set the HTML attributes ('ID', 'class', 'style', 'role') for the commands.

When style attributes are added, if the same attributes were already present, they will be replaced. This is not so in the case of `class` attribute. Classes will be added to the element instead of replacing the existing ones.

Single or multiple CSS classes can be added to the Toolbar commands using the Toolbar item `cssClass` property.

#### CSHTML

```
<ejs-toolbar id="defaultToolbar" items="ViewBag.Items">
</ejs-toolbar>
```

#### CUSTOMIZATION.CS

```
public ActionResult Index()
{
    List<ToolBarItem> items = new List<ToolBarItem>();
    items.Add(new ToolBarItem { Text = "Bold", Type = ItemType.Button ,
HtmlAttributes = new HtmlAttributes { Class = "custom_bold", Id = "itemId" }
});
    items.Add(new ToolBarItem { Text = "Italic", HtmlAttributes = new
HtmlAttributes { Class = "custom_italic" } });
    items.Add(new ToolBarItem { Text = "Underline", HtmlAttributes = new
HtmlAttributes { Class = "custom_underline" } });
    items.Add(new ToolBarItem { Type = ItemType.Separator });
    items.Add(new ToolBarItem { Text = "Uppercase", CssClass = "e-txt-
casing" });
    ViewBag.Items = items;
    return View();
}
public class HtmlAttributes
{
    public string Class { get; set; }
    public string Id { get; set; }
```

```
}
```

Output be like the below.

Set [Essential JS 2 Tooltip](#) to the commands

The `tooltipText` property of the `ToolBar` item is used to set the HTML Tooltip to the commands that can be viewed as hint texts on mouse hover.

Initialize the Tooltip with the `ToolBar` target. Refer to the following code example:

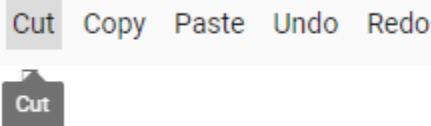

#### CSHTML

```
<ejs-toolbar id="defaultToolBar" width="300">
  <e-toolbar-items>
    <e-toolbar-item type="Button" text="Cut" tooltipText='Cut'></e-
toolbar-item>
    <e-toolbar-item type="Button" text="Copy" tooltipText='Copy'></e-
toolbar-item>
    <e-toolbar-item type="Button" text="Paste" tooltipText='Paste'></e-
toolbar-item>
    <e-toolbar-item type="Button" text="Undo" tooltipText='Undo'></e-
toolbar-item>
    <e-toolbar-item type="Button" text="Redo" tooltipText='Redo'></e-
toolbar-item>
  </e-toolbar-items>
</ejs-toolbar>
```

#### TOOLTIP.CS

```
public ActionResult Index()
{
    return View();
}
```

Output be like the below.

Set [item-wise custom template](#)

The `ToolBar` supports adding template commands using the `template` property. Template property can be given as the `HTML` element that is either a `string` or a `query selector`.

### As a string

The HTML element tag can be given as a string for the template property. Here, the checkbox is rendered as a HTML template.

template: "<div><input type='checkbox' id='check1' checked=''>Accept</input></div>"

,

### As a selector

The template property also allows getting template content through query selector. Here, checkbox 'ID' attribute is specified in the template.

template: "#Template"

,

## CSHTML

```
@using Syncfusion.EJ2.Navigations;
@{
    var content = "<div><input type='checkbox' id='check1'
checked=''>Accept</input></div>";
}
<div>
    <div>
        <ejs-toolbar id="defaultToolbar" width="330">
            <e-toolbar-items>
                <e-toolbar-item text="Cut"></e-toolbar-item>
                <e-toolbar-item type="Separator"></e-toolbar-item>
                <e-toolbar-item text="Paste"></e-toolbar-item>
                <e-toolbar-item type="Separator"></e-toolbar-item>
                <e-toolbar-item template=content></e-toolbar-item>
                <e-toolbar-item text="Undo"></e-toolbar-item>
                <e-toolbar-item text="Redo"></e-toolbar-item>
                <e-toolbar-item template="#Template"></e-toolbar-item>
            </e-toolbar-items>
        </ejs-toolbar>
    </div>
    <button id='Template' class='e-btn'>Template</button>
</div>
```

## SELECTOR.CS

```
public ActionResult Index()
{
    return View();
}
```

### Add Toggle Button in ToolBar Control

ToolBar supports to add a toggle Button by using the template property. Refer below steps

- By using Toolbar template property, pass required HTML String to render toggle button.

template='<button class="e-btn" id="media\_btn"></button>'

- Now render the toggle Button into the targeted element in Toolbar created event handler and bind click event for it. On clicking the toggle Button, change the required icon and content based on current active state.

### CSHTML

```
@using Syncfusion.EJ2.Navigations;
@{
    var content1 = "<button class='e-btn' id='media_btn'></button>";
    var content2 = "<button class='e-btn' id='zoom_btn'></button>";
    var content3 = "<button class='e-btn' id='undo_btn'></button>";
    var content4 = "<button class='e-btn' id='filter_btn'></button>";
    var content5 = "<button class='e-btn' id='visible_btn'></button>";
}
<ejs-toolbar id="defaultToolbar" created="created">
    <e-toolbar-items>
        <e-toolbar-item template=content1></e-toolbar-item>
        <e-toolbar-item type="Separator"></e-toolbar-item>
        <e-toolbar-item template=content2></e-toolbar-item>
        <e-toolbar-item type="Separator"></e-toolbar-item>
        <e-toolbar-item template=content3></e-toolbar-item>
        <e-toolbar-item type="Separator"></e-toolbar-item>
        <e-toolbar-item template=content4></e-toolbar-item>
        <e-toolbar-item type="Separator"></e-toolbar-item>
        <e-toolbar-item template=content5></e-toolbar-item>
    </e-toolbar-items>
</ejs-toolbar>
<script type="text/javascript">
    function created() {
        zoomBtn = new ej.buttons.Button({ cssClass: `e-flat`, iconCss: 'e-
icons e-zoomin-icon', isToggle: true });
        zoomBtn.appendTo('#zoom_btn');
        mediaBtn = new ej.buttons.Button({ cssClass: `e-flat`, iconCss: 'e-
icons e-play-icon', isToggle: true });
        mediaBtn.appendTo('#media_btn');
        undoBtn = new ej.buttons.Button({ cssClass: `e-flat`, iconCss: 'e-
icons e-undo-icon', isToggle: true });
        undoBtn.appendTo('#undo_btn');
        filterBtn = new ej.buttons.Button({ cssClass: `e-flat`, iconCss:
'e-icons e-filter-icon', isToggle: true });
        filterBtn.appendTo('#filter_btn');
        visibleBtn = new ej.buttons.Button({ cssClass: `e-flat`, iconCss:
'e-icons e-hide-icon', isToggle: true, content: 'Hide' });
        visibleBtn.appendTo('#visible_btn');
        document.getElementById('zoom_btn').onclick = () => {
            if (document.getElementById('zoom_btn').classList.contains('e-
active')) {
                zoomBtn.iconCss = 'e-icons e-zoomout-icon';
            } else {
                zoomBtn.iconCss = 'e-icons e-zoomin-icon';
            }
        };
        document.getElementById('media_btn').onclick = () => {
```

```

        if (document.getElementById('media_btn').classList.contains('e-
active')) {
            mediaBtn.iconCss = 'e-icons e-pause-icon';
        } else {
            mediaBtn.iconCss = 'e-icons e-play-icon';
        }
    };
    document.getElementById('undo_btn').onclick = () => {
        if (document.getElementById('undo_btn').classList.contains('e-
active')) {
            undoBtn.iconCss = 'e-icons e-redo-icon';
        } else {
            undoBtn.iconCss = 'e-icons e-undo-icon';
        }
    };
    document.getElementById('filter_btn').onclick = () => {
        if
(document.getElementById('filter_btn').classList.contains('e-active')) {
            filterBtn.iconCss = 'e-icons e-filternone-icon';
        } else {
            filterBtn.iconCss = 'e-icons e-filter-icon';
        }
    };
    document.getElementById('visible_btn').onclick = () => {
        if
(document.getElementById('visible_btn').classList.contains('e-active')) {
            document.getElementById('content').style.display = 'none';
            visibleBtn.content = 'Show';
            visibleBtn.iconCss = 'e-icons e-show-icon';
        } else {
            document.getElementById('content').style.display = 'block';
            visibleBtn.content = 'Hide';
            visibleBtn.iconCss = 'e-icons e-hide-icon';
        }
    };
    };
}
</script>
<style>
    #container {
        visibility: hidden;
    }
    #loader {
        color: #008cff;
        height: 40px;
        left: 45%;
        position: absolute;
        top: 45%;
        width: 30%;
    }
    .e-hide-icon::before {
        content: '\e81d';
    }
    .e-show-icon::before {
        content: '\e7cb';
    }
    .e-filter-icon::before {
        content: '\e818';
    }

```

```

    }
    .e-filternone-icon::before {
        content: '\e819';
    }
    .e-undo-icon::before {
        content: '\e76e';
    }
    .e-redo-icon::before {
        content: '\e726';
    }
    .e-play-icon::before {
        content: '\e798';
    }
    .e-pause-icon::before {
        content: '\e753';
    }
    .e-zoomin-icon::before {
        content: '\e7b7';
    }
    .e-zoomout-icon::before {
        content: '\e81c';
    }
}
</style>

```

### TOGGLEBUTTON.CS

```

public ActionResult Index()
{
    return View();
}

```

### How to customize toolbar scrollStep

ToolBar supports to customize the scrolling distance when you click the left and right side navigation icons. we can customize `ScrollStep` property for scrolling distance. Refer to the following code example.

By using Toolbar scrollStep property, pass a required value to customize toolbar scrollStep.

### CSHTML

```

@using Syncfusion.EJ2.Navigations;
<ejs-toolbar id="defaultToolbar" width="600" scrollStep="50" >
    <e-toolbar-items>
        <e-toolbar-item prefixIcon="e-cut-icon tb-icons"
        tooltipText="Cut"></e-toolbar-item>
        <e-toolbar-item prefixIcon="e-copy-icon tb-icons"
        tooltipText="Copy"></e-toolbar-item>
        <e-toolbar-item prefixIcon="e-paste-icon tb-icons"
        tooltipText="Paste"></e-toolbar-item>
        <e-toolbar-item type="Separator"></e-toolbar-item>
        <e-toolbar-item prefixIcon="e-bold-icon tb-icons"
        tooltipText="Bold"></e-toolbar-item>
        <e-toolbar-item prefixIcon="e-underline-icon tb-icons"
        tooltipText="Underline"></e-toolbar-item>
        <e-toolbar-item prefixIcon="e-italic-icon tb-icons"
        tooltipText="Italic"></e-toolbar-item>
    </e-toolbar-items>
</ejs-toolbar>

```

```

    <e-toolbar-item prefixIcon="e-color-icon tb-icons"
tooltipText="Color-Picker"></e-toolbar-item>

{  
    return View();  
}
```

## ToolTip

### Getting Started with ASP.NET MVC ToolTip Control

#### Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add ASP.NET MVC controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

### PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](https://nuget.org). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

```
<namespaces>
```

```
<add namespace="Syncfusion.EJ2"/>
```

```
</namespaces>
```

,

### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the `<head>` of `~/Pages/Shared/_Layout.cshtml` file as follows,

#### ~/ \_LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

### Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

#### ~/ \_LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

### Add ASP.NET MVC Tooltip control

Now, add the Syncfusion ASP.NET MVC Tooltip control in `~/Views/Home/Index.cshtml` page.

#### CSHTML

```
@Html.EJS().Tooltip("Tooltip").Content("Lets go green & Save Earth
!!!").ContentTemplate(@<span id='target'>Show Tooltip</span>).Render()
```

Press **Ctrl+F5** (Windows) or **⌘+F5** (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Tooltip control will be rendered in the default web browser.

Lets go green & Save Earth !!!

Show Tooltip

### Initialize Tooltip within a container

You can create Tooltips on multiple targets within a container. To do so, you have to define specific target elements to the [Target](#) property so that the Tooltip is initialized only on matched targets within a container. In this case, the Tooltip content is assigned from the `title` attribute of the target element.

Refer to the following code example to create a Tooltip on multiple targets within a container.

#### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Popups
@Html.EJS().Tooltip("Tooltip").Target(".e-info").Position(Syncfusion.EJ2.Popups.Position.RightCenter).ContentTemplate(
@<form id="details" role="form">
    <table>
        <tr>
            <td class="info"> User Name:</td>
            <td> <input type="text" class="e-info"
name="firstname" title="Please enter your name"> </td>
        </tr>
        <tr>
            <td class="info"> Email Address:</td>
            <td> <input type="text" class="e-info"
name="email" title="Enter a valid email address"></td>
        </tr>
        <tr>
            <td class="info"> Password:</td>
            <td> <input type="password" class="e-info"
name="password" title="Be at least 8 characters length"></td>
        </tr>
        <tr>
            <td class="info"> Confirm Password:</td>
            <td> <input type="password" class="e-info"
name="Cpwd" title="Re-enter your password"></td>
        </tr>
    </table>
    <input id="sample" type="submit" value="Submit">
    <input id="clear" type="reset" value="Reset">
</form>).Render()

<style>
    #container {
        visibility: hidden;
    }
    #loader {
        color: #008cff;
        height: 40px;
        left: 45%;
        position: absolute;
        top: 45%;
        width: 30%;
    }
    #details table th, #details table td {
        padding: 15px;
        text-align: left;
    }
    #details .info {
        font-weight: bold;
```

```

}

</style>

```

User Name  Please enter your name

Email Address

Password

Confirm Password

**Note:** In the above sample, `#details` refers to the container's id, and the target `.e-info` refers to the target elements available within that container.

**Note:** [View Sample in GitHub.](#)

- [Positioning Tooltip](#)
- [Tooltip Open Mode](#)
- [Customize the Tooltip](#)

## Setting Dimension in Tooltip Control

### Height and width

The Tooltip can either be assigned auto height and width values or specific pixel values. The `width` and `height` properties are used to set the outer dimension of the Tooltip element. The default value for both the properties is `auto`. It also accepts string and number values in pixels.

The following sample explains how to set dimensions for the Tooltip.

### CSHTML

```

<ejs-tooltip id="tooltip" height="40px" width="150px" content="Tooltip
with specific width and height">
  <e-content-template>
    <span id='target'>Show Tooltip</span>
  </e-content-template>
</ejs-tooltip>
<style>
#tooltip {
  position: absolute;
  left: calc( 50% - 60px);
  top: 38%;
}
</style>

```

**HEIGHT-WIDTH.CS**

```
public ActionResult Dimension()
{
    return View();
}
```

Output be like the below.

*Scroll mode*

When **height** is specified with a certain pixel value and the Tooltip content overflows, the scrolling mode gets enabled.

**CSHTML**

```
<ejs-tooltip id="tooltip" height="60px" width="300px" isSticky="true"
target="#target" content="<div><b>Environmentally friendly</b> or
environment-friendly, (also referred to as eco-friendly, nature-friendly,
and green) are marketing and sustainability terms referring to goods and
services, laws, guidelines and policies that inflict reduced, minimal, or no
harm upon ecosystems or the environment.</div>">
    <e-content-template>
        <div id='container'>
            <p>
                A green home is a type of house designed to be
                <a id="target">
                    <u>environmentally friendly</u>
                </a> and sustainable. And also focuses on the efficient
                use of "energy, water, and building materials." As green homes
                have become more prevalent we have also seen the
                emergence of green affordable housing.
            </p>
        </div>
    </e-content-template>
</ejs-tooltip>
<style>
#tooltip {
    position: absolute;
    left: calc( 50% - 60px);
    top: 38%;
}
</style>
```

**SCROLL-MODE.CS**

```
public ActionResult Dimension()
```

```
{
    return View();
}
```

Output be like the below.

**Note:** The scrolling mode can best be seen when the sticky mode of the Tooltip is enabled. To enable sticky mode, set the `isSticky` property to true.

### Content in Tooltip Control

A text or a piece of information assigned to the Tooltip's `content` property will be displayed as the main text stream of the Tooltip. It can be a string or a template content. If the `content` property is not provided with any specific value, then it takes the value assigned to the `title` attribute of the target element on which the Tooltip was initialized. The content can also dynamically be assigned to the Tooltip via Fetch.

#### Template content

Any text or image can be added to the Tooltip, by default. To customize the Tooltip layout or to create your own visualized element on the Tooltip, template can be used.

Refer to the following code example to add formatted HTML content to the Tooltip.

#### CSHTML

```
<ejs-tooltip id="tooltipContent" target="#target"
content="<div><p><strong>Environmentally friendly</strong> or
<strong>environment-friendly</strong>, <i>(also referred to as eco-friendly,
nature-friendly, and green)</i> are marketing and sustainability terms
referring to goods and services, laws, guidelines and policies that inflict
reduced, minimal, or no harm upon ecosystems or the environment.</p></div>">
    <e-content-template>
        <div id='container'>
            <p>
                A green home is a type of house designed to be
                <a id="target">
                    <u>environmentally friendly</u>
                </a> and sustainable. And also focuses on the efficient
                use of "energy, water, and building materials." As green homes
                have become more prevalent we have also seen the
                emergence of green affordable housing.
            </p>
        </div>
    </e-content-template>
</ejs-tooltip>
```

#### TEMPLATE.CS

```
public ActionResult Template()
{
    return View();
}
```

```
}

```

Output be like the below.

A green home is a type of house designed to be environmentally friendly and sustainable. And also focuses on the efficient use of "energy, water and building materials". As green houses have become more prevalent we have also seen th

Environmentally friendly or environment-friendly, (also referred to as eco-friendly, nature-friendly, and green) are marketing and sustainability terms referring to goods and services, laws, guidelines and policies that inflict reduced, minimal, or no harm upon ecosystems or the environment.

### Dynamic content via Fetch

The Tooltip content can be dynamically loaded by making use of the Fetch call. The Fetch request is usually made within the `beforeRender` event of the Tooltip, and then the Tooltip's `content` is assigned the value retrieved on it's success.

**Note:** The Tooltip **target** property includes a unique identifier used to associate Tooltips with specific elements on a webpage or application interface. When setting the Tooltip **target** value as a GUID (Globally Unique Identifier), it's important to note that the GUID must start with a combination of **letters** before the numeric portion of the GUID. For example, **target: '# + ' tooltip'+ '96ad88bd-294c-47c3-999b-a9daa3285a05'**.

### CSHTML

```
<div id='container'>
    <h4 class="list-header">National Sports</h4>
    <!-- Tooltip element rendering for AjaxContent loading -->
    <ejs-tooltip id="Tooltip" content="Loading..."
beforeRender="onBeforeRender" target="#countrylist [title]"
showTipPointer="true" position="RightCenter">
        <e-content-template>
            <!-- ListView element -->

}
</style>

```

### AJAXCONTENT.CS

```

public ActionResult AjaxContent()
{
    List<object> country = new List<object>();
    country.Add(new { id = "1", text = "Australia" });
    country.Add(new { id = "2", text = "Bhutan" });
    country.Add(new { id = "3", text = "China" });
    country.Add(new { id = "4", text = "Cuba" });
    country.Add(new { id = "5", text = "India" });
    country.Add(new { id = "6", text = "Switzerland" });
    country.Add(new { id = "7", text = "United States" });
    ViewBag.data = country;
    return View();
}

```

Output be like the below.

### Tooltip Positioning in Tooltip Control

Tooltips can be attached to 12 static locations around the target. On initializing the Tooltip, you can set the position property with any one of the following values:

- TopLeft
- TopCenter
- TopRight
- BottomLeft
- BottomCenter

- BottomRight
- LeftTop
- LeftCenter
- LeftBottom
- RightTop
- RightCenter
- RightBottom

**Note:** By default, Tooltip is placed at the TopCenter of the target element.

### CSHTML

```
<ejs-tooltip id="Tooltip" position="TopCenter" content="Tooltip content">
  <e-content-template>
    <div id='container'> <div id="content" title="Tooltip content">
<span>Show tooltip</span> <select id="positions" class="form-control"
onchange="onChange(this)"> <option value="TopLeft">Top Left</option> <option
value="TopCenter" selected="">Top Center</option> <option
value="TopRight">Top Right</option> <option value="BottomLeft">Bottom
Left</option> <option value="BottomCenter">Bottom Center</option> <option
value="BottomRight">Bottom Right</option> <option value="LeftTop">Left
Top</option> <option value="LeftCenter">Left Center</option> <option
value="LeftBottom">Left Bottom</option> <option value="RightTop">Right
Top</option> <option value="RightCenter">Right Center</option> <option
value="RightBottom">Right Bottom</option> </select></div> </div>
    </e-content-template>
  </ejs-tooltip>
<style>
  #target {
    background-color: #ececec;
    border: 1px solid #c8c8c8;
    box-sizing: border-box;
    margin: 70px auto;
    padding: 20px;
    width: 200px;
  }
  /* csslint ignore:start */
  .customtip.e-tooltip-wrap {
    padding: 4px;
  }
  .customtip.e-tooltip-wrap .e-arrow-tip.e-tip-bottom {
    height: 20px;
    width: 12px;
  }
  .customtip.e-tooltip-wrap .e-arrow-tip.e-tip-top {
    height: 20px;
    width: 12px;
  }
  .customtip.e-tooltip-wrap .e-arrow-tip.e-tip-left {
    height: 12px;
    width: 20px;
  }
  .customtip.e-tooltip-wrap .e-arrow-tip.e-tip-right {
    height: 12px;
    width: 20px;
  }
</style>
```

```

    }
    .customtip.e-tooltip-wrap .e-arrow-tip-outer.e-tip-bottom {
        border-left: 6px solid transparent;
        border-right: 6px solid transparent;
        border-top: 20px solid #616161;
    }
    .customtip.e-tooltip-wrap .e-arrow-tip-outer.e-tip-top {
        border-bottom: 20px solid #616161;
        border-left: 6px solid transparent;
        border-right: 6px solid transparent;
    }
    .customtip.e-tooltip-wrap .e-arrow-tip-outer.e-tip-left {
        border-bottom: 6px solid transparent;
        border-right: 20px solid #616161;
        border-top: 6px solid transparent;
    }
    .customtip.e-tooltip-wrap .e-arrow-tip-outer.e-tip-right {
        border-bottom: 6px solid transparent;
        border-left: 20px solid #616161;
        border-top: 6px solid transparent;
    }
}
</style>
<script>
    var tooltip;
    window.onload = function () {
        tooltip = document.getElementById('Tooltip').ej2_instances[0];
    }
    function onChange(args) {
        tooltip.position = args.value;
    }
</script>

```

### TOOLTIPPOSITIONS.CS

```

public ActionResult TooltipAnimation()
{
    ViewBag.content = "Tooltip Content";
    return View();
}

```

Output be like the below.

### Tip pointer positioning

The ToolTip pointer can be attached or detached from the ToolTip by using the `showTipPointer` property. Pointer positions can be adjusted using the `tipPointerPosition` property that can be assigned to one of the following values:

- `auto`
- `start`
- `middle`
- `end`

The following code example illustrates how to set the pointer to the start position of the ToolTip.

#### CSHTML

```
<div class="control-section">
  <ejs-tooltip id="tooltip" tipPointerPosition="Start" content="Tooltip
content">
    <e-content-template>
      <div id='target'>
        <span>Show tooltip</span>
      </div>
    </e-content-template>
  </ejs-tooltip>
</div>
<style>
  #container {
    visibility: hidden;
  }
  #loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
  }
  #target {
    background-color: #ececfc;
    border: 1px solid #c8c8c8;
    box-sizing: border-box;
    margin: 50px auto;
    padding: 20px;
    width: 250px;
  }
</style>
```

#### TIPPOINTER.CS

```
public ActionResult TipPointer()
{
    ViewBag.content = "Tooltip Content";
    return View();
}
```

Output be like the below.

By default, tip pointers are auto adjusted so that the arrow does not point outside the target element.

### Dynamic positioning

The Tooltip and its tip pointer can be positioned dynamically based on the target's location. This can be achieved by using the `refresh` method, which auto adjusts the Tooltip over the target.

### CSHTML

```
<ejs-tooltip id="targetContainer" content="Tooltip content" offsetX="-15"
target="#demoSmart">
  <e-content-template>
    <div id="demoSmart"></div>
  </e-content-template>
</ejs-tooltip>
<script type="text/javascript">
  var tooltip, ele;
  window.onload = function () {
    ele = document.getElementById('demoSmart');
    tooltip =
document.getElementById("targetContainer").ej2_instances[0];
    //////Initialize Draggable for tooltip element
    var drag = new ej.base.Draggable(ele, {
      clone: false,
      dragArea: '#targetContainer',
      drag: function (args) {
        if (args.element.getAttribute('data-tooltip-id') === null) {
          tooltip.open(args.element);
        }
        else {
          tooltip.refresh(args.element);
        }
      },
      dragStart: function (args) {
        if (args.element.getAttribute('data-tooltip-id') !== null) {
          return;
        }
        tooltip.open(args.element);
      },
      dragStop: function (args) {
        tooltip.close();
      }
    });
  };
</script>
<style type="text/css">
  #demoSmart {
    background: rebeccapurple;
```

```

        height: 50px;
        left: 35%;
        position: absolute;
        top: 35%;
        width: 50px;
    }
    #targetContainer {
        margin: 10px;
        min-height: 320px;
        width: 100%;
        float: left;
        border: 1px solid #dddddd;
        border-radius: 3px;
    }
    .control-section {
        padding: 3px;
        margin-right: 20px;
    }
}
</style>

```

### DYNAMICPOSITION.CS

```

public ActionResult DynamicPosition()
{
    ViewBag.custom = "Drag Me";
    return View();
}

```

**Note:** When mouse trailing option is enabled, the tip pointer position gets auto adjusted based on the target, and other position values like start, end, and middle are not applied (to prevent the pointer from moving out of target).

Output be like the below.

### Mouse Trailing

Tooltips can be positioned relative to the mouse pointer. This behavior can be enabled or disabled by using the `mouseTrail` property. By default, it is set to `false`.

### CSHTML

```

<ejs-tooltip id="Tooltip" mouseTrail="true" content="Tooltip content">
    <e-content-template>
        <div id="target" style="margin: 50px;">
            Show tooltip
        </div>
    </e-content-template>
</ejs-tooltip>

```

```

        </e-content-template>
    </ejs-tooltip>
<style>
    #target {
        background-color: #ececec;
        border: 1px solid #c8c8c8;
        box-sizing: border-box;
        margin: 80px auto;
        padding: 20px;
        width: 200px;
    }
</style>

```

### MOUSETRAILING.CS

```

public ActionResult MouseTrailing()
{
    return View();
}

```

Output be like the below.

**Note:** When mouse trailing option is enabled, the tip pointer position gets auto adjusted based on the target, and other position values like start, end, and middle are not applied (to prevent the pointer from moving out of target).

### Setting offset values

Offset values are set to specify the distance between the target and tooltip element.

`offsetX` and `offsetY` properties are used to specify the offset left and top values.

- `offsetX` specifies the distance between the target and Tooltip element in X axis.
- `offsetY` specifies the distance between the target and Tooltip element in Y axis.

The following code example illustrates how to set offset values.

### CSHTML

```

<ejs-tooltip id="Tooltip" mouseTrail="true" showTipPointer="false"
content="Tooltip content" offsetX="30" offsetY="30">
    <e-content-template>
        <div id="target">Show tooltip</div>
    </e-content-template>
</ejs-tooltip>
<style>
    #target {
        background-color: #ececec;

```

```
border: 1px solid #c8c8c8;
box-sizing: border-box;
margin: 80px auto;
padding: 20px;
width: 200px;
}
</style>
```

### OFFSETVALUES.CS

```
public ActionResult offsetvalues ()
{
    ViewBag.content = "Tooltip Content";
    return View();
}
```

Output be like the below.

**Note:** By default, collision is handled automatically and therefore when collision is detected the Tooltip fits horizontally and flips vertically.

### Open Mode in Tooltip Control

You can decide the mode on which the Tooltip is to be opened on a page, i.e., on hovering, focusing, or clicking on the target elements.

**Note:** On mobile devices, Tooltips appear when you tap and hold the element, even if the `opensOn` option is assigned with `Hover`.

<br/> Tooltips are also displayed as long as you continue to tap and hold the element. On lift, it disappears in the next 1.5 seconds.

<br/> If there is another action before that time ends, then the Tooltip disappears.

The `opensOn` property can take either a single or a combination of multiple values, separated by space from the following options. The table below explains how the Tooltip opens on both desktop and mobile based on the value(s) assigned to the `opensOn` property. By default, it takes `Auto` value.

| Values | Desktop   | Mobile   |
|--------|---|--|
| Auto   | Tooltip appears when you hover over the target or when the target element receives the focus. | Tooltip opens on tap and hold of the target element. |
| Hover  | Tooltip appears when you hover over the target.   | Tooltip opens on tap and hold of the target element. |

| **Click** | Tooltip appears when you click a target element. | Tooltip appears when you single tap the target element. |

| **Focus** | Tooltip appears when you focus (say through tab key) on a target element. | Tooltip appears with a single tap on the target element. |

| **Custom** | Tooltip is not triggered by any default action. So, you have to bind your own events and use either **open** or **close** public methods. | Same as Desktop. |

To open the Tooltip for multiple actions, say while hovering over or clicking on a target element, the **opensOn** property can be assigned with multiple values, separated by space as **Hover Click**.

**Note:** **Auto** value cannot be used with any combination for multiple values.

The following code example shows how to set the open mode for Tooltips.

### CSHTML

```
<ejs-tooltip id="tooltiphover" content=@ViewBag.hover
OpensOn="Hover">
    <e-content-template>
        <div class="blocks"><span>Hover Me !(Default)</span></div>
    </e-content-template>
</ejs-tooltip>
<ejs-tooltip id="tooltipclick" content=@ViewBag.click
OpensOn="Click">
    <e-content-template>
        <div class="blocks"><span>Click Me !</span></div>
    </e-content-template>
</ejs-tooltip>
<ejs-tooltip id="tooltipfocus" content=@ViewBag.focus
OpensOn="Focus" target=".e-info">
    <e-content-template>
        <div class="blocks"><span><input class="e-info" type="text"
placeholder="Focus and blur" /></span></div>
    </e-content-template>
</ejs-tooltip>
<ejs-tooltip id="tooltipcustom" content=@ViewBag.custom
OpensOn="Custom">
    <e-content-template>
        <div class="blocks">
            <input id="tooltipopen" value="Click to open tooltip
manually" type="button"/>
        </div>
    </e-content-template>
</ejs-tooltip>
<style>
    #tooltiphover {
        width: 200px;
        box-sizing: border-box;
        display: inline-block;
    }
    #tooltipclick {
        width: 200px;
        box-sizing: border-box;
        display: inline-block;
    }
}
```

```

#tooltipfocus {
    width: 200px;
    box-sizing: border-box;
    display: inline-block;
    line-height: 17px;
}
#tooltipcustom {
    width: 200px;
    box-sizing: border-box;
    display: inline-block;
}
#tooltipfocus .blocks span {
    line-height: 17px;
}
#tooltipcustom .blocks #tooltipopen {
    line-height: 17px;
}
.blocks {
    background-color: #ececec;
    border: 1px solid #c8c8c8;
    box-sizing: border-box;
    display: inline-block;
    line-height: 50px;
    margin: 0 10px 10px 0;
    overflow: hidden;
    text-align: center;
    vertical-align: middle;
    width: 200px;
}
</style>
<script>
    document.getElementById('tooltipopen').addEventListener("click",
function () {
    var customTooltip =
document.getElementById('tooltipcustom').ej2_instances[0];
    if (this.getAttribute("data-tooltip-id")) {
        customTooltip.close();
    } else {
        customTooltip.open(this);
    }
});
</script>

```

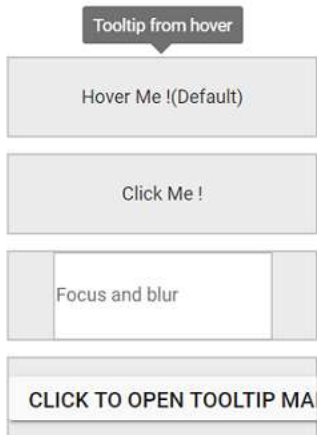

**OPEN-MODE.CS**

```

public ActionResult OpenMode()
{
    ViewBag.hover = "Tooltip from hover";
    ViewBag.click = "Tooltip from click";
    ViewBag.focus = "Tooltip from focus";
    ViewBag.custom = "Tooltip from custom mode";
    return View();
}

```

Output be like the below.

### Custom open mode

Other than the above specified options, the Custom mode makes the Tooltip appear on screen for user-defined custom actions such as right-click, double-click, and so on. Here, the tooltip is not triggered by any default action, and you have to bind your own events and use either `open` or `close` public methods to show or hide the Tooltips.

The following code example shows how to define custom open mode for the Tooltip.

### CSHTML

```
<ejs-tooltip id="box" content="Tooltip from custom mode"
OpensOn="Custom" created="created">
  <e-content-template>
    <div id="content">
      Double-click to open Tooltip.
    </div>
  </e-content-template>
</ejs-tooltip>
<style>
#box {
  background-color: #ececec;
  border: 1px solid #c8c8c8;
  box-sizing: border-box;
  margin: 50px auto;
  padding: 20px;
  width: 250px;
}
</style>
<script>
function created() {
  document.getElementById('box').addEventListener("dblclick", function
() {
    var tooltip = document.getElementById('box').ej2_instances[0];
    if (this.getAttribute("data-tooltip-id")) {
      tooltip.close();
    } else {
      tooltip.open(this);
    }
  });
}
```

```
</script>
```

### CUSTOM-MODE.CS

```
public ActionResult CustomMode()
{
    return View();
}
```

Output be like the below.

### Sticky mode

With this mode set to `true`, Tooltips can be made to show up on the screen as long as the close icon is pressed. In this mode, close icon is attached to the Tooltip located at the top right corner. This mode can be enabled or disabled using the `isSticky` property.

### CHTML

```
<ejs-tooltip id="target" content="Tooltip content" isSticky="true">
  <e-content-template>
    <div id="content">
      Show tooltip
    </div>
  </e-content-template>
</ejs-tooltip>
<style>
  #target {
    background-color: #ececec;
    border: 1px solid #c8c8c8;
    box-sizing: border-box;
    margin: 80px auto;
    padding: 20px;
    width: 200px;
  }
</style>
```

### STICKY-MODE.CS

```
public ActionResult StickyMode()
{
    ViewBag.content = "Click close icon to close me";
    return View();
}
```

Output be like the below.

### Open/Close Tooltip with delay

The Tooltips can be opened or closed after some delay by using the `openDelay` and `closeDelay` properties.

#### CSHTML

```
<ejs-tooltip id="target" content="Tooltip content" openDelay="1000"
closeDelay="1000">
  <e-content-template>
    <div id="content">
      Show tooltip
    </div>
  </e-content-template>
</ejs-tooltip>
<style>
  #target {
    background-color: #ececec;
    border: 1px solid #c8c8c8;
    box-sizing: border-box;
    margin: 80px auto;
    padding: 20px;
    width: 200px;
  }
</style>
```

#### DELAY-MODE.CS

```
public ActionResult DelayMode()
{
    ViewBag.content = "Tooltip with delay";
    return View();
}
```

Output be like the below.

### Animation in Tooltip Control

To animate the Tooltip, a set of specific animation effects are available, and it can be controlled using the `animation` property. The animation property also allows you to set delay, duration, and various other effects of your choice.

`AnimationModel` is derived from base to apply the chosen animation effect, duration, etc. on Tooltips.

By default, Tooltip entrance occurs over 150 ms using the `ease-out` timing function. It exits also at 150 ms, but uses `ease-in` timing function.

### CSHTML

```
<ejs-tooltip id="tooltip" content= "Tooltip content"
animation="ViewBag.animation">
  <e-content-template>
    <div id="target">
      Show tooltip
    </div>
  </e-content-template>
</ejs-tooltip>
<style>
#target {
  background-color: #ececec;
  border: 1px solid #c8c8c8;
  box-sizing: border-box;
  margin: 50px auto;
  padding: 10px;
  width: 100px;
}
</style>
```

### ANIMATION.CS

```
public ActionResult TooltipAnimation()
{
    ViewBag.animation = new
    {
        open = new { effect = "ZoomIn", duration = 1000, delay = 0 },
        close = new { effect = "ZoomOut", duration = 500, delay = 0 }
    };
    return View();
}
```

Output be like the below.

The default animation effect for the Tooltip is set to **FadeIn** for its open action, and **FadeOut** for its close action. The default **duration** is set to 150 ms and **delay** is set to 0.

#### Animation effects

The animation effects that are applicable to Tooltips are:

- **FadeIn**
- **FadeOut**
- **FadeZoomIn**
- **FadeZoomOut**
- **FlipXDownIn**
- **FlipXDownOut**
- **FlipXUpIn**
- **FlipXUpOut**
- **FlipYLeftIn**
- **FlipYLeftOut**
- **FlipYRightIn**
- **FlipYRightOut**
- **ZoomIn**
- **ZoomOut**
- **None**

When the **effect** is specified as **None**, no effect will be applied to the Tooltip, and animation is considered to be set to **off**.

**Note:** Some of the above animation effects suits the Tooltip better when its tip pointer is hidden.

<br/> This can be achieved by setting the **showTipPointer** to false.

#### Animating via open/close methods

Animations can also be applied on Tooltips dynamically through **open** and **close** methods. These methods accept the animation model as an optional parameter. If you pass **TooltipAnimationSettings**, animation takes this model; otherwise, it takes the values from the **animation** property. It is also possible to pass different animations for Tooltips on each target.

Refer to the code snippet below to apply animations using public methods.

#### CSHTML

```
<ejs-tooltip id="tooltip" content="Tooltip content" opensOn="Custom"
created="created">
```

```

    <e-content-template>
      <div id="target">
        Show tooltip
      </div>
    </e-content-template>
  </ejs-tooltip>
</style>
<script>
  #target {
    background-color: #ececec;
    border: 1px solid #c8c8c8;
    box-sizing: border-box;
    margin: 50px auto;
    padding: 10px;
    width: 100px;
  }
</script>
<script>
  function created() {
    document.getElementById('target').addEventListener("click", function
  () {
    var tooltip =
document.getElementById('tooltip').ej2_instances[0];
    if (this.getAttribute("data-tooltip-id")) {
      var closeAnimation = { effect: 'FadeOut', duration: 1000 }
      tooltip.close(closeAnimation);
    } else {
      var openAnimation = { effect: 'FadeIn', duration: 1000 }
      tooltip.open(this, openAnimation);
    }
  });
}
</script>

```

### ANIMATION-OPENCLOSE.CS

```

public ActionResult TooltipAnimation()
{
    return View();
}

```

Output be like the below.

### Apply transition

The transition effect can be applied on Tooltips by using the `beforeRender` event as given in the following work-around code example.

**CSHTML**

```

<ejs-tooltip id="tooltip" target=".circletool"
beforeRender="onBeforeRender" afterClose="onAfterClose" closeDelay=1000
animation="ViewBag.animation">
    <e-content-template>
        <div>
            <h3> Transition effect </h3>
            <div id="box" class="e-prevent-select">
                <div class="circletool" style="top:18%;left:5%"
title="This is Turtle !!!"></div>
                <div class="circletool" style="top:30%;left:30%"
title="This is Snake !!!"></div>
                <div class="circletool" style="top:80%;left:80%"
title="This is Croc !!!"></div>
                <div class="circletool" style="top:65%;left:50%"
title="This is String Ray !!!"></div>
                <div class="circletool" style="top:75%;left:15%"
title="This is Blob Fish !!!"></div>
                <div class="circletool" style="top:30%;left:70%"
title="This is Mammoth !!!"></div>
            </div>
        </div>
    </e-content-template>
</ejs-tooltip>
<style>
#box {
    border: 1px solid #c8c8c8;
    box-sizing: border-box;
    height: 200px;
    margin-left: 10px;
    margin-right: 10px;
    position: relative;
}
.circletool {
    background: yellowgreen;
    border-radius: 50px;
    height: 20px;
    position: absolute;
    width: 20px;
}
</style>
<script>
function onBeforeRender(args) {
    if (args.element) {
        // here prevent animation while apply transition
        this.animation = { open: { effect: 'None' } };
        args.element.style.display = 'block';
        args.element.style.transitionProperty = 'left,top';
        args.element.style.transitionDuration = '1000ms';
    }
}
function onAfterClose(args) {
    // restore the animation effects
    this.animation = { open: { effect: 'ZoomIn', duration: 500 }, close:
{ effect: 'ZoomOut', duration: 500 } };
}

```

```
</script>
```

### ANIMATION-TRANSITION.CS

```
public ActionResult TooltipAnimation()
{
    ViewBag.animation = new
    {
        open = new { effect = "ZoomIn", duration = 500 },
        close = new { effect = "ZoomOut", duration = 500 }
    };
    return View();
}
```

Output be like the below.

Transition effect

### Customization in Tooltip Control

The Tooltip can be customized by using the `cssClass` property, which accepts custom CSS class names that define specific user-defined styles and themes to be applied on the Tooltip element.

#### Tip pointer customization

Styling the tip pointer's size, background, and border color's can be done using the `cssClass` property, as given below.

### CSHTML

```
<ejs-tooltip id="tooltip" cssClass="customtip" content="Tooltip arrow
customized">
    <e-content-template>
        <div id="target">
            Show tooltip
        </div>
    </e-content-template>
</ejs-tooltip>
<style>
    #target {
        background-color: #ececec;
        border: 1px solid #c8c8c8;
        box-sizing: border-box;
        margin: 70px auto;
        padding: 20px;
        width: 200px;
    }
    /* csslint ignore:start */
    .customtip.e-tooltip-wrap {
```

```
padding: 4px;
}
.customtip.e-tooltip-wrap .e-arrow-tip.e-tip-bottom {
    height: 20px;
    width: 12px;
}
.customtip.e-tooltip-wrap .e-arrow-tip.e-tip-top {
    height: 20px;
    width: 12px;
}
.customtip.e-tooltip-wrap .e-arrow-tip.e-tip-left {
    height: 12px;
    width: 20px;
}
.customtip.e-tooltip-wrap .e-arrow-tip.e-tip-right {
    height: 12px;
    width: 20px;
}
.customtip.e-tooltip-wrap .e-arrow-tip-outer.e-tip-bottom {
    border-left: 6px solid transparent;
    border-right: 6px solid transparent;
    border-top: 20px solid #616161;
}
.customtip.e-tooltip-wrap .e-arrow-tip-outer.e-tip-top {
    border-bottom: 20px solid #616161;
    border-left: 6px solid transparent;
    border-right: 6px solid transparent;
}
.customtip.e-tooltip-wrap .e-arrow-tip-outer.e-tip-left {
    border-bottom: 6px solid transparent;
    border-right: 20px solid #616161;
    border-top: 6px solid transparent;
}
.customtip.e-tooltip-wrap .e-arrow-tip-outer.e-tip-right {
    border-bottom: 6px solid transparent;
    border-left: 20px solid #616161;
    border-top: 6px solid transparent;
}
</style>
```

### TOOLTIP-POINTER.CS

```
public ActionResult TooltipPointer()
{
    return View();
}
```

Output be like the below.

### Tooltip customization

The complete look and feel of the Tooltip can be customized by changing it's background color, opacity, content font, etc. The following code example shows the way to achieve it.

#### CSHTML

```
<ejs-tooltip id="target" cssClass="customtooltip" content="Tooltip
customized">
  <e-content-template>
    <div id="content" >
      Show tooltip
    </div>
  </e-content-template>
</ejs-tooltip>
<style>
#target {
  background-color: #ececec;
  border: 1px solid #c8c8c8;
  box-sizing: border-box;
  margin: 70px auto;
  padding: 20px;
  width: 200px;
}
.customtooltip.e-tooltip-wrap .e-tip-content {
  line-height: 20px;
}
.customtooltip.e-tooltip-wrap .e-arrow-tip.e-tip-bottom {
  height: 12px;
  left: 50%;
  top: 100%;
  width: 24px;
}
.customtooltip.e-tooltip-wrap .e-arrow-tip.e-tip-top {
  height: 12px;
  left: 50%;
  top: -9px;
  width: 24px;
}
.customtooltip.e-tooltip-wrap .e-arrow-tip.e-tip-left {
  height: 24px;
  left: -9px;
  top: 48%;
  width: 12px;
}
.customtooltip.e-tooltip-wrap .e-arrow-tip.e-tip-right {
```

```
        height: 24px;
        left: 100%;
        top: 50%;
        width: 12px;
    }
    .customtooltip.e-tooltip-wrap {
        border-radius: 4px;
        opacity: 1;
    }
    .customtooltip.e-tooltip-wrap.e-popup {
        background-color: #fff;
        border: 2px solid #000;
    }
    .customtooltip.e-tooltip-wrap .e-tip-content {
        color: #000;
        font-size: 12px;
    }
    .customtooltip.e-tooltip-wrap .e-arrow-tip-outer.e-tip-bottom {
        border-left: 12px solid transparent;
        border-right: 14px solid transparent;
        border-top: 12px solid #000;
    }
    .customtooltip.e-tooltip-wrap .e-arrow-tip-outer.e-tip-top {
        border-bottom: 12px solid #000;
        border-left: 12px solid transparent;
        border-right: 12px solid transparent;
    }
    .customtooltip.e-tooltip-wrap .e-arrow-tip-outer.e-tip-left {
        border-bottom: 12px solid transparent;
        border-right: 12px solid #000;
        border-top: 12px solid transparent;
    }
    .customtooltip.e-tooltip-wrap .e-arrow-tip-outer.e-tip-right {
        border-bottom: 12px solid transparent;
        border-left: 12px solid #000;
        border-top: 12px solid transparent;
    }
    .customtooltip.e-tooltip-wrap .e-arrow-tip-inner.e-tip-bottom {
        color: #fff;
        font-size: 25.9px;
    }
}
</style>
```

#### TOOLTIP-VIEW.CS

```
public ActionResult TooltipView()
{
    return View();
}
```

Output be like the below.

### Styles and Appearance

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

#### Customizing the tooltip

Use the following CSS to customize the tooltip.

```
`css
.e-tooltip-wrap {
border-radius: 4px;
opacity: 1;
}
`
```

#### Customizing the tooltip popup

Use the following CSS to customize the tooltip popup properties.

```
`css
.e-tooltip-wrap.e-popup {
background-color: #fff;
border: 2px solid #000;
}
`
```

#### Customizing the tooltip content

Use the following CSS to customize the tooltip content.

```
`css
.e-tooltip-wrap .e-tip-content {
color: red;
font-size: 12px;
line-height: 20px;
}
`
```

### Customizing the tooltip arrow tip

Use the following CSS to customize the tooltip arrow tip.

```
`css
/ To customize the arrow tip at bottom /
.e-tooltip-wrap .e-arrow-tip.e-tip-bottom {
height: 12px;
left: 50%;
top: 100%;
width: 24px;
}
/ To customize the arrow tip at top /
.e-tooltip-wrap .e-arrow-tip.e-tip-top {
height: 12px;
left: 50%;
top: -9px;
width: 24px;
}
/ To customize the arrow tip at left /
.e-tooltip-wrap .e-arrow-tip.e-tip-left {
height: 24px;
left: -9px;
top: 48%;
width: 12px;
}
/ To customize the arrow tip at right /
.e-tooltip-wrap .e-arrow-tip.e-tip-right {
height: 24px;
left: 100%;
top: 50%;
width: 12px;
}
`
```

### Customizing the tooltip inner tip

Use the following CSS to customize the tooltip inner tip.

```
`css
.e-tooltip-wrap .e-arrow-tip-inner.e-tip-right,
.e-tooltip-wrap .e-arrow-tip-inner.e-tip-left,
.e-tooltip-wrap .e-arrow-tip-inner.e-tip-bottom,
.e-tooltip-wrap .e-arrow-tip-inner.e-tip-top {
color: #fff;
font-size: 25.9px;
}
`
```

#### [Customizing the tooltip outer tip](#)

Use the following CSS to customize the tooltip outer tip.

```
`css
/ To customize the arrow tip at bottom /
.e-tooltip-wrap .e-arrow-tip-outer.e-tip-bottom {
border-left: 12px solid transparent;
border-right: 14px solid transparent;
border-top: 12px solid #000;
}
/ To customize the arrow tip at top /
.e-tooltip-wrap .e-arrow-tip-outer.e-tip-top {
border-bottom: 12px solid #000;
border-left: 12px solid transparent;
border-right: 12px solid transparent;
}
/ To customize the arrow tip at left /
.e-tooltip-wrap .e-arrow-tip-outer.e-tip-left {
border-bottom: 12px solid transparent;
border-right: 12px solid #000;
border-top: 12px solid transparent;
}
/ To customize the arrow tip at right /
.e-tooltip-wrap .e-arrow-tip-outer.e-tip-right {
border-bottom: 12px solid transparent;
```

```
border-left: 12px solid #000;
border-top: 12px solid transparent;
}
,
```

### Accessibility in ASP.NET MVC Tooltip component

The Tooltip component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Tooltip component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

```
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
```

</style>

<div> - All features of the component meet the requirement.</div>

```
<div> - Some features of the component do not meet the requirement.</div>
```

```
<div> - The component does not meet the requirement.</div>
```

### WAI-ARIA attributes

The Tooltip component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Tooltip component.

| Attributes | Description |
|------------|-------------|
|------------|-------------|

|     |     |
|-----|-----|
| --- | --- |
|-----|-----|

|                |  |
|----------------|--|
| role="tooltip" | The element that serves as the container for the tooltip has the ARIA role of <b>tooltip</b> . |
|----------------|--|

|                  |  |
|------------------|--|
| aria-describedby | This attribute is added to the target element on which the Tooltip gets opened, when focusing or hovering over it. It usually holds the randomly generated Id value of the Tooltip element.<br>In case, the target element already holds an <b>aria-describedby</b> attribute with Id value of some other component, then the Tooltip Id value can be additionally appended to the existing <b>aria-describedby</b> attribute separated by a space as shown in the example below.<br><b>For example:</b> <code>aria-describedby = "my-text my-tooltip"</code> <b>my-text</b> is the Id of some other component. <b>my-tooltip</b> is the id of Tooltip component.<br>When the Tooltip is closed, the <b>aria-describedby</b> attribute is removed from the target. |
|------------------|--|

|             |   |
|-------------|---|
| aria-hidden | This attribute is assigned to the Tooltip element whose default value is true.<br>When <b>true</b> , it denotes that the Tooltip element is in a hidden or a closed state. When the Tooltip appears on the screen, it's value changes to <b>false</b> . |
|-------------|---|

### Keyboard interaction

The Tooltip component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Tooltip component.

| Keys | Description |
|------|-------------|
|------|-------------|

|     |     |
|-----|-----|
| --- | --- |
|-----|-----|

|        |                                  |
|--------|----------------------------------|
| Escape | Closes or dismisses the Tooltip. |
|--------|----------------------------------|

|     |  |
|-----|--|
| Tab | A form control receiving focus (say through tab key), opens the Tooltip, and on focus out closes it. |
|-----|--|

1. When the Tooltip is being displayed on the target element, focus continues to stay on it.
2. If the Tooltip opens on mouse entering into the target element space, then it should be dismissed only when the mouse leaves that target.
3. If the Tooltip opens on the target element that receives focus, then it should be closed only when the focus moves out of that target element.

Likewise, if the Tooltip opens on a click, then it should be closed only on another click action.

### Ensuring accessibility

The Tooltip component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Tooltip component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Tooltip component with accessibility tools.

## Migration from Essential JS 1

This article describes the API migration process of Tooltip component from Essential JS 1 to Essential JS 2.

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Position | **Property:** *Position* <br/><br/> @Html.EJ().ToolTip("tooltip").Content("Tooltip content").Position(e => e.Target(target => target.Horizontal("right").Vertical("center")).Stem(e => e.Horizontal("left").Vertical("center"))) | **Property:** *Position* <br/><br/> @Html.EJS().ToolTip("tooltip").Position(Syncfusion.EJ2.Popups.Position.TopCenter) |

| Animation | **Property:** *Animation* <br/><br/> @Html.EJ().ToolTip("tooltip").Content("Tooltip content").Animation(e => e.Effect(Effect.Fade).Speed(200)) | **Property:** *Animation* <br/><br/> List<Object> animation = new List<Object>(); <br/> animation.Add(new { open = new { effect = "FadeIn" }, close = new { effect = "fadeOut" } }); <br/> ViewBag.animation = animation; <br/><br/> @Html.EJS().ToolTip("tooltip").Animation(ViewBag.animation) |

| Close Time Out | **Property:** *AutoCloseTimeout* <br/><br/> @Html.EJ().ToolTip("tooltip").Content("Tooltip content").AutoCloseTimeout(2000).CloseMode(CloseMode.Auto) | **Property:** *CloseDelay*, *openDelay* <br/><br/> @Html.EJS().ToolTip("tooltip").CloseDelay(500) |

| Sticky Mode | **Property:** *CloseMode* <br/><br/> @Html.EJ().ToolTip("tooltip").Content("Tooltip content").CloseMode(CloseMode.Sticky) | **Property:** *IsSticky* <br/><br/> @Html.EJS().ToolTip("tooltip").IsSticky(true) |

| Offset from target | **Not Applicable** | **Property:** *OffsetX/OffsetY* <br/><br/> @Html.EJS().ToolTip("tooltip").OffsetX(10).OffsetY(10); |

| Open mode of tooltip | **Not Applicable** | **Property:** *OpensOn* <br/><br/> @Html.EJS().ToolTip("tooltip").OpensOn("Click") |

| Enable disable the tip of tooltip | **Not Applicable** | **Property:** *ShowTipPointer* <br/><br/> @Html.EJS().ToolTip("tooltip").ShowTipPointer(true) |

| Hide | **Method:** *hide()* <br/><br/> @Html.EJ().ToolTip("tooltip").Content("Tooltip content") <br/><br/> var tooltipObj = \$("#tooltip").ejToolTip("instance"); <br/> tooltipObj.hide(); | **Method:** *close()* <br/><br/> @Html.EJS().ToolTip("tooltip").OpensOn("Custom") <br/> <br/> var tooltipObj = document.getElementById('tooltip').ej2\_instances[0]; <br/> tooltipObj.close(); |

| Show | **Method:** *show()* <br/><br/> @Html.EJ().ToolTip("tooltip").Content("Tooltip content") <br/><br/> var tooltipObj = \$("#tooltip").ejToolTip("instance"); <br/> tooltipObj.show(); |

**Method:** *open()* `<br/><br/> @Html.EJS().ToolTip("tooltip").OpensOn("Custom") <br/> <br/> var tooltipObj = document.getElementById('tooltip').ej2_instances[0]; <br/> tooltipObj.open(); |`  
 | Enable | **Method:** *enable()* `<br/><br/> @Html.EJ().ToolTip("tooltip").Content("Tooltip content") <br/><br/> var tooltipObj = $("#tooltip").ejToolTip("instance"); <br/> tooltipObj.enable(); |`  
**Method:** *destroy()* `<br/><br/> @Html.EJS().ToolTip("tooltip").OpensOn("Custom") <br/> <br/> var tooltipObj = document.getElementById('tooltip').ej2_instances[0]; <br/> tooltipObj.destroy(); |`  
 | Close | **Event:** *close* `<br/><br/> @Html.EJ().ToolTip("tooltip").Content("Tooltip content").ClientSideEvents(e => e.Close("onClose")) <br/> <br/> function onClose(args) { } |`  
**Event:** *AfterClose* `<br/><br/> @Html.EJS().ToolTip("tooltip").AfterClose("onAfterClose") <br/> <br/> function onAfterClose() { } |`  
 | Open | **Event:** *open* `<br/><br/> @Html.EJ().ToolTip("tooltip").Content("Tooltip content").ClientSideEvents(e => e.Open("onOpen")) <br/> <br/> function onOpen(args) { } |`  
**Event:** *AfterOpen* `<br/><br/> @Html.EJS().ToolTip("tooltip").AfterOpen("onAfterOpen") <br/> <br/> function onAfterOpen() { } |`  
 | Before Collision | **Not Applicable** | **Event:** *BeforeCollision* `<br/><br/> @Html.EJS().ToolTip("tooltip").BeforeCollision("onBeforeCollision") <br/> <br/> function onBeforeCollision() { } |`  
 | Tracking | **Event:** *tracking* `<br/><br/> @Html.EJ().ToolTip("sample").Content("Tooltip content").ClientSideEvents(e => e.Tracking("onTracking")).Associate(Associate.MouseFollow) <br/> <br/> function onTracking(args) { } |` **Method:** *MouseTrail* `<br/><br/> @Html.EJS().ToolTip("tooltip").MouseTrail(true) |`

## How To

### Show Tooltip on disabled elements and disable tooltip

By default, Tooltips will not be displayed on disabled elements. However, it is possible to enable this behavior by following the steps below.

1. Add a disabled element like the `button` element into a div whose display style is set to `inline-block`.
2. Set the pointer event as `none` for the disabled element (button) through CSS.
3. Now, initialize the Tooltip for outer div element that holds the disabled button element.

### CSHTML

```
<ejs-tooltip id="tooltip" content="Tooltip content">
  <e-content-template>
    <div id="box" style="display: inline-block;">
      <input type="button" id="disabledbutton" disabled
value="Disabled button" />
    </div>
  </e-content-template>
</ejs-tooltip>
<style>
  #tooltip {
    height: 40px;
```

```

        left: 45%;
        position: absolute;
        top: 45%;
        width: auto;
    }
    #disabledbutton {
        pointer-events: none;
        color: graytext;
    }
</style>

```

### DISABLED.CS

```

public ActionResult Disabled()
{
    ViewBag.content = "Tooltip from disabled element";
    return View();
}

```

### Dynamic Tooltip content with HTML elements

The HTML tags such as `<div>`, `<span>`, **bold**, *italic*, underline, etc., can be used. Style attributes can also be applied with HTML tags.

Here, Bold, Italic, Underline, and Anchor tags are used.

```
document.getElementById('content').style.display = 'block';
```

### CSHTML

```

<div id="container">
    <ejs-tooltip id="target" cssClass="customtooltip" content="<div
id='tooltip'><h2>HTML Tags</h2>Through templates, <b><span
style='color:#e3165b'>tooltip content</span></b> can be loaded with <u><i>
inline HTML, images, iframe, videos, maps </i></u>. A title can be added to
the content</div>">
        <e-content-template>
            <div id="tooltipContent">
                <div class="content">
                    <button class="text" id="Title">HTML (With
Title)</button>
                </div>
            </div>
        </e-content-template>
    </ejs-tooltip>

```

### HTML-CONTENT.CS

```

public ActionResult TooltipView()
{
    return View();
}

```

### Custom Tooltip with dynamic HTML

To load an `iframe` element in tooltip, set the required `iframe` in the `content` of tooltip while initializing the tooltip component. Refer to the following code.

content: '<iframe src="https://www.syncfusion.com/products/essential-js2"></iframe>'

,

### CSHTML

```

<div id="container">
    <ejs-tooltip id="target" cssClass="e-tooltip-css" opensOn="Click"
width="350" height="250" content="<iframe
src='https://www.syncfusion.com/products/essential-js2'
id='tooltipFrame'></iframe>">
        <e-content-template>
            <div id="tooltipContent">
                <div class="content">
                    <button class="text" id="iframeContent">Embedded
Iframe</button>
                </div>
            </div>
        </e-content-template>
    </ejs-tooltip>
</div>
<style>
#tooltipContent {

```

```
position: relative;
left: 50%;
transform: translateX(-50%);
margin: 65px 10px;
}
.content {
display: inline-block;
width: 49%;
}
#tooltipFrame {
width: 332px;
height: 233px;
}
.content button {
position: relative;
left: 50%;
transform: translateX(-50%);
}
</style>
```

### HTML-PAGE.CS

```
public ActionResult TooltipView()
{
    return View();
}
```

#### Tooltip open or display modes

The open mode property of tooltip can be defined on a target that is hovering, focusing, or clicking.

Tooltip component have the following types of open mode:

- Auto
- Hover
- Click
- Focus
- Custom

##### Auto

Tooltip appears when you hover over the target or when the target element receives the focus.

##### Hover

Tooltip appears when you hover over the target.

##### Click

Tooltip appears when you click a target element.

##### Focus

Tooltip appears when you focus (say through tab key) on a target element.

##### Custom

Tooltip is not triggered by any default action. So, bind your own events and use either open or close public methods.

CSHTML

```

<div id='container'>
  <div id="showToolTip">
    <div id="first">
      <ejs-tooltip id="tooltip01" opensOn="Hover" content="ToolTip
from hover">
        <e-content-template>
          <button class="blocks e-btn e-primary e-outline"
id="tooltiphover">Hover me! (Default)</button>
        </e-content-template>
      </ejs-tooltip>
      <ejs-tooltip id="tooltip02" opensOn="Click" content="ToolTip
from click">
        <e-content-template>

    }
    .blocks {
        margin: 0 10px 0 10px;
        text-transform: none;
        width: 168px;
    }
    #showTooltip {
        display: table;
        padding-top: 40px;
        margin: 0 auto;
    }
    #focus {
        border: 1px solid #ff4081;
        text-align: center;
        height: 31px;
        width: 168px;
    }
    ::placeholder {
        color: #ff4081;
    }
</style>
<script>
    document.getElementById('tooltipcustom').addEventListener("dblclick",
function () {
    if (this.getAttribute("data-tooltip-id")) {

document.getElementById('customTooltip').ej2_instances[0].close();
    } else {

document.getElementById('customTooltip').ej2_instances[0].open(this);
    }
    });
</script>

```

### OPEN-CUSTOM.CS

```

public ActionResult TooltipView()
{
    return View();
}

```

### Fancy Tooltip Customization

The arrow of the tooltip can be customized as needed by customizing CSS in the sample-side. The EJ2 tooltip component is achieved through CSS3 format and positioned the tip arrow according to the tooltip positions like `TopCenter`, `BottomLeft`, `RightTop`, and more.

Here, the tip arrow is customized as Curved tooltip and Bubble tooltip.

#### *Curved tip*

The content for the tip pointer arrow has been added. To customize the curved tip arrow, override the following CSS class of tip arrow.

```
cssClass = 'curvetips e-tooltip-css',
,

`css
.e-arrow-tip-outer.e-tip-bottom,
.e-arrow-tip-outer.e-tip-top {
border-left: none !important;
border-right: none !important;
border-top: none !important;
}
.e-arrow-tip.e-tip-top {
transform: rotate(170deg);
}
,
```

#### *Bubble tip*

The two **divs**(inner div and outer div) have been added to achieve the bubble tip arrow. To customize the bubble tip arrow, override the following CSS class of tip arrow.

```
`js
cssClass: 'bubbletip e-tooltip-css'
,

`css
.e-arrow-tip-outer.e-tip-bottom, .e-arrow-tip-outer.e-tip-top
{
border-radius: 50px;
height: 10px;
width: 10px;
}
.e-arrow-tip-inner.e-tip-bottom, .e-arrow-tip-inner.e-tip-top
{
border-radius: 50px;
height: 10px;
```

```
width: 10px;
```

```
}
```

```
,
```

These tip arrow customizations have been achieved through CSS changes in the sample level. The tooltip position can be changed by using the radio button click event.

### CSHTML

```
<div id='container'>
  <div id="customization" class="customTipContainer">
    <ejs-tooltip id="arrow" content="Tooltip arrow customized"
cssClass='curvetips e-tooltip-css'>
      <e-content-template>

{
    return View();
}
```

#### Dynamic Tooltip content

The tooltip content can be changed dynamically using the Fetch request.

When you hover over the icons, its respective data will be retrieved dynamically and then assigned to the tooltip's content.

Refer to the following code snippet to change the tooltip content dynamically.

```
`js
function onBeforeRender(args): void {
  this.content = 'Loading...';
  this.dataBind();
  var fetchApi = new Fetch('./tooltip.json', 'GET');
  fetchApi.send().then(
    (result: any) => {
      for (var i: number = 0; i < result.length; i++) {
        if (result[i].Id == args.target.id) {
          / tslint:disable /
          this.content = result[i].Sports;
          / tslint:enable /
        }
      }
      this.dataBind();
    },
    (reason: any) => {
      this.content = reason.message;
      this.dataBind();
    }
  );
}
```

```

}
,

```

### CSHTML

## DYNAMIC-CONTENT.CS

```

public ActionResult MouseTrailing()
{
    return View();
}

```

## Create and show Tooltip on multiple targets

Tooltip can be created and shown on multiple targets within a container by defining the specific target elements to the target property. So, the tooltip is initialized only on matched targets within a container.

## CSHTML

```

<div id="container">
    <form id="details" role="form">
        <div>
            <div class="info">User Name:</div>

```

```

        <div class="inputs">
            <ejs-tooltip id="tooltip1" position="RightCenter"
target="#uname">
                <e-content-template>
                    <input type="text" id="uname" class="e-info e-
input" name="firstname" title="Please enter your name" />
                </e-content-template>
            </ejs-tooltip>
        </div>
    </div>
    <br/>

    var tooltip1 = document.getElementById('tooltip1').ej2_instances[0];
    var tooltip3 = document.getElementById('tooltip3').ej2_instances[0];
    var name = document.getElementById('uname').value;
    var pwd = document.getElementById('pwd').value;
    var cpwd = document.getElementById('cpwd').value;
    if(name.length > 0 & name.length < 4){
        document.getElementById('uname').title = 'Required Minimum 4
Characters';
        document.getElementById('uname').style.backgroundColor = 'red';
        var target = document.getElementById('uname');
        tooltip1.open(target);
    } else {
        document.getElementById('uname').style.backgroundColor = 'white';
    }
    if(pwd !== '' && pwd.length < 8){
        document.getElementById('pwd').title = 'Required Minimum 8
Characters';
        document.getElementById('pwd').style.backgroundColor = 'red';
        var pwdtarget = document.getElementById('pwd');
        tooltip3.open(pwdtarget);
    } else {
        document.getElementById('pwd').style.backgroundColor = 'white';
    }
    if(name.length >= 4 && pwd !== '' && pwd.length >= 8 && pwd == cpwd ){
        alert('Form Submitted');
    } else {
        alert('Details are not Valid');
    }
})
document.getElementById('clear').addEventListener('click', function(){
    var tooltip1 = document.getElementById('tooltip1').ej2_instances[0];
    var tooltip3 = document.getElementById('tooltip3').ej2_instances[0];
    document.getElementById('uname').style.backgroundColor = 'white';
    document.getElementById('pwd').style.backgroundColor = 'white';
    var target = document.getElementById('uname');
    tooltip1.close(target);
    document.getElementById('uname').title = 'Please enter your name';
    var pwdtarget = document.getElementById('pwd');
    tooltip3.close(pwdtarget);
});
</script>
<style>
#details .info {
    font-weight: bold;
    width: 165px;
    display: inline-block;
    margin-left: 10px;
}
#details .inputs {
    display: inline-block;
}
#details .btn{
    margin-top: 10px;
    position: relative;

```

```

    left: 50%;
    transform: translateX(-50%);
    display: inline-block;
}
#details #sample{
    margin-left:10px;
}
#details #clear{
    margin-left:10px;
}
#details {
    padding-top: 30px;
    padding-bottom: 30px;
    position: relative;
    left: 50%;
    transform: translateX(-50%);
    display: inline-block;
}
</style>

```

## MULTI-TARGET.CS

```

public ActionResult MouseTrailing()
{
    return View();
}

```

## Tree Grid

### Immutable Mode

To enable this feature, you have to set the `EnableImmutableMode` property as **true**.

**Note:** \* This feature uses the primary key value for data comparison. So, you need to provide the [IsPrimaryKey](#) column.

## CSHTML

```

<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.DataSource"
allowPaging="true" childMapping="Children" treeColumnIndex="1"
enableImmutableMode="true">
    <e-treegrid-pagesettings pageSize="true" pageSize="10"
pageCount="4"></e-treegrid-pagesettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
isPrimaryKey="true" textAlign="Right" width="95"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="220"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText=" Start Date"
textAlign="Right" format="yMd" type="date" width="115"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="100"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>

```

**IMMUTABLE.CS**

```
public ActionResult Index()
{
    var treeData = TreeGridItems.GetTreeData();
    ViewBag.datasource = treeData;
    return View();
}
```

## Limitations

The following features are not supported in the immutable mode:

- Frozen rows and columns
- Row Template
- Detail Template
- Column reorder
- Virtualization

## Rows in ASP.NET MVC Tree Grid Component

The row represents record details fetched from data source.

## Customize rows

You can customize the appearance of a row by using the [RowDataBound](#) event.

The [RowDataBound](#) event triggers for every row. In the event handler, you can get the **args** which contains details of the row.

**CSHTML**

```
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource" height="275"
enableHover="false" rowDataBound="rowDataBound" childMapping="Children"
treeColumnIndex="1">
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="90"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="180"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText="Start Date"
textAlign="Right"
format="yMd" width="90"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="80"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
<script>
function rowDataBound(args) {
    if (args.data['Duration'] > 5) {
        args.row.style.background = '#336c12';
    } else if (args.data['Duration'] < 5) {
        args.row.style.background = '#7b2b1d';
    }
}
</script>
```

**CUSTOMIZEROWS.CS**

```
public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}
```

## Styling alternate rows

You can change the treegrid's alternative rows' background color by overriding the **.e-altrow** class.

```
`css
```

```
.e-treegrid .e-altrow {
background-color: #fafafa;
}
,
```

Refer to the following example.

**CSHTML**

```
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource" height="275"
enableHover="false" childMapping="Children" treeColumnIndex="1">
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="90"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="180"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText=" Start Date"
textAlign="Right"
format="yMd" width="90"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="80"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
<style>
    .e-treegrid .e-altrow {
        background-color: #ffd800;
    }
</style>
```

**ALTERNATEROWS.CS**

```
public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}
```

## Cell in ASP.NET MVC Tree Grid Component

### Customize cell styles

The appearance of cells can be customized by using the [QueryCellInfo](#) event.

The [QueryCellInfo](#) event triggers for every cell. In that event handler, you can get **QueryCellInfoEventArgs** that contains the details of the cell.

### CSHTML

```
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource"
queryCellInfo="customizeCell" height="300" childMapping="Children"
treeColumnIndex="1">
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="100"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="190"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="110"></e-treegrid-column>
        <e-treegrid-column field="Progress" headerText="Progress"
textAlign="Right" width="110"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
<script>
    function customizeCell(QueryCellInfoEventArgs) {
        var args = QueryCellInfoEventArgs;
        if (args.column.field === 'Progress' && args.cell.innerHTML > 90 &&
args.cell.innerHTML <= 100) {
            args.cell.setAttribute('style', 'background-
color:#336c12;color:white;');
        } else if (+args.cell.innerHTML > 20 && args.column.field ===
'Progress') {
            args.cell.setAttribute('style', 'background-
color:#7b2b1d;color:white;');
        }
    }
</script>
```

### QUERYCELL.CS

```
public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}
```

### <!-- Auto wrap

The auto wrap allows the cell content of the treegrid to wrap to the next line when it exceeds the boundary of the cell width. The Cell Content wrapping works based on the position of white space between words.

To enable auto wrap, set the [allowTextWrap](#) property to **true**.

You can configure the auto wrap mode by setting the [textWrapSettings.wrapMode](#) property.

There are three types of `wrapMode`. They are:

- **Both:** Both value is set by default. Auto wrap will be enabled for both the content and the header.
- **Header:** Auto wrap will be enabled only for the header.
- **Content:** Auto wrap will be enabled only for the content.

When a column width is not specified, then auto wrap of columns will be adjusted with respect to the treegrid's width.

In the following example, the `textWrapSettings.wrapMode` is set to `Content`.

### CSHTML

```
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource"
allowTextWrap="true" height="300" childMapping="Children" allowPaging="true"
treeColumnIndex="1">
  <e-treegrid-columns>
    <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="90"></e-treegrid-column>
    <e-treegrid-column field="TaskName" headerText="Task Name"
width="75"></e-treegrid-column>
    <e-treegrid-column field="StartDate" headerText=" Start Date"
textAlign="Right" format="yMd" type="date" width="90"></e-treegrid-column>
    <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="90"></e-treegrid-column>
    <e-treegrid-column field="Progress" headerText="Progress"
textAlign="Right" width="90"></e-treegrid-column>
  </e-treegrid-columns>
</ejs-treegrid>
```

### AUTOWRAP.CS

```
public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}
```

### Custom Attributes

You can customize the treegrid cells by adding a CSS class to the [customAttribute](#) property of the column.

`CSS

```
.e-attr {
```

```
background: '#d7f0f4';
```

```
}
```

```
,
```

In the below example, we have customized the cells of **TaskID** and **StartDate** columns.

#### CSHTML

```
@{
    object attr = new { @class = "e-attr" };
}
<style>
    .e-attr {
        background: '#d7f0f4';
    }
</style>
<ejs-treegrid id="TreeGrid" dataSource="ViewBag.datasource" height="300"
childMapping="Children" treeColumnIndex="1">
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" customAttribute="@ (attr) "
headerText="Task ID" textAlign="Right" width="90"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="160"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText="Start Date"
customAttribute="@ (attr) " textAlign="Right" width="120" format="yMd"></e-
treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="90"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

#### CUSTOMATTR.CS

```
public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}
```

#### Grid Lines

The [gridLines](#) have option to display cell border and it can be defined by the [gridLines](#) property.

The available modes of grid lines are:

- | Modes | Actions |
- |-----|-----|
- | Both | Displays both the horizontal and vertical grid lines. |
- | None | No grid lines are displayed. |
- | Horizontal | Displays the horizontal grid lines only. |
- | Vertical | Displays the vertical grid lines only. |
- | Default | Displays grid lines based on the theme. |

#### CSHTML

```
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource"
gridLines="Both" height="300" childMapping="Children" treeColumnIndex="1">
  <e-treegrid-columns>
    <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="90"></e-treegrid-column>
    <e-treegrid-column field="TaskName" headerText="Task Name"
width="160"></e-treegrid-column>
    <e-treegrid-column field="StartDate" headerText="Start Date"
textAlign="Right" width="120" format="yMd"></e-treegrid-column>
    <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="90"></e-treegrid-column>
  </e-treegrid-columns>
</ejs-treegrid>
```

### GRIDLINES.CS

```
public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}
```

By default, the treegrid renders with **Default** mode.

#### Clip Mode

The clip mode provides options to display its overflow cell content and it can be defined by the [columns.clipMode](#) property.

There are three types of [clipMode](#). They are:

- **Clip**: Truncates the cell content when it overflows its area.
- **Ellipsis**: Displays ellipsis when the cell content overflows its area.
- **EllipsisWithTooltip**: Displays ellipsis when the cell content overflows its area, also it will display the tooltip while hover on ellipsis is applied.

### CSHTML

```
<ejs-treegrid id="TreeGrid" dataSource="ViewBag.datasource"
gridLines="Both" height="300" childMapping="Children" treeColumnIndex="1">
  <e-treegrid-columns>
    <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="90"></e-treegrid-column>
    <e-treegrid-column field="TaskName" headerText="Task Name"
clipMode="EllipsisWithTooltip" width="160"></e-treegrid-column>
    <e-treegrid-column field="Assignee.FirstName" headerText="Assignee"
clipMode="Ellipsis" width="120"></e-treegrid-column>
    <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="90" clipMode="Clip"></e-treegrid-column>
    <e-treegrid-column field="Priority" headerText="Priority"
textAlign="Right" width="90"></e-treegrid-column>
  </e-treegrid-columns>
</ejs-treegrid>
```

**CLIPMODE.CS**

```
public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}
```

By default, [columns.clipMode](#) value is **Ellipsis**.

-->

## Editing in ASP.NET MVC Tree Grid Component

The TreeGrid component has options to dynamically insert, delete and update records.

Editing feature is enabled by using [EditSettings](#) property and it requires a primary key column for CRUD operations.

To define the primary key, set [IsPrimaryKey](#) to **true** using [Column](#) API of that particular column.

**CSHTML**

```
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource"
childMapping="Children" height="270" treeColumnIndex="1">
    <e-treegrid-editSettings allowAdding="true" allowDeleting="true"
allowEditing="true" mode="Cell"></e-treegrid-editSettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
isPrimaryKey="true" textAlign="Right" width="90"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="60"></e-treegrid-column>
        <e-treegrid-column field="Priority" headerText="Priority"
width="120"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="120"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

**EDIT.CS**

```
public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}
```

**Note:** You can disable editing for a particular column, by specifying [AllowEditing](#) of [Column](#) API to **false**.

## Toolbar with edit option

The treegrid toolbar has the built-in items to execute Editing actions.

You can define this by using the [Toolbar](#) property.

**CSHTML**

```
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource"
childMapping="Children" height="270" treeColumnIndex="1" toolbar="@ (new
List<string>() { "Add", "Edit", "Delete", "Cancel", "Update" })">
    <e-treegrid-editSettings allowAdding="true" allowDeleting="true"
allowEditing="true" mode="Row"></e-treegrid-editSettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
isPrimaryKey="true" textAlign="Right" width="90"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="60"></e-treegrid-column>
        <e-treegrid-column field="Priority" headerText="Priority"
width="120"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="120"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

**EDITTOOLS.CS**

```
public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}
```

## Adding row position

The TreeGrid control provides the support to add the new row in the top, bottom, above selected row, below selected row and child position of tree grid content using [NewRowPosition](#) property of [EditSettings](#) API. By default, a new row will be added at the top of the treegrid.

The following examples shows how to set new row position as **Child** in tree grid.

**CSHTML**

```
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.dataSource" height="400"
childMapping="Children"
treeColumnIndex="1" toolbar="@ (new List<string>() { "Add", "Delete",
"Update", "Cancel" })">
    <e-treegrid-editSettings allowAdding="true" allowEditing="true"
allowDeleting="true" newRowPosition="Child"></e-treegrid-editSettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
isPrimaryKey="true" textAlign="Right" width="70"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
editType="stringedit" width="180"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText="Start Date"
editType="datetimepickeredit" textAlign="Right" width="185"
format="yMd"></e-treegrid-column>
        <e-treegrid-column field="Priority" headerText="Priority"
defaultValue='Normal' width="100"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

**NEWROW.CS**

```
public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.dataSource = tree;
    return View();
}
```

Confirmation messages

*Delete confirmation*

The delete confirm dialog can be shown when deleting a record by defining the

[ShowDeleteConfirmDialog](#) as **true**

**CSHTML**

```
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.dataSource" height="400"
childMapping="Children" treeColumnIndex="1" toolbar="@ (new List<string>() {
"Add", "Delete", "Update", "Cancel" })">
    <e-treegrid-editsettings allowAdding="true" allowEditing="true"
allowDeleting="true" showDeleteConfirmDialog="true" mode="Cell"></e-
treegrid-editsettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
isPrimaryKey="true" textAlign="Right" width="100"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
editType="stringedit" width="190"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText="Start Date"
editType="datepickeredit" textAlign="Right" format="yMd" type="date"
width="130"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
editType="numericedit" textAlign="Right" width="120"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

**DELETECONFIRM.CS**

```
public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.dataSource = tree;
    return View();
}
```

**Note:** The [ShowDeleteConfirmDialog](#) supports all type of edit modes.

Default column values on add new

The treegrid provides an option to set the default value for the columns when adding a new record in it.

To set a default value for the particular column by defining the [DefaultValue](#) in [Column](#) API.

**CSHTML**

```
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource" height="400"
childMapping="Children" treeColumnIndex="1" toolbar="@ (new List<string>() {
"Add", "Delete", "Update", "Cancel" })">
    <e-treegrid-editsettings allowAdding="true" allowEditing="true"
allowDeleting="true"></e-treegrid-editsettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
isPrimaryKey="true" textAlign="Right" width="70"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
editType="stringedit" width="180"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText="Start Date"
editType="datetimepickeredit" format="yMd" textAlign="Right"
width="185"></e-treegrid-column>
        <e-treegrid-column field="Priority" headerText="Priority"
defaultValue="Normal" width="100"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

### DEFAULTVALUE.CS

```
public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}
```

### Disable editing for particular column

You can disable editing for particular columns by using the [AllowEditing](#) property of [Column](#) API.

In the following demo, editing is disabled for the **Start Date** column.

### CSHTML

```
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.dataSource" height="400"
childMapping="Children" treeColumnIndex="1" toolbar="@ (new List<string>() {
"Add", "Delete", "Update", "Cancel" })">
    <e-treegrid-editsettings allowAdding="true" allowEditing="true"
allowDeleting="true"></e-treegrid-editsettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
isPrimaryKey="true" textAlign="Right" width="70"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
editType="stringedit" width="180"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText="Start Date"
allowEditing="false" editType="datetimepickeredit" format="yMd"
textAlign="Right" width="185"></e-treegrid-column>
        <e-treegrid-column field="Priority" headerText="Priority"
width="100"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

### DISABLE.CS

```
public IActionResult Index()
```

```
{
    var tree = TreeData.GetDefaultData();
    ViewBag.dataSource = tree;
    return View();
}
```

Troubleshoot: Editing works only for first row

The Editing functionalities can be performed based upon the primary key value of the selected row.

If [IsPrimaryKey](#) is not defined in the treegrid, then edit or delete action take places the first row.

## Sorting

Sorting enables you to sort data in the **Ascending** or **Descending** order.

To sort a column, click the column header.

To sort multiple columns, press and hold the CTRL key and click the column header. You can clear sorting of any one of the multi-sorted columns by pressing and holding the SHIFT key and clicking the specific column header.

To enable sorting in the TreeGrid, set the [AllowSorting](#) to true. Sorting options can be configured through the [SortSettings](#).

## CSHTML

```
<ejs-treegrid id="TreeGrid" allowSorting="true"
dataSource="@ViewBag.datasource" height="315" childMapping="subTasks"
treeColumnIndex="1" allowPaging="true">
    <e-treegrid-columns>
        <e-treegrid-column field="category" headerText="Category"
width="90"></e-treegrid-column>
        <e-treegrid-column field="orderName" headerText="Order Name"
width="180"></e-treegrid-column>
        <e-treegrid-column field="orderDate" headerText="Order Date"
textAlign="Right" format="yMd" width="90"></e-treegrid-column>
        <e-treegrid-column field="units" headerText="Units"
textAlign="Right" width="80"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

## DEFAULTSORTING.CS

```
public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}
```

**Note:** TreeGrid columns are sorted in the **Ascending** order. If you click the already sorted column, the sort direction toggles.

<br/> You can apply and clear sorting by invoking [sortByColumn](#) and [clearSorting](#) methods.

<br/> To disable sorting for a particular column, set the [AllowSorting](#) property of [Column](#) to **false**.

## Initial sort

To sort at initial rendering, set the **Field** and **Direction** in the [Columns](#) property of [SortSettings](#).

**CSHTML**

```
@{
    List<object> cols = new List<object>();
    cols.Add(new { field = "category", direction = "Ascending" });
    cols.Add(new { field = "orderName", direction = "Descending" });
}
<ejs-treegrid id="TreeGrid" allowSorting="true"
dataSource="@ViewBag.datasource" height="315" childMapping="subTasks"
treeColumnIndex="1">
    <e-treegrid-sortsettings columns="cols"></e-treegrid-sortsettings>
    <e-treegrid-columns>
        <e-treegrid-column field="category" headerText="Category"
width="90"></e-treegrid-column>
        <e-treegrid-column field="orderName" headerText="Order Name"
width="180"></e-treegrid-column>
        <e-treegrid-column field="orderDate" headerText="Order Date"
textAlign="Right" format="yMd" width="90"></e-treegrid-column>
        <e-treegrid-column field="units" headerText="Units"
textAlign="Right" width="80"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

**INITIALSORT.CS**

```
public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}
```

## Sorting events

During the sort action, the treegrid component triggers two events. The [ActionBegin](#) event triggers before the sort action starts, and the [ActionComplete](#) event triggers after the sort action is completed. Using these events you can perform the needed actions.

**CSHTML**

```
<ejs-treegrid id="TreeGrid" allowSorting="true"
dataSource="@ViewBag.datasource" height="315" childMapping="subTasks"
actionBegin="actionHandler" actionComplete="actionHandler"
treeColumnIndex="1">
    <e-treegrid-columns>
        <e-treegrid-column field="category" headerText="Category"
width="90"></e-treegrid-column>
        <e-treegrid-column field="orderName" headerText="Order Name"
width="180"></e-treegrid-column>
        <e-treegrid-column field="orderDate" headerText="Order Date"
textAlign="Right" format="yMd" width="90"></e-treegrid-column>
        <e-treegrid-column field="units" headerText="Units"
textAlign="Right" width="80"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

```

    </e-treegrid-columns>
  </ejs-treegrid>
  <script>
    function actionHandler(args) {
      alert(args.requestType + ' ' + args.type); //custom Action
    }
  </script>

```

### EVENTHANDLERS.CS

```

public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}

```

**Note:** The **args.requestType** is the current action name. For example, in sorting the **args.requestType** value is 'sorting'.

<!-- Custom sort comparer

You can customize the default sort action for a column by defining the [column.sortComparer](#) property. The sort comparer function has the same functionality like [Array.sort](#) sort comparer.

In the following example, custom sort comparer function was defined in the **Category** column.

```
import { TreeGrid, Sort } from '@syncfusion/ej2-treegrid';
```

```
import { sortData } from './datasource.ts';
```

```
TreeGrid.Inject(Sort);
```

```
// The custom function
```

```
let sortComparer: (reference: string, comparer: string) => number = (reference: string,
```

```
comparer: string) => {
```

```
  if (reference < comparer) {
```

```
    return -1;
```

```
  }
```

```
  if (reference > comparer) {
```

```
    return 1;
```

```
  }
```

```
  return 0;
```

```
};
```

```
let treeGridObj: TreeGrid = new TreeGrid({
```

```
  dataSource: sortData,
```

```
  childMapping: 'subtasks',
```

```

allowSorting: true,
height: 315,
treeColumnIndex: 1,
columns: [
{ field: 'Category', headerText: 'Category', width: 140 },
{ field: 'orderName', headerText: 'Order Name', width: 200 },
{ field: 'orderDate', headerText: 'Order Date', width: 120, textAlign: 'Right', format: 'yMd', type: 'date' },
{ field: 'units', headerText: 'Units', width: 90, textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
`

```

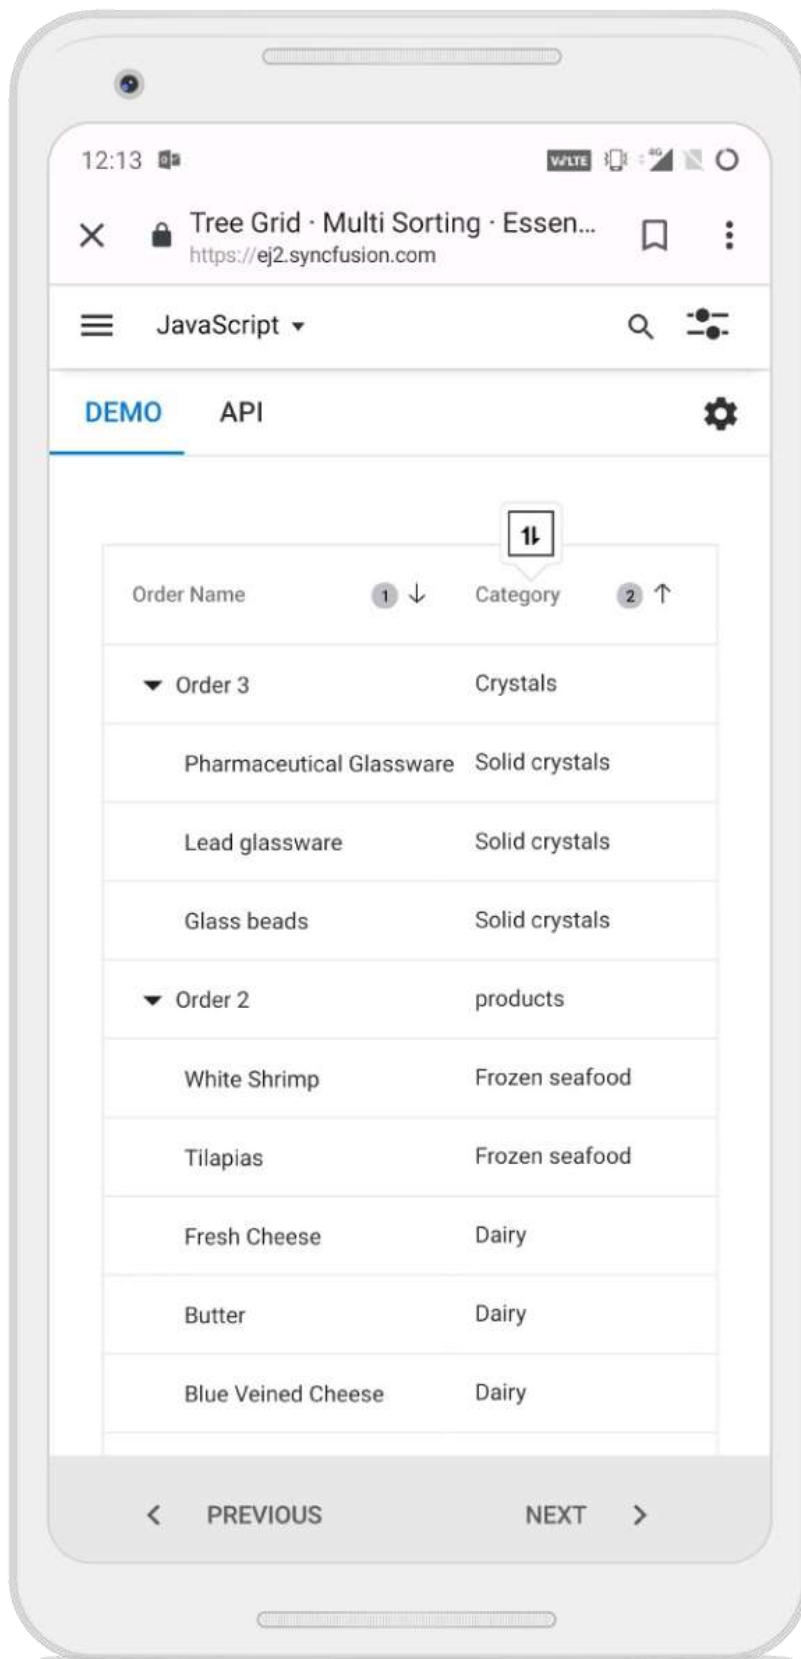

**Note:** The sort comparer function will work only for the local data. -->

#### Touch interaction

When you tap the treegrid header on touchscreen devices, the selected column header is sorted. A

popup  is displayed for multi-column sorting. To sort multiple columns, tap the popup , and then tap the desired treegrid headers.

The following screenshot shows treegrid touch sorting.

## Filtering in ASP.NET MVC Tree Grid Component

Filtering allows you to view specific or related records based on filter criteria. To enable filtering in the TreeGrid, set the [AllowFiltering](#) to true. Filtering options can be configured through [FilterSettings](#).

### CSHTML

```
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource" height="275"
childMapping="Children" treeColumnIndex="1" allowFiltering="true"
allowPaging="true">
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="100"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="190"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText=" Start Date"
textAlign="Right" format="yMd" type="date" width="120"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="110"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

### DEFAULTFILTERING.CS

```
public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}
```

**Note:** You can apply and clear filtering by using [filterByColumn](#) and [clearFiltering](#) methods.

<br/> To disable filtering for a particular column, set [AllowFiltering](#) property of [Column](#) to false.

### Filter hierarchy modes

TreeGrid provides support for a set of filtering modes with [HierarchyMode](#) of [FilterSettings](#) property.

The below are the type of filter mode available in TreeGrid.

- **Parent** : This is the default filter hierarchy mode in TreeGrid. The filtered records are displayed with its parent records, if the filtered records not have any parent record then the filtered records only displayed.
- **Child** : The filtered records are displayed with its child record, if the filtered records not have any child record then the filtered records only displayed.
- **Both** : The filtered records are displayed with its both parent and child record, if the filtered records not have any parent and child record then the filtered records only displayed.
- **None** : The filtered records are only displayed.

### CSHTML

```
<ejs-dropdownlist id="mode" dataSource="@ViewBag.dropdata"
placeholder="Select a Mode" change="onModeChange" index="0"
popupHeight="220px">
    <e-dropdownlist-fields text="mode" value="id"></e-dropdownlist-fields>
```

```

</ejs-dropdownlist>
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource" height="275"
childMapping="Children" treeColumnIndex="1" allowFiltering="true">
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="100"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="190"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText=" Start Date"
textAlign="Right" format="yMd" type="date" width="120"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="110"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
<script>
    function onModeChange(e) {
        var treegrid = document.getElementById("TreeGrid").ej2_instances[0];
        var mode = e.value;
        treegrid.filterSettings.hierarchyMode = mode;
        treegrid.clearFiltering();
    }
</script>

```

#### FILTERMODES.CS

```

public ActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    ViewBag.dropdata = new List<object>() {
        new { id= "Parent", mode= "Parent" },
        new { id= "Child", mode= "Child" },
        new { id= "Both", mode= "Both" },
        new { id= "None", mode= "None" },
    };
    return View();
}

```

#### Initial filter

To apply the filter at initial rendering, set the filter **Predicate** object in [Columns](#) property of [FilterSettings](#).

#### CSHTML

```

@{
    List<object> filterColumns = new List<object>();
    filterColumns.Add(new { field = "TaskName", matchCase = false, @operator
= "startswith", predicate = "and", value = "plan" });
    filterColumns.Add(new { field = "Duration", matchCase = false, @operator
= "equal", predicate = "and", value = 5 });
}
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource" height="275"
childMapping="Children" treeColumnIndex="1" allowFiltering="true">
    <e-treegrid-filterSettings columns="filterColumns"></e-treegrid-
filterSettings>

```

```

<e-treegrid-columns>
  <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="100"></e-treegrid-column>
  <e-treegrid-column field="TaskName" headerText="Task Name"
width="190"></e-treegrid-column>
  <e-treegrid-column field="StartDate" headerText=" Start Date"
textAlign="Right" format="yMd" type="date" width="120"></e-treegrid-column>
  <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="110"></e-treegrid-column>
</e-treegrid-columns>
</ejs-treegrid>

```

### INITIALFILTER.CS

```

public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}

```

### Filter operators

The filter operator for a column can be defined in the **Operator** property of [Columns](#) in [FilterSettings](#).

The available operators and its supported data types are:

| Operator           | Description   | Supported Types                                 |
|--------------------|---|---|
| startswith         | Checks whether the value begins with the specified value.               | String  |
| endswith           | Checks whether the value ends with the specified value.                 | String  |
| contains           | Checks whether the value contains the specified value.                  | String  |
| equal              | Checks whether the value is equal to the specified value.               | String &#124; Number &#124; Boolean &#124; Date |
| notequal           | Checks for values not equal to the specified value.                     | String &#124; Number &#124; Boolean &#124; Date |
| greaterthan        | Checks whether the value is greater than the specified value.           | Number &#124; Date                              |
| greaterthanorequal | Checks whether a value is greater than or equal to the specified value. | Number &#124; Date                              |
| lessthan           | Checks whether the value is less than the specified value.              | Number &#124; Date                              |
| lessthanorequal    | Checks whether the value is less than or equal to the specified value.  | Number &#124; Date                              |

**Note:** By default, the **Operator** [Columns](#) value is **equal**.

### Search

You can search records in a TreeGrid, by using the [search](#) method with search key as a parameter. This also provides an option to integrate search text box in treegrid's toolbar by adding **search** item to the [Toolbar](#).

**CSHTML**

```
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource" height="270"
toolbar="@ (new List<string>() { "Search" })" childMapping="Children"
treeColumnIndex="1">
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="100"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="190"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText=" Start Date"
textAlign="Right" format="yMd" type="date" width="120"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="110"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

**DEFAULTSEARCHING.CS**

```
public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}
```

## Initial search

To apply search at initial rendering, set the fields, operator, key, and ignoreCase in the [SearchSettings](#).

**CSHTML**

```
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource" height="270"
toolbar="@ (new List<string>() { "Search" })" childMapping="Children"
treeColumnIndex="1">
    <e-treegrid-searchSettings fields="@ (new string[] { "TaskName" })"
operator="contains" key="plan" ignoreCase="true">
    </e-treegrid-searchSettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="100"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="190"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText=" Start Date"
textAlign="Right" format="yMd" type="date" width="120"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="110"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

**INITIALSEARCH.CS**

```
public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
}
```

```
return View();
}
```

**Note:** By default, treegrid searches all the bound column values. To customize this behavior define the [SearchSettings.Fields](#) property.

### Search operators

The search operator can be defined in the [Operators](#) property of [SearchSettings](#) to configure specific searching.

The following operators are supported in searching:

#### Operator | Description

startsWith | Checks whether a value begins with the specified value.

endsWith | Checks whether a value ends with the specified value.

contains | Checks whether a value contains the specified value.

equal | Checks whether a value is equal to the specified value.

notEqual | Checks for values not equal to the specified value.

**Note:** By default, the [Operators](#) value is **contains**.

### Search by external button

To search treegrid records from an external button, invoke the [search](#) method.

### CSHTML

```
<input type="text" id="searchText">
<ejs-button id="Search" content="Search" cssClass="e-primary"></ejs-button>
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasources" height="270"
childMapping="Children" treeColumnIndex="1">
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="100"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="190"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText="Start Date"
textAlign="Right" format="yMd" type="date" width="120"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="110"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
<script>
    document.getElementById('Search').addEventListener('click', function
(args) {
        var val = document.getElementById('searchText').value;
        var treegrid = document.getElementById('TreeGrid').ej2_instances[0];
        treegrid.search(val);
    });
</script>
```

### SEARCHEXTERNAL.CS

```
public IActionResult Index()
```

```
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}
```

### Search specific columns

By default, treegrid searches all visible columns. You can search specific columns by defining the specific column's field names in the [Fields](#) property of [SearchSettings](#).

### CSHTML

```
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource" height="270"
toolbar="@ (new List<string>() { "Search" })" childMapping="Children"
treeColumnIndex="1">
    <e-treegrid-searchSettings fields="@ (new string[] { "TaskName",
"Duration" })">
    </e-treegrid-searchSettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="100"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="190"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText=" Start Date"
textAlign="Right" format="yMd" type="date" width="120"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="110"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

### SEARCHCOLUMNS.CS

```
public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}
```

### Paging

Paging provides an option to display TreeGrid data in page segments. To enable paging, set the [AllowPaging](#) to true. When paging is enabled, pager component renders at the bottom of the treegrid.

Paging options can be configured through the [PageSettings](#).

### CSHTML

```
<ejs-treegrid id="TreeGrid" dataSource="ViewBag.datasource"
allowPaging="true" childMapping="Children" treeColumnIndex="1">
    <e-treegrid-pagesettings pageSize="7"></e-treegrid-pagesettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="100"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="190"></e-treegrid-column>
```

```

<e-treegrid-column field="StartDate" headerText=" Start Date"
textAlign="Right" format="yMd" type="date" width="120"></e-treegrid-column>
<e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="110"></e-treegrid-column>
</e-treegrid-columns>
</ejs-treegrid>

```

### DEFAULTPAGING.CS

```

public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}

```

**Note:** You can achieve better performance by using treegrid paging to fetch only a pre-defined number of records from the data source.

### Page Size Mode

Two behaviour are available in TreeGrid paging to display certain number of records in a current page. Following are the two types of [PageSizeMode](#) property of [PageSettings](#).

- **All** : This is the default mode. The number of records in a page is based on [PageSize](#) property.
- **Root** : The number of root nodes or the 0th level records to be displayed per page is based on [PageSize](#) property.

With [PageSizeMode](#) property as **Root**, only the root level or the 0th level records are considered in records count.

### CSHTML

```

<ejs-treegrid id="TreeGrid" dataSource="ViewBag.datasource"
allowPaging="true" childMapping="Children" treeColumnIndex="1">
    <e-treegrid-pagesettings pageSize="2" pageSizeMode="Root"></e-treegrid-
pagesettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="100"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="190"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText=" Start Date"
textAlign="Right" format="yMd" type="date" width="120"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="110"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>

```

### PAGEMODE.CS

```

public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
}

```

```

ViewBag.datasource = tree;
return View();
}

```

## Template

You can use custom elements inside the pager instead of default elements.

The custom elements can be defined by using the [Template](#) property.

Inside this template, you can access the [CurrentPage](#), [PageSize](#), [PageCount](#), [TotalPage](#) and [TotalRecordCount](#) values.

## CSHTML

```

<style>
    #container {
        visibility: hidden;
    }
    #loader {
        color: #008cff;
        font-family: 'Helvetica Neue', 'calibri';
        font-size: 14px;
        height: 40px;
        left: 45%;
        position: absolute;
        top: 45%;
        width: 30%;
    }
</style>
<script id="template" type="text/x-template">
    <div class="e-pagertemplate">
        <div class="col-lg-12 control-section">
            <div class="content-wrapper">
                <input id="currentPage" type="text" value=${currentPage}
style="padding-left: 10px; text-align: left">
            </div>
        </div>

        <div id="totalPages" class="e-pagertemplatemessage" style="margin-
top: 5px; margin-left: 30px; border: none; display: inline-block ">
            <span class="e-pagenomsg">${currentPage} of ${totalPages} pages
(${totalRecordsCount} items)</span>
        </div>
    </div>
</script>
<ejs-treegrid id="TreeGrid" dataSource="ViewBag.datasource"
dataBound="dataBound" actionComplete="actionComplete" allowPaging="true"
childMapping="Children" treeColumnIndex="1">
    <e-treegrid-pagesettings pageSize="6" template="#template"></e-treegrid-
pagesettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="100"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="190"></e-treegrid-column>

```

```

<e-treegrid-column field="StartDate" headerText=" Start Date"
textAlign="Right" format="yMd" type="date" width="120"></e-treegrid-column>
<e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="110"></e-treegrid-column>
</e-treegrid-columns>
</ejs-treegrid>
<script>
    var flag = true;
    function dataBound(args) {
        if (flag) {
            flag = false;
            updateTemplate();
        }
    }
    function actionComplete(args) {
        if (args.requestType === 'paging') {
            updateTemplate();
        }
    }
    function updateTemplate() {
        var numeric = new ej.inputs.NumericTextBox({
            min: 1,
            max: 6,
            step: 1,
            width: 75,
            format: '###.##',
            change: function(args) {
                var treegridObj =
document.getElementById('TreeGrid').ej2_instances[0];
                var value = args.value;
                treegridObj.goToPage(value);
            }
        });
        numeric.appendTo('#currentPage');
    };
</script>

```

#### PAGERTEMPLATE.CS

```

public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}

```

#### Pager with Page Size Dropdown

The pager Dropdown allows you to change the number of records in the TreeGrid dynamically. It can be enabled by defining the [PageSizes](#) property of [PageSettings](#) as **true**.

#### CSHTML

```

<ejs-treegrid id="TreeGrid" dataSource="ViewBag.datasource"
allowPaging="true" childMapping="Children" treeColumnIndex="1">

```

```

<e-treegrid-pagesettings pageSize="10" pageSizes="true"></e-treegrid-
pagesettings>
<e-treegrid-columns>
  <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="100"></e-treegrid-column>
  <e-treegrid-column field="TaskName" headerText="Task Name"
width="190"></e-treegrid-column>
  <e-treegrid-column field="StartDate" headerText="Start Date"
textAlign="Right" format="yMd" type="date" width="120"></e-treegrid-column>
  <e-treegrid-column field="EndDate" headerText="End Date"
textAlign="Right" format="yMd" type="date" width="120"></e-treegrid-column>
  <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="110"></e-treegrid-column>
  <e-treegrid-column field="Progress" headerText="Progress"
textAlign="Right" width="110"></e-treegrid-column>
  <e-treegrid-column field="Priority" headerText="Priority"
width="110"></e-treegrid-column>
</e-treegrid-columns>
</ejs-treegrid>

```

### PAGESIZES.CS

```

public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}

```

| Task ID            | Task Name                  | Start Date | End Date  | Duration | Progress | Priority                |

### How to render Pager at the Top of the TreeGrid

By default, Pager will be rendered at the bottom of the TreeGrid. You can also render the Pager at the top of the TreeGrid by using the [DataBound](#) event.

**CSHTML**

```

<ejs-treegrid id="TreeGrid" dataSource="ViewBag.dataSource"
dataBound="dataBound" allowPaging="true" childMapping="Children"
treeColumnIndex="1">
    <e-treegrid-pagesettings pageSize="7" pageSizes="true"></e-treegrid-
pagesettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="100"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="190"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText="Start Date"
textAlign="Right" format="yMd" type="date" width="120"></e-treegrid-column>
        <e-treegrid-column field="EndDate" headerText="End Date"
textAlign="Right" format="yMd" type="date" width="120"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="110"></e-treegrid-column>
        <e-treegrid-column field="Progress" headerText="Progress"
textAlign="Right" width="110"></e-treegrid-column>
        <e-treegrid-column field="Priority" headerText="Priority"
width="110"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
<script>
    var initialLoad = true;
    function dataBound(args) {
        if (initialLoad) {
            initialLoad = false;
            var pager = document.getElementsByClassName('e-gridpager');
            var topElement;
            if (this.toolbar) {
                topElement = document.getElementsByClassName('e-toolbar');
            } else {
                topElement = document.getElementsByClassName('e-
gridheader');
            }
            topElement[0].before(pager[0]);
        }
    };
</script>

```

**CUSTOMIZE.CS**

```

public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}

```

**Note:** During the paging action, the pager component triggers the below three events.

<br/> The **created** event triggers when Pager is created.

<br/> The **click** event triggers when the numeric items in the pager is clicked.

The **dropDownChanged** event triggers when pageSize DropDownList value is selected.

### Selection in ASP.NET MVC Tree Grid Component

Selection provides an option to highlight a row or a cell. It can be done through simple mouse down or arrow keys. To disable selection in the TreeGrid, set the [AllowSelection](#) to false.

The treegrid supports two types of selection that can be set by using the [Type](#) property in [SelectionSettings](#). They are:

- **Single:** The Single value is set by default, and it only allows selection of a single row or a cell.
- **Multiple:** Allows you to select multiple rows or cells.

To perform the multi-selection, press and hold CTRL key and click the desired rows or cells. To select range of rows or cells, press and hold the SHIFT key and click the rows or cells.

### CSHTML

```
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource"
allowPaging="true" allowSelection="true" childMapping="Children"
treeColumnIndex="1">
    <e-treegrid-selectionsettings type="Multiple"></e-treegrid-
selectionsettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="100"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="190"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText=" Start Date"
textAlign="Right" format="yMd" type="date" width="120"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="110"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

### SELECTION.CS

```
public ActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}
```

### Selection mode

The treegrid supports three types of selection mode that can be set by using the [Mode](#) property of [SelectionSettings](#). They are:

- **Row:** The Row value is set by default, and allows you to select only rows.
- **Cell:** Allows you to select only cells.
- **Both:** Allows you to select rows and cells at the same time.

### CSHTML

```

<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource"
allowPaging="true" allowSelection="true" childMapping="Children"
treeColumnIndex="1">
    <e-treegrid-selectionsettings mode="Both"></e-treegrid-
selectionsettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="100"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="190"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText=" Start Date"
textAlign="Right" format="yMd" type="date" width="120"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="110"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>

```

### SELECTION-MODE.CS

```

public ActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}

```

### Aggregates in ASP.NET MVC Tree Grid Component

Aggregate values are displayed in the TreeGrid footer and in parent row footer for child row aggregate values. It can be configured through [Aggregates](#) property.

[Field](#) and [Type](#) are the minimum properties required to represent an aggregate column.

By default, the aggregate value can be displayed in the treegrid footer, and footer of child rows. To show the aggregate value in one of the cells, use the [FooterTemplate](#).

#### Built-in aggregate types

The aggregate type should be specified in the [Type](#) property to configure an aggregate column.

The built-in aggregates are,

- Sum
- Average
- Min
- Max
- Count
- Truecount
- Falsecount

**Note:** Multiple aggregates can be used for an aggregate column by setting the [Type](#) property with an array of aggregate types.

<br/> Multiple types for a column is supported only when one of the aggregate templates is used.

### Child aggregate

Aggregate value is calculated for child rows, and it is displayed in the parent row footer. Use the [ShowChildSummary](#) property to render the child rows aggregate value.

### CSHTML

```
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource" height="260"
childMapping="Children" treeColumnIndex="1">
  <e-treegrid-aggregates>
    <e-treegrid-aggregate showChildSummary="true">
      <e-treegrid-aggregate-columns>
        <e-treegrid-aggregate-column field="Approved"
type="TrueCount" columnName="Approved" footerTemplate="Approved:
${TrueCount}"></e-treegrid-aggregate-column>
      </e-treegrid-aggregate-columns>
    </e-treegrid-aggregate>
  </e-treegrid-aggregates>
  <e-treegrid-columns>
    <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="80"></e-treegrid-column>
    <e-treegrid-column field="TaskName" headerText="Task Name"
width="200"></e-treegrid-column>
    <e-treegrid-column field="StartDate" headerText=" Start Date"
textAlign="Right" format="yMd" type="date" width="100"></e-treegrid-column>
    <e-treegrid-column field="Approved" headerText="Approved"
type="boolean" textAlign="Center" displayAsCheckBox="true" width="100"></e-
treegrid-column>
  </e-treegrid-columns>
</ejs-treegrid>
```

### CHILDAGGREGATE.CS

```
public IActionResult Index()
{
    ViewBag.datasource = TreeSummaryData.GetData();
    return View();
}
```

### Context menu in ASP.NET MVC Tree Grid Component

The TreeGrid has options to show the context menu when right clicked on it. To enable this feature, you need to define either default or custom item in the [ContextMenuItems](#).

The default items are in the following table.

| Items      | Description                  |
|------------|------------------------------|
| AutoFit    | Auto fit the current column. |
| AutoFitAll | Auto fit all columns.        |
| Edit       | Edit the current record.     |
| Delete     | Delete the current record.   |
| Save       | Save the edited record.      |

**Cancel** | Cancel the edited state.

**PdfExport** | Export the treegrid data as Pdf document.

**ExcelExport** | Export the treegrid data as Excel document.

**CsvExport** | Export the treegrid data as CSV document.

**SortAscending** | Sort the current column in ascending order.

**SortDescending** | Sort the current column in descending order.

**FirstPage** | Go to the first page.

**PrevPage** | Go to the previous page.

**LastPage** | Go to the last page.

**NextPage** | Go to the next page.

**AddRow** | Add new row to the treegrid.

### **CSHTML**

```
@{
    var contextItems = new string[]{
        "SortAscending", "SortDescending", "Edit", "Delete", "Save",
        "Cancel",
        "PdfExport", "ExcelExport", "CsvExport", "FirstPage", "PrevPage",
        "LastPage", "NextPage", "Indent", "Outdent" };
}
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource"
selectedRowIndex="2" contextMenuItems="contextItems" allowExcelExport="true"
allowPdfExport="true" allowSorting="true" allowPaging="true"
allowResizing="true" childMapping="Children" treeColumnIndex="1">
    <e-treegrid-pagesettings pageSize="7"></e-treegrid-pagesettings>
    <e-treegrid-editsettings allowAdding="true" allowEditing="true"
allowDeleting="true" mode="Row"></e-treegrid-editsettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
isPrimaryKey="true" textAlign="Right" width="90"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="180" textAlign="Left"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText="Start Date"
editType="datepickeredit" textAlign="Right" format="yMd" type="date"
width="90"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
editType="numericedit" textAlign="Right" width="80"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

### **DEFAULT-CONTEXTMENU.CS**

```
public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}
```

```
}

```

### Custom context menu items

The custom context menu items can be added by defining the [ContextMenuItems](#) as a collection of **ContextMenuItemModel**.

Actions for this customized items can be defined in the [ContextMenuClick](#) event.

In the below sample, we have shown context menu item for parent rows to expand or collapse child rows.

### CSHTML

```
@{
    List<object> contextItems = new List<Object>();
    contextItems.Add(new { text = "Collapse the Row", target = ".e-content",
id = "collapserow" });
    contextItems.Add(new { text = "Expand the Row", target = ".e-content",
id = "expandrow" });
}
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource"
contextMenuOpen="onOpen" contextMenuClick="onClick"
contextMenuItems="contextItems" allowExcelExport="true"
allowPdfExport="true" allowSorting="true" allowPaging="true"
childMapping="Children" treeColumnIndex="1">
    <e-treegrid-pagesettings pageSize="7"></e-treegrid-pagesettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
isPrimaryKey="true" textAlign="Right" width="90"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="180" textAlign="Left"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText=" Start Date"
textAlign="Right" format="yMd" type="date" width="90"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="80"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
<script>
    function onOpen(args) {
        var treegrid = document.getElementById("TreeGrid").ej2_instances[0];
        var elem = args.event.target;
        var uid = elem.closest('.e-row').getAttribute('data-uid');
        if (ejs.base.isNullOrUndefined(ejs.base.getValue('hasChildRecords',
treegrid.grid.getRowObjectFromUID(uid).data))) {
            args.cancel = true;
        } else {
            var flag = ej.base.getValue('expanded',
treegrid.grid.getRowObjectFromUID(uid).data);
            var val = flag ? 'none' : 'block';

            document.querySelectorAll('li#expandrow')[0].setAttribute('style', 'display:
' + val + ';');
            val = !flag ? 'none' : 'block';

            document.querySelectorAll('li#collapserow')[0].setAttribute('style',
'display: ' + val + ';');
        }
    }

```

```

    }
}
function onClick(args) {
    var treegrid = document.getElementById("TreeGrid").ej2_instances[0];
    treegrid.getColumnByField("TaskId");
    if (args.item.id === "collapserow")
        treegrid.collapseRow(treegrid.getSelectedRows()[0],
treegrid.getSelectedRecords()[0]);
    else
        treegrid.expandRow(treegrid.getSelectedRows()[0],
treegrid.getSelectedRecords()[0]);
}
</script>

```

### CUSTOM-CONTEXTMENU.CS

```

public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}

```

Enable and disable context menu items dynamically

You can enable and disable the context menu items using the [enableItems](#) method in [contextMenuOpen](#) event.

### CSHTML

```

@{
    ....
    var data = TreeGridItems.GetTreeData();
    List<object> contextItems = new List<Object>();
    contextItems.Add(new { text= "Edit Record", target= ".e-content", id=
"Edit_record" });
    contextItems.Add(new { text = "Delete Record", target = ".e-content", id
= "Delete_record" });
}
<ejs-treegrid id="TreeGrid" dataSource="@data"
contextMenuOpen="ContextMenuOpen" contextMenuClick="ContextMenuClick"
contextMenuItems="contextItems" allowPaging="true" childMapping="Children"
treeColumnIndex="1">
    <e-treegrid-pagesettings pageSize="7"></e-treegrid-pagesettings>
    <e-treegrid-editSettings allowAdding="true" allowDeleting="true"
allowEditing="true" mode="Row"></e-treegrid-editSettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
isPrimaryKey="true" textAlign="Right" width="90"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="180" textAlign="Left"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText=" Start Date"
textAlign="Right" format="yMd" type="date" width="90"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="80"></e-treegrid-column>
    </e-treegrid-columns>

```

```

</ejs-treegrid>
<script>
    function ContextMenuOpen(args) {
        if (args.rowInfo.rowData.hasChildRecords == true) {
            this.grid.contextMenuModule.contextMenu.enableItems(['Edit
Record'], true); //Enable edit
            this.grid.contextMenuModule.contextMenu.enableItems(['Delete
Record'], false); //Disable delete
        } else {
            this.grid.contextMenuModule.contextMenu.enableItems(['Edit
Record'], false); //Disable edit
            this.grid.contextMenuModule.contextMenu.enableItems(['Delete
Record'], true); //Enable edit
        }
    }
    function ContextMenuClick(args) {
        if (args.element.innerHTML == "Edit Record") {
            this.startEdit(args.rowInfo.row);
        }
        else if (args.element.innerHTML == "Delete Record") {
            this.deleteRecord(args.rowInfo.row);
        }
    }
}
</script>

```

#### ENABLE-CONTEXTMENU.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        return View(TreeGridItems.GetTreeData());
    }
}

    Duration = 5
};
TreeGridItems Child3 = new TreeGridItems()
{
    TaskId = 4,
    TaskName = "Allocate resources",
    StartDate = new DateTime(2016, 06, 07),
    Duration = 5
};
Record1.Children.Add(Child1);
Record1.Children.Add(Child2);
Record1.Children.Add(Child3);
TreeGridItems Record2 = new TreeGridItems()
{
    TaskId = 6,
    TaskName = "Design",
    StartDate = new DateTime(2021, 08, 25),
    Duration = 3,
    Children = new List<TreeGridItems>()
};
TreeGridItems Child5 = new TreeGridItems()
{
    TaskId = 7,
    TaskName = "Software Specification",
    StartDate = new DateTime(2021, 08, 25),
    Duration = 3
};
TreeGridItems Child6 = new TreeGridItems()
{
    TaskId = 8,
    TaskName = "Develop prototype",
    StartDate = new DateTime(2021, 08, 25),
    Duration = 3
};
TreeGridItems Child7 = new TreeGridItems()
{
    TaskId = 9,
    TaskName = "Get approval from customer",
    StartDate = new DateTime(2024, 06, 27),
    Duration = 2
};
Record2.Children.Add(Child5);
Record2.Children.Add(Child6);
Record2.Children.Add(Child7);
BusinessObjectCollection.Add(Record1);
BusinessObjectCollection.Add(Record2);
```

```

        return BusinessObjectCollection;
    }
}

```

**Note:** You can hide or show an item in context menu for specific area inside of treegrid by defining the [Target](#) property.

## ToolBar

The TreeGrid provides ToolBar support to handle treegrid actions. The [ToolBar](#) property accepts either the collection of built-in toolbar items and [ItemModel](#) objects for custom toolbar items or HTML element ID for toolbar template.

To use ToolBar, inject **ToolBar** module in the treegrid.

### Built-in toolbar items

Built-in toolbar items execute standard actions of the treegrid, and it can be added by defining the [ToolBar](#) as a collection of built-in items. It renders the button with icon and text.

The following table shows built-in toolbar items and its actions.

| Built-in Toolbar Items | Actions                                |
|------------------------|--|
| ExpandAll              | Expands all the rows.                  |
| CollapseAll            | Collapses all the rows.                |
| Add                    | Adds a new record.                     |
| Edit                   | Edits the selected record.             |
| Update                 | Updates the edited record.             |
| Delete                 | Deletes the selected record.           |
| Cancel                 | Cancels the edit state.                |
| Search                 | Searches the records by the given key. |
| Print                  | Prints the treegrid.                   |
| ExcelExport            | Exports the treegrid to Excel.         |
| PdfExport              | Exports the treegrid to PDF.           |
| WordExport             | Exports the treegrid to Word.          |

## CSHTML

```

<ejs-treegrid id="TreeGrid" dataSource="ViewBag.datasourcesource" height="265"
toolbar="@ (new List<string>() { "Print", "Search" }) " childMapping="Children"
treeColumnIndex="1">
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="90"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="180" textAlign="Left"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText=" Start Date"
textAlign="Right" format="yMd" type="date" width="90"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>

```

```

        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="80"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>

```

### DEFAULT-TOOLBAR.CS

```

public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}

```

**Note:** \* The [ToolBar](#) has options to define both built-in and custom toolbar items.

Custom toolbar items

Custom toolbar items can be added by defining the [ToolBar](#) as a collection of [ItemModels](#).

Actions for this customized toolbar items are defined in the [ToolBarClick](#) event.

By default, Custom toolbar items are in position **Left**. You can change the position by using the [Align](#) property. In the below sample, we have applied position **Right** for the **Quick Filter** toolbar item.

### CSHTML

```

@{
    List<object> toolbarItems = new List<object>();
    toolbarItems.Add(new { text = "Quick Filter", tooltipText = "Quick
Filter", id = "toolbarfilter", align = "Right" });
}
<ejs-treegrid id="TreeGrid" dataSource="ViewBag.datasource" height="400"
allowFiltering="true" toolbar=toolbarItems toolbarClick="toolbarClick"
childMapping="Children" treeColumnIndex="1">
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="90"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="180" textAlign="Left"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText="Start Date"
textAlign="Right" format="yMd" type="date" width="90"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="80"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
<script>
    function toolbarClick(args) {
        if (args.item.id === 'toolbarfilter') {
            var treegrid =
document.getElementById("TreeGrid").ej2_instances[0];
            treegrid.filterByColumn("TaskName", "startswith",
"Testing");;
        }
    }
</script>

```

**CUSTOM-TOOLBAR.CS**

```
public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}
```

**Note:** \* The [ToolBar](#) has options to define both built-in and custom toolbar items.

<br/> \* If a toolbar item does not match the built-in items, it will be treated as a custom toolbar item.

**Built-in and custom items in toolbar**

TreeGrid have an option to use both built-in and custom toolbar items at same time.

In the below example, **ExpandAll**, **CollapseAll** are built-in toolbar items and **Click** is custom toolbar item.

**CSHTML**

```
@{
    List<object> toolbarItems = new List<object>();
    toolbarItems.Add("ExpandAll");
    toolbarItems.Add("CollapseAll");
    toolbarItems.Add(new { text = "Click", tooltipText = "Click", id
= "Click", prefixIcon = "e-time" });
}
<ejs-treegrid id="TreeGrid" dataSource="ViewBag.datasource" height="270"
toolbar=toolbarItems toolbarClick="toolbarClick" childMapping="Children"
treeColumnIndex="1">
<e-treegrid-editsettings allowAdding="true" allowEditing="true"
allowDeleting="true"></e-treegrid-editsettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="90"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="180" textAlign="Left"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText=" Start Date"
textAlign="Right" format="yMd" type="date" width="90"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="80"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
<script>
    function toolbarClick(args) {
        if (args.item.text === 'Click') {
            alert("Custom toolbar click...");
        }
    }
</script>
```

**BUILTINCUSTOMITEMS.CSS**

```
#container {
    visibility: hidden;
```

```

}
#loader {
    color: #008cff;
    font-family: 'Helvetica Neue','calibiri';
    font-size: 14px;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.e-treegrid .e-time::before {
    content: '\e20c'
}

```

### Enable/disable toolbar items

You can enable/disable toolbar items by using the `enableItems` method.

### CSHTML

```

@{
    List<object> toolbarItems = new List<object>();
    toolbarItems.Add("QuickFilter");
    toolbarItems.Add("ClearFilter");
}

<ejs-button id="enable" content="Enable"></ejs-button>
<ejs-button id="disable" content="Disable"></ejs-button>
<ejs-treegrid id="TreeGrid" dataSource="ViewBag.datasource" height="200"
allowFiltering="true" toolbar=toolbarItems toolbarClick="toolbarClick"
childMapping="Children" treeColumnIndex="1">
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="90"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="180" textAlign="Left"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText=" Start Date"
textAlign="Right" format="yMd" type="date" width="90"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="80"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
<script>
    function toolbarClick(args) {
        if (args.item.text === 'QuickFilter') {
            var treegrid =
document.getElementById("TreeGrid").ej2_instances[0];
            treegrid.filterByColumn("TaskName", "startswith",
"Testing");
        }
        if (args.item.text === 'ClearFilter') {
            var treegrid =
document.getElementById("TreeGrid").ej2_instances[0];
            treegrid.clearFiltering();
        }
    }
}

```

```

        document.getElementById('enable').onclick = () => {
            var treegrid =
document.getElementById("TreeGrid").ej2_instances[0];
            treegrid.toolbarModule.enableItems([treegrid.element.id +
'_gridcontrol_QuickFilter', treegrid.element.id +
'_gridcontrol_ClearFilter'], true); // enable toolbar items.
        };
        document.getElementById('disable').onclick = () => {
            var treegrid =
document.getElementById("TreeGrid").ej2_instances[0];
            treegrid.toolbarModule.enableItems([treegrid.element.id +
'_gridcontrol_QuickFilter', treegrid.element.id +
'_gridcontrol_ClearFilter'], false); // disable toolbar items.
        };
</script>

```

### TOOLBAR-ENABLE.CS

```

public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}

```

## Globalization in ASP.NET MVC Tree Grid control

### Localization

The [Localization](#) library allows you to localize default text content of the TreeGrid. The treegrid component has static text on some features (like toolbar area text, filter menu text, pager information text, etc.) that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the [Locale](#) value and translation object.

The following list of properties and its values are used in the treegrid.

| Locale keywords | Text |

|-----|-----|

EmptyRecord | No records to display

True | true

False | false

ExpandAll | Expand All

CollapseAll | Collapse All

RowIndent | Indent

RowOutdent | Outdent

InvalidFilterMessage | Invalid Filter Data

FilterbarTitle | \s filter bar cell

Add | Add

Edit | Edit

Cancel | Cancel

Update | Update

Delete | Delete

Print | Print

Pdfexport | PDF Export

Excelexport | Excel Export

Wordexport | Word Export

Csvexport | CSV Export

Search | Search

Save | Save

EditOperationAlert | No records selected for edit operation

DeleteOperationAlert | No records selected for delete operation

SaveButton | Save

OKButton | OK

CancelButton | Cancel

EditFormTitle | Details of

AddFormTitle | Add New Record

ConfirmDelete | Are you sure you want to Delete Record?

SearchColumns | search columns

Matches | No Matches Found

FilterButton | Filter

ClearButton | Clear

StartsWith | Starts With

EndsWith | Ends With

Contains | Contains

Equal | Equal

NotEqual | Not Equal

LessThan | Less Than

LessThanOrEqual | Less Than Or Equal

GreaterThan | Greater Than

GreaterThanOrEqual | Greater Than Or Equal

ChooseDate | Choose a Date

EnterValue | Enter the value

autoFitAll | Auto Fit all columns

autoFit | Auto Fit this column

Export | Export

FirstPage | First Page

LastPage | Last Page

PreviousPage | Previous Page

NextPage | Next Page

SortAscending | Sort Ascending

SortDescending | Sort Descending

EditRecord | Edit Record

DeleteRecord | Delete Record

Above | Above

Below | Below

AddRow | Add Row

FilterMenu | Filter

SelectAll | Select All

Blanks | Blanks

FilterTrue | True

FilterFalse | False

NoResult | No Matches Found

ClearFilter | Clear Filter

NumberFilter | Number Filters

TextFilter | Text Filters

DateFilter | Date Filters

MatchCase | Match Case

Between | Between

CustomFilter | Custom Filter

CustomFilterPlaceholder | Enter the value

CustomFilterDatePlaceholder | Choose a date

AND | AND

OR | OR

ShowRowsWhere | Show rows where:

currentPageInfo | {0} of {1} pages

totalItemsInfo | ({0} items)

firstPageTooltip | Go to first page

lastPageTooltip | Go to last page

nextPageTooltip | Go to next page

previousPageTooltip | Go to previous page

nextPagerTooltip | Go to next pager items

previousPagerTooltip | Go to previous pager items

pagerDropDown | Items per page

pagerAllDropDown | Items

All | All

### Loading translations

To load translation object in an application, use **load** function of the **L10n** class.

The following example demonstrates the TreeGrid in **Deutsch** culture.

### CSHTML

```
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource" height="220"
childMapping="Children" locale="de-DE" allowFiltering="true"
allowPaging="true" toolbar="@ (new List<string>() {"Print"})"
treeColumnIndex="1">
    <e-treegrid-pagesettings pageSize="7"></e-treegrid-pagesettings>
    <e-treegrid-filtersettings type="Menu"></e-treegrid-filtersettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="90"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="180"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="80"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
<script>
    ej.base.L10n.load({
        'de-DE': {
            'treegrid': {
                'EmptyRecord': 'Keine Aufzeichnungen angezeigt',
                'Expand All': 'Alle erweitern',
                'Collapse All': 'Alles einklappen',
                'Print': 'Drucken',
                'Pdfexport': 'PDF-Export',
                'Excelexport': 'Excel-Export',
                'Wordexport': 'Word-Export',
                'FilterButton': 'Filter',
                'ClearButton': 'klar',
                'StartsWith': 'Beginnt mit',
                'EndsWith': 'Endet mit',
                'Contains': 'Enthält',
```

```

        "Equal": "Gleich",
        "NotEqual": "Nicht gleich",
        "LessThan": "Weniger als",
        "LessThanOrEqual": "Weniger als oder gleich",
        "GreaterThan": "Größer als",
        "GreaterThanOrEqual": "Größer als oder gleich",
        "EnterValue": "Geben Sie den Wert ein",
        "FilterMenu": "Filter"
    },
    'pager': {
        'currentPageInfo': '{0} von {1} Seiten',
        'totalItemsInfo': '({0} Beiträge)',
        'firstPageTooltip': 'Zur ersten Seite',
        'lastPageTooltip': 'Zur letzten Seite',
        'nextPageTooltip': 'Zur nächsten Seite',
        'previousPageTooltip': 'Zurück zur letzten Seite',
        'nextPagerTooltip': 'Gehen Sie zu den nächsten Pager-
Elementen',
        'previousPagerTooltip': 'Gehen Sie zu vorherigen Pager-
Elementen'
    },
    "dropdowns": {
        "noRecordsTemplate": "Keine Aufzeichnungen gefunden"
    },
    "datepicker": {
        "placeholder": "Wählen Sie ein Datum",
        "today": "heute"
    }
}
});
</script>

```

## GLOBAL.CS

```

public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}

```

## Internationalization

The [Internationalization](#) library is used to globalize number, date, and time values in treegrid component using format strings in the [Format](#) property of [Column](#).

## CSHTML

```

<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource" height="220"
childMapping="subTasks" locale="de-DE" allowFiltering="true"
allowPaging="true" toolbar="(new List<string>() {"Print"})"
treeColumnIndex="1">
    <e-treegrid-pagesettings pageSize="7"></e-treegrid-pagesettings>
    <e-treegrid-filtersettings type="Menu"></e-treegrid-filtersettings>
    <e-treegrid-columns>

```

```

    <e-treegrid-column field="orderId" headerText="Order ID"
textAlign="Right" width="90"></e-treegrid-column>
    <e-treegrid-column field="orderName" headerText="Order Name"
width="180"></e-treegrid-column>
    <e-treegrid-column field="price" headerText="Price"
textAlign="Right" format="C2" type="number" width="80"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
<script>
    ej.base.setCurrencyCode('EUR');
    ej.base.L10n.load({
        'de-DE': {
            'treegrid': {
                'EmptyRecord': 'Keine Aufzeichnungen angezeigt',
                'Expand All': 'Alle erweitern',
                'Collapse All': 'Alles einklappen',
                'Print': 'Drucken',
                'Pdfexport': 'PDF-Export',
                'Excelext': 'Excel-Export',
                'Wordexport': 'Word-Export',
                'FilterButton': 'Filter',
                'ClearButton': 'klar',
                'StartsWith': 'Beginnt mit',
                'EndsWith': 'Endet mit',
                'Contains': 'Enthält',
                'Equal': 'Gleich',
                'NotEqual': 'Nicht gleich',
                'LessThan': 'Weniger als',
                'LessThanOrEqual': 'Weniger als oder gleich',
                'GreaterThan': 'Größer als',
                'GreaterThanOrEqual': 'Größer als oder gleich',
                'EnterValue': 'Geben Sie den Wert ein',
                'FilterMenu': 'Filter'
            },
            'pager': {
                'currentPageInfo': '{0} von {1} Seiten',
                'totalItemsInfo': '({0} Beiträge)',
                'firstPageTooltip': 'Zur ersten Seite',
                'lastPageTooltip': 'Zur letzten Seite',
                'nextPageTooltip': 'Zur nächsten Seite',
                'previousPageTooltip': 'Zurück zur letzten Seit',
                'nextPagerTooltip': 'Gehen Sie zu den nächsten Pager-
Elementen',
                'previousPagerTooltip': 'Gehen Sie zu vorherigen Pager-
Elementen'
            },
            'dropdowns': {
                'noRecordsTemplate': 'Keine Aufzeichnungen gefunden'
            },
            'datepicker': {
                'placeholder': 'Wählen Sie ein Datum',
                'today': 'heute'
            }
        }
    });
</script>

```

**INTERNALIZATION.CS**

```
public IActionResult Index()
{
    var tree = TreeDataFormat.GetDataFormat();
    ViewBag.datasource = tree;
    return View();
}
```

**Note:** In the above sample, **Price** column is formatted by **NumberFormatOptions**.

By default, [Locale](#) value is **en-US**. If you want to change the **en-US** culture to a different culture, you have to change the [Locale](#) accordingly.

**Right to left (RTL)**

RTL provides an option to switch the text direction and layout of the TreeGrid component from right to left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Farsi, Urdu, etc.). To enable RTL Grid, set the [EnableRtl](#) to true.

**CSHTML**

```
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource" height="220"
childMapping="Children" locale="ar-AE" enableRtl="true"
allowFiltering="true" allowPaging="true" toolbar="@ (new List<string>()
{"Print"})" treeColumnIndex="1">
    <e-treegrid-pagesettings pageSize="7"></e-treegrid-pagesettings>
    <e-treegrid-filtersettings type="Menu"></e-treegrid-filtersettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="90"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="180"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="80"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
<script>
    ej.base.L10n.load({
        'ar-AE': {
            'treegrid': {
                'EmptyRecord': "لا سجلات لعرضها",
                'Print': "طباعة",
                'FilterButton': "منقي",
                'ClearButton': "واضح",
                'StartsWith': "ابدا ب",
                'EndsWith': "ينتهي مع",
                'Contains': "يحتوي على",
                'Equal': "مساو",
                'NotEqual': "غير متساوي",
                'LessThan': "أقل من",
                'LessThanOrEqual': "اصغر من أو يساوي",
                'GreaterThan': "أكثر من",
                'GreaterThanOrEqual': "أكبر من أو يساوي",
                'ChooseDate': "اختر تاريخا",
                'EnterValue': "أدخل القيمة",
            }
        }
    });
```

```

        "FilterMenu": "منقي"
    },
    'pager': {

    }
    }
});
</script>

```

### ENABLERTL.CS

```

public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}

```

### See Also

- [Internationalization](#)
- [Localization](#)

### Scrolling

The scrollbar will be displayed in the treegrid when content exceeds the element [Width](#) or [Height](#). The vertical and horizontal scrollbars will be displayed based on the following criteria:

The vertical scrollbar appears when the total height of rows present in the treegrid exceeds its element height.

The horizontal scrollbar appears when the sum of columns width exceeds the treegrid element width.

The [Height](#) and [Width](#) are used to set the treegrid height and width, respectively.

**Note:** The default value for [Height](#) and [Width](#) is **auto**.

#### Set width and height

To specify the [Width](#) and [Height](#) of the scroller in the pixel, set the pixel value to a number.

### CSHTML

```
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource" height="315"
width="400" childMapping="Children" treeColumnIndex="1">
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="90"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="180"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText="Start Date"
textAlign="Right" format="yMd" type="date" width="120"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="110"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

### WIDTH-HEIGHT.CS

```
public IActionResult Index()
{
    var tree = TreeGridItems.GetTreeData();
    ViewBag.datasource = tree;
    return View();
}
```

Responsive with parent container

Specify the [Width](#) and [Height](#) as **100%** to make the treegrid element fill its parent container.

Setting the [Height](#) to **100%** requires the treegrid parent element to have explicit height.

### CSHTML

```
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource" height="100%"
width="100%" childMapping="Children" treeColumnIndex="1">
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="90"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="180"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText="Start Date"
textAlign="Right" format="yMd" type="date" width="120"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="110"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

### RESPONSIVE.CS

```
public IActionResult Index()
{
    var tree = TreeGridItems.GetTreeData();
    ViewBag.datasource = tree;
    return View();
}
```

Scroll to selected row

You can scroll the treegrid content to the selected row position by using the [RowSelected](#) event.

### CSHTML

```
<ejs-numerictextbox id="numeric" change="onChange" min="0" width="200"
showSpinButton="false" format="##" placeholder="Enter index to select a
row"></ejs-numerictextbox>
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource" height="270"
width="100%" childMapping="Children" treeColumnIndex="1"
rowSelected="rowSelected">
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="90"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="180"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText="Start Date"
textAlign="Right" format="yMd" type="date" width="120"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="110"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
<script>
    function onChange(args) {
        var treegrid = document.getElementById("TreeGrid").ej2_instances[0];
        treegrid.selectRow(parseInt(this.getText(), 10));
    }
    function rowSelected(args) {
        var rowHeight =
this.getRows()[treegrid.getSelectedRowIndex()[0]].scrollHeight;
        this.getContent().children[0].scrollTop = rowHeight *
this.getSelectedRowIndex()[0];
    }
</script>
```

### SELECTED-ROW.CS

```
public IActionResult Index()
{
    var tree = TreeGridItems.GetTreeData();
    ViewBag.datasource = tree;
    return View();
}
```

## Frozen rows and columns

Frozen rows and columns

Frozen rows and columns provides an option to make rows and columns always visible in the top and left side of the tree grid while scrolling.

In this demo, the [FrozenColumns](#) is set as **2** and the [FrozenRows](#) is set as **3**. Hence, the left two columns and top three rows are frozen.

### CSHTML

```
<ejs-treegrid id="TreeGrid" dataSource="ViewBag.datasourcesource" height="410"
width="auto" childMapping="Children" treeColumnIndex="1" frozenRows= "3"
allowSelection="false" frozenColumns="2">
    <e-treegrid-columns>
        <e-treegrid-column field='TaskId' headerText='Task ID'
width='100' textAlign='Right'></e-treegrid-column>
        <e-treegrid-column field='TaskName' headerText='Task Name'
width='230'></e-treegrid-column>
        <e-treegrid-column field='StartDate' headerText='Start Date'
width='150' format="yMd" textAlign='Right'></e-treegrid-column>
        <e-treegrid-column field='EndDate' headerText='End Date'
width='150' format="yMd" textAlign='Right'></e-treegrid-column>
        <e-treegrid-column field='Duration' headerText='Duration'
width='120' textAlign='Right'></e-treegrid-column>
        <e-treegrid-column field='Progress' headerText='Progress'
width='120' textAlign='Right'></e-treegrid-column>
        <e-treegrid-column field='Priority' headerText='Priority'
width='120'></e-treegrid-column>
        <e-treegrid-column field="Approved" headerText="Approved"
textAlign="Left" width="110" type="boolean"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

### FREEZECOLUMN.CS

```
public IActionResult FrozenColumn()
{
    ViewBag.datasourcesource = TreeData.GetDefaultData();
    return View();
}
```

### *Freeze particular columns*

To freeze particular column in the tree grid, the [IsFrozen](#) property can be used.

In this demo, the columns with field name **TaskName** and **StartDate** is frozen using the [IsFrozen](#) property.

### CSHTML

```
<ejs-treegrid id="TreeGrid" dataSource="ViewBag.datasourcesource" height="410"
width="auto" childMapping="Children" allowSelection="false">
    <e-treegrid-columns>
        <e-treegrid-column field='TaskId' headerText='Task ID' width='100'
textAlign='Right'></e-treegrid-column>
        <e-treegrid-column field='TaskName' headerText='Task Name'
width='230' isFrozen="true"></e-treegrid-column>
        <e-treegrid-column field='StartDate' headerText='Start Date'
width='150' isFrozen="true" format="yMd" textAlign='Right'></e-treegrid-
column>
        <e-treegrid-column field='EndDate' headerText='End Date' width='150'
format="yMd" textAlign='Right'></e-treegrid-column>
        <e-treegrid-column field='Duration' headerText='Duration'
width='120' textAlign='Right'></e-treegrid-column>
        <e-treegrid-column field='Progress' headerText='Progress'
width='120' textAlign='Right'></e-treegrid-column>
```

```

    <e-treegrid-column field='Priority' headerText='Priority'
width='120'></e-treegrid-column>
    <e-treegrid-column field="Approved" headerText="Approved"
textAlign="Left" width="110" type="boolean"></e-treegrid-column>
  </e-treegrid-columns>
</ejs-treegrid>

```

### ISFREEZE.CS

```

public IActionResult FrozenColumn()
{
    ViewBag.datasource = TreeData.GetDefaultData();
    return View();
}

```

#### Freeze direction

You can freeze the tree grid columns on the left or right side by using the [column.freeze](#) property and the remaining columns will be movable. The tree grid will automatically move the columns to the left or right position based on the [column.freeze](#) value.

Types of the [column.freeze](#) directions:

- **Left:** Allows you to freeze the columns at the left.
- **Right:** Allows you to freeze the columns at the right.

In this demo, the **Task Name** column is frozen at the left and the **Priority** column is frozen at the right side of the content table.

### CSHTML

```

<ejs-treegrid id="TreeGrid" dataSource="ViewBag.datasource" height="410"
treeColumnIndex="1" childMapping="Children" allowSelection="false">
  <e-treegrid-columns>
    <e-treegrid-column field='TaskId' headerText='Task ID' width='100'
textAlign='Right'></e-treegrid-column>
    <e-treegrid-column field='TaskName' headerText='Task Name'
width='230' freeze="Left"></e-treegrid-column>
    <e-treegrid-column field='StartDate' headerText='Start Date'
width='150' format="yMd" textAlign='Right'></e-treegrid-column>
    <e-treegrid-column field='EndDate' headerText='End Date' width='150'
format="yMd" textAlign='Right'></e-treegrid-column>
    <e-treegrid-column field='Duration' headerText='Duration'
width='120' textAlign='Right'></e-treegrid-column>
    <e-treegrid-column field='Progress' headerText='Progress'
width='120' textAlign='Right'></e-treegrid-column>
    <e-treegrid-column field='Priority' headerText='Priority'
width='120' freeze="Right"></e-treegrid-column>
    <e-treegrid-column field="Approved" headerText="Approved"
textAlign="Left" width="110" type="boolean"></e-treegrid-column>
  </e-treegrid-columns>
</ejs-treegrid>

```

### FREEZE-DIRECTION.CS

```
public IActionResult FrozenColumn()
{
    ViewBag.datasource = TreeData.GetDefaultData();
    return View();
}
```

### Limitations of frozen tree grid

The following features are not supported in frozen rows and columns:

- Row Template
- Detail Template
- Cell Editing

Freeze Direction feature has the below limitations, along with the above mentioned limitations.

- Infinite scroll cache mode
- Freeze direction in the stacked header is not compatible with column reordering.

### Tree Grid Virtualization

TreeGrid allows you to load large amount of data without performance degradation.

#### Row Virtualization

Row virtualization allows you to load and render rows only in the content viewport. It is an alternative way of paging in which the rows will be appended while scrolling vertically. To setup the row virtualization, you need to define [EnableVirtualization](#) as true and content height by [Height](#) property.

The number of records displayed in the TreeGrid is determined implicitly by height of the content area and a buffer records will be maintained in the TreeGrid content in addition to the original set of rows.

Expand and Collapse state of any child record will be persisted.

#### CSHTML

```
<ejs-treegrid id="TreeGrid" height="600" dataSource="ViewBag.datasource"
enableVirtualization="true" childMapping="Children" treeColumnIndex="1">
    <e-treegrid-columns>
        <e-treegrid-column field="TaskID" headerText="Player Jersey"
textAlign="Right" width="120"></e-treegrid-column>
        <e-treegrid-column field="FIELD1" headerText="Player Name"
width="120"></e-treegrid-column>
        <e-treegrid-column field="FIELD2" headerText="Year"
textAlign="Right" width="100"></e-treegrid-column>
        <e-treegrid-column field="FIELD3" headerText="Stint"
textAlign="Right" width="120"></e-treegrid-column>
        <e-treegrid-column field="FIELD4" headerText="TMID"
textAlign="Right" width="120"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

#### ROWVIRTUAL.CS

```
public IActionResult VirtualScrolling()
{
}
```

```

        ViewBag.datasource = VirtualDataFormat.GetVirtualData();
        return View();
    }

```

### Column Virtualization

Column virtualization allows you to virtualize columns. It will render column only in the current view port and all other columns are rendered on demand during horizontal scrolling.

To setup the column virtualization, set the [EnableVirtualization](#) and [EnableColumnVirtualization](#) properties as `true`.

### CSHTML

```

<ejs-treegrid id="TreeGrid" height="600" dataSource="ViewBag.datasource"
enableVirtualization="true" enableColumnVirtualization="true"
childMapping="Children" treeColumnIndex="1">
    <e-treegrid-columns>
        <e-treegrid-column field="TaskID" headerText="Player Jersey"
textAlign="Right" width="120"></e-treegrid-column>
        <e-treegrid-column field="FIELD1" headerText="Player Name"
width="120"></e-treegrid-column>
        <e-treegrid-column field="FIELD2" headerText="Year"
textAlign="Right" width="100"></e-treegrid-column>
        <e-treegrid-column field="FIELD3" headerText="Stint"
textAlign="Right" width="120"></e-treegrid-column>
        <e-treegrid-column field="FIELD4" headerText="TMID"
textAlign="Right" width="120"></e-treegrid-column>
        <e-treegrid-column field="FIELD6" headerText="GP" width= 120
textAlign="Right"></e-treegrid-column>
        <e-treegrid-column field="FIELD7" headerText="GS" width= 120
textAlign="Right"></e-treegrid-column>
        <e-treegrid-column field="FIELD8" headerText="Minutes" width= 120
textAlign="Right"></e-treegrid-column>
        <e-treegrid-column field="FIELD9" headerText="Points" width= 120
textAlign="Right"></e-treegrid-column>
        <e-treegrid-column field="FIELD10" headerText="oRebounds" width= 120
textAlign="Right"></e-treegrid-column>
        <e-treegrid-column field="FIELD11" headerText="dRebounds" width= 120
textAlign="Right"></e-treegrid-column>
        <e-treegrid-column field="FIELD12" headerText="Rebounds" width= 120
textAlign="Right"></e-treegrid-column>
        <e-treegrid-column field="FIELD13" headerText="Assists" width= 120
textAlign="Right"></e-treegrid-column>
        <e-treegrid-column field="FIELD14" headerText="Steals" width= 120
textAlign="Right"></e-treegrid-column>
        <e-treegrid-column field="FIELD15" headerText="Blocks" width= 120
textAlign="Right"></e-treegrid-column>
        <e-treegrid-column field="FIELD16" headerText="Turnovers" width= 120
textAlign="Right"></e-treegrid-column>
        <e-treegrid-column field="FIELD17" headerText="PF" width= 120
textAlign="Right"></e-treegrid-column>
        <e-treegrid-column field="FIELD18" headerText="fgAttempted" width=
120 textAlign="Right"></e-treegrid-column>
        <e-treegrid-column field="FIELD19" headerText="ftAttempted" width=
120 textAlign="Right"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>

```

```

    <e-treegrid-column field="FIELD20" headerText="ThreeAttempted"
width= 120 textAlign="Right"></e-treegrid-column>
    <e-treegrid-column field="FIELD21" headerText="ThreeMade" width= 120
textAlign="Right"></e-treegrid-column>
    <e-treegrid-column field="FIELD22" headerText="PostGP" width= 120
textAlign="Right"></e-treegrid-column>
    <e-treegrid-column field="FIELD23" headerText="ftMade" width= 120
textAlign="Right"></e-treegrid-column>
    <e-treegrid-column field="FIELD24" headerText="fgMade" width= 120
textAlign="Right"></e-treegrid-column>
    <e-treegrid-column field="FIELD25" headerText="ffmade" width= 120
textAlign="Right"></e-treegrid-column>
    <e-treegrid-column field="FIELD26" headerText="PostGS" width= 120
textAlign="Right"></e-treegrid-column>
    <e-treegrid-column field="FIELD27" headerText="PostMinutes" width=
120 textAlign="Right"></e-treegrid-column>
    <e-treegrid-column field="FIELD28" headerText="PostPoints" width=
120 textAlign="Right"></e-treegrid-column>
    <e-treegrid-column field="FIELD29" headerText="PostoRebounds" width=
120 textAlign="Right"></e-treegrid-column>
    <e-treegrid-column field="FIELD30" headerText="PostdRebounds" width=
120 textAlign="Right"></e-treegrid-column>
  </e-treegrid-columns>
</ejs-treegrid>

```

### COLUMNVIRTUAL.CS

```

public IActionResult VirtualScrolling()
{
    ViewBag.datasource = VirtualDataFormat.GetVirtualData();
    return View();
}

```

**Note:** Column's **Width** is required for column virtualization. If column's width is not defined then tree grid will consider its value as **200px**.

### Limitations for Virtualization

- Due to the element height limitation in browsers, the maximum number of records loaded by the treegrid is limited by the browser capability.
- Cell selection will not be persisted in row.
- Virtual scrolling is not compatible with detail template, clipboard functionality and row drag and drop features.
- The page size provided must be two times larger than the number of visible rows in the TreeGrid. If the page size is failed to meet this condition then the size will be determined by TreeGrid.
- The virtual height of the treegrid content is calculated using the row height and total number of records in the data source and hence features which changes row height such as text wrapping are not supported. If you want to increase the row height to accommodate the content then you can specify the row height as below to ensure all the table rows are in same height.

`css

```
.e-treegrid .e-row {
height: 2em;
}
,
```

- Programmatic selection using the **SelectRows** method is not supported in virtual scrolling.
- When virtualization is active in a tree grid, the editCell method is unusable for records outside the currently visible viewport.

### Tree Grid Infinite scrolling

Infinite scrolling is used to load a huge amount of data without degrading the Tree Grid performance. This feature works like the lazy loading concept, which means the buffer data is loaded only when the scrollbar reaches the end of the scroller.

To use Infinite scrolling, set **EnableInfiniteScrolling** property as true.

**Note:** \* In this feature, Tree Grid will not make a new data request when you visit the same page again.

#### CSHTML

```
<ejs-treegrid id="TreeGrid" height="600" dataSource="ViewBag.datasource"
enableInfiniteScrolling="true" childMapping="Children" treeColumnIndex="1">
  <e-treegrid-pagesettings pageSize="50"></e-treegrid-pagesettings>
  <e-treegrid-columns>
    <e-treegrid-column field="TaskID" headerText="Player Jersey"
textAlign="Right" width="120"></e-treegrid-column>
    <e-treegrid-column field="FIELD1" headerText="Player Name"
width="120"></e-treegrid-column>
    <e-treegrid-column field="FIELD2" headerText="Year"
textAlign="Right" width="100"></e-treegrid-column>
    <e-treegrid-column field="FIELD3" headerText="Stint"
textAlign="Right" width="120"></e-treegrid-column>
    <e-treegrid-column field="FIELD4" headerText="TMID"
textAlign="Right" width="120"></e-treegrid-column>
  </e-treegrid-columns>
</ejs-treegrid>
```

#### INFINITESCROLL.CS

```
public IActionResult InfiniteScrolling()
{
    ViewBag.datasource = VirtualDataFormat.GetVirtualData();
    return View();
}
```

### InitialBlocks

You can define the initial loading pages count by using **InitialBlocks** property of **InfiniteScrollSettings**. By default, this feature loads three pages in initial rendering.

In the below demo, we have changed this property value to load five page records instead of three.

#### CSHTML

```
<ejs-treegrid id="TreeGrid" height="600" dataSource="ViewBag.datasource"
enableInfiniteScrolling="true" childMapping="Children" treeColumnIndex="1">
  <e-treegrid-infinitescrollsettings initialBlocks="5"></e-treegrid-
infinitescrollsettings>
  <e-treegrid-pagesettings pageSize="50"></e-treegrid-pagesettings>
  <e-treegrid-columns>
    <e-treegrid-column field="TaskID" headerText="Player Jersey"
textAlign="Right" width="120"></e-treegrid-column>
    <e-treegrid-column field="FIELD1" headerText="Player Name"
width="120"></e-treegrid-column>
    <e-treegrid-column field="FIELD2" headerText="Year"
textAlign="Right" width="100"></e-treegrid-column>
    <e-treegrid-column field="FIELD3" headerText="Stint"
textAlign="Right" width="120"></e-treegrid-column>
    <e-treegrid-column field="FIELD4" headerText="TMID"
textAlign="Right" width="120"></e-treegrid-column>
  </e-treegrid-columns>
</ejs-treegrid>
```

### INFINITESCROLL.CS

```
public IActionResult InfiniteScrolling()
{
    ViewBag.datasource = VirtualDataFormat.GetVirtualData();
    return View();
}
```

### Cache Mode

Cache is used to store the loaded rows object in the Tree Grid instance which can be reused for creating the row elements whenever you scroll to already visited page. Also, this mode maintains row elements based on the `MaxBlocks` count value of `InfiniteScrollSettings`, once this limit exceeds then it will remove row elements from DOM for new rows.

To enable the cache mode in Infinite scrolling, set `EnableCache` property of `InfiniteScrollSettings` as true.

### CSHTML

```
<ejs-treegrid id="TreeGrid" height="600" dataSource="ViewBag.datasource"
enableInfiniteScrolling="true" childMapping="Children" treeColumnIndex="1">
  <e-treegrid-infinitescrollsettings enableCache="true"></e-treegrid-
infinitescrollsettings>
  <e-treegrid-pagesettings pageSize="50"></e-treegrid-pagesettings>
  <e-treegrid-columns>
    <e-treegrid-column field="TaskID" headerText="Player Jersey"
textAlign="Right" width="120"></e-treegrid-column>
    <e-treegrid-column field="FIELD1" headerText="Player Name"
width="120"></e-treegrid-column>
    <e-treegrid-column field="FIELD2" headerText="Year"
textAlign="Right" width="100"></e-treegrid-column>
    <e-treegrid-column field="FIELD3" headerText="Stint"
textAlign="Right" width="120"></e-treegrid-column>
    <e-treegrid-column field="FIELD4" headerText="TMID"
textAlign="Right" width="120"></e-treegrid-column>
  </e-treegrid-columns>
```

```
</ejs-treegrid>
```

### INFINITESCROLL.CS

```
public IActionResult InfiniteScrolling()
{
    ViewBag.datasource = VirtualDataFormat.GetVirtualData();
    return View();
}
```

### Limitations for Infinite Scrolling

- Due to the element height limitation in browsers, the maximum number of records loaded by the tree grid is limited due to the browser capability.
- Initial loading rows total height must be greater than the viewport height.
- Cell selection will not be persisted in cache mode.
- Infinite scrolling is not compatible with batch editing, cell editing, detail template and hierarchy features.
- The aggregated information and total group items are displayed based on the current view items. To get these information regardless of the view items, refer to the
- Programmatic selection using the [selectRows](#) and [selectRow](#) method is not supported in infinite scrolling.

### State Persistence

State persistence refers to the TreeGrid's state maintained in the browser's [localStorage](#) even if the browser is refreshed or if you move to the next page within the browser.

State persistence stores treegrid's model object in the local storage when the [enablePersistence](#) is defined as true.

#### Get or set localStorage value

If the [enablePersistence](#) property is set to true, the treegrid property value is saved in the **window.localStorage** for reference. You can get/set the localStorage value by using the getItem/setItem method in the **window.localStorage**.

```
//get the TreeGrid model.
```

```
var value = window.localStorage.getItem('treegridTreeGrid'); //"treegridTreeGrid" is component name + component id.
```

```
var model = JSON.parse(model);
```

```
,
```

```
//set the TreeGrid model.
```

```
window.localStorage.setItem('treegridTreeGrid', JSON.stringify(model)); //"treegridTreeGrid" is component name + component id.
```

```
,
```

## Print

To print the TreeGrid, use the [print](#) method from treegrid instance. The print option can be displayed on the [Toolbar](#) by adding the **print** toolbar item.

### CSHTML

```
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.dataSource" height="265"
childMapping="Children" treeColumnIndex="1" toolbar="@ (new List<string>() {
"Print" }) ">
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="90"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="180"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText="Start Date"
textAlign="Right" format="yMd" type="date" width="120"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="110"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

### PRINT.CS

```
public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.dataSource = tree;
    return View();
}
```

## Page setup

Some of the print options cannot be configured through JavaScript code. So, you have to customize the layout, paper size, and margin options using the browser page setup dialog. Refer to the following links to know more about the browser page setup:

- [Chrome](#)
- [Firefox](#)
- [Safari](#)
- [IE](#)

## Print using an external button

To print the treegrid from an external button, invoke the [print](#) method.

### CSHTML

```
<ejs-button id="print" content="Print"></ejs-button>
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource" height="265"
childMapping="Children" treeColumnIndex="1">
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="90"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="180"></e-treegrid-column>
```

```

        <e-treegrid-column field="StartDate" headerText="Start Date"
textAlign="Right" format="yMd" type="date" width="120"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="110"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>

<script>
    document.getElementById('print').addEventListener('click', () => {
        var treegrid = document.getElementById("TreeGrid").ej2_instances[0];
        treegrid.print();
    });
</script>

```

### PRINT-BUTTON.CS

```

public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}

```

Print the visible page

By default, the treegrid prints all the pages. To print the current page alone, set the [PrintMode](#) to **CurrentPage**.

### CSHTML

```

<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource" height="220"
childMapping="Children" allowPaging="true" treeColumnIndex="1"
toolbar="@ (new List<string>() { "Print" })" printMode="CurrentPage">
    <e-treegrid-pagesettings pageSize="8"></e-treegrid-pagesettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="90"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="180"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText="Start Date"
textAlign="Right" format="yMd" type="date" width="90"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="80"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>

```

### CURRENT-PAGE.CS

```

public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}

```

### Print large number of columns

By default, the browser uses A4 as page size option to print pages and to adapt the size of the page the browser print preview will auto-hide the overflowed contents. Hence treegrid with large number of columns will cut off to adapt the print page.

To show large number of columns when printing, adjust the scale option from print option panel based on your content size.

### Show or Hide columns while Printing

You can show a hidden column or hide a visible column while printing the treegrid using [ToolbarClick](#) and [PrintComplete](#) events.

In [ToolbarClick](#) event, based on **args.item.text** as **print**. We can show or hide columns by setting [Visible](#) of [Column](#) property to **true** or **false** respectively.

In [PrintComplete](#) event, We have reversed the state back to the previous state.

In the below example, we have **Duration** as a hidden column in the treegrid. While printing, we have changed **Duration** to visible column and **StartDate** as hidden column.

### CSHTML

```
<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasources" height="265"
childMapping="Children" treeColumnIndex="1" toolbar="@ (new List<string>() {
"Print"})" toolbarClick="toolbarClick" printComplete="printComplete">
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="90"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="180"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText="Start Date"
textAlign="Right" format="yMd" type="date" width="90"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="80" visible="false"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

```

<script>
    function toolbarClick(args) {
        if (args.item.text === 'Print') {
            var cols = this.grid.columns;
            for (var i = 0; i < cols.length; i++) {
                if (cols[i].field == "Duration") {
                    cols[i].visible = true;
                }
                else if (cols[i].field == "StartDate") {
                    cols[i].visible = false;
                }
            }
        }
    }
    function printComplete(args) {
        var cols = this.grid.columns;
        for (var i = 0; i < cols.length; i++) {
            if (cols[i].field == "Duration") {
                cols[i].visible = false;
            }
            else if (cols[i].field == "StartDate") {
                cols[i].visible = true;
            }
        }
    }
}
</script>

```

### SHOW-HIDE.CS

```

public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}

```

### Limitations of Printing Large Data

When treegrid contains large number of data, printing all the data at once is not a best option for the browser performance. Because to render all the DOM elements in one page will produce performance issues in the browser. It leads to browser slow down or browser hang.

If printing of all the data is still needed, we suggest to Export the treegrid to **Excel** or **CSV** or **Pdf** and then print it from another non-web based application.

### Adaptive View in ASP.NET MVC Tree Grid Component

The Tree Grid user interface (UI) was redesigned to provide an optimal viewing experience and improve usability on small screens. This interface will render the filter, sort, and edit dialogs adaptively.

#### Render adaptive dialogs

When you enable the [enableAdaptiveUI](#) property, the tree grid will render the filter, sort, and edit dialogs in full screen for a better user experience. The following demo demonstrates this behavior.

### CSHTML

```
<ejs-treegrid id="adaptivebrowser" dataSource="ViewBag.dataSource"
enableAdaptiveUI="true" childMapping="Children" treeColumnIndex="1"
height="100%" allowPaging="true" allowFiltering="true" allowSorting="true"
toolbar="@ (new List<string>() { "Add", "Edit", "Delete", "Update", "Cancel",
"Search" }) " load="onLoad">
    <e-treegrid-editSettings allowAdding="true" allowDeleting="true"
allowEditing="true" mode="Dialog"></e-treegrid-editSettings>
    <e-treegrid-filterSettings type="Excel"></e-treegrid-filterSettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID" textAlign="Right"
width="135"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="280"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="140"></e-treegrid-column>
        <e-treegrid-column field="Progress" headerText="Progress"
textAlign="Right" width="145"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

#### DEFAULT.CS

```
public IActionResult Adaptive()
{
    var order = TreeData.GetDefaultData();
    ViewBag.dataSource = order;
    return View();
}
```

### Loading Animation in ASP.NET MVC Tree Grid Component

The Tree Grid displays a loading indicator while the data is being fetched and bound to the tree grid during initial rendering, refreshing, and after performing any tree grid actions like sorting, filtering, and more.

The tree grid supports two indicator types, which can be enabled by setting the `loadingIndicator.indicatorType` property to `Spinner` or `Shimmer`. The default value of the indicator type is `Spinner`.

In the following sample, the Shimmer indicator is displayed while the tree grid is loading and refreshing when using the remote data.

#### LOADINGANIMATION.CS

```
public ActionResult LoadingAnimation()
{
    return View();
}
```

### PDF Export in ASP.NET MVC Tree Grid Component

PDF export allows exporting TreeGrid data to PDF document. You need to use the [pdfExport](#) method for exporting. To enable PDF export in the treegrid, set the [AllowPdfExport](#) as true.

#### CSHTML

```

<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource" height="220"
childMapping="Children" treeColumnIndex="1" toolbar="@ (new List<string>() {
"PdfExport" })" allowPdfExport="true" allowPaging="true"
toolbarClick="toolbarClick">
    <e-treegrid-pagesettings pageSize="7"></e-treegrid-pagesettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="90"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="180"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText="Start Date"
textAlign="Right" format="yMd" type="date" width="90"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="80"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
<script>
    function toolbarClick(args) {
        if (args['item'].text === 'PDF Export') {
            var treegrid =
document.getElementById("TreeGrid").ej2_instances[0];
            treegrid.pdfExport();
        }
    }
</script>

```

## EXPORT.CS

```

public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}

```

## Excel Export in ASP.NET MVC Tree Grid Component

The excel export allows exporting TreeGrid data to Excel document. You need to use the [excelExport](#) method for exporting. To enable Excel export in the treegrid, set the [AllowExcelExport](#) as true.

## CSHTML

```

<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource" height="220"
childMapping="Children" treeColumnIndex="1" toolbar="@ (new List<string>() {
"ExcelExport" })" allowExcelExport="true" allowPaging="true"
toolbarClick="toolbarClick">
    <e-treegrid-pagesettings pageSize="7"></e-treegrid-pagesettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="90"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="180"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText="Start Date"
textAlign="Right" format="yMd" type="date" width="90"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="80"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>

```

```

</e-treegrid-columns>
</ejs-treegrid>
<script>
    function toolbarClick(args) {
        if (args['item'].text === 'Excel Export') {
            var treegrid =
document.getElementById("TreeGrid").ej2_instances[0];
            treegrid.excelExport();
        }
    }
</script>

```

## EXPORT.CS

```

public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}

```

## Persist collapsed state

You can persist the collapsed state in the exported document by defining `isCollapsedStatePersist` property as true in `TreeGridExcelExportProperties` parameter of [excelExport](#) method.

## CSHTML

```

<ejs-treegrid id="TreeGrid" dataSource="@ViewBag.datasource" height="220"
childMapping="Children" treeColumnIndex="1" toolbar="@ (new List<string>() {
"ExcelExport"})" allowExcelExport="true" allowPaging="true"
toolbarClick="toolbarClick">
    <e-treegrid-pagesettings pageSize="7"></e-treegrid-pagesettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="90"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="180"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText="Start Date"
textAlign="Right" format="yMd" type="date" width="90"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="80"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
<script>
    function toolbarClick(args) {
        if (args['item'].text === 'Excel Export') {
            var excelExportProperties = {
                isCollapsedStatePersist: true
            };
            var treegrid =
document.getElementById("TreeGrid").ej2_instances[0];
            treegrid.excelExport(excelExportProperties);
        }
    }
</script>

```

**IS-COLLAPSED.CS**

```
public IActionResult Index()
{
    var tree = TreeData.GetDefaultData();
    ViewBag.datasource = tree;
    return View();
}
```

## Clipboard

The clipboard provides an option to copy selected rows or cells data into the clipboard.

The following list of keyboard shortcuts is supported in the Tree Grid to copy selected rows or cells data into the clipboard.

Interaction keys | Description

**Ctrl + C | Copy selected rows or cells data into clipboard.**

**Ctrl + Shift + H | Copy selected rows or cells data with header into clipboard.**

**CSHTML**

```
<ejs-treegrid id="TreeGrid" dataSource="ViewBag.dataSource" height="350"
childMapping="Children" treeColumnIndex="1">
    <e-treegrid-selectionsettings type="Multiple" mode="Row"></e-treegrid-
selectionsettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="70"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="200"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText=" Start Date"
textAlign="Right" format="yMd" type="date" width="80"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="80"></e-treegrid-column>
        <e-treegrid-column field="Progress" headerText="Progress"
textAlign="Right" width="80"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

**COPY.CS**

```
public IActionResult Index()
{
    var treeData = TreeGridItems.GetTreeData();
    ViewBag.datasource = treeData;
    return View();
}
```

## Copy to clipboard by external buttons

To copy selected rows or cells data into the clipboard with help of external buttons, you need to invoke the [copy](#) method.

**CSHTML**

```

<ejs-button id="copy" content="Copy"></ejs-button>
<ejs-button id="copyHeader" content="Copy Header"></ejs-button>
<ejs-treegrid id="TreeGrid" dataSource="ViewBag.dataSource" height="350"
childMapping="Children" treeColumnIndex="1">
  <e-treegrid-selectionsettings type="Multiple" mode="Row"></e-treegrid-
selectionsettings>
  <e-treegrid-columns>
    <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="70"></e-treegrid-column>
    <e-treegrid-column field="TaskName" headerText="Task Name"
width="200"></e-treegrid-column>
    <e-treegrid-column field="StartDate" headerText=" Start Date"
textAlign="Right" format="yMd" type="date" width="80"></e-treegrid-column>
    <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="80"></e-treegrid-column>
    <e-treegrid-column field="Progress" headerText="Progress"
textAlign="Right" width="80"></e-treegrid-column>
  </e-treegrid-columns>
</ejs-treegrid>
<script>
  document.getElementById("copy").addEventListener("click", function () {
    var treegrid = document.getElementById("TreeGrid").ej2_instances[0];
    treegrid.copy();
  })
  document.getElementById("copyHeader").addEventListener("click", function
() {
    var treegrid = document.getElementById("TreeGrid").ej2_instances[0];
    treegrid.copy(true);
  })
</script>

```

**COPYBUTTONS.CS**

```

public IActionResult Index()
{
    var treeData = TreeGridItems.GetTreeData();
    ViewBag.datasource = treeData;
    return View();
}

```

**Copy Hierarchy Modes**

Tree Grid provides support for a set of copy modes with **CopyHierarchyMode** property.

The below are the type of copy mode available in TreeGrid.

- **Parent** : This is the default copy hierarchy mode in Tree Grid. Clipboard value have the selected records with its parent records, if the selected records not have any parent record then the selected record will be in clipboard.
- **Child** : Clipboard value will have the selected records with its child record. If the selected records do not have any child record then the selected records will be in clipboard.

- **Both** : Clipboard value will have the selected records with its both parent and child record. If the selected records do not have any parent and child record then the selected records alone in clipboard.
- **None** : Only the Selected records will be in clipboard.

### CSHTML

```
@{
    List<object> toolbar = new List<object>();
    toolbar.Add(new { text = "Copy", tooltipText = "Copy", prefixIcon = "e-copy", id = "copy" });
    toolbar.Add(new { text = "Copy With Header", tooltipText = "Copy With Header", prefixIcon = "e-copy", id = "copyHeader" });
}
<ejs-dropdownlist id="mode" dataSource="@ViewBag.dropdata"
placeholder="Select a Mode" change="onModeChange" index="0"
popupHeight="220px">
    <e-dropdownlist-fields text="mode" value="id"></e-dropdownlist-fields>
</ejs-dropdownlist>
<ejs-treegrid id="TreeGrid" dataSource="ViewBag.dataSource"
allowPaging="true" childMapping="Children" treeColumnIndex="1"
toolbarClick="toolbarClick" toolbar="toolbar">
    <e-treegrid-pagesettings pageSize="10" ></e-treegrid-pagesettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
textAlign="Right" width="70"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="200"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText=" Start Date"
textAlign="Right" format="yMd" type="date" width="80"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="80"></e-treegrid-column>
        <e-treegrid-column field="Progress" headerText="Progress"
textAlign="Right" width="80"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
<script>
    function toolbarClick(args) {
        if (this.getSelectedRecords().length > 0) {
            var withHeader = false;
            if (args.item.id === 'copyHeader') {
                withHeader = true;
            }
            this.copy(withHeader);
        } else {
            var dialogObj =
document.getElementById('alert_dialog').ej2_instances[0];
            dialogObj.show();
        }
    }
    function onModeChange(e) {
        var treegrid =
document.getElementById("TreeGrid").ej2_instances[0];
        var mode = e.value;
        treegrid.copyHierarchyMode = mode;
    }
</script>
```

```
</script>
```

## HIERARCHY.CS

```
public IActionResult Index()
{
    var treeData = TreeGridItems.GetTreeData();
    ViewBag.datasource = treeData;
    List<Object> dropData = new List<object>() {
        new { id = "Parent", mode = "Parent" },
        new { id = "Child", mode = "Child" },
        new { id = "Both", mode = "Both" },
        new { id = "None", mode = "None" }
    };
    ViewBag.dropdata = dropData;
    return View();
}
```

## AutoFill

AutoFill Feature allows you to copy the data of selected cells and paste it to another cells by just dragging the autofill icon of the selected cells up to required cells. This feature is enabled by defining `EnableAutoFill` property as true.

## CSHTML

```
<ejs-treegrid id="TreeGrid" dataSource="ViewBag.dataSource" height="350"
enableAutoFill="true" childMapping="Children" treeColumnIndex="1"
toolbar="@ (new List<string>() { "Add", "Delete", "Update", "Cancel" }) ">
    <e-treegrid-selectionsettings type="Multiple" mode="Cell"
cellSelectionMode="Box"></e-treegrid-selectionsettings>
    <e-treegrid-editsettings allowAdding="true" allowEditing="true"
allowDeleting="true" mode="Batch"></e-treegrid-editsettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
isPrimaryKey="true" textAlign="Right" width="70"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="200"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText=" Start Date"
textAlign="Right" format="yMd" type="date" width="80"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="80"></e-treegrid-column>
        <e-treegrid-column field="Progress" headerText="Progress"
textAlign="Right" width="80"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

## AUTOFILL.CS

```
public IActionResult Index()
{
    var treeData = TreeGridItems.GetTreeData();
    ViewBag.datasource = treeData;
    return View();
}
```

**Note:** \* If `EnableAutoFill` is set to true, then the autofill icon will be displayed on cell selection to copy cells.

<br/> \* It requires the selection `Mode` to be `Cell`, `CellSelectionMode` to be `Box` and also Batch Editing should be enabled.

#### *Limitations of AutoFill*

- Since the string values are not parsed to number and date type, so when the selected string type cells are dragged to number type cells then it will display as **NaN**. For date type cells, when the selected string type cells are dragged to date type cells then it will display as an **empty cell**.
- Linear series and the sequential data generations are not supported in this autofill feature.

#### Paste

You can able to copy the content of a cell or a group of cells by selecting the cells and pressing Ctrl + C shortcut key and paste it to another set of cells by selecting the cells and pressing Ctrl + V shortcut key.

#### C#HTML

```
<ejs-treegrid id="TreeGrid" dataSource="ViewBag.dataSource" height="350"
childMapping="Children" treeColumnIndex="1" toolbar="@ (new List<string>() {
"Add", "Delete", "Update", "Cancel" })">
    <e-treegrid-selectionsettings type="Multiple" mode="Cell"
cellSelectionMode="Box"></e-treegrid-selectionsettings>
    <e-treegrid-editsettings allowAdding="true" allowEditing="true"
allowDeleting="true" mode="Batch"></e-treegrid-editsettings>
    <e-treegrid-columns>
        <e-treegrid-column field="TaskId" headerText="Task ID"
isPrimaryKey="true" textAlign="Right" width="70"></e-treegrid-column>
        <e-treegrid-column field="TaskName" headerText="Task Name"
width="200"></e-treegrid-column>
        <e-treegrid-column field="StartDate" headerText=" Start Date"
textAlign="Right" format="yMd" type="date" width="80"></e-treegrid-column>
        <e-treegrid-column field="Duration" headerText="Duration"
textAlign="Right" width="80"></e-treegrid-column>
        <e-treegrid-column field="Progress" headerText="Progress"
textAlign="Right" width="80"></e-treegrid-column>
    </e-treegrid-columns>
</ejs-treegrid>
```

#### PASTE.CS

```
public IActionResult Index()
{
    var treeData = TreeGridItems.GetTreeData();
    ViewBag.datasource = treeData;
    return View();
}
```

**Note:** To perform paste functionality, it requires the selection **Mode** to be **Cell**, **CellSelectionMode** to be **Box** and also Batch Editing should be enabled.

#### *Limitations of Paste Functionality*

- Since the string values are not parsed to number and date type, so when the copied string type cells are pasted to number type cells then it will display as **NaN**. For date type cells, when the copied string format cells are pasted to date type cells then it will display as an **empty cell**.

#### Accessibility in Tree Grid control

The Tree Grid component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Tree Grid component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

### WAI-ARIA attributes

The Tree Grid component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Tree Grid component:

| Attributes | Purpose |

| --- | --- |

| **role=treegrid** | Used to convey a significant and contextual message to the user. |

| **aria-selected** | Accurately reflect the selection state, whether it's single-select or multi-select. |

| **aria-expanded** | It can be used to show whether a node is expanded or collapsed, making it easier for screen reader users to navigate and understand the hierarchy. |

| **aria-sort** | Indicate the current sorting order of a table column for users with disabilities, facilitating accessible data presentation and interaction. |

| **aria-busy** | Loading state to improve accessibility for users, particularly those relying on screen readers. |

| **aria-invalid** | To indicate whether the user's input in a form field is valid or invalid, aiding users, including those with disabilities, in understanding and correcting their input. |

| **aria-grabbed** | Provides accessibility information for users interacting with draggable elements |

| **aria-owns** | Establishing relationships between an element and the elements it owns or controls. |

| **aria-label** | Provides an accessible name for the close icon. |

### Keyboard interaction

The Tree Grid component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Tree Grid component.

Interaction Keys | Description

**PageDown** | Goes to the next page.

**PageUp** | Goes to the previous page.

**Ctrl + Alt + PageDown** | Goes to the last page.

**Ctrl + Alt + PageUp** | Goes to the first page.

**Alt + PageDown** | Goes to the next page.

**Alt + PageUp** | Goes to the previous page.

**Home** | Goes to the first cell.

**End** | Goes to the last cell.

**Ctrl + Home** | Goes to the first row.

**Ctrl + End** | Goes to the last row.

**DownArrow** | Moves the cell focus downward.

**UpArrow** | Moves the cell focus upward.

**LeftArrow** | Moves the cell focus left side.

**RightArrow** | Moves the cell focus right side.

**Shift + DownArrow** | Extends the row/cell selection downwards.

**Shift + UpArrow** | Extends the row/cell selection upwards.

**Shift + LeftArrow** | Extends the cell selection to the left side.

**Shift + RightArrow** | Extends the cell selection to the right side.

**Enter** | Moves the row/cell selection downward. If current cell is in edit state, then completes the editing. If the current cell is a header then performs sorting.

**Shift + Enter** | Moves the row/cell selection upward. If the current cell is a header then clears sorting for the selected column.

**Ctrl + Enter** | If the current cell is a header then performs multi-sorting.

**Tab** | Moves the cell selection right side.

**Shift + Tab** | Moves the cell selection left side.

**Esc** | Deselects all the rows/cells.

**Ctrl + A** | Selects all the rows/cells.

**UpArrow** | Moves up a row/cell selection.

**DownArrow** | Moves down a row/cell selection.

**RightArrow** | Moves to the right cell selection.

**LeftArrow** | Moves to the left cell selection.

**Ctrl + Shift + DownArrow** | Expands the selected group.

**Ctrl + DownArrow** | Expands all the visible groups.

**Ctrl + Shift + UpArrow** | Collapses the selected group.

**Ctrl + UpArrow** | Collapses all the visible groups.

**Ctrl + P** | Prints the TreeGrid.

### Ensuring accessibility

The Tree Grid component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Tree Grid component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Tree Grid component with accessibility tools.

- [Accessibility in Syncfusion ASP.NET MVC components](#)

## Styling

To modify the TreeGrid appearance, you need to override the default CSS of treegrid. Find the list of CSS classes and its corresponding section in treegrid. Also, you have an option to create your own custom theme for all the ASP.NET MVC controls using our [Theme Studio](#).

Section | CSS class | Purpose of CSS class

**Root** | e-treegrid | This classes are in this root element (div) of the treegrid control.

**Header** | e-gridheader | This class is added in the root element of header element. In this class, You can override thin line between header and content of the treegrid.

| e-table | This class is added at 'table' of the treegrid header. This CSS class makes table width as 100 %.

| e-columnheader | This class is added at 'tr' of the treegrid header.

| e-headercell | This class is added in 'th' element of treegrid header. You can override background color of header and border color.

| e-headercelldiv | This class is add in div which present 'th' element in the header. we recommend you to use the e-headercelldiv to override skeleton of header.

**Body** | e-gridcontent | This class is added at root of body content. This is to override background color of the body.

| e-table | This class is added to table of content. This CSS class makes table width as 100 %.

| e-altrow | This class is added to alternate rows of treegrid. This is to override alternate row color of the treegrid.

| e-rowcell | This class is added to all cells in the treegrid. This is to override cells appearance and styling.

| e-groupcaption | This class is added to the 'td' of group caption which is to change the background color of caption cell.

| e-selectionbackground | This class is added to rowcell's of the treegrid. This is override selection.

| e-hover | This class adds to row of treegrid, while hovering the treegrid rows.

**Pager** | e-pager | This class is added to root element of the pager. This to change appearance of the background color and color of font.

| e-pagercontainer | This class is added to numeric items of the pager.

| e-parentmsgbar | This class is added to pager info of the pager.

**Summary** | e-gridfooter | This class is added to root of the summary div.

| e-summaryrow | This class is added to rows of treegrid summary.

| |e-summarycell| This class is added to cells of summary row. This to override background color of summary.

## TreeMap

### Getting Started with ASP.NET MVC TreeMap Control

#### Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add ASP.NET MVC controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

#### PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](https://nuget.org). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

<namespaces>

<add namespace="Syncfusion.EJ2"/>

</namespaces>

,

**Note:** Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

#### Add script resources

Here, the script is referred using CDN inside the <head> of ~/Pages/Shared/\_Layout.cshtml file as follows,

#### ~/ LAYOUT.CSHTML

```
<head>
...
```

```
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

#### ~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

Add ASP.NET MVC TreeMap control

Now, add the Syncfusion ASP.NET MVC TreeMap control in `~/Views/Home/Index.cshtml` page.

#### CSHTML

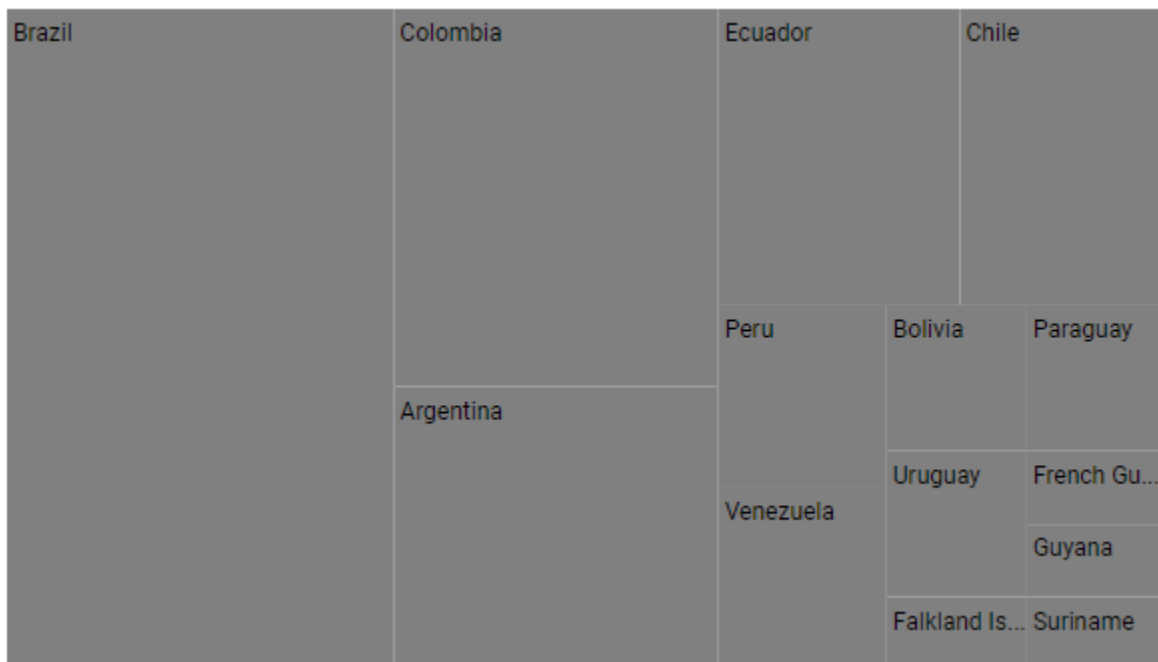

```
<h2> Essential JS 2 for ASP.NET MVC TreeMap </h2>
<div id="container">
@Html.EJS().TreeMap("container").Load("load").WeightValuePath("Count").LeafItemSettings(leaf=>leaf.LabelPath("State")).Render()
</div>
<script>
function load(args)
{
var data = [
{ Title: 'State wise International Airport count in South America', State: "Brazil", Count: 25 },
{ Title: 'State wise International Airport count in South America', State: "Colombia", Count: 12 },
{ Title: 'State wise International Airport count in South America', State: "Argentina", Count: 9 },
{ Title: 'State wise International Airport count in South America', State: "Ecuador", Count: 7 },
{ Title: 'State wise International Airport count in South America', State: "Chile", Count: 6 },
{ Title: 'State wise International Airport count in South America', State: "Peru", Count: 3 },
{ Title: 'State wise International Airport count in South America', State: "Venezuela", Count: 3 },
{ Title: 'State wise International Airport count in South America', State: "Bolivia", Count: 2 },
{ Title: 'State wise International Airport count in South America', State: "Paraguay", Count: 2 },
{ Title: 'State wise International Airport count in South America', State: "Uruguay", Count: 2 },
```

```

{ Title: 'State wise International Airport count in South America', State:
"Falkland Islands", Count: 1 },
{ Title: 'State wise International Airport count in South America', State:
"French Guiana", Count: 1 },
{ Title: 'State wise International Airport count in South America', State:
"Guyana", Count: 1 },
{ Title: 'State wise International Airport count in South America', State:
"Suriname", Count: 1 },
];
args.treemap.dataSource = data;
}
</script>

```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC TreeMap control will be rendered in the default web browser.

**Note:** [View Sample in GitHub.](#)

## Data Binding

The TreeMap control supports data binding using the dataSource property.

## Populate data

The dataSource property accepts collection values as input. For example, a list of objects can be provided as input. Data can be given as either flat or hierarchical collection to the dataSource property.

<!-- markdownlint-disable MD036 -->

## Flat collection

The following code shows, how to bind a flat collection as data source to the TreeMap control.

## CSHTML

```
@using Syncfusion.EJ2;
```

```

<div id="container">
  <ejs-treemap id="container" load="load" height="350px"
weightValuePath="GDP">
    <e-treemap-leafitemsettings labelPath="State"></e-treemap-
leafitemsettings>
  </ejs-treemap>
</div>
<script>
  function load(args)
  {
    var data = [
      {State:"United States", GDP:17946, percentage:11.08,
Rank:1},
      {State:"China", GDP:10866, percentage: 28.42, Rank:2},
      {State:"Japan", GDP:4123, percentage:-30.78, Rank:3},
      {State:"Germany", GDP:3355, percentage:-5.19, Rank:4},
      {State:"United Kingdom", GDP:2848, percentage:8.28, Rank:5},
      {State:"France", GDP:2421, percentage:-9.69, Rank:6},
      {State:"India", GDP:2073, percentage:13.65, Rank:7},
      {State:"Italy", GDP:1814, percentage:-12.45, Rank:8},
      {State:"Brazil", GDP:1774, percentage:-27.88, Rank:9},
      {State:"Canada", GDP:1550, percentage:-15.02, Rank:10}
    ];
    args.treemap.dataSource = data;
  }
</script>

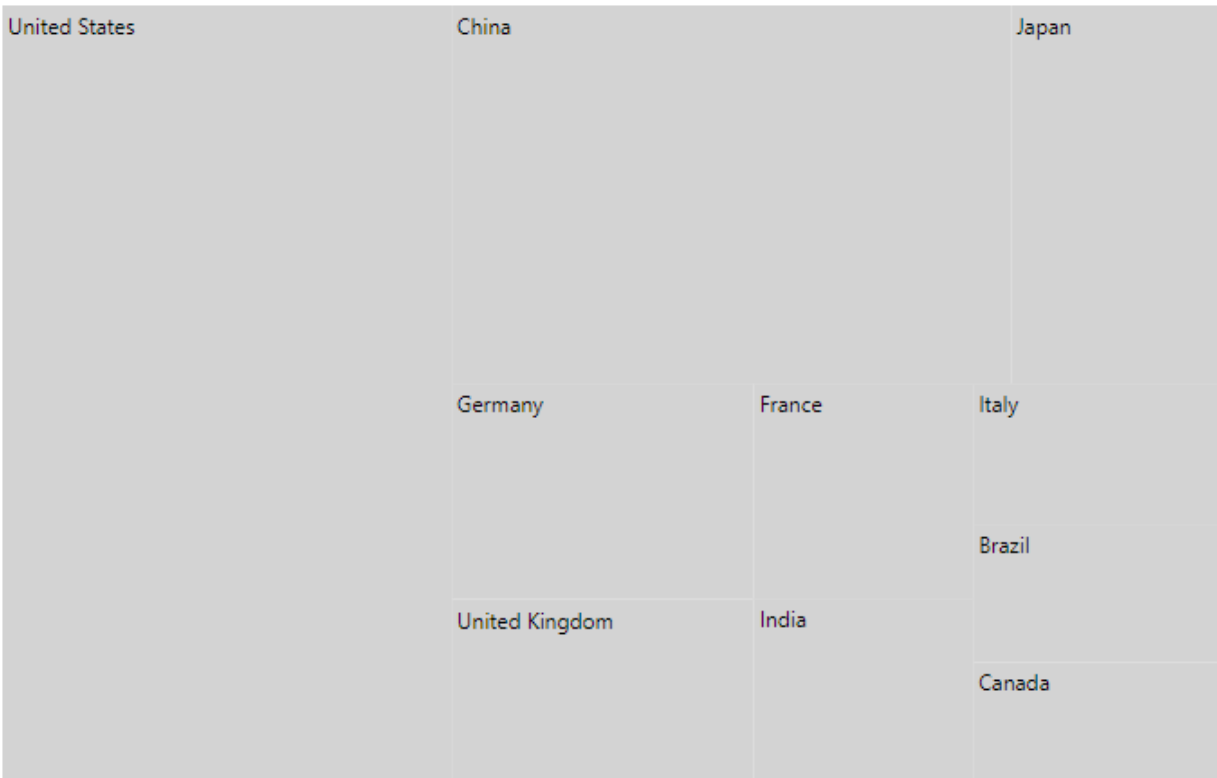

```

**FLAT.CS**

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
  public class HomeController : Controller
  {
    public IActionResult Index()
    {
      return View();
    }
  }
}

```

### *Hierarchical collection*

The following code shows, how to bind a hierarchical collection as data source to the TreeMap control.

<!-- markdownlint-disable MD010 -->

### **CSHTML**

```
@{
    var border = new TreeMapBorder{ Color = "white", Width = 0.5 };
    var borders = new TreeMapBorder{ Color = "black", Width = 0.5 };
}
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
weightValuePath="Population">
        <e-treemap-leafitemsettings labelPath="Region" fill='#0077b3'
border='border' ></e-treemap-leafitemsettings>
        <e-treemap-levels>
            <e-treemap-level groupPath= 'Continent'
fill='#004466' border='borders'><e-treemap-level>
                <e-treemap-level groupPath= 'States' fill='#0099e6'
border='borders'><e-treemap-level>
                    </e-treemap-level>
                </e-treemap-level>
            </e-treemap-levels>
        </ejs-treemap>
    </div>
<script>
    function load(args)
    {
        var data = [{
            "Continent": [{
```

```

        "Name": "Africa",
        "Population": 1216130000,
        "States": [{
            "Name": "Eastern Africa",
            "Population": 410637987,
            "Region": [{
                "Name": "Ethiopia",
                "Population": 107534882
            }]
        },
        {
            "Name": "Middle Africa",
            "Population": 158562976,
            "Region": [{
                "Name": "Democratic, Republic
of the Congo",
                "Population": 84004989
            }]
        }
    ]
},
{
    "Continent": [{
        "Name": "Asia",
        "Population": 4436224000,
        "States": [{
            "Name": "Central Asia",
            "Population": 69787760,
            "Region": [{
                "Name": "Uzbekistan",
                "Population": 32364996
            }]
        },
        {
            "Name": "Eastern Asia",
            "Population": 1641908531,
            "Region": [{
                "Name": "China",
                "Population": 1415045928
            }]
        }
    ]
},
{
    "Continent": [{
        "Name": "North America",
        "Population": 579024000,
        "States": [{
            "Name": "Central America",
            "Population": 174988756,
            "Region": [{
                "Name": "Mexico",
                "Population": 130759074
            }]
        }
    ]
},

```

```

        {
            "Name": "Northern America",
            "Population": 358593810,
            "Region": [{
                "Name": "U.S.",
                "Population": 3267667480
            }]
        }
    ]
},
{
    "Continent": [{
        "Name": "South America",
        "Population": 422535000,
        "States": [{
            "Name": "Brazil",
            "Population": 204519000
        }]
    }]
},
{
    "Continent": [{
        "Name": "Europe",
        "Population": 738849000,
        "States": [{
            "Name": "Eastern Europe",
            "Population": 291953328,
            "Region": [{
                "Name": "Russia",
                "Population": 143964709
            }]
        },
        {
            "Name": "Northern Europe",
            "Population": 103642971,
            "Region": [{
                "Name": "United Kingdom",
                "Population": 66573504
            }]
        }
    ]
}]
}
];
args.treemap.dataSource = data;
}
</script>

```

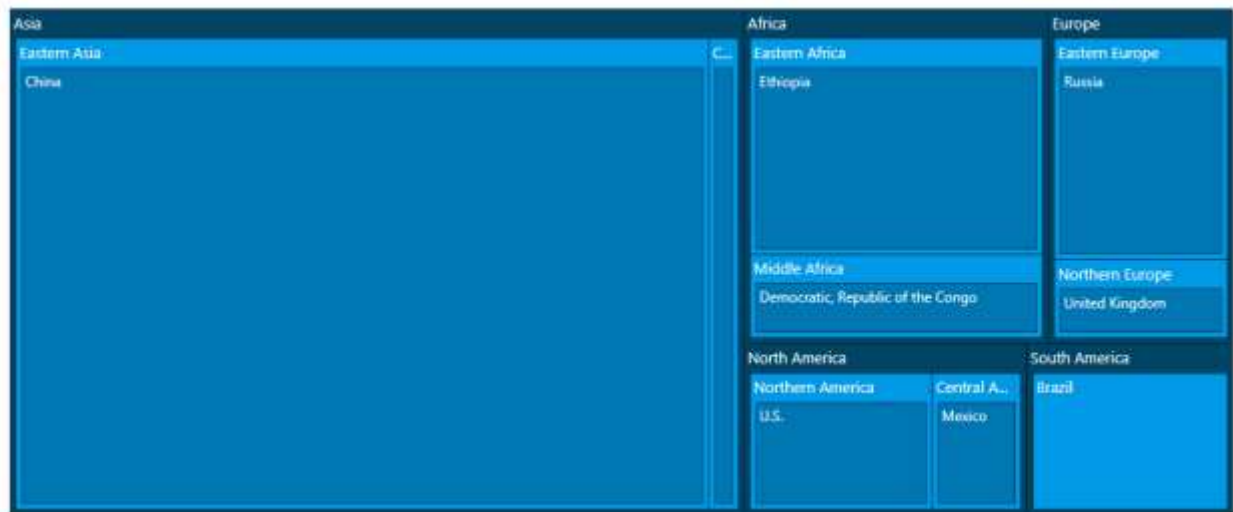

## HIERACHICAL.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;

```

```
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

## Layout

Determine the visual representation of nodes belonging to all the TreeMap levels using the `layoutType` property.

### Types of layout

The available layout types are,

- Squarified
- SliceAndDiceVertical
- SliceAndDiceHorizontal
- SliceAndDiceAuto

### Squarified

The **Squarified** layout displays the nested rectangles based on aspect ratio in the TreeMap. The rectangles will be split based on the height and width of the parent. The default rendering type of layout is **Squarified**.

### CSHTML

```
@using Syncfusion.EJ2;
<div id="container">
```

```

<ejs-treemap id="container" load="load" height="350px"
weightValuePath="GDP" >
  </ejs-treemap>
</div>
<script>
  function load(args)
  {
    var data = [
      {State:"United States", GDP:17946, percentage:11.08, Rank:1},
      {State:"China", GDP:10866, percentage: 28.42, Rank:2},
      {State:"Japan", GDP:4123, percentage:-30.78, Rank:3},
      {State:"Germany", GDP:3355, percentage:-5.19, Rank:4},
      {State:"United Kingdom", GDP:2848, percentage:8.28, Rank:5},
      {State:"France", GDP:2421, percentage:-9.69, Rank:6},
      {State:"India", GDP:2073, percentage:13.65, Rank:7},
      {State:"Italy", GDP:1814, percentage:-12.45, Rank:8},
      {State:"Brazil", GDP:1774, percentage:-27.88, Rank:9},
      {State:"Canada", GDP:1550, percentage:-15.02, Rank:10}
    ];
    args.treemap.dataSource = data;
  }
</script>

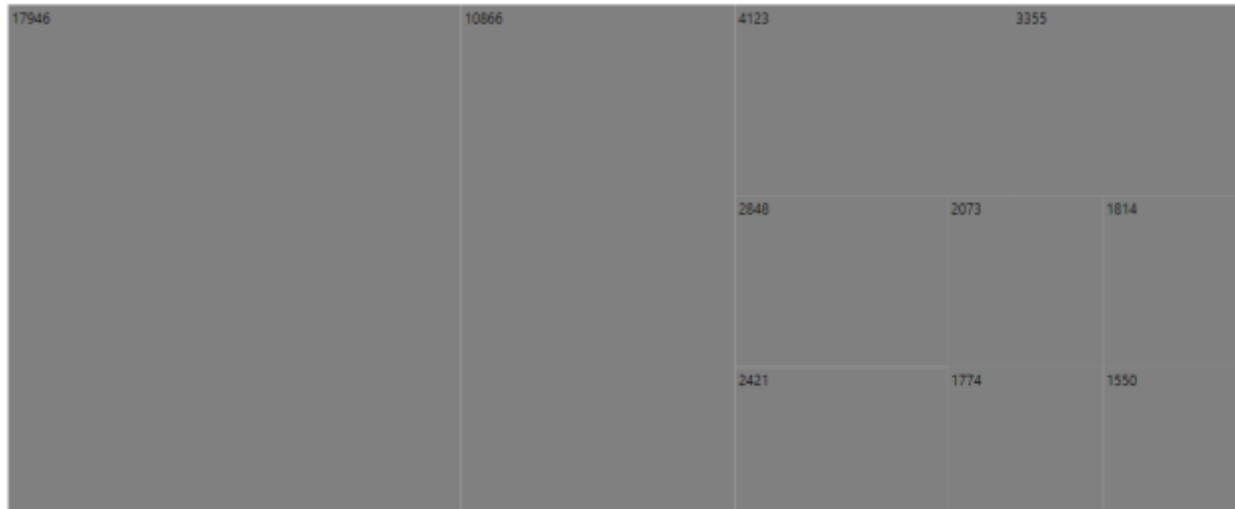

```

### SQUARIFIED.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

### *SliceAndDiceVertical*

The `SliceAndDiceVertical` layout creates rectangles with high aspect ratio and displays items in a vertically sorted order.

### CSHTML

```
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
    weightValuePath="GDP" layoutType='SliceAndDiceVertical' >
    </ejs-treemap>
</div>
<script>
    function load(args)
    {
        var data = [
            {State:"United States", GDP:17946, percentage:11.08, Rank:1},
            {State:"China", GDP:10866, percentage: 28.42, Rank:2},
            {State:"Japan", GDP:4123, percentage:-30.78, Rank:3},
            {State:"Germany", GDP:3355, percentage:-5.19, Rank:4},
            {State:"United Kingdom", GDP:2848, percentage:8.28, Rank:5},
            {State:"France", GDP:2421, percentage:-9.69, Rank:6},
            {State:"India", GDP:2073, percentage:13.65, Rank:7},
            {State:"Italy", GDP:1814, percentage:-12.45, Rank:8},
            {State:"Brazil", GDP:1774, percentage:-27.88, Rank:9},
            {State:"Canada", GDP:1550, percentage:-15.02, Rank:10}
        ];
        args.treemap.dataSource = data;
    }
</script>
```

### SLICE\_VERTICAL.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
```

```
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

### *SliceAndDiceHorizontal*

The **SliceAndDiceHorizontal** layout creates rectangles with high aspect ratio and displays items in a horizontally sorted order.

### **CSHTML**

```
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
    weightValuePath="GDP" layoutType= 'SliceAndDiceHorizontal'>
    </ejs-treemap>
</div>
<script>
    function load(args)
    {
        var data = [
            {State:"United States", GDP:17946, percentage:11.08, Rank:1},
            {State:"China", GDP:10866, percentage: 28.42, Rank:2},
            {State:"Japan", GDP:4123, percentage:-30.78, Rank:3},
            {State:"Germany", GDP:3355, percentage:-5.19, Rank:4},
            {State:"United Kingdom", GDP:2848, percentage:8.28, Rank:5},
            {State:"France", GDP:2421, percentage:-9.69, Rank:6},
            {State:"India", GDP:2073, percentage:13.65, Rank:7},
            {State:"Italy", GDP:1814, percentage:-12.45, Rank:8},
```

```

    {State:"Brazil", GDP:1774, percentage:-27.88, Rank:9},
    {State:"Canada", GDP:1550, percentage:-15.02, Rank:10}
  ];
  args.treemap.dataSource = data;
}
</script>

```

### SLICE\_HORIZONTAL.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

### *SliceAndDiceAuto*

The `SliceAndDiceAuto` layout creates rectangles with high aspect ratio and display items sorted both horizontally and vertically.

### CSHTML

```

@using Syncfusion.EJ2;
<div id="container">

```

```

<ejs-treemap id="container" load="load" height="350px"
weightValuePath="GDP" layoutType= 'SliceAndDiceAuto' >
</ejs-treemap>
</div>
<script>
function load(args)
{
    var data = [
        {State:"United States", GDP:17946, percentage:11.08, Rank:1},
        {State:"China", GDP:10866, percentage: 28.42, Rank:2},
        {State:"Japan", GDP:4123, percentage:-30.78, Rank:3},
        {State:"Germany", GDP:3355, percentage:-5.19, Rank:4},
        {State:"United Kingdom", GDP:2848, percentage:8.28, Rank:5},
        {State:"France", GDP:2421, percentage:-9.69, Rank:6},
        {State:"India", GDP:2073, percentage:13.65, Rank:7},
        {State:"Italy", GDP:1814, percentage:-12.45, Rank:8},
        {State:"Brazil", GDP:1774, percentage:-27.88, Rank:9},
        {State:"Canada", GDP:1550, percentage:-15.02, Rank:10}
    ];
    args.treemap.dataSource = data;
}
</script>

```

### SLICE\_AUTO.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

### Right-to-left rendering

The TreeMap control supports right-to-left rendering for all its elements such as nodes, tooltip, data labels, and legends.

### Legend with Rtl support

If you set the `enableRtl` property to true, then the legend icon will be rendered on the right and the legend text will be rendered on the left of the legend icon.

### CSHTML

```
@{
    var colorMaps = new[]{
        new { value='Ford', color='green'},
        new { value='Audi', color='red'},
        new { value='Maruti', color='orange'},
    };
    var border= new TreeMapBorder{color='black',width=2}
}
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
    weightValuePath="count" colorValuePath= "color" enableRtl=true>
        <e-treemap-leafitemsettings labelPath="Car" ></e-treemap-
        leafitemsettings>
            <e-treemap-legendsettings visible= "true" position=
            "Top"></e-treemap-legendsettings>
        </ejs-treemap>
    </div>
<script>
    function load(args)
    {
        var data = [{ Car:'Mustang', Brand:'Ford', count:232, color:
        '#71B081' },
                    { Car:'EcoSport', Brand:'Ford', count:121, color:
        '#5A9A77' },
                    { Car:'Swift', Brand:'Maruti', count:143, color:
        '#498770' },
    ]
    }
```

```

        { Car:'Baleno', Brand:'Maruti', count:454, color:
'#39776C' },
        { Car:'Vitara Brezza', Brand:'Maruti', count:545 ,
color: '#266665' },
        { Car:'A3 Cabriolet', Brand:'Audi',count:123, color:
'#124F5E' }
    ];
    args.treemap.dataSource = data;
}
</script>

```

### LEGEND-RTL.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

### Tooltip with Rtl support

If the `enableRtl` property is set to true, the tooltip data will be rendered in reverse direction.

The following example shows the format of the tooltip.

**CSHTML**

```
@{
    var colorMaps = new[]{
        new { value='Ford', color='green'},
        new { value='Audi', color='red'},
        new { value='Maruti', color='orange'},
    };

    var border= new TreeMapBorder{color='black',width=2}
}
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
weightValuePath="count" colorValuePath= "color">
        <e-treemap-leafitemsettings labelPath="fruit" ></e-treemap-
leafitemsettings>
            <e-treemap-tooltipSettings visible= "true"
format="${count} : ${fruit}"></e-treemap-legendsettings>
        </ejs-treemap>
    </div>
<script>
    function load(args)
    {
        var data = [{ fruit:'Apple', count:5000 },
                    { fruit:'Mango', count:3000 },
                    { fruit:'Orange', count:2300 },
                    { fruit:'Banana', count:500 },
                    { fruit:'Grape', count:4300 },
                    { fruit:'Papaya', count:1200 },
                    { fruit:'Melon', count:4500 }
                ];
        args.treemap.dataSource = data;
        args.treemap.palette=['#71B081','#5A9A77', '#498770', '#39776C',
        '#266665','#124F5E'];
    }
</script>
```

**TOOLTIP-RTL.CS**

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

```
}
```

### Treemap Item Rendering Direction

The direction of TreeMap item is **TopLeftBottomRight** by default and customize the rendering direction of the TreeMap item by setting the **RenderDirection** property.

The TreeMap can be rendered in the following directions:

- TopLeftBottomRight
- TopRightBottomLeft
- BottomRightTopLeft
- BottomLeftTopRight

The following example demonstrate how to render the treemap in the RTL direction with **TopLeftBottomRight**.

### CSHTML

```
@{
}
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
    weightValuePath="count" >
        <e-treemap-leafitemsettings labelPath="fruit" ></e-treemap-
        leafitemsettings>

    </ejs-treemap>
</div>
<script>
    function load(args)
    {
        var data = [{ fruit:'Apple', count:5000 },
                    { fruit:'Mango', count:3000 },
                    { fruit:'Orange', count:2300 },
```

```

        { fruit:'Banana', count:500 },
        { fruit:'Grape', count:4300 },
        { fruit:'Papaya', count:1200 },
        { fruit:'Melon', count:4500 }
    ];
    args.treemap.dataSource = data;
    args.treemap.palette=['#71B081', '#5A9A77', '#498770', '#39776C',
    '#266665', '#124F5E'];
    args.treemap.renderDirection = 'TopLeftBottomRight';
    }
</script>

```

### RENDER-DIRECTION-ONE.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

The following example demonstrate how to render the treemap in the RTL direction with `TopRightBottomLeft`.

### CSHTML

```
@{
}
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
weightValuePath="count" >
        <e-treemap-leafitemsettings labelPath="fruit" ></e-treemap-
leafitemsettings>

    </ejs-treemap>
</div>
<script>
    function load(args)
    {
        var data = [{ fruit:'Apple', count:5000 },
                    { fruit:'Mango', count:3000 },
                    { fruit:'Orange', count:2300 },
                    { fruit:'Banana', count:500 },
                    { fruit:'Grape', count:4300 },
                    { fruit:'Papaya', count:1200 },
                    { fruit:'Melon', count:4500 }
                ];
        args.treemap.dataSource = data;
        args.treemap.palette=[ '#71B081', '#5A9A77', '#498770', '#39776C',
        '#266665', '#124F5E'];
        args.treemap.renderDirection = 'TopRightBottomLeft';
    }
</script>
```

### RENDER-DIRECTION-TWO.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

The following example demonstrate how to render the treemap in the RTL direction with **BottomRightTopLeft**.

### CSHTML

```
@{
}
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
    weightValuePath="count" >
        <e-treemap-leafitemsettings labelPath="fruit" ></e-treemap-
        leafitemsettings>

        </ejs-treemap>
    </div>
<script>
    function load(args)
    {
        var data = [{ fruit:'Apple', count:5000 },
                    { fruit:'Mango', count:3000 },
                    { fruit:'Orange', count:2300 },
                    { fruit:'Banana', count:500 },
                    { fruit:'Grape', count:4300 },
                    { fruit:'Papaya', count:1200 },
                    { fruit:'Melon', count:4500 }
        ];
        args.treemap.dataSource = data;
        args.treemap.palette=[ '#71B081', '#5A9A77', '#498770', '#39776C',
        '#266665', '#124F5E' ];
        args.treemap.renderDirection = 'TopLeftBottomRight';
    }
</script>
```

### RENDER-DIRECTION-THREE.CS

```
using System;
using System.Collections.Generic;
```

```

using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

The following example demonstrate how to render the treemap in the RTL direction with BottomLeftTopRight.

### CSHTML

```

@{
}
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
weightValuePath="count" >
        <e-treemap-leafitemsettings labelPath="fruit" ></e-treemap-
leafitemsettings>

        </ejs-treemap>
    </div>
<script>
    function load(args)
    {
        var data = [{ fruit:'Apple', count:5000 },

```

```

        { fruit:'Mango', count:3000 },
        { fruit:'Orange', count:2300 },
        { fruit:'Banana', count:500 },
        { fruit:'Grape', count:4300 },
        { fruit:'Papaya', count:1200 },
        { fruit:'Melon', count:4500 }
    ];
    args.treemap.dataSource = data;
    args.treemap.palette=[ '#71B081', '#5A9A77', '#498770', '#39776C',
    '#266665', '#124F5E' ];
    args.treemap.renderDirection = 'BottomLeftTopRight';
    }
</script>

```

#### RENDER-DIRECTION-FOUR.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

## Leaf Item

A leaf item defines a visualized data element and does not contain child nodes but contains parent node if the levels are specified in the TreeMap.

## Leaf label

Label is represented by item name or value. Label will be appeared by specifying the `labelPath` property and customize the label style using the `labelStyle` property.

## CSHTML

```
@{
    var border = new TreeMapBorder{ Color = "#000000", Width = 0.5 };
}
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
weightValuePath="GDP" >
        <e-treemap-leafitemsettings labelPath="State" border ='border'>
            <e-leafitemsettings-labelstyle color= '#000000'></e-
leafitemsettings-labelstyle>
        </e-treemap-leafitemsettings>
    </ejs-treemap>
</div>
<script>
    function load(args)
    {
        var data = [
            {State:"United States", GDP:17946, percentage:11.08, Rank:1},
            {State:"China", GDP:10866, percentage: 28.42, Rank:2},
            {State:"Japan", GDP:4123, percentage:-30.78, Rank:3},
            {State:"Germany", GDP:3355, percentage:-5.19, Rank:4},
            {State:"United Kingdom", GDP:2848, percentage:8.28, Rank:5},
            {State:"France", GDP:2421, percentage:-9.69, Rank:6},
            {State:"India", GDP:2073, percentage:13.65, Rank:7},
            {State:"Italy", GDP:1814, percentage:-12.45, Rank:8},
            {State:"Brazil", GDP:1774, percentage:-27.88, Rank:9},
            {State:"Canada", GDP:1550, percentage:-15.02, Rank:10}
        ];
        args.treemap.dataSource = data;
    }
</script>
```

## LEAFLABEL.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
    }
```

```

public IActionResult Index()
{
    return View();
}
}

```

<!-- markdownlint-disable MD036 -->

### Label position and format

Positioning the leaf item label using the `labelPosition` property and the text format can be customized by specifying data source properties name in the `labelFormat` property.

### CSHTML

```

@{
    var labelStyle = new TreeMapBorder{ Color = "#000000", Width = 0.5 };
}
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
    weightValuePath="GDP" >
        <e-treemap-leafitemsettings labelPath="State"
        labelPosition='TopCenter' labelFormat= '${State}<br>${GDP}
        Trillion<br>(${percentage} %)' >
            </e-treemap-leafitemsettings>
        </ejs-treemap>
    </div>
<script>
    function load(args)
    {
        var data = [
            {State:"United States", GDP:17946, percentage:11.08, Rank:1},
            {State:"China", GDP:10866, percentage: 28.42, Rank:2},
            {State:"Japan", GDP:4123, percentage:-30.78, Rank:3},
            {State:"Germany", GDP:3355, percentage:-5.19, Rank:4},
            {State:"United Kingdom", GDP:2848, percentage:8.28, Rank:5},
            {State:"France", GDP:2421, percentage:-9.69, Rank:6},

```

```

    {State:"India", GDP:2073, percentage:13.65, Rank:7},
    {State:"Italy", GDP:1814, percentage:-12.45, Rank:8},
    {State:"Brazil", GDP:1774, percentage:-27.88, Rank:9},
    {State:"Canada", GDP:1550, percentage:-15.02, Rank:10}
  ];
  args.treemap.dataSource = data;
}
</script>

```

## FORMAT.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

<!-- markdownlint-disable MD036 -->

### Label template and position

Specifies the template of leaf item label and position of the template to be customized using `labelTemplate` and `templatePosition` properties.

## CSHTML

```

@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
weightValuePath="Gold" >
        <e-treemap-leafitemsettings labelPath="Sport" fill='#993399'
templatePosition= 'Center' labelTemplate= '<div style="pointer-events:
none;"></img></div>'>
            <e-leafitemsettings-labelstyle color= '#000000'></e-
leafitemsettings-labelstyle>
        </e-treemap-leafitemsettings>
    </ejs-treemap>
</div>
<script>
    function load(args)
    {
        var data = [

    }
}

```

## Levels

TreeMap supports **n** number of levels and each level is separated by using the `groupPath` property.

<!-- markdownlint-disable MD036 -->

## Group path

The `groupPath` property is used to separate each level of the TreeMap by specifying the property from the data source.

In the following example, three levels are added and each level is configured using the `groupPath` property.

## CSHTML

```
@{
    var border = new TreeMapBorder{ Color = "black", Width = 0.5 };
    var palette = new string[] { "#f44336", "#29b6f6", "#ab47bc", "#ffc107",
    "#5c6bc0", "#009688" };
}
@using Syncfusion.EJ2;

    ];
    args.treemap.dataSource = data;
}
</script>

```

### HEADER HEIGHT.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

### Header template and position

The TreeMap header supports to customize header of each item using the `headerTemplate` property. It uses Essential JS2 Template engine to render the elements. You can position the template using the `templatePosition` property.

### CSHTML

```

@{
    var border = new TreeMapBorder{ Color = "black", Width = 0.5 };
    var palette = new string[] { "#f44336", "#29b6f6", "#ab47bc", "#ffc107",
"#5c6bc0", "#009688" };
}
@using Syncfusion.EJ2;
<div id="container">

```

```

    <ejs-treemap id="container" load="load" height="350px"
    weightValuePath="EmployeesCount" palette="palette" >
        <e-treemap-levels>
            <e-treemap-level groupPath="Country"
            headerTemplate='<div>{{Country}}</div>' headerPosition='Center'
            border="border">
                <e-treemap-level groupPath="JobDescription"
                headerTemplate='<div>{{JobDescription}}</div>' headerPosition='Center'
                border="border">

        }
    </script>

```

```

    };
    args.treemap.dataSource = data;
}
</script>

```

### TEMPLATE.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

### Color Mapping

Color mapping is used to customize the color for each group or item based on the specified types. The following options are available to customize the group and leaf items in the TreeMap.

#### Range color mapping

Range color mapping is used to apply color to the items by giving specific ranges in the DataSource, and it should be specifying the data source properties to the `rangeColorValuePath`. The color mapping ranges to be specified in the `from` and `to` properties of the `colorMapping`.

### CSHTML

```

@{
    var colorMaps = new[]
    {
        new { value= 25, color= "#634D6F"},
        new { value= 12, color= "#B34D6D"},
        new { value= 9, color= "#557C5C" },
        new { value= 7, color= "#44537F" },
        new { value= 6, color= "#637392" },
        new { value= 3, color= "#7C754D" },
        new { value= 2, color= "#2E7A64" },
        new { value= 1, color= "#95659A" }
    };
}
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"

        ];
        args.treemap.dataSource = data;
    }
</script>

```

**RANGE.CS**

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

**Equal color mapping**

Equal color mapping is used to fill colors to each item by specifying equal value present in the data source, that can be specified in the `equalColorValuePath` property.

**CSHTML**

```

@{
    var colorMaps = new[]{
        new { from=500, to=3000, color='orange' },
        new { from=3000, to=5000, color='green' }
    };
}
@using Syncfusion.EJ2;
<div id="container">

```

```

    <ejs-treemap id="container" load="load" height="350px"
weightValuePath="count" rangeColorValuePath="count">
        <e-treemap-leafitemsettings labelPath="fruit"
colorMapping="colorMaps"></e-treemap-leafitemsettings>
    </ejs-treemap>
</div>
<script>
    function load(args)
    {
        var data = [{ fruit:'Apple', count:5000 },
                    { fruit:'Mango', count:3000 },
                    { fruit:'Orange', count:2300 },
                    { fruit:'Banana', count:500 },
                    { fruit:'Grape', count:4300 },
                    { fruit:'Papaya', count:1200 },
                    { fruit:'Melon', count:4500 }
        ];
        args.treemap.dataSource = data;
    }
</script>

```

**EQUAL.CS**

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

### Desaturation color mapping

Desaturation color mapping is used to apply colors to the items based on `minOpacity` and `maxOpacity` properties in the `colorMapping`.

### CSHTML

```
@{
    var colorMaps = new[]{
        new {from=500,to=3000,
            minOpacity=0.2,maxOpacity=0.5,color='orange'},
        new {from=3000,to=5000,
            minOpacity=0.5,maxOpacity=0.8,color='green'},
    };
}
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
        weightValuePath="count" rangeColorValuePath="count">
        <e-treemap-leafitemsettings labelPath="fruit"
            colorMapping="colorMaps"></e-treemap-leafitemsettings>
    </ejs-treemap>
</div>
<script>
    function load(args)
    {
        var data = [{ fruit:'Apple', count:5000 },
                    { fruit:'Mango', count:3000 },
                    { fruit:'Orange', count:2300 },
                    { fruit:'Banana', count:500 },
                    { fruit:'Grape', count:4300 },
                    { fruit:'Papaya', count:1200 },
                    { fruit:'Melon', count:4500 }
        ];
        args.treemap.dataSource = data;
    }
</script>
```

### DESATURATION.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

### Palette color mapping

The palette color mapping is used to fill the color to each group or leaf item by given colors in the `palette` property.

### CSHTML

```

@{
    var colorMaps = new[]
    {
        new { value= 25, color= "#634D6F"},
        new { value= 12, color= "#B34D6D"},
        new { value= 9, color= "#557C5C" },
        new { value= 7, color= "#44537F" },
        new { value= 6, color= "#637392" },
        new { value= 3, color= "#7C754D" },
        new { value= 2, color= "#2E7A64" },
        new { value= 1, color= "#95659A" }
    };
}

```

```

@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
weightValuePath="Count" equalColorValuePath="Count">
        <e-treemap-leafitemsettings labelPath="State"
colorMapping="colorMaps"></e-treemap-leafitemsettings>
    </ejs-treemap>
</div>
<script>
    function load(args)
    {
        var data = [
            { Title: 'State wise International Airport count in South
America', State: "Brazil", Count: 25 },
            { Title: 'State wise International Airport count in South
America', State: "Colombia", Count: 12 },
            { Title: 'State wise International Airport count in South
America', State: "Argentina", Count: 9 },
            { Title: 'State wise International Airport count in South
America', State: "Ecuador", Count: 7 },
            { Title: 'State wise International Airport count in South
America', State: "Chile", Count: 6 },
            { Title: 'State wise International Airport count in South
America', State: "Peru", Count: 3 },
            { Title: 'State wise International Airport count in South
America', State: "Venezuela", Count: 3 },
            { Title: 'State wise International Airport count in South
America', State: "Bolivia", Count: 2 },
            { Title: 'State wise International Airport count in South
America', State: "Paraguay", Count: 2 },
            { Title: 'State wise International Airport count in South

            { Title: 'State wise International Airport count in South
America', State: "Falkland Islands", Count: 1 },
            { Title: 'State wise International Airport count in South
America', State: "French Guiana", Count: 1 },
            { Title: 'State wise International Airport count in South
America', State: "Guyana", Count: 1 },
            { Title: 'State wise International Airport count in South
America', State: "Suriname", Count: 1 },
        ];
        args.treemap.dataSource = data;
    }
</script>

```

**PALLETE.CS**

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers

```

```
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

### Desaturation with multiple colors

Multiple colors are used as gradient effect to specific shapes based on the ranges in datasource. By using [color] property, you can set n number of colors.

### CSHTML

```
@{
    var colorMaps = new[]
    {
        new { value= 25, color= "#634D6F"},
        new { value= 12, color= "#B34D6D"},
        new { value= 9, color= "#557C5C" },
        new { value= 7, color= "#44537F" },
        new { value= 6, color= "#637392" },
        new { value= 3, color= "#7C754D" },
        new { value= 2, color= "#2E7A64" },
        new { value= 1, color= "#95659A" }
    };
}
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
weightValuePath="Count" equalColorValuePath="Count">
        <e-treemap-leafitemsettings labelPath="State"
colorMapping="colorMaps"></e-treemap-leafitemsettings>
    </ejs-treemap>
</div>
<script>
```

```

function load(args)
{
    var data = [
        { Title: 'State wise International Airport count in South America', State: "Brazil", Count: 25 },
        { Title: 'State wise International Airport count in South America', State: "Colombia", Count: 12 },
        { Title: 'State wise International Airport count in South America', State: "Argentina", Count: 9 },

    }
}

```

### Color for items excluded from color mapping

Get the excluded ranges from data source using the color mapping and apply the specific color to those items, without specifying the `from` and `to` properties.

### CSHTML

```
@{
    var colorMaps = new[]
    {
        new { value= 25, color= "#634D6F"},
        new { value= 12, color= "#B34D6D"},
        new { value= 9, color= "#557C5C" },
        new { value= 7, color= "#44537F" },
        new { value= 6, color= "#637392" },
        new { value= 3, color= "#7C754D" },
        new { value= 2, color= "#2E7A64" },
        new { value= 1, color= "#95659A" }
    };
}
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
weightValuePath="Count" equalColorValuePath="Count">
        <e-treemap-leafitemsettings labelPath="State"
colorMapping="colorMaps"></e-treemap-leafitemsettings>
    </ejs-treemap>
</div>
<script>
    function load(args)
    {
        var data = [
            { Title: 'State wise International Airport count in South
America', State: "Brazil", Count: 25 },
            { Title: 'State wise International Airport count in South
America', State: "Colombia", Count: 12 },
            { Title: 'State wise International Airport count in South
America', State: "Argentina", Count: 9 },
```

```

        { Title: 'State wise International Airport count in South
America', State: "Ecuador", Count: 7 },
        { Title: 'State wise International Airport count in South
America', State: "Chile", Count: 6 },
        { Title: 'State wise International Airport count in South
America', State: "Peru", Count: 3 },
        { Title: 'State wise International Airport count in South
America', State: "Venezuela", Count: 3 },
        { Title: 'State wise International Airport count in South
America', State: "Bolivia", Count: 2 },
        { Title: 'State wise International Airport count in South
America', State: "Paraguay", Count: 2 },
        { Title: 'State wise International Airport count in South

        { Title: 'State wise International Airport count in South
America', State: "Suriname", Count: 1 },
    ];
    args.treemap.dataSource = data;
}
</script>

```

### EXCLUDECOLOR.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

Bind the colors to the items from data source

To set the color for each item from the data source, bind the data source property to the `colorValuePath`.

### CSHTML

```
@{
    var colorMaps = new[]
    {
        new { value= 25, color= "#634D6F"},
        new { value= 12, color= "#B34D6D"},
        new { value= 9, color= "#557C5C" },
        new { value= 7, color= "#44537F" },
        new { value= 6, color= "#637392" },
        new { value= 3, color= "#7C754D" },
        new { value= 2, color= "#2E7A64" },
        new { value= 1, color= "#95659A" }
    };
}
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
weightValuePath="Count" equalColorValuePath="Count">
        <e-treemap-leafitemsettings labelPath="State"
colorMapping="colorMaps"></e-treemap-leafitemsettings>
    </ejs-treemap>
</div>

        { Title: 'State wise International Airport count in South
America', State: "Guyana", Count: 1 },
        { Title: 'State wise International Airport count in South
America', State: "Suriname", Count: 1 },
    ];
    args.treemap.dataSource = data;
}
</script>

```

## MULTIPLECOLOR.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

## Data Label

Data Labels are used to identify the name of items or groups in the TreeMap component. Data Labels will be shown by specifying the data source properties in the `labelPath` of the `leafItemSettings`.

## Format

Customize the labels for each item using the `labelFormat` property in the `leafItemSettings`.

## CSHTML

```
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
    weightValuePath="count">
        <e-treemap-leafitemsettings labelPath="Car" format='${Car}-
        ${Brand}'></e-treemap-leafitemsettings>
    </ejs-treemap>
</div>
<script>
    function load(args)
    {
        var data = [{ Car:'Mustang', Brand:'Ford', count:232 },
                    { Car:'EcoSport', Brand:'Ford', count:121 },
                    { Car:'Swift', Brand:'Maruti', count:143 },
                    { Car:'Baleno', Brand:'Maruti', count:454 },
                    { Car:'Vitara Brezza', Brand:'Maruti', count:545 },
                    { Car:'A3 Cabriolet', Brand:'Audi', count:123 },
                    { Car:'RS7 Sportback', Brand:'Audi', count:523 }
        ];
        args.treemap.dataSource = data;
    }
</script>
```

## FORMAT.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
```

```

using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

## Template

The template supports customizing labels of each leaf node using the `labelTemplate` property. It uses Essential JS2 template engine to render elements and the position of templates can be customize using the `templatePosition` property.

## CSHTML

```

@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
    weightValuePath="count">
        <e-treemap-leafitemsettings labelPath="Car"
        templatePosition='Center' labelTemplate='<div>{{:Car}}-
        {{:Brand}}</div>'></e-treemap-leafitemsettings>
    </ejs-treemap>
</div>
<script>
    function load(args)
    {
        var data = [{ Car:'Mustang', Brand:'Ford', count:232 },
                    { Car:'EcoSport', Brand:'Ford', count:121 },
                    { Car:'Swift', Brand:'Maruti', count:143 },

```

```

        { Car:'Baleno', Brand:'Maruti', count:454 },
        { Car:'Vitara Brezza', Brand:'Maruti', count:545 },
        { Car:'A3 Cabriolet', Brand:'Audi',count:123 },
        { car:'RS7 Sportback', Brand:'Audi', count:523 }
    ];
    args.treemap.dataSource = data;
}
</script>

```

### TEMPLATE.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

### InterSectAction

When the label size in each item exceeds the actual size, use the `interSectAction` property in the `leafItemSettings` to customise the labels.

### CSHTML

```
@using Syncfusion.EJ2;
```

```

<div id="container">
  <ejs-treemap id="container" load="load" height="350px"
weightValuePath="count">
    <e-treemap-leafitemsettings labelPath="Car" format='${Car}-
${Brand}' interSeactAction='WrapByWord'></e-treemap-leafitemsettings>
  </ejs-treemap>
</div>
<script>
  function load(args)
  {
    var data = [{ Car:'Mustang', Brand:'Ford', count:232 },
                { Car:'EcoSport', Brand:'Ford', count:121 },
                { Car:'Swift', Brand:'Maruti', count:143 },
                { Car:'Baleno', Brand:'Maruti', count:454 },
                { Car:'Vitara Brezza', Brand:'Maruti', count:545 },
                { Car:'A3 Cabriolet', Brand:'Audi', count:123 },
                { car:'RS7 Sportback', Brand:'Audi', count:523 }
    ];
    args.treemap.dataSource = data;
  }
</script>

```

### INTERSECTACTION.CS

```

using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
  public class HomeController : Controller
  {
    public IActionResult Index()
    {
      return View();
    }
  }
}

```

## Legend

Legend is used to provide valuable information for interpreting what the TreeMap displays. The legends can be represented in various colors, shapes or other identifiers based on the data.

## Position and alignment

Legend position is used to place legend in various positions. Based on the legend position, the legend item will be aligned. For example, if the position is top or bottom, the legend items are placed by rows. If the position is left or right, the legend items are placed by columns.

The following options are available to customize the legend position:

- Top
- Bottom
- Left
- Right
- Float

## CSHTML

```
@{
    var colorMaps = new[]{
        new { from=500, to=3000, color='orange' },
        new { from=3000, to=5000, color='green' }
    };
}
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
    weightValuePath="count" rangeColorValuePath="count">
        <e-treemap-leafitemsettings labelPath="fruit"
    colorMapping="colorMaps"></e-treemap-leafitemsettings>
        <e-treemap-legendsettings visible= "true"
    position="@Syncfusion.EJ2.TreeMap.LegendPosition.Top" ></e-treemap-
    legendsettings>
    </ejs-treemap>
</div>
```

```

<script>
function load(args)
{
    var data = [{ fruit:'Apple', count:5000 },
                { fruit:'Mango', count:3000 },
                { fruit:'Orange', count:2300 },
                { fruit:'Banana', count:500 },
                { fruit:'Grape', count:4300 },
                { fruit:'Papaya', count:1200 },
                { fruit:'Melon', count:4500 }
    ];
    args.treemap.dataSource = data;
}
</script>

```

### POSITION.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

Legend Alignment is used to align the legend items in specific location. The following options are available to customize the legend alignment:

- Near
- Center
- Far

**CSHTML**

```
@{
    var colorMaps = new[]{
        new { from=500, to=3000, color='orange' },
        new { from=3000, to=5000, color='green' }
    };
}
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
weightValuePath="count" rangeColorValuePath="count">
        <e-treemap-leafitemsettings labelPath="fruit"
colorMapping="colorMaps"></e-treemap-leafitemsettings>
        <e-treemap-legendsettings visible= "true"
alignment='Far'></e-treemap-legendsettings>
    </ejs-treemap>
</div>
<script>
    function load(args)
    {
        var data = [{ fruit:'Apple', count:5000 },
                    { fruit:'Mango', count:3000 },
                    { fruit:'Orange', count:2300 },
                    { fruit:'Banana', count:500 },
                    { fruit:'Grape', count:4300 },
                    { fruit:'Papaya', count:1200 },
                    { fruit:'Melon', count:4500 }
                ];
        args.treemap.dataSource = data;
    }
</script>
```

**ALIGN.CS**

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

```
}
```

### Legend mode

The TreeMap control supports two different types of legend rendering modes such as **Default** and **Interactive**.

<!-- markdownlint-disable MD036 -->

### Default mode

In default mode, the legends have symbols with legend labels that are used to identify the items in the TreeMap.

### CSHTML

```
@{
    var colorMaps = new[]{
        new { value='Ford', color='green'},
        new { value='Audi', color='red'},
        new { value='Maruti', color='orange'},
    };
    var border= new TreeMapBorder{color='black',width=2}
}
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
weightValuePath="count" equalColorValuePath='Brand',>
        <e-treemap-leafitemsettings labelPath="Car"
colorMapping="colorMaps"></e-treemap-leafitemsettings>
        <e-treemap-legendsettings visible= "true"
position="@Syncfusion.EJ2.TreeMap.LegendPosition.Top" border='border'></e-
treemap-legendsettings>
    </ejs-treemap>
</div>
<script>
    function load(args)
    {
        var data = [{ Car:'Mustang', Brand:'Ford', count:232 },
                    { Car:'EcoSport', Brand:'Ford', count:121 },
```

```

        { Car:'Swift', Brand:'Maruti', count:143 },
        { Car:'Baleno', Brand:'Maruti', count:454 },
        { Car:'Vitara Brezza', Brand:'Maruti', count:545 },
        { Car:'A3 Cabriolet', Brand:'Audi',count:123 },
        { car:'RS7 Sportback', Brand:'Audi', count:523 }
    ];
    args.treemap.dataSource = data;
}
</script>

```

### DEFAULT.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

<!-- markdownlint-disable MD036 -->

#### Interactive mode

The legends can be made interactive with an arrow mark that indicates exact range color in the legend when the mouse hovers on the TreeMap item. Enable this option by setting the `mode` property in the `legendSettings` to **Interactive**.

**CSHTML**

```
@{
    var colorMaps = new[]{
        new { value='Ford', color='green'},
        new { value='Audi', color='red'},
        new { value='Maruti', color='orange'},
    };

    var border= new TreeMapBorder{color='black',width=2}
}
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
weightValuePath="count" equalColorValuePath='Brand',>
        <e-treemap-leafitemsettings labelPath="Car"
colorMapping="colorMaps"></e-treemap-leafitemsettings>
        <e-treemap-legendsettings visible= "true"
position="@Syncfusion.EJ2.TreeMap.LegendPosition.Top"
mode="@LegendMode.Interactive" border='border'></e-treemap-legendsettings>
    </ejs-treemap>
</div>
<script>
    function load(args)
    {
        var data = [{ Car:'Mustang', Brand:'Ford', count:232 },
                    { Car:'EcoSport', Brand:'Ford', count:121 },
                    { Car:'Swift', Brand:'Maruti', count:143 },
                    { Car:'Baleno', Brand:'Maruti', count:454 },
                    { Car:'Vitara Brezza', Brand:'Maruti', count:545 },
                    { Car:'A3 Cabriolet', Brand:'Audi',count:123 },
                    { car:'RS7 Sportback', Brand:'Audi', count:523 }
                ];
        args.treemap.dataSource = data;
    }
</script>
```

**INTERACTIVE.CS**

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

### Legend size

Customize the legend size by modifying the `height` and `width` properties in the `legendSettings`. It accepts values in both percentage and pixel.

### CSHTML

```
@{
    var colorMaps = new[]{
        new { value='Ford', color='green'},
        new { value='Audi', color='red'},
        new { value='Maruti', color='orange'},
    };
    var border= new TreeMapBorder{color='black',width=2}
}
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
    weightValuePath="count" equalColorValuePath='Brand',>
        <e-treemap-leafitemsettings labelPath="Car"
        colorMapping="colorMaps"></e-treemap-leafitemsettings>
        <e-treemap-legendsettings visible= "true"
        position="@Syncfusion.EJ2.TreeMap.LegendPosition.Top" width:'200px'
        height:'50px' border='border'></e-treemap-legendsettings>
    </ejs-treemap>
</div>
<script>
    function load(args)
    {
        var data = [{ Car:'Mustang', Brand:'Ford', count:232 },
                    { Car:'EcoSport', Brand:'Ford', count:121 },
                    { Car:'Swift', Brand:'Maruti', count:143 },
                    { Car:'Baleno', Brand:'Maruti', count:454 },
                    { Car:'Vitara Brezza', Brand:'Maruti', count:545 },
                    { Car:'A3 Cabriolet', Brand:'Audi',count:123 },
                    { Car:'RS7 Sportback', Brand:'Audi', count:523 }
        ];
        args.treemap.dataSource = data;
    }
}
```

```
}
</script>
```

### SIZE.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

### Paging support

TreeMap support legend paging, if the legend items cannot be placed within the provided height and width of the legend.

### CSHTML

```
@{
    var colorMaps = new[]{
        new { value='Ford', color='green'},
        new { value='Audi', color='red'},
        new { value='Maruti', color='orange'},
    };
    var border= new TreeMapBorder{color='black',width=2}
```

```

}
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
weightValuePath="count" equalColorValuePath='Brand',>

legendsettings>
    </ejs-treemap>
</div>
<script>
    function load(args)
    {
        var data = [{ fruit: 'Apple', count: 5000 , color: 'red' },
            { fruit: 'Mango', count: 3000, color: 'blue' },
            { fruit: 'Orange', count: 2300,color: 'green'},
            { fruit: 'Mango', count: 500, color: 'pink' },
            { fruit: 'Apple', count: 4300, color: 'yellow' },
            { fruit: 'Papaya', count: 1200 color: 'orange'},
            { fruit: 'Melon', count: 4500, color: 'violet' }
        ];
        args.treemap.dataSource = data;
        args.treemap.colorValuePath = color;
        args.treemap.LegendSettings.visible = true;
        args.treemap.LegendSettings.valuePath = fruit;
        args.treemap.LegendSettings.removeDuplicateLegend = true;
        args.treemap.palette = [];
    }
</script>

```

#### DUPLICATELEGEND.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

### Legend Responsiveness

Use a responsive legend that switches positions between the right and the bottom based on the available height and width. To enable the responsive legend, set the `position` property to **Auto** in the `legendSettings` and the legend position is changed based on the available height and width.

### CSHTML

```
@{
    var size= new TreeMapSize{
        width= 700,
        height= 500
    }
}
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px" size= "size"
    weightValuePath="count" >
        <e-treemap-leafitemsettings labelPath="fruit" ></e-treemap-
        leafitemsettings>
        <e-treemap-legendsettings visible= "true" position =
        "Top" ></e-treemap-legendsettings>
    </ejs-treemap>
</div>
<script>
    function load(args)
    {
        var data = [{ fruit:'Apple', count:5000 },
                    { fruit:'Grape', count:3000 },
                    { fruit:'Apple', count:2300 },
                    { fruit:'Banana', count:500 },
                    { fruit:'Grape', count:4300 },
                    { fruit:'Papaya', count:1200 }
        ];

        args.treemap.dataSource = data;
    }
</script>
```

### LEGEND-RESPONSIVE.CS

```

using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
```

```

using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

### Drill-down

The TreeMap supports drill-down to expose the hierarchy, achieved by clicking a node. If an item is clicked in the TreeMap, it will be moved to the next level or sub level hierarchy and returned back to the previous level by clicking the node.

#### Perform drill-down action

The TreeMap items can be drilled by setting the `enableDrillDown` property to **true**.

#### CSHTML

```
@{
```

```

var border = new TreeMapBorder{ Color = "black", Width = 0.5 };

        ];
    }

```

```

    };
    args.treemap.dataSource = data;
}
</script>

```

### DRILLDOWN.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

### On-demand data loading

All the child items are rendered during the normal drill-down process, and visible at the initial rendering of the TreeMap. But on-demand data loading, it will not render child items at initial rendering, and child nodes will be rendered during the drill-down process by setting the `drillDownView` property to **true**.

### CSHTML

```

@{
    var border = new TreeMapBorder{ Color = "black", Width = 0.5 };
    var palette = new string[] { "#f44336", "#29b6f6", "#ab47bc", "#ffc107",
    "#5c6bc0", "#009688" };
}

```

```

        public IActionResult Index()
        {
            return View();
        }
    }
}
```

### Breadcrumb support

TreeMap items are drilled, up to any level of parent using breadcrumb navigation and the level from root parent to current level is displayed at the top of item layout. It can be enabled by using the `enableBreadcrumb` property to **true** and customize the breadcrumb connector using the `breadcrumbConnector` property. By default, -(hyphen) is the connector.

### CSHTML

```
@{
    var border = new TreeMapBorder{ Color = "black", Width = 0.5 };
    var palette = new string[] { "#f44336", "#29b6f6", "#ab47bc", "#ffc107",
    "#5c6bc0", "#009688" };
}
```

```

@using Syncfusion.EJ2;

</script>
```

### DRILLDOWN-BREADCRUMB.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

### Tooltip

Tooltip is used to display details about the items in the TreeMap. When space constraints prevent us from displaying the information using Data Labels, the tooltip comes in handy.

### Default tooltip

The tooltip is not visible by default, to make it visible, set the `visible` property in the `tooltipSettings` to `true`.

### CSHTML

```
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
    weightValuePath="count" >
```

```

        <e-treemap-leafitemsettings labelPath="fruit" ></e-treemap-
leafitemsettings>
        <e-treemap-tooltipsettings visible='true'></e-
treemap-tooltipsettings>

    </ejs-treemap>
</div>
<script>
    function load(args)
    {
        var data = [{ fruit:'Apple', count:5000 },
                    { fruit:'Mango', count:3000 },
                    { fruit:'Orange', count:2300 },
                    { fruit:'Banana', count:500 },
                    { fruit:'Grape', count:4300 },
                    { fruit:'Papaya', count:1200 },
                    { fruit:'Melon', count:4500 }
        ];
        args.treemap.dataSource = data;
    }
</script>

```

### TOOLTIP.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

### Format tooltip

The tooltip content is displayed by default based on the `weightValuePath`. In addition, to show more information in the tooltip, use the `format` property and define field from the data source as `${datafield}`.

### CSHTML

```
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
    weightValuePath="count" >
        <e-treemap-leafitemsettings labelPath="fruit" ></e-treemap-
        leafitemsettings>
            <e-treemap-tooltipsettings visible='true'
            format='Name:${fruit} - TotalCount:${count}'></e-treemap-tooltipsettings>

        </ejs-treemap>
    </div>
<script>
    function load(args)
    {
        var data = [{ fruit:'Apple', count:5000 },
                    { fruit:'Mango', count:3000 },
                    { fruit:'Orange', count:2300 },
                    { fruit:'Banana', count:500 },
                    { fruit:'Grape', count:4300 },
                    { fruit:'Papaya', count:1200 },
                    { fruit:'Melon', count:4500 }
                ];
        args.treemap.dataSource = data;
    }
</script>
```

### FORMAT.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

### Tooltip template

Tooltip can be rendered as a custom component using the `template` property in the `tooltipSettings` which accepts one or more UI elements as an input, that can be rendered as a part of the tooltip rendering. You can use `${datafield}` as placeholder in HTML element to display the values from data source.

### CSHTML

```
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
weightValuePath="count" >
        <e-treemap-leafitemsettings labelPath="fruit" ></e-treemap-
leafitemsettings>
            <e-treemap-tooltipsettings visible='true'
template='<div><p>Name: ${fruit}</p><p>Total Count: ${count}</p></div>'>
            </e-treemap-tooltipsettings>
        </ejs-treemap>
    </div>
<script>
    function load(args)
    {
        var data = [{ fruit:'Apple', count:5000 },
                    { fruit:'Mango', count:3000 },
                    { fruit:'Orange', count:2300 },
                    { fruit:'Banana', count:500 },
                    { fruit:'Grape', count:4300 },
                    { fruit:'Papaya', count:1200 },
                    { fruit:'Melon', count:4500 }
        ];
        args.treemap.dataSource = data;
    }
</script>
```

### TEMPLATE.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
```

```
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

## Selection and Highlight

### Selection

Selection is used to select a particular group or item to differentiate from other items. Each item or each group can be selected and deselected while interacting with the items. The corresponding Treemap items are also selected while tapping a specific legend item, and vice versa.

The `fill` property is used to change the selected item color. The `color` and the `width` properties are used to customize the selected item border, and the selection is enabled by using the `enable` property to `true` in the `selectionSettings`.

### CSHTML

```
@{
    var border= new TreeMapBorder{color= 'black', width=0.3}
}
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
    weightValuePath="count" >
        <e-treemap-leafitemsettings labelPath="fruit" fill= '#8ebfe2'
        labelPosition= 'Center'></e-treemap-leafitemsettings>
        <e-treemap-levels>
            <e-treemap-level groupPath= 'dataType' fill= '#c5e2f7'
            headerAlignment= 'Center' groupGap= 5 >
                <e-treemap-level groupPath= 'product' fill=
                '#a4d1f2' headerAlignment= 'Center' groupGap= 2 >
                    <e-treemap-selectionsettings enable='true' fill=
                    '#58a0d3' border='border' opacity= '1'></e-treemap-selectionsettings>
                </e-treemap-level>
            </e-treemap-level>
        </e-treemap-levels>
    </ejs-treemap>
</div>
```

    ];
    args.treemap.dataSource = data;
}
</script>

```

## HIGHLIGHT.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

```

    }
  }
}

```

## Print and Export

### Print

To use the print functionality, we should set the [allowPrint](#) property to **true**. The rendered treemap can be printed directly from the browser by calling the method [print](#).

### CSHTML

```

@using Syncfusion.EJ2;
<div id="container">
  <button id="print" style="width: 100px">Print</button>
  <ejs-treemap id="container" allowPrint="true" load="load"
    height="350px" weightValuePath="GDP">
    <e-treemap-leafitemsettings labelPath="State"
    labelFormat='${State}<br>${GDP} Trillion<br>(${percentage} %)'>
      <e-leafitemsettings-labelstyle color='#000000'></e-
    leafitemsettings-labelstyle>
    </e-treemap-leafitemsettings>
  </ejs-treemap>
</div>
<script>
  function load(args) {
    window.treemap = args.treemap;
    var data = [
      { State: "United States", GDP: 17946, percentage: 11.08, Rank: 1
    },
      { State: "China", GDP: 10866, percentage: 28.42, Rank: 2 },
      { State: "Japan", GDP: 4123, percentage: -30.78, Rank: 3 },
      { State: "Germany", GDP: 3355, percentage: -5.19, Rank: 4 },
      { State: "United Kingdom", GDP: 2848, percentage: 8.28, Rank: 5
    },
      { State: "France", GDP: 2421, percentage: -9.69, Rank: 6 },
      { State: "India", GDP: 2073, percentage: 13.65, Rank: 7 },
      { State: "Italy", GDP: 1814, percentage: -12.45, Rank: 8 },
    ];
  }
</script>

```

```

        { State: "Brazil", GDP: 1774, percentage: -27.88, Rank: 9 },
        { State: "Canada", GDP: 1550, percentage: -15.02, Rank: 10 }
    ];
    args.treemap.dataSource = data;
};
window.onload = function () {
    document.getElementById('print').onclick = () => {
        window.treemap.print();
    };
}
</script>

```

## PRINT.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

## Export

### Image Export

To use the image export functionality, we should set the [allowImageExport](#) property to **true**. The rendered treemap can be exported as an image using the [export](#) method. The method requires two parameters: image type and file name. The treemap can be exported as an image in the following formats.

- JPEG
- PNG
- SVG

## CSHTML

```

@using Syncfusion.EJ2;
<div id="container">
    <button id="export" style="width: 100px">Export</button>
    <ejs-treemap id="container" allowImageExport="true" load="load"
height="350px" weightValuePath="GDP" >
        <e-treemap-leafitemsettings labelPath="State" labelFormat=
'${State}<br>${GDP} Trillion<br>(${percentage} %)' >

```

```

        <e-leafitemsettings-labelstyle color='#000000'></e-leafitemsettings-labelstyle>
    </e-treemap-leafitemsettings>
</ejs-treemap>
</div>
<script>
    function load(args)
    {
        window.treemap = args.treemap;
        var data = [
            {State:"United States", GDP:17946, percentage:11.08, Rank:1},
            {State:"China", GDP:10866, percentage: 28.42, Rank:2},
            {State:"Japan", GDP:4123, percentage:-30.78, Rank:3},
            {State:"Germany", GDP:3355, percentage:-5.19, Rank:4},
            {State:"United Kingdom", GDP:2848, percentage:8.28, Rank:5},
            {State:"France", GDP:2421, percentage:-9.69, Rank:6},
            {State:"India", GDP:2073, percentage:13.65, Rank:7},
            {State:"Italy", GDP:1814, percentage:-12.45, Rank:8},
            {State:"Brazil", GDP:1774, percentage:-27.88, Rank:9},
            {State:"Canada", GDP:1550, percentage:-15.02, Rank:10}
        ];
        args.treemap.dataSource = data;
    };
    window.onload = function () {
        document.getElementById('export').onclick = () => {
            window.treemap.export('PNG', 'TreeMap');
        };
    }
</script>

```

## EXPORT.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

We can get the image file as base64 string for the JPEG and PNG formats. The treemap can be exported to image as a base64 string using the [export](#) method. There are four parameters required: image type, file name, orientation of the exported PDF document which must be set as **null** for image export and finally **allowDownload** which should be set as **false** to return base64 string.

**CSHTML**

```

@using Syncfusion.EJ2;
<div id="container">
    <button id="export" style="width: 100px">Export</button>
    <ejs-treemap id="container" load="load" allowImageExport="true"
height="350px" weightValuePath="GDP" >
        <e-treemap-leafitemsettings labelPath="State" labelFormat=

            <e-leafitemsettings-labelstyle color='#000000'></e-leafitemsettings-
labelstyle>
        </e-treemap-leafitemsettings>
    </ejs-treemap>
</div>
<script>
    function load(args) {
        window.treemap = args.treemap;
        var data = [
            {State:"United States", GDP:17946, percentage:11.08, Rank:1},
            {State:"China", GDP:10866, percentage: 28.42, Rank:2},
            {State:"Japan", GDP:4123, percentage:-30.78, Rank:3},
            {State:"Germany", GDP:3355, percentage:-5.19, Rank:4},
            {State:"United Kingdom", GDP:2848, percentage:8.28, Rank:5},
            {State:"France", GDP:2421, percentage:-9.69, Rank:6},
            {State:"India", GDP:2073, percentage:13.65, Rank:7},
            {State:"Italy", GDP:1814, percentage:-12.45, Rank:8},
            {State:"Brazil", GDP:1774, percentage:-27.88, Rank:9},
            {State:"Canada", GDP:1550, percentage:-15.02, Rank:10}
        ];
        args.treemap.dataSource = data;
    };
    window.onload = function () {
        document.getElementById('export').onclick = () => {
            window.treemap.export('JPEG', 'TreeMap', null,
false).then((data) => {
                let base64 = data;
                document.writeln(base64);
            });
        };
    }
</script>

```

**EXPORT.CS**

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {

```

```

        public IActionResult Index()
        {
            return View();
        }
    }
}

```

### PDF Export

To use the PDF export functionality, we should set the [allowPdfExport](#) property to **true**. The rendered treemap can be exported as PDF using the [export](#) method. The [export](#) method requires three parameters: file type, file name and orientation of the PDF document. The orientation setting is optional and **0** indicates portrait and **1** indicates landscape.

### CSHTML

```

@using Syncfusion.EJ2;
<div id="container">
    <button id="export" style="width: 100px">Export</button>
    <ejs-treemap id="container" allowPdfExport="true" load="load"
height="350px" weightValuePath="GDP" >
        <e-treemap-leafitemsettings labelPath="State" labelFormat=
'${State}<br>$$GDP Trillion<br>($percentage %)' >
            <e-leafitemsettings-labelstyle color='#000000'></e-leafitemsettings-
labelstyle>
        </e-treemap-leafitemsettings>
    </ejs-treemap>
</div>
<script>
function load(args)
{
    window.treemap= args.treemap;
    var data = [
        {State:"United States", GDP:17946, percentage:11.08, Rank:1},
        {State:"China", GDP:10866, percentage: 28.42, Rank:2},
        {State:"Japan", GDP:4123, percentage:-30.78, Rank:3},
        {State:"Germany", GDP:3355, percentage:-5.19, Rank:4},
        {State:"United Kingdom", GDP:2848, percentage:8.28, Rank:5},
        {State:"France", GDP:2421, percentage:-9.69, Rank:6},
        {State:"India", GDP:2073, percentage:13.65, Rank:7},
        {State:"Italy", GDP:1814, percentage:-12.45, Rank:8},
        {State:"Brazil", GDP:1774, percentage:-27.88, Rank:9},
        {State:"Canada", GDP:1550, percentage:-15.02, Rank:10}
    ];
    args.treemap.dataSource = data;
};
window.onload = function () {
    document.getElementById('export').onclick = () => {
        window.treemap.export('PDF', 'TreeMap', 0);
    };
}
</script>

```

### EXPORT.CS

```

using System;

```

```

using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

**Note:** The exporting of the treemap as base64 string is not supported in the PDF export.

### Accessibility in ASP.NET MVC TreeMap component

TreeMap has built-in accessibility features like screen reading and WAI-ARIA attributes.

#### WAI-ARIA attributes

The TreeMap component follows the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the TreeMap component:

| Attributes         | Purpose   |
|--------------------|---|
| ---                | ---   |
| <b>role=region</b> | It specifies the TreeMap areas that do not support interactive functions like selection and highlight.    |
| <b>role=button</b> | It specifies the TreeMap areas where interactive functions such as selection and highlight are available. |
| <b>aria-label</b>  | Provides an accessible name for the data labels, legend title, and legend item labels.                    |

#### Screen reading in TreeMap

Accessibility in the TreeMap component ensures that all users, regardless of ability or disability, can use screen reading. The following TreeMap elements will be read aloud using screen reading software, such as Narrator for Windows.

| Elements          | Description  |
|-------------------|--|
| ---               | ---  |
| Data labels       | Reads the labels displayed on leaf items of the TreeMap. |
| Legend title      | Reads the title of the legend in the TreeMap.            |
| Legend item label | Reads the label of the legend item in the TreeMap.       |

#### Ensuring accessibility

The TreeMap component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the TreeMap component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the TreeMap component with accessibility tools.

See also

- [Accessibility in ASP.NET MVC components](#)

## Internationalization

The TreeMap control supports internationalization for the following elements:

- Data label
- Tooltip

For more information about number and date formatter, refer to [internationalization](#).

<!-- markdownlint-disable MD036 -->

## Globalization

Globalization is the process of designing and developing a component that works in different cultures/locales. Internationalization library is used to globalize number, date, and time values in the tree map control using the `format` property in the Treemap.

### Numeric format

In the following code example, tooltip is globalized to Deutsch culture.

#### CSHTML

```
@using Syncfusion.EJ2;
<div id="container">
    <ejs-treemap id="container" load="load" height="350px"
    weightValuePath="GDP" format='c' UserGroupingSeparation= 'true'>
    </ejs-treemap>
</div>
<script>
    function load(args)
    {
        var data = [
            {State:"United States", GDP:17946, percentage:11.08, Rank:1},
            {State:"China", GDP:10866, percentage: 28.42, Rank:2},
            {State:"Japan", GDP:4123, percentage:-30.78, Rank:3},
            {State:"Germany", GDP:3355, percentage:-5.19, Rank:4},
            {State:"United Kingdom", GDP:2848, percentage:8.28, Rank:5},
            {State:"France", GDP:2421, percentage:-9.69, Rank:6},
            {State:"India", GDP:2073, percentage:13.65, Rank:7},
            {State:"Italy", GDP:1814, percentage:-12.45, Rank:8},
            {State:"Brazil", GDP:1774, percentage:-27.88, Rank:9},
            {State:"Canada", GDP:1550, percentage:-15.02, Rank:10}
        ];
        args.treemap.dataSource = data;
    }
</script>
```

#### INTERNATIONALIZATION.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

## Migration from Essential JS 1

This article describes the API migration process of Accordion component from Essential JS 1 to Essential JS 2.

### Data Binding

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| **Datasource** | **Property:** *dataSource* <br/> <br/>

```

@(Html.EJ().TreeMap("container").<br/>DataSource(datasource)<br/>.WeightValuePath("popul
ation"))<br/>@section ControlsSection{@{ var datasource =
ViewData["medals"];}<br/><br/>script:<br/><br/>public ActionResult
Customization()<br/>{ViewData["medals"] = MedalData.GetPopulation();<br/>return
View();}public class MedalData{<br/>public static List<MedalData>
GetPopulation()<br/>List<MedalData> medals = new List<MedalData>();<br/>medals.Add(new
MedalData(){<br/>Continent: "Asia", Population: 1749046000} return medals; }}| Property:
dataSource <br/>@Html.EJS().TreeMap("container")<br/>.Load("load")<br/>.LayoutType(LayoutM
ode.Squarified).Render();<br/>function load(args)<br/>{var data=[{ Continent: "Asia",
Population: 1749046000}];<br/>args.treemap.dataSource = data;}|

```

### Appearance

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| **Layout** | **Property:** *itemsLayoutMode* <br/> <br/>

```

@(Html.EJ().TreeMap("container").<br/>ItemsLayoutMode("SliceAndDiceAuto"))| Property:
layoutType <br/> <br/>

```

```

@Html.EJS().TreeMap("container")<br/>.LayoutType(LayoutMode.Squarified)<br/>.Render();|

```

| **Weight Value Path** | **Property:** *weightValuePath* <br/> <br/>

```

@(Html.EJ().TreeMap("container").<br/>.WeightValuePath("Population"))| Property:

```

`weightValuePath<br/><br/>`

`@Html.EJS().TreeMap("container")<br/>.WeightValuePath("Population")<br/>.Render();|`

| Range Color Value Path | **Property:** `colorValuePath<br/><br/>`

`@(Html.EJ().TreeMap("container").<br/>.ColorValuePath("Continent"))|Property:`

`rangeColorValuePath<br/><br/>`

`@Html.EJS().TreeMap("container")<br/>.ColorValuePath("Continent")<br/>.Render();|`

| Equal Color Value Path | Not Applicable | **Property:**

`equalColorValuePath<br/><br/>@Html.EJS().TreeMap("container")<br/>.equalColorValuePath('Asia').Render();|`

| Height | **Property:** `height<br/><br/>@(Html.EJ().TreeMap("container").Height(50))|Property:`

`height<br/><br/>@Html.EJS().TreeMap("container")<br/>.Height('50px')<br/>.Render();|`

| Width | **Property:** `width<br/><br/>@(Html.EJ().TreeMap("container").<br/>.Width(400))|Property:`

`width<br/><br/>@Html.EJS().TreeMap("container")<br/>.Width('400px')<br/>.Render();|`

| Theme | Not Applicable | **Property:** `theme<br/><br/>`

`@Html.EJS().TreeMap("container")<br/>.theme('Highcontrast').Render();|`

| Localization | **Property:** `locale<br/><br/>@(Html.EJ().TreeMap("container").<br/>.Locale("en-`

`US"))|Property: locale<br/><br/>@Html.EJS().TreeMap("container")<br/>.Locale("en-US")<br/>.Render();|`

| Palette Colors | **Property:** `paletteColorMapping.colors<br/><br/>`

`@(Html.EJ().TreeMap("container").<br/>.TreeMapPaletteColorMapping(<br/>.colors(['red','green']))|Property: palette<br/><br/>@Html.EJS().TreeMap("container")<br/>.Palette(new string[]<br/>{'#C33764','AB3566'})<br/>.Render();|`

| Margin | Not Applicable | **Property:** `margin<br/><br/>`

`@Html.EJS().TreeMap("container")<br/>.Margin(mar=>mar.<br/>.left(10).top('10'))<br/>.Render();|`

| Resize | **Property:** `enableResize<br/><br/>`

`@(Html.EJ().TreeMap("container").<br/>.enableResize(true))| Not Applicable |`

| Responsive | **Property:**

`isResponsive<br/>@(Html.EJ().TreeMap("container").<br/>.isResponsive(true))| Not Applicable |`

## Leaf Items

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Border Color | **Property:**

`leafItemSettings.borderBrush<br/><br/>@(Html.EJ().TreeMap("container")<br/>.LeafItemsSetting(l`

`ls => { lls.showLabels(true)<br/>.borderBrush("blue")<br/>})|Property:`

`leafItemSettings.border<br/><br/>@Html.EJS().TreeMap("container")<br/>.LeafItemSettings(<br/>leaf => leaf.Border(new TreeMapBorder<br/>{ Color = "white", Width = 0.5 })<br/>)<br/>.Render();|`

|Border Width| **Property:**

`leafItemSettings.borderThickness`  
`@(Html.EJ().TreeMap("container").LeafItemsSetting(`  
`lls =>{ lls.showLabels(true) .borderThickness(5)`  
`)| Property:`

`leafItemSettings.border`

`@Html.EJS().TreeMap("container").LeafItemSettings(`  
`leaf =>leaf.Border(new`  
`TreeMapBorder{ Width = 0.5 })`  
`.Render();|`

|Gap Value| **Property:** `leafItemSettings.gap`

`@(Html.EJ().TreeMap("container").LeafItemsSetting(`  
`lls =>{`  
`lls.showLabels(true)`  
`.gap(5)`  
`)| Property: leafItemSettings.gap`

`@Html.EJS().TreeMap("container").LeafItemSettings(`  
`leaf`  
`=>leaf.Gap(5)`  
`.Render();|`

|Leaf Item Label| **Property:** `leafItemSettings.itemTemplate`

`@(Html.EJ().TreeMap("container").LeafItemsSetting(`  
`lls =>{lls.showLabels(true)`  
`.ItemTemplate("template")`  
`)| Property:`

`leafItemSettings.labelTemplate`  
`@Html.EJS().TreeMap("container").LeafItemSettings(`  
`leaf =>`  
`leaf.LabelTemplate('template')`  
`.Render();|`

|Leaf Label Path| **Property:** `leafItemSettings.labelPath`

`@(Html.EJ().TreeMap("container").LeafItemsSetting(`  
`lls =>{`  
`lls.showLabels(true)`  
`.LabelPath("GameName")`  
`)| Property:`

`leafItemSettings.labelPath`

`@Html.EJS().TreeMap("container").LeafItemSettings(`  
`leaf`  
`=>`  
`leaf.LabelPath('GameName')`  
`.Render();|`

|Leaf Label Position| **Property:**

`leafItemSettings.labelPosition`  
`@(Html.EJ().TreeMap("container").LeafItemsSetting(`  
`lls =>{ lls.showLabels( true)`  
`labelPosition: "topcenter"`  
`)| Property:`

`leafItemSettings.labelPosition`

`@Html.EJS().TreeMap("container").LeafItemSettings(`  
`leaf`  
`=>`  
`leaf.LabelPosition('Center')`  
`.Render();|`

|Leaf Label Color| Not Applicable| **Property:** `leafItemSettings.fill`

`@Html.EJS().TreeMap("container").LeafItemSettings(`  
`leaf`  
`=>`  
`leaf.Fill('red')`  
`.Render();|`

|Random Colors| Not Applicable| **Property:** `leafItemSettings.autoFill`

`@Html.EJS().TreeMap("container").LeafItemSettings(`  
`leaf`  
`=>`  
`leaf.AutoFill(true)`  
`.Render();|`

|Format| Not Applicable| **Property:** `leafItemSettings.labelFormat`

`@Html.EJS().TreeMap("container").LeafItemSettings(`  
`leaf`  
`=>`  
`leaf.LabelFormat('${Continent}-${Population}')`  
`.Render();|`

|Labels Visibility| **Property:**

`leafItemSettings.showLabels`  
`@(Html.EJ().TreeMap("container")`  
`lls =>{`  
`lls.ShowLabels(true)`  
`)| Property: leafItemSettings.showLabels`

```
@Html.EJS().TreeMap("container")<br/>.LeafItemSettings(<br/>leaf
=><br/>leaf.ShowLabels(false)<br/><br/>.Render();|
```

```
|Opacity| Not Applicable|Property: leafItemSettings.opacity <br/><br/>
@Html.EJS().TreeMap("container")<br/>.LeafItemSettings(<br/>leaf
=><br/>leaf.Opacity(0.7))<br/>.Render();|
```

```
|Padding| Not Applicable|Property: leafItemSettings.padding <br/><br/>
@Html.EJS().TreeMap("container")<br/>.LeafItemSettings(<br/>leaf =><br/>leaf.Padding(5)
)<br/>.Render();|
```

```
|Font Customization| Not Applicable|Property: leafItemSettings.labelStyle<br/><br/>
@Html.EJS().TreeMap("container")<br/>.LeafItemSettings(<br/>leaf
=><br/>leaf.LabelStyle(new<br/>TreeMapFont {size= '12px', color= 'red', opacity= 0.5
})<br/><br/>.Render();|
```

```
|Position of Template| Not Applicable|Property:
leafItemSettings.templatePosition<br/>@Html.EJS().TreeMap("container")<br/>.LeafItemSettings(<br/>leaf =><br/>leaf.TemplatePosition('Center')<br/><br/>.Render();|
```

## Legend

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

```
|Legend Alignment| Property: legendSettings.alignment<br/><br/>
@ (Html.EJ().TreeMap("container").<br/>.TreeMapLegend(t1=>{t1.Alignment("far")<br/>} )|Prop
erty: legendSettings.alignment<br/><br/>
@Html.EJS().TreeMap("container")<br/>.LegendSettings(<br/>t1=>
t1.Alignment("far")<br/>).Render();|
```

```
|Legend Visibility| Property: showLegend<br/><br/>
@ (Html.EJ().TreeMap("container").<br/>.TreeMapLegend(t1=>{t1.ShowLegend(false)<br/>} )|Pro
perty: legendSettings.visible<br/><br/>
@Html.EJS().TreeMap("container")<br/>.LegendSettings(<br/>t1=>t1.ShowLegend(false)<br/>).R
ender();|
```

```
|Legend Position| Property: legendSettings.dockPosition<br/><br/>
@ (Html.EJ().TreeMap("container").<br/>.TreeMapLegend(t1=>{t1.DockPosition("bottom")<br/>
})|Property: legendSettings.position<br/><br/>
@Html.EJS().TreeMap("container")<br/>.LegendSettings(<br/>t1=>
t1.position('Top')<br/>).Render();|
```

```
|Legend Height| Property: legendSettings.height<br/><br/>
@ (Html.EJ().TreeMap("container").<br/>.TreeMapLegend(t1=>{t1.Height(100)<br/>} )|Property:
legendSettings.height<br/><br/>
@Html.EJS().TreeMap("container")<br/>.LegendSettings(<br/>t1=>
t1.Height('100px')<br/>).Render();|
```

```
|Legend Width| Property: legendSettings.width<br/><br/>
@ (Html.EJ().TreeMap("container").<br/>.TreeMapLegend(t1=>{t1.Width(100)<br/>} )|Property:
```

*legendSettings.width*<br/><br/>

@Html.EJS().TreeMap("container")<br/>.LegendSettings(<br/>t1=>t1.Width('100')<br/>).Render();|

|Shape Height| **Property:**

*legendSettings.iconHeight*<br/><br/>@(Html.EJ().TreeMap("container").<br/>.TreeMapLegend(t1=>{t1.IconHeight(15)<br/>}))| **Property:**

*legendSettings.shapeHeight*<br/><br/>@(Html.EJS().TreeMap("container")<br/>.LegendSettings(<br/>t1=>t1.ShapeHeight('40px')<br/>).Render();|

|Shape Width| **Property:** *legendSettings.iconWidth*<br/><br/>

@(Html.EJ().TreeMap("container").<br/>.TreeMapLegend(t1=>{t1.IconWidth(8)<br/>}))| **Property:** *legendSettings.shapeWidth*<br/><br/>

@Html.EJS().TreeMap("container")<br/>.LegendSettings(<br/>t1=>t1.ShapeWidth('40px')<br/>).Render();|

|Padding| Not Applicable| **Property:** *legendSettings.shapePadding*<br/><br/>

@Html.EJS().TreeMap("container")<br/>.LegendSettings(<br/>t1=>t1.ShapePadding(10)<br/>).Render();|

|Legend Title| **Property:** *legendSettings.title*<br/><br/>

@(Html.EJ().TreeMap("container").<br/>.TreeMapLegend(t1=>{t1.Title("Population")<br/>}))| **Property:** *legendSettings.title*<br/><br/>

@Html.EJS().TreeMap("container")<br/>.LegendSettings(<br/>t1=>t1.Title('Legend')<br/>).Render();|

|Legend Shape| Not Applicable| **Property:** *legendSettings.shape*<br/><br/>

@Html.EJS().TreeMap("container")<br/>.LegendSettings(<br/>t1=>t1.Shape('Rectangle')<br/>).Render();|

|Legend Mode| **Property:**

*legendSettings.mode*<br/><br/>@(Html.EJ().TreeMap("container").<br/>.TreeMapLegend(t1=>{t1.mode("interactive")<br/>}))| **Property:** *legendSettings.mode*<br/><br/>

@Html.EJS().TreeMap("container")<br/>.LegendSettings(<br/>t1=>t1.mode("interactive")<br/>).Render();|

|Legend Text Customization| Not Applicable| **Property:** *legendSettings.textStyle*<br/><br/>

@Html.EJS().TreeMap("container")<br/>.LegendSettings(<br/>legend=>legend.TextStyle(new TreeMapFont<br/>{ Size= "10px", Opacity= 0.5, Color= "red"<br/>}))<br/>).Render();|

|Legend Title Customization| Not Applicable| **Property:** *legendSettings.titleStyle*<br/><br/>

@Html.EJS().TreeMap("container")<br/>.LegendSettings(<br/>legend=><br/>legend.TitleStyle(new TreeMapFont<br/>{ Size= "10px", Opacity= 0.5, Color= "red" })<br/>).Render();|

|Legend Shape Border| Not Applicable| **Property:** *legendSettings.shapeBorder*<br/><br/>

@Html.EJS().TreeMap("container")<br/>.LegendSettings(<br/>legend.ShapeBorder(new TreeMapBorder<br/>{ Color= "red", Width= 1 })<br/>).Render();|

|Legend Template| **Property:**

*legendSettings.template*<br/><br/>@(Html.EJ().TreeMap("container").<br/>.TreeMapLegend(t1=>{t1.template("template")<br/>}))| Not Applicable|

| Left Label | **Property:** *legendSettings.leftLabel*<br/><br/>  
@Html.EJ().TreeMap("container").<br/>.TreeMapLegend(t1=>t1.Mode("interactive")<br/>.Left  
Label("10Million")<br/>}| Not Applicable|

| Right Label | **Property:** *legendSettings.rightLabel*<br/><br/>  
@Html.EJ().TreeMap("container").<br/>.TreeMapLegend(t1=>t1.Mode("interactive")<br/>.Left  
Label("10Million")<br/>}| Not Applicable|

| Legend Shape Image | Not Applicable| **Property:** *legendSettings.imageUrl*<br/><br/>  
@Html.EJS().TreeMap("container")<br/>.LegendSettings(<br/>t1=>t1.ImageUrl("<br/>").Render(  
);|

| Position in Intractive Legend | Not Applicable| **Property:** *legendSettings.labelPosition*<br/><br/>  
@Html.EJS().TreeMap("container")<br/>.LegendSettings(<br/>t1=>t1.LabelPosition("Center")<br  
/>).Render();|

| Legend Location | Not Applicable| **Property:** *legendSettings.location*<br/><br/>  
@Html.EJS().TreeMap("container")<br/>.LegendSettings(<br/>t1=>t1.Location({ x=10, y= 20  
})<br/>).Render();|

| Legend Orientation | Not Applicable| **Property:** *legendSettings.orientation*<br/><br/>  
@Html.EJS().TreeMap("container")<br/>.LegendSettings(<br/>t1=>t1.Orientation("Horizontal")<br  
/>).Render();|

## Levels

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Random Colors | Not Applicable| **Property:** *levels.autoFill*<br/><br/>  
@Html.EJS().TreeMap("container")<br/>.Levels(<br/>l1=>l1.AutoFill(true)<br/>).Render();|

```
@Html.EJS().TreeMap("container")<br/>.TooltipSettings(new  
TreeMapTooltipSettings{<br/>Visible =true, MarkerShapes='Circle' }<br/>).Render();|
```

| Tooltip Color Opacity | Not Applicable | **Property:** *tooltipSettings.opacity*<br/><br/>

```
@Html.EJS().TreeMap("container")<br/>.TooltipSettings(new  
TreeMapTooltipSettings{<br/>Visible =true, Opacity: 0.5 }<br/>).Render();|
```

| Tooltip Text Style | Not Applicable | **Property:** *tooltipSettings.textStyle*<br/><br/>

```
@Html.EJS().TreeMap("container")<br/>.TooltipSettings(new TreeMapTooltipSettings  
{<br/>Visible =true<br/>TextStyle=(new TreeMapFont { Color= 'red', Opacity=0.5, Size= '12px'  
})).Render();|
```

## Drilldown

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Drilldown | **Property:**

```
enableDrillDown<br/>@(Html.EJ().TreeMap("container")<br/>.EnableDrillDown(true))| Property:  
enableDrillDown<br/><br/>
```

```
@Html.EJS().TreeMap("container")<br/>.EnableDrillDown(true).Render();|
```

| Drilldown Level | **Property:**

```
drillDownLevel<br/>@(Html.EJ().TreeMap("container")<br/>.DrillDownLevel(1))| Property:  
InitialDrillSettings.groupIndex<br/><br/>
```

```
@Html.EJS().TreeMap("container")<br/>.EnableDrillDown(true)<br/>InitialDrillDown<br/>(new  
TreeMapInitialDrillSettings<br/>{ GroupIndex =1}).Render();|
```

## Methods

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Treemap Refresh Method | **Method:** *refresh*<br/><br/> var treemap = <br/> &#160;

```
$("#container").ejTreeMap("instance"); <br/> treemap.refresh();| Method: refresh<br/><br/> var
```

```
treemap = <br/> &#160; document.getElementById('container').ej2_instances[0]; <br/>
treemap.refresh();|
```

```
| Method to Drilldown| Method: drillDown<br/><br/> var treemap = <br/> &#160;
$("#container").ejTreeMap("instance"); <br/> treemap.drillDown();| Not Applicable|
```

```
| Append to Method| Not Applicable| Method: appendTo<br/><br/> var treemap = <br/> &#160;
document.getElementById('container').ej2_instances[0]; <br/> treemap.appendTo();|
```

```
| Add Event Listener Method| Not Applicable| Method: addEventListener<br/><br/> var treemap =
<br/> &#160; document.getElementById('container').ej2_instances[0]; <br/>
treemap.addEventListener();|
```

```
| TreeMap Destroy Method| Not Applicable| Method: destroy<br/><br/> var treemap = <br/> &#160;
document.getElementById('container').ej2_instances[0]; <br/> treemap.destroy();|
```

```
| TreeMap Exporting Method| Not Applicable| Method: export<br/><br/> var treemap = <br/> &#160;
document.getElementById('container').ej2_instances[0]; <br/> treemap.export();|
```

```
| Get the Module Name| Not Applicable| Method: getModuleName<br/><br/> var treemap = <br/>
&#160; document.getElementById('container').ej2_instances[0]; <br/>
treemap.getModuleName();|
```

```
| Printing the TreeMap| Not Applicable| Method: print<br/><br/> var treemap = <br/> &#160;
document.getElementById('container').ej2_instances[0]; <br/> treemap.print();|
```

```
| Resizing the TreeMap| Not Applicable| Method: resizeOnTreeMap<br/><br/> var treemap = <br/>
&#160; document.getElementById('container').ej2_instances[0]; <br/>
treemap.resizeOnTreeMap();|
```

```
| Inject Method (Tooltip)| Not Applicable| Method: resizeOnTreeMap<br/><br/>
TreeMap.Inject(TreeMapTooltip); <br/> var treemap = <br/> &#160;
document.getElementById('container').ej2_instances[0]; <br/> treemap.resizeOnTreeMap();|
```

```
| Remove Event Listener Method| Not Applicable| Method: removeEventListener<br/><br/> var
treemap = <br/> &#160; document.getElementById('container').ej2_instances[0]; <br/>
treemap.removeEventListener();|
```

## Events

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

```
| TreeMap Load Event| Not Applicable| Event: load<br/><br/>
@Html.EJS().TreeMap("container")<br/>. Load("load").Render();<br/>function
itemMove(args)<br/>{<br/>}|
```

```
| TreeMap Loaded Event| Not Applicable| Event: loaded<br/><br/>
@Html.EJS().TreeMap("container")<br/>. Loaded("load").Render();<br/>function
load(args)<br/>{<br/>}|
```

|Event Before Print| Not Applicable| **Event:**

```
beforePrint<br/><br/>@Html.EJS().TreeMap("container")<br/>.BeforePrint("beforePrint").Render();<br/>function beforePrint(args)<br/>{<br/>}
```

|Click Event| **Event:**

```
click<br/><br/>@(Html.EJ().TreeMap("container")<br/>.Click("click"))<br/><script><br/>function click(args)<br/>{<br/>}| Event: click<br/><br/>@Html.EJS().TreeMap("container")<br/>.Click("click").Render();<br/>function click(args)<br/>{<br/>}
```

|Drill Start Event| **Event:**

```
drillStarted<br/><br/>@(Html.EJ().TreeMap("container")<br/>.DrillStarted("drillStarted"))<br/><script><br/>function drillStarted(args)<br/>{<br/>}| Event: drillStart<br/><br/>@Html.EJS().TreeMap("container")<br/>.DrillStart("drillStart").Render();<br/>function drillStart(args)<br/>{<br/>}
```

|Drill End Event| Not Applicable| **Event:** drillEnd<br/><br/>

```
@Html.EJS().TreeMap("container")<br/>.DrillEnd("drillEnd").Render();<br/>function drillEnd(args)<br/>{<br/>}
```

|Event on Item Click| Not Applicable| **Event:** itemClick<br/><br/>

```
@Html.EJS().TreeMap("container")<br/>.ItemClick("itemClick").Render();<br/>function itemClick(args)<br/>{<br/>}
```

|Event Before Print| Not Applicable| **Event:**

```
beforePrint<br/><br/>@Html.EJS().TreeMap("container")<br/>.BeforePrint("beforePrint").Render();<br/>function beforePrint(args)<br/>{<br/>}
```

|Click Event| **Event:**

```
click<br/><br/>@(Html.EJ().TreeMap("container")<br/>.Click("click"))<br/><script></br>function click(args)</br>{</br>}| Event: click<br/><br/>@Html.EJS().TreeMap("container")<br/>.Click("click").Render();<br/>function click(args)<br/>{<br/>}
```

|Drill Start Event| **Event:**

```
drillStarted<br/><br/>@(Html.EJ().TreeMap("container")<br/>.DrillStarted("drillStarted"))<br/>function drillStarted(args)<br/>{<br/>}| Event: drillStart<br/><br/>@Html.EJS().TreeMap("container")<br/>.DrillStart("drillStart").Render();<br/>function drillStart(args)<br/>{<br/>}
```

|Drill End Event| Not Applicable| **Event:** drillEnd<br/><br/>

```
@Html.EJS().TreeMap("container")<br/>.DrillEnd("drillEnd").Render();<br/>function drillEnd(args)<br/>{<br/>}
```

|Event on Item Click| Not Applicable| **Event:** itemClick<br/><br/>

```
@Html.EJS().TreeMap("container").ItemClick("itemClick").Render();<br/>function itemClick(args)<br/>{<br/>}
```

|Treemap Item Select Event| **Event:** treeMapItemSelected<br/><br/>

```

```

```
@Html.EJS().TreeMap("container") <br/> .ItemSelected("itemSelected").Render();<br/>function
itemSelected(args) <br/> { <br/>}|
```

## How To

### How To

```
<!-- markdownlint-disable MD036 -->
```

*Customize the header for treemap drilldown*

```
<!-- markdownlint-disable MD033 -->
```

You can add a header element as `<div>` and customize it to show the population of a particular country or continent on treemap drill-down.

To customize the header for treemap drill-down, follow the given steps:

#### Step 1:

```
<!-- markdownlint-disable MD031 -->
```

Initialize the treemap and enable the drill-down option.

```
`html
```

```
@Html.EJS().TreeMap("container").WeightValuePath("Population").Format("n").UseGroupingSeparator(
true).WeightValuePath("Population").Palette(new string[] { "#9999ff", "#CCFF99", "#FFFF99",
"#FF9999", "#FF99FF", "#FFCC66" }).LeafItemSettings(leaf =>
```

```
leaf.LabelPath("Name").ShowLabels(false)).EnableDrillDown(true).Levels(level =>
```

```
{
```

```
level.GroupPath("Continent").Fill("#336699").Border(br => br.Color("black").Width(0.5)).Add();
```

```
level.GroupPath("States").Fill("#336699").Border(br => br.Color("black").Width(0.5)).Add();
```

```
level.GroupPath("Region").Fill("#336699").Border(br => br.Color("black").Width(0.5)).Add();
```

```
}).Render()
```

```
`
```

#### Step 2:

Show the population of a particular continent in the treemap `loaded` event. In this event, you can get the header element.

```
loaded: function (args: ILoadedEventArgs) {
```

```
var header = document.getElementById('header');
```

```
var population = 0;
```

```
for (var i = 0; i < args.treemap.layout.renderItems[0]['parent'].Continent.length; i++) {
```

```
population += +(args.treemap.layout.renderItems[0]['parent'].Continent[i]['data'].Population);
```

```
}
```

```
header.innerHTML = 'Continent - Population : ' + population
```

```
}
```

**Step 3:**

Customize the population for drilled countries or states in the header element when drill-down the treemap. The `drillEnd` event will be triggered when treemap is drilled.

**CSHTML**

```
@{
    var palette = new string[] { "#9999ff", "#CCFF99", "#FFFF99", "#FF9999",
    "#FF99FF", "#FFCC66" };
    var border = new TreeMapBorder { Color = "black", Width = 0.5 };
}
@using Syncfusion.EJ2;
<div>
    <div id="header" style="background-color: #179bd7"></div>
    <ejs-treemap id="container" load="load" loaded="loaded"
drillEnd="drillEnd" weightValuePath="Population" format="n"
palette="palette"
        useGroupingSeparator="true" enableDrillDown="true">
        <e-treemap-leafitemsettings labelPath="Name" showLabels="false">
        </e-treemap-leafitemsettings>
        <e-treemap-levels>
            <e-treemap-level groupPath="Continent" fill="#336699"
border="border">
                </e-treemap-level>
            <e-treemap-level groupPath="Sates" fill="#336699"
border="border">
                </e-treemap-level>
            <e-treemap-level groupPath="Region" fill="#336699"
border="border">
                </e-treemap-level>
            </e-treemap-levels>
        </e-treemap>
    </div>
<script>
    function loaded(args) {
        var header = document.getElementById('header');
        var population = 0;
        for (var i = 0; i <
args.treemap.layout.renderItems[0]['parent'].Continent.length; i++) {
            population +=
+ (args.treemap.layout.renderItems[0]['parent'].Continent[i]['data'].Populati
on);
        }
        header.innerHTML = 'Continent - Population : ' + population
    }
    function drillEnd(args) {
        var header = document.getElementById('header');
        var layout =
document.getElementById("container_TreeMap_Squarified_Layout");
        var population = 0;
        if (args.treemap.layout.renderItems[0]['isDrilled']) {
            for (var i = 0; i < args.treemap.layout.renderItems.length; i++)
{
```

```

        population +=
+ (args.treemap.layout.renderItems[i]['data'].Population);

#### Add label template with drill down

You can add a label template as `<div>` element to the treemap control when using the label template. To add a label template to the treemap control, you have to hide another labels by setting the `showLabels` property to **false** in `leafItemSettings` to show only the label template.

To add label template to treemap drilldown, follow the given steps:

#### Step 1:

Create a treemap control and enable the drill-down option.

```
`html
```

```
@Html.EJS().TreeMap("container").Load("load").DrillStart("drillStart").WeightValuePath("Sales").Palette
(new string[] { "white"}).LeafItemSettings(leaf =>
```

```
leaf.ShowLabels(false).LabelTemplate("#template").TemplatePosition(Syncfusion.EJ2.TreeMap.LabelPosi
tion.Center)).EnableDrillDown(true).Levels(level =>
```

```
{
```

```
level.GroupPath("Continent").Border(br => br.Color("black").Width(0.5)).Add();
```

```
level.GroupPath("Company").Border(br => br.Color("black").Width(0.5)).Add();
```

```
}).Render()
```

**Step 2:**

Add the label template in the `leafItemSettings` options, and then set the `showLabels` property to **false** to hide another labels and show only label template.

**CSHTML**

```
@{
    var palette = new string[] { "white" };
    var border = new TreeMapBorder { Color = "black", Width = 0.5 };
}
@using Syncfusion.EJ2;
<div>
    <div>
        <ejs-treemap id="container" load="load" drillStart="drillStart"
weightValuePath="Sales" enableDrillDown="true" palette="palette">
            <e-treemap-leafitemsettings showLabels="false"
labelTemplate="#template" templatePosition="Center">
                </e-treemap-leafitemsettings>
            <e-treemap-levels>
                <e-treemap-level groupPath="Continent" border="border">
                    </e-treemap-level>
                </e-treemap-levels>
            </e-treemap>
        </div>
    </div>
    <div id="template" style="display:none">
        <div style="background-color: red">{{:Company}}</div>
    </div>
    <script>
        function drillStart(args) {
            var labelElementGroup =
document.getElementById('container_Label_Template_Group');
            labelElementGroup.remove();
        }
        function load(args) {
            var data = [
                { Continent: "China", Company: "Volkswagen", Sales: 3005994 },
                { Continent: "China", Company: "General Motors", Sales: 1230044
},
                { Continent: "China", Company: "Honda", Sales: 1197023 },
                { Continent: "United States", Company: "General Motors", Sales:
3042775 },
                { Continent: "United States", Company: "Ford", Sales: 2599193 },
                { Continent: "United States", Company: "Toyota", Sales: 2449587
},
                { Continent: "Japan", Company: "Toyota", Sales: 1527977 },
                { Continent: "Japan", Company: "Honda", Sales: 706982 },
                { Continent: "Japan", Company: "Suzuki", Sales: 623041 },
                { Continent: "Germany", Company: "Volkswagen", Sales: 655977 },
                { Continent: "Germany", Company: "Mercedes", Sales: 310845 },
                { Continent: "Germany", Company: "BMW", Sales: 261931 },
                { Continent: "United Kingdom", Company: "Ford ", Sales: 319442
},
            ],
        }
    </script>

```

```

        { Continent: "United Kingdom", Company: "Vauxhall", Sales:
251146 },
        { Continent: "United Kingdom", Company: "Volkswagen", Sales:
206994 }
    ];
    args.treemap.dataSource = data;
}
</script>

```

### LABEL.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;

namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

### Sample reference

[treemap sample.](#)

### Screenshot

## TreeView

### Getting Started with ASP.NET MVC TreeView Control

#### Prerequisites

##### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

#### PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](https://nuget.org). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

```
<namespaces>
```

```
<add namespace="Syncfusion.EJ2"/>
```

```
</namespaces>
```

,

#### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

#### ~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
```

```
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

#### ~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

Add ASP.NET MVC TreeView control

Now, add the Syncfusion ASP.NET MVC TreeView control in `~/Views/Home/Index.cshtml` page.

#### CSHTML

```
@Html.EJS().TreeView("listdata").Render();
```

Binding data source

TreeView can load data either from local data sources or remote data services. This can be done using the `dataSource` property that is a member of the `fields` property. The `dataSource` property supports array of JavaScript objects and `DataManager`. Here, an array of JSON values is passed to the TreeView control.

#### CSHTML

```
@model List<object>
@Html.EJS().TreeView("listdata").Fields(field=>
    field.Id("id").ParentID("pid").Selected("selected").
    Expanded("expanded").Text("name").HasChildren("hasChild")
    .DataSource(Model)).Render()
```

#### SELFREFERENTIAL.CS

```
public ActionResult Index()
{
    List<object> listdata = new List<object>();
    listdata.Add(new
    {
        id = 1,
        name = "Australia",
        hasChild = true,
        expanded = true
    });
    listdata.Add(new
```

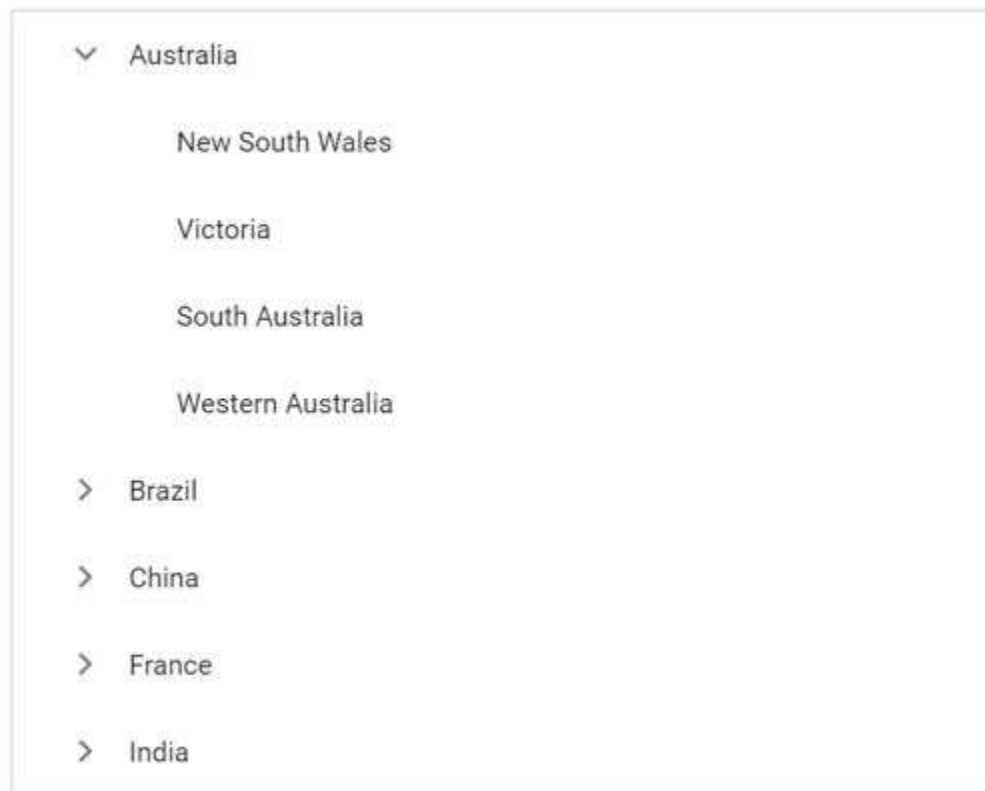

```
{
    id = 2,
    pid = 1,
    name = "New South Wales",
});
listdata.Add(new
{
    id = 3,
    pid = 1,
    name = "Victoria"
});
listdata.Add(new
{
    id = 4,
    pid = 1,
    name = "South Australia"
});
listdata.Add(new
{
    id = 6,
    pid = 1,
    name = "Western Australia",
});
listdata.Add(new
{
    id = 7,
    name = "Brazil",
    hasChild = true
});
listdata.Add(new
{
    id = 8,
    pid = 7,
    name = "Paraná"
});
listdata.Add(new
{
    id = 9,
    pid = 7,
    name = "Ceará"
});
listdata.Add(new
{
    id = 10,
    pid = 7,
    name = "Acre"
});
listdata.Add(new
{
    id = 11,
    name = "China",
    hasChild = true
});
listdata.Add(new
{
    id = 12,
    pid = 11,
```

```
name = "Guangzhou"
});
listdata.Add(new
{
    id = 13,
    pid = 11,
    name = "Shanghai"
});
listdata.Add(new
{
    id = 14,
    pid = 11,
    name = "Beijing"
});
listdata.Add(new
{
    id = 15,
    pid = 11,
    name = "Shantou"
});
listdata.Add(new
{
    id = 16,
    name = "France",
    hasChild = true
});
listdata.Add(new
{
    id = 17,
    pid = 16,
    name = "Pays de la Loire"
});
listdata.Add(new
{
    id = 18,
    pid = 16,
    name = "Aquitaine"
});
listdata.Add(new
{
    id = 19,
    pid = 16,
    name = "Brittany"
});
listdata.Add(new
{
    id = 20,
    pid = 16,
    name = "Lorraine"
});
listdata.Add(new
{
    id = 21,
    name = "India",
    hasChild = true
});
listdata.Add(new
```

```
{
    id = 22,
    pid = 21,
    name = "Assam"
});
listdata.Add(new
{
    id = 23,
    pid = 21,
    name = "Bihar"
});
listdata.Add(new
{
    id = 24,
    pid = 21,
    name = "Tamil Nadu"
});
return View(listdata);
}
```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC TreeView control will be rendered in the default web browser.

**Note:** [View Sample in GitHub.](#)

**Note:** You can also explore our [ASP.NET MVC TreeView example](#) to know how to present and manipulate data.

## Data Binding in Treeview Control

The TreeView control provides the option to load data either from local data sources or from remote data services. This can be done through `dataSource` property that is a member of the `fields` property. The `dataSource` property supports array of JavaScript objects and `DataManager`. It also supports different kinds of data services such as OData, OData V4, Web API, URL, and JSON with the help of `DataManager` adapters.

TreeView has `load on demand` (Lazy load), by default. It reduces the bandwidth size when consuming huge data. It loads first level nodes initially, and when parent node is expanded, loads the child nodes based on the `parentID/child` member.

By default, the `loadOnDemand` is set to true. By disabling this property, all the tree nodes are rendered at the beginning itself.

You can use the `dataBound` event to perform actions. This event will be triggered once the data source is populated in the TreeView.

### Local data

To bind local data to the TreeView, you can assign a JavaScript object array to the `dataSource` property. The TreeView control requires three fields (ID, text, and parentID) to render local data source. When mapper fields are not specified, it takes the default values as the mapping fields. Local data source can also be provided as an instance of the `DataManager`. It supports two kinds of local data binding methods.

- Hierarchical data
- Self-referential data

### Hierarchical data

TreeView can be populated with hierarchical data source that contains nested array of JSON objects. You can directly assign hierarchical data to the `dataSource` property, and map all the field members with corresponding keys from the hierarchical data to `fields` property.

In the following example, **code**, **name**, and **countries** columns from hierarchical data have been mapped to **id**, **text**, and **child** fields, respectively.

### CSHTML

```
<ejs-treeview id="hierarchical">
    <e-treeview-fields child="ViewBag.child"
dataSource="ViewBag.data" id="code" text="name" selected="selected"
expanded="expanded"></e-treeview-fields>
</ejs-treeview>
```

### HIERARCHICAL.CS

```
public IActionResult LocalData() {
    List<Continents> continents = new List<Continents>();
    List<Countries> countries = new List<Countries>();
    continents.Add(new Continents
    {
        code = "NA",
        name = "North America",
        expanded=true,
```

```

        child = countries,
    });
    countries.Add(new Countries { code = "USA", name = "United
States of America", selected=true});
    countries.Add(new Countries { code = "CUB", name = "Cuba"
});
    countries.Add(new Countries { code = "MEX", name = "Mexico"
});
    List<Countries> countries2 = new List<Countries>();
    continents.Add(new Continents
    {
        code = "AF",
        name = "Africa",
        child = countries2,
    });
    countries2.Add(new Countries { code = "NGA", name = "Nygeria"
});
    countries2.Add(new Countries { code = "EGY", name = "Egypt" });
    countries2.Add(new Countries { code = "ZAF", name = "South
Africa" });
    List<Countries> countries3 = new List<Countries>();
    continents.Add(new Continents
    {
        code = "AS",
        name = "Asia",
        child = countries3,
    });
    countries3.Add(new Countries { code = "CHN", name = "China" });
    countries3.Add(new Countries { code = "IND", name = "India" });
    countries3.Add(new Countries { code = "JPN", name = "Japan" });
    List<Countries> countries4 = new List<Countries>();
    continents.Add(new Continents
    {
        code = "EU",
        name = "Europe",
        child = countries4,
    });
    countries4.Add(new Countries { code = "DNK", name = "Denmark"
});
    countries4.Add(new Countries { code = "FIN", name = "Finland"
});
    countries4.Add(new Countries { code = "AUT", name = "Austria"
});
    List<Countries> countries5 = new List<Countries>();
    continents.Add(new Continents
    {
        code = "SA",
        name = "South America",
        child = countries5,
    });
    countries5.Add(new Countries { code = "BRA", name = "Brazil" });
    countries5.Add(new Countries { code = "COL", name = "Colombia"
});
    countries5.Add(new Countries { code = "ARG", name = "Argentina"
});
    List<Countries> countries6 = new List<Countries>();
    continents.Add(new Continents

```

```

        {
            code = "OC",
            name = "Oceania",
            child = countries6,
        });
        countries6.Add(new Countries { code = "AUS", name = "Australia"
});
        countries6.Add(new Countries { code = "NZL", name = "Newzealand"
});
        countries6.Add(new Countries { code = "WSM", name = "Samoa" });
        List<Countries> countries7 = new List<Countries>();
        continents.Add(new Continents
        {
            code = "AN",
            name = "Antartica",
            child = countries7,
        });
        countries7.Add(new Countries { code = "BVT", name = "Bouvet
Island" });
        countries7.Add(new Countries { code = "ATF", name = "French
Southern Lands" });
        char[] value = { 'c', 'h', 'i', 'l', 'd' };
        string Child = new string(value);
        ViewBag.child = Child;
        ViewBag.data = continents;
        return View();
    }
}
public class Continents
{
    public string code;
    public string name;
    public bool expanded;
    public bool selected;
    public List<Countries> child;
}
public class Countries
{
    public string code;
    public string name;
    public bool expanded;
    public bool selected;
}

```

### Self-referential data

TreeView can be populated from self-referential data structure that contains array of JSON objects with `parentID` mapping.

You can directly assign self-referential data to the `dataSource` property, and map all the field members with corresponding keys from self-referential data to [fields](#) property.

To render the root level nodes, specify the `parentID` as null or no need to specify the `parentID` in `dataSource`.

In the following example, **id**, **pid**, **hasChild**, and **name** columns from self-referential data have been mapped to **id**, **parentID**, **hasChildren**, and **text** fields, respectively.

#### CSHTML

```
@{
    .....
    List<object> listdata = new List<object>();
    listdata.Add(new
    {
        id = 1,
        name = "Australia",
        hasChild = true,
        expanded = true
    });
    listdata.Add(new
    {
        id = 2,
        pid = 1,
        name = "New South Wales",
    });
    listdata.Add(new
    {
        id = 3,
        pid = 1,
        name = "Victoria"
    });
    listdata.Add(new
    {
        id = 4,
        pid = 1,
        name = "South Australia"
    });
    listdata.Add(new
    {
        id = 6,
        pid = 1,
        name = "Western Australia",
    });
    listdata.Add(new
    {
        id = 7,
        name = "Brazil",
        hasChild = true
    });
    listdata.Add(new
    {
        id = 8,
        pid = 7,
        name = "Paraná"
    });
    listdata.Add(new
    {
        id = 9,
        pid = 7,
        name = "Ceará"
    });
};
```

```
listdata.Add(new
{
    id = 10,
    pid = 7,
    name = "Acre"
});
listdata.Add(new
{
    id = 11,
    name = "China",
    hasChild = true
});
listdata.Add(new
{
    id = 12,
    pid = 11,
    name = "Guangzhou"
});
listdata.Add(new
{
    id = 13,
    pid = 11,
    name = "Shanghai"
});
listdata.Add(new
{
    id = 14,
    pid = 11,
    name = "Beijing"
});
listdata.Add(new
{
    id = 15,
    pid = 11,
    name = "Shantou"
});
listdata.Add(new
{
    id = 16,
    name = "France",
    hasChild = true
});
listdata.Add(new
{
    id = 17,
    pid = 16,
    name = "Pays de la Loire"
});
listdata.Add(new
{
    id = 18,
    pid = 16,
    name = "Aquitaine"
});
listdata.Add(new
{
    id = 19,
```

```

        pid = 16,
        name = "Brittany"
    });
    listdata.Add(new
    {
        id = 20,
        pid = 16,
        name = "Lorraine"
    });
    listdata.Add(new
    {
        id = 21,
        name = "India",
        hasChild = true
    });
    listdata.Add(new
    {
        id = 22,
        pid = 21,
        name = "Assam"
    });
    listdata.Add(new
    {
        id = 23,
        pid = 21,
        name = "Bihar"
    });
    listdata.Add(new
    {
        id = 24,
        pid = 21,
        name = "Tamil Nadu"
    });
<ejs-treeview id="listdata">
    <e-treeview-fields dataSource="listdata" id="id" parentId="pid"
    text="name" hasChildren="hasChild" expanded="expanded"></e-treeview-fields>
</ejs-treeview>

```

### SELFREFERENTIAL.CS

```

public IActionResult LocalData()
{
    List<object> listdata = new List<object>();
    listdata.Add(new
    {
        id = 1,
        name = "Australia",
        hasChild = true,
        expanded = true
    });
    listdata.Add(new
    {

        id = 16,
        name = "France",
        hasChild = true
    });
    listdata.Add(new
    {
        id = 17,
        pid = 16,
        name = "Pays de la Loire"
    });
    listdata.Add(new
    {
        id = 18,
        pid = 16,
        name = "Aquitaine"
    });
    listdata.Add(new
    {
        id = 19,
        pid = 16,
        name = "Brittany"
    });
    listdata.Add(new
    {
        id = 20,
        pid = 16,
        name = "Lorraine"
    });
    listdata.Add(new
    {
        id = 21,
        name = "India",
        hasChild = true
    });
    listdata.Add(new
    {
        id = 22,
        pid = 21,
        name = "Assam"
    });
    });
```

```
listdata.Add(new
{
    id = 23,
    pid = 21,
    name = "Bihar"
});
listdata.Add(new
{
    id = 24,
    pid = 21,
    name = "Tamil Nadu"
});
ViewBag.dataSource = listdata;
return View();
}
```

### Remote data

TreeView can also be populated from a remote data service with the help of **DataManager** control and **Query** property.

It supports different kinds of data services such as OData, OData V4, Web API, URL, and JSON with the help of **DataManager** adaptors.

You can assign service data as an instance of **DataManager** to the **dataSource** property. To interact with remote data source, you have to provide the endpoint **url**.

The **DataManager** that acts as an interface between the service endpoint and the TreeView requires the following information to interact with service endpoint properly.

- **DataManager->url**: Defines the service endpoint to fetch data.
- **DataManager->adaptor**: Defines the adaptor option. By default, **ODataAdaptor** is used for remote binding.

Adaptor is responsible for processing response and request from/to the service endpoint. The **@syncfusion/ej2-data** package provides some predefined adaptors designed to interact with service endpoints. They are,

- **UrlAdaptor**: Used to interact with remote services. This is the base adaptor for all remote based adaptors.
- **ODataAdaptor**: Used to interact with OData endpoints.
- **ODataV4Adaptor**: Used to interact with OData V4 endpoints.
- **WebApiAdaptor**: Used to interact with Web API created under OData standards.
- **WebMethodAdaptor**: Used to interact with web methods.

In the following example, **ODataV4Adaptor** is used to fetch data from remote services. The **EmployeeID**, **FirstName**, and **EmployeeID** columns from Employees table have been mapped to **id**, **text**, and **hasChildren** fields respectively for first level nodes.

The **OrderID**, **EmployeeID**, and **ShipName** columns from orders table have been mapped to **id**, **parentID**, and **text** fields respectively for second level nodes.

**CSHTML**

```
<ejs-treeview id="tree">
  <e-treeview-fields child="ViewBag.child" query="new
ej.data.Query().from('Employees').select('EmployeeID,FirstName,Title').take(
5)" id="EmployeeID" text="FirstName" hasChildren="EmployeeID">
    <e-data-manager
url="https://services.odata.org/V4/Northwind/Northwind.svc"
adaptor="ODataV4Adaptor" crossDomain="true"></e-data-manager>
  </e-treeview-fields>
</ejs-treeview>
```

**REMOTEDATA.CS**

```
public IActionResult RemoteData()
{
    TreeViewFieldsSettings childData = new TreeViewFieldsSettings();
    childData.Query = "new
ej.data.Query().from('Orders').select('OrderID,EmployeeID,ShipName').take(5)
";
    childData.Id = "OrderID";
    childData.Text = "ShipName";
    childData.ParentID = "EmployeeID";
    childData.DataSource = new DataManager
    {
        Url =
"https://services.odata.org/V4/Northwind/Northwind.svc",
        Adaptor = "ODataV4Adaptor",
        CrossDomain = true
    };
    ViewBag.child = childData;
    return View();
}
```

**CheckBox**

The TreeView control allows you to check more than one node in TreeView without affecting the UI's appearance by enabling the [showCheckBox](#) property. When this property is enabled, checkbox appears before each TreeView node text.

- If one of the child nodes is not in a checked state, then the parent node will be in an intermediate state.
- If all the child nodes are in checked state, then the parent node's state will also be checked.
- If a parent node is checked, then all the child nodes' state will also be checked.

By default, the checkbox state of parent and child nodes are dependent on each other. If you need independent checked state, you can achieve it using the [autoCheck](#) property.

Using the [checkedNodes](#) property, you can set the nodes that need to be checked or get the ID of nodes that are currently checked in the TreeView control.

If you need to prevent the node check action for a particular node, the [nodeChecking](#) event can be used which is triggered before the TreeView node is checked/unchecked. The [nodeChecked](#) event will be triggered when the TreeView node is checked/unchecked successfully.

In the following example, the `showCheckBox` property is enabled.

### CSHTML

```
<ejs-treeview id="treedata" showCheckBox="true">
    <e-treeview-fields dataSource="ViewBag.dataSource" id="id"
parentId="pid" text="name" hasChildren="hasChild" expanded="expanded"></e-
treeview-fields>
</ejs-treeview>
```

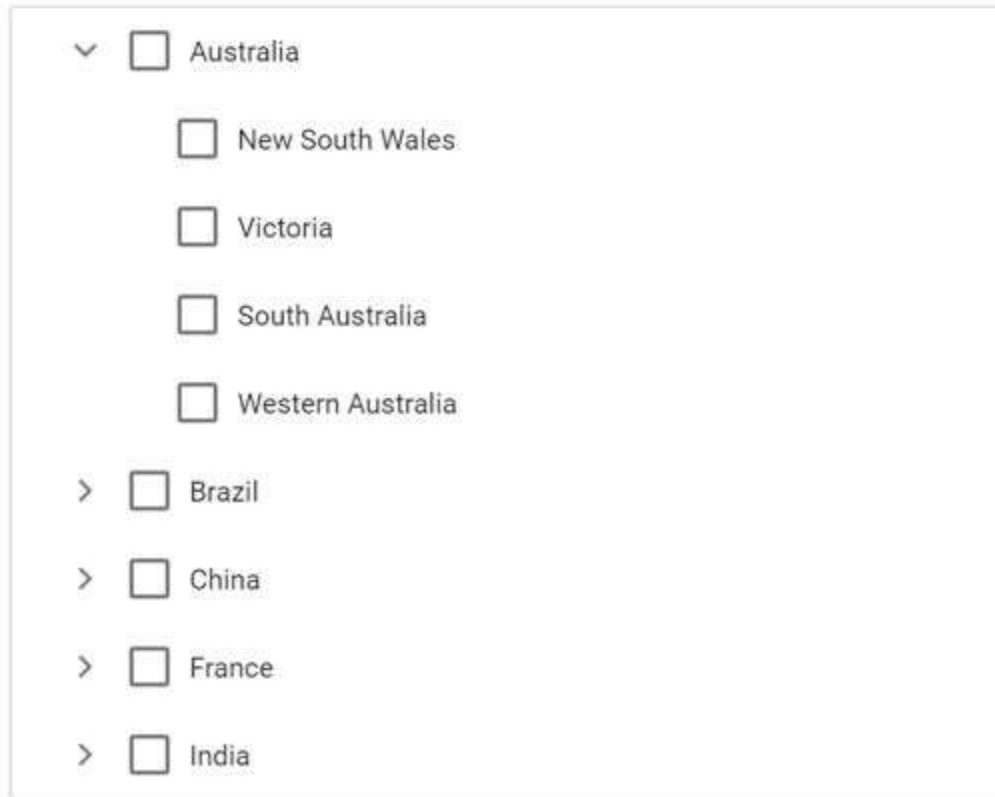

### CHECKBOX.CS

```
public IActionResult CheckBox()
{
    List<object> treedata = new List<object>();
    treedata.Add(new
    {
        id = 1,
        name = "Australia",
        hasChild = true,
        expanded = true
    });
    treedata.Add(new
    {
        id = 2,
        pid = 1,
        name = "New South Wales",
    });
    treedata.Add(new
    {
        id = 3,
        pid = 1,
        name = "Victoria"
    });
    treedata.Add(new
    {
        id = 4,
        pid = 1,
        name = "South Australia"
    });
    treedata.Add(new
    {
        id = 6,
        pid = 1,
        name = "Western Australia",
    });
    treedata.Add(new
    {
        id = 7,
        name = "Brazil",
        hasChild = true
    });
    treedata.Add(new
    {
        id = 8,
        pid = 7,
        name = "Paraná"
    });
}
```

```
});  
treedata.Add(new  
{  
    id = 9,  
    pid = 7,  
    name = "Ceará"  
});  
treedata.Add(new  
{  
    id = 10,  
    pid = 7,  
    name = "Acre"  
});  
treedata.Add(new  
{  
    id = 11,  
    name = "China",  
    hasChild = true  
});  
treedata.Add(new  
{  
    id = 12,  
    pid = 11,  
    name = "Guangzhou"  
});  
treedata.Add(new  
{  
    id = 13,  
    pid = 11,  
    name = "Shanghai"  
});  
treedata.Add(new  
{  
    id = 14,  
    pid = 11,  
    name = "Beijing"  
});  
treedata.Add(new  
{  
    id = 15,  
    pid = 11,  
    name = "Shantou"  
});  
treedata.Add(new  
{  
    id = 16,  
    name = "France",  
    hasChild = true  
});  
treedata.Add(new  
{  
    id = 17,  
    pid = 16,  
    name = "Pays de la Loire"  
});  
treedata.Add(new  
{
```

```
        id = 18,  
        pid = 16,  
        name = "Aquitaine"  
    });  
    treedata.Add(new  
    {  
        id = 19,  
        pid = 16,  
        name = "Brittany"  
    });  
    treedata.Add(new  
    {  
        id = 20,  
        pid = 16,  
        name = "Lorraine"  
    });  
    treedata.Add(new  
    {  
        id = 21,  
        name = "India",  
        hasChild = true  
    });  
    treedata.Add(new  
    {  
        id = 22,  
        pid = 21,  
        name = "Assam"  
    });  
    treedata.Add(new  
    {  
        id = 23,  
        pid = 21,  
        name = "Bihar"  
    });  
    treedata.Add(new  
    {  
        id = 24,  
        pid = 21,  
        name = "Tamil Nadu"  
    });  
    ViewBag.dataSource = treedata;  
    return View();  
}
```

Output be like the below.

### Checked nodes

You can get or set the checked nodes in TreeView at initial rendering and dynamically by using the [checkedNodes](#) property. It returns the checked nodes' ID as an array.

In the following example, the **New South Wales** and **Western Australia** nodes are checked at initial rendering. If any more nodes are checked, the checked nodes' IDs will be displayed in alert.

### CSHTML

```
<ejs-treeview id="treedata" showCheckBox="true"
checkedNodes="ViewBag.checkedNodes" nodeChecked="nodeChecked">
  <e-treeview-fields dataSource="ViewBag.dataSource" id="id"
parentId="pid" text="name" hasChildren="hasChild" expanded="expanded"></e-
treeview-fields>
</ejs-treeview>
<script>
  function nodeChecked(args) {
    alert("The checked node's id: " + this.checkedNodes); // To alert
the checked node's id.
  }
</script>
```

### CHECKBOX.CS

```
public IActionResult CheckBox()
{
    List<object> treedata = new List<object>();
    treedata.Add(new
```

```
{
    id = 1,
    name = "Australia",
    hasChild = true,
    expanded = true
});
treedata.Add(new
{
    id = 2,
    pid = 1,
    name = "New South Wales",
});
treedata.Add(new
{
    id = 3,
    pid = 1,
    name = "Victoria"
});
treedata.Add(new
{
    id = 4,
    pid = 1,
    name = "South Australia"
});
treedata.Add(new
{
    id = 6,
    pid = 1,
    name = "Western Australia",
});
treedata.Add(new
{
    id = 7,
    name = "Brazil",
    hasChild = true
});

    id = 9,
    pid = 7,
    name = "Ceará"
});
treedata.Add(new
{
    id = 10,
    pid = 7,
    name = "Acre"
});
treedata.Add(new
{
    id = 11,
```

```
        name = "China",
        hasChild = true
    });
treedata.Add(new
{
    id = 12,
    pid = 11,
    name = "Guangzhou"
});
treedata.Add(new
{
    id = 13,
    pid = 11,
    name = "Shanghai"
});
treedata.Add(new
{
    id = 14,
    pid = 11,
    name = "Beijing"
});
treedata.Add(new
{
    id = 15,
    pid = 11,
    name = "Shantou"
});
treedata.Add(new
{
    id = 16,
    name = "France",
    hasChild = true
});
treedata.Add(new
{
    id = 17,
    pid = 16,
    name = "Pays de la Loire"
});
treedata.Add(new
{
    id = 18,
    pid = 16,
    name = "Aquitaine"
});
treedata.Add(new
{
    id = 19,
    pid = 16,
    name = "Brittany"
});
treedata.Add(new
{
    id = 20,
    pid = 16,
    name = "Lorraine"
});
```

```
treedata.Add(new
{
    id = 21,
    name = "India",
    hasChild = true
});
treedata.Add(new
{
    id = 22,
    pid = 21,
    name = "Assam"
});
treedata.Add(new
{
    id = 23,
    pid = 21,
    name = "Bihar"
});
treedata.Add(new
{
    id = 24,
    pid = 21,
    name = "Tamil Nadu"
});
ViewBag.dataSource = treedata;
ViewBag.checkedNodes = new string[] { "2", "6" };
return View();
}
```

### Node Editing in Treeview Control

The TreeView allows you to edit nodes by setting the [allowEditing](#) property to **true**. To directly edit the nodes in place, **double click** the TreeView node or **select** the node and press **F2** key.

When editing is completed by focus out or by pressing the **Enter** key, the modified node's text saves automatically. If you do not want to save the modified node's text in TreeView node, press **Escape** key. It does not save the edited text to the TreeView node.

- Node editing can also be performed programmatically by using the `beginEdit` method. On passing the node ID or element through this method, the edit textbox will be created for the particular node thus allowing us to edit it.
- If you need to validate or prevent editing, the [nodeEditing](#) event can be used which is triggered before the TreeView node is renamed. On successfully renaming a node the [nodeEdited](#) event will be triggered.

In the following example, the first level node's text cannot be changed, but all other level nodes' text can be changed.

### CSHTML

```
<ejs-treeview id="treedata" allowEditing="true">
  <e-treeview-fields dataSource="ViewBag.dataSource" id="id"
parentId="pid" text="name" hasChildren="hasChild" expanded="expanded"
selected="is_selected"></e-treeview-fields>
</ejs-treeview>
```

## NODEEDITING.CS

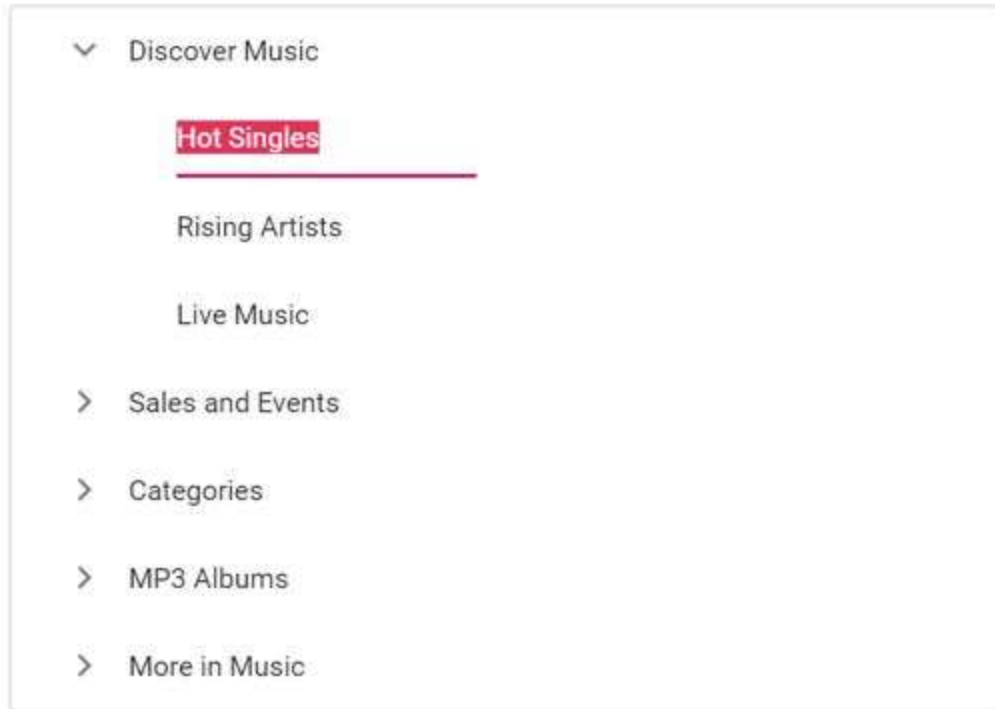

```
public IActionResult NodeEdit()
{
    List<object> treedata = new List<object>();
    treedata.Add(new
    {
        id = 1,
        name = "Discover Music",
        hasChild = true,
        expanded = true
    });
    treedata.Add(new
    {
        id = 2,
        pid = 1,
        name = "Hot Singles",
    });
    treedata.Add(new
    {

        pid = 1,
        name = "Rising Artists"
    });
    treedata.Add(new
    {
        id = 4,
        pid = 1,
        name = "Live Music"
    });
    treedata.Add(new
    {
        id = 5,
        hasChild = true,
        name = "Sales and Events",
    });
    treedata.Add(new
    {
        id = 6,
        pid=5,
        name = "100 Albums - $5 Each",
    });
    treedata.Add(new
    {
        id = 7,
        pid = 5,
        name = "Hip-Hop and R&B Sale"
    });
    treedata.Add(new
    {
```

```
        id = 8,  
        pid = 5,  
        name = "CD Deals"  
    });  
    treedata.Add(new  
    {  
        id = 10,  
        hasChild = true,  
        name = "Categories"  
    });  
    treedata.Add(new  
    {  
        id = 11,  
        pid=10,  
        name = "Bestselling Albums",  
  
    });  
    treedata.Add(new  
    {  
        id = 12,  
        pid = 10,  
        name = "New Releases"  
    });  
    treedata.Add(new  
    {  
        id = 13,  
        pid = 10,  
        name = "Bestselling Songs"  
    });  
    treedata.Add(new  
    {  
        id = 14,  
        hasChild = true,  
        name = "MP3 Albums"  
    });  
    treedata.Add(new  
    {  
        id = 15,  
        pid = 14,  
        name = "Rock"  
    });  
    treedata.Add(new  
    {  
        id = 16,  
        name = "Gospel",  
        pid = 14,  
    });  
    treedata.Add(new  
    {  
        id = 17,  
        pid = 14,  
        name = "Latin Music"  
    });  
    treedata.Add(new  
    {  
        id = 18,  
        pid = 14,
```

```
        name = "Jazz"
    });
    treedata.Add(new
    {
        id = 19,
        hasChild = true,
        name = "More in Music"
    });
    treedata.Add(new
    {
        id = 20,
        pid = 19,
        name = "Music Trade-In"
    });
    treedata.Add(new
    {
        id = 21,
        name = "Redeem a Gift Card",
        pid = 19
    });
    treedata.Add(new
    {
        id = 22,
        pid = 19,
        name = "Band T-Shirts"
    });

    ViewBag.dataSource = treedata;
    return View();
}
```

Output be like the below.

### Multi Selection in TreeView Control

Selection provides an interactive support and highlights the node that you select. Selection can be done through simple mouse down or keyboard interaction.

The TreeView also supports selection of multiple nodes by setting [allowMultiSelection](#) to **true**.

To multi-select, press and hold **CTRL** key and click the desired nodes. To select range of nodes, press and hold the **SHIFT** key and click the nodes. In the following example, the `allowMultiSelection` property is enabled.

**Note:** Multi selection is not applicable through touch interactions.

#### CSHTML

```
<ejs-treeview id="treedata" allowMultiSelection="true">
  <e-treeview-fields dataSource="ViewBag.dataSource" id="id"
    parentId="pid" text="name" hasChildren="hasChild" expanded="expanded"
    selected="is_selected"></e-treeview-fields>
</ejs-treeview>
```

#### MULTISELECTION.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
```

```
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TreeView
{
    public partial class TreeViewController : Controller
    {
        public IActionResult MultiSelection()
        {
            List<object> treedata = new List<object>();
            treedata.Add(new
            {
                id = 1,
                name = "Australia",

{  
    id = 24,  
    pid = 21,  
    name = "Tamil Nadu"  
});  
ViewBag.dataSource = treedata;  
return View();  
}  
}  
}
```

Output be like the below.

### Selected nodes

You can get or set the selected nodes in TreeView at initial rendering and dynamically by using the [selectedNodes](#) property. It will return the selected node's ID as an array.

- The [nodeselecting](#) event is triggered before a node is selected/unselected which can be used to prevent the selection.
- The [nodeSelected](#) event is triggered once a node is successfully selected/unselected.

In the following example, **New South Wales** and **Western Australia** nodes are selected at initial rendering. When a node is selected, the selected node's ID is displayed in alert.

### CSHTML

```
<ejs-treeview id="treedata" allowMultiSelection="true"
selectedNodes="ViewBag.selectedNodes" nodeSelected="nodeSelected">
  <e-treeview-fields dataSource="ViewBag.dataSource" id="id"
parentId="pid" text="name" hasChildren="hasChild" expanded="expanded"
selected="is_selected"></e-treeview-fields>
</ejs-treeview>
<script>
  function nodeSelected(args) {
    alert("The selected node's id: " + this.selectedNodes); // To alert
the selected node's id.
  }
</script>
```

### SELECTIONNODE.CS

}
}
}

```

## Drag and Drop

The TreeView control allows you to drag and drop any node by setting [allowDragAndDrop](#) to **true**. Nodes can be dragged and dropped at all levels of the same TreeView.

The dragged nodes can be dropped at any level by indicator lines with **line**, **plus/minus**, and **restrict** icons. It represents the exact position where the node is to be dropped as sibling or child.

The following table explains the usage of indicator icons.

| Icons | Description |
|-------|-------------|
|-------|-------------|

|-----|-----|

| Plus icon | Indicates that the dragged node is to be added as child of target node. |

| Minus or restrict icon | Indicates that the dragged node is not to be dropped at the hovered region. |

| In between icon | Indicates that the dragged node is to be added as siblings of hovered region. |

- If you need to prevent dragging action for a particular node, the [nodeDragStart](#) event can be used which is triggered when the node drag is started. If you need to prevent dropping action for a particular node, the [nodeDragStop](#) event can be used which is triggered when the drag is stopped.
- The [nodeDragging](#) event is triggered when the TreeView node is being dragged. You can customize the cloned element in this event.
- The [nodeDropped](#) event is triggered when the TreeView node is dropped on the target element successfully.

In the following sample, the [allowDragAndDrop](#) property is enabled.

#### CSHTML

```
<ejs-treeview id="treedata" allowDragAndDrop="true">
    <e-treeview-fields dataSource="ViewBag.dataSource" id="id"
    parentId="pid" text="name" hasChildren="hasChild" expanded="expanded"
    selected="is_selected"></e-treeview-fields>
</ejs-treeview>
```

#### DRAGANDDROP.CS

```
public IActionResult DragDrop()
{
    List<object> treedata = new List<object>();
    treedata.Add(new
    {
        id = 1,
        name = "ASP.NET MVC Team",
        hasChild = true,
        expanded = true
    });
    treedata.Add(new
    {
        id = 2,
        pid = 1,
        name = "Smith",
        is_selected=true
    });
    treedata.Add(new
    {
        id = 3,
        pid = 1,
        name = "Johnson",
        is_selected = true
    });
    treedata.Add(new
    {
```

```
        id = 4,
        pid = 1,
        name = "Anderson"
    });
    treedata.Add(new
    {
        id = 6,
        hasChild = true,
        name = "Windows Team",
    });
    treedata.Add(new
    {
        id = 7,
        pid=6,
        name="Clark"

    });
    treedata.Add(new
    {
        id = 8,
        pid = 6,
        name = "Wright"
    });
    treedata.Add(new
    {
        id = 9,
        pid = 6,
        name = "Lopez"
    });
    treedata.Add(new
    {
        id = 10,
        hasChild = true,
        name = "Web Team"
    });
    treedata.Add(new
    {
        id = 11,
        pid=10,
        name = "Joshua",

    });
    treedata.Add(new
    {
        id = 12,
        pid = 10,
        name = "Matthew"
    });
    treedata.Add(new
    {
        id = 13,
        pid = 10,
        name = "David"
    });
    treedata.Add(new
    {
        id = 14,
```

```
        hasChild = true,
        name = "Build Team"
    });
    treedata.Add(new
    {
        id = 15,
        pid = 14,
        name = "Ryan"
    });
    treedata.Add(new
    {
        id = 16,
        pid=14,
        name = "Justin",

    });
    treedata.Add(new
    {
        id = 17,
        pid = 14,
        name = "Robert"
    });
    treedata.Add(new
    {
        id = 18,
        hasChild=true,
        name = "WPF Team"
    });
    treedata.Add(new
    {
        id = 19,
        pid = 18,
        name = "Brown"
    });
    treedata.Add(new
    {
        id = 20,
        pid = 18,
        name = "Johnson"
    });
    treedata.Add(new
    {
        id = 21,
        pid = 18,
        name = "Miller"
    });
    ViewBag.dataSource = treedata;
    return View();
}
```

Output be like the below.

### Multiple-node drag and drop

To drag and drop more than one node, you should enable the [allowMultiSelection](#) property along with the [allowDragAndDrop](#) property.

To perform multi-selection, press and hold **CTRL** key and click the desired nodes. To select range of nodes, press and hold the **SHIFT** key and click the nodes.

In the following sample, the [allowMultiSelection](#) property is enabled along with the [allowDragAndDrop](#) property.

### CSHTML

```
<ejs-treeview id="treedata" allowDragAndDrop="true"
allowMultiSelection="true">
    <e-treeview-fields dataSource="ViewBag.dataSource" id="id"
parentId="pid" text="name" hasChildren="hasChild" expanded="expanded"
selected="is_selected"></e-treeview-fields>
</ejs-treeview>
```

### DRAGANDDROP.CS

```
public IActionResult DragDrop()
{
    List<object> treedata = new List<object>();
    treedata.Add(new
    {
        id = 1,
        name = "ASP.NET MVC Team",
        hasChild = true,
        expanded = true
    });
    treedata.Add(new
    {
        id = 2,
        pid = 1,
```

```
        name = "Smith",
        is_selected=true
    });
    treedata.Add(new
    {
        id = 3,

- [How to restrict the drag-and-drop for particular tree nodes](#)

## Template

The TreeView control allows you to customize the look of TreeView nodes by using the [nodeTemplate](#) property. This property accepts either `template string` or HTML element ID.

In the following sample, employee information such as employee photo, name, and designation have been included using the `nodeTemplate` property.

The template expression should be provided inside the `${...}` interpolation syntax.

### CSHTML

```
<ejs-treeview id="treedata" cssClass="custom"
nodeTemplate="@Html.Raw("<div><img class=\"eimage\"
src=\"https://ej2.syncfusion.com/demos/src/images/employees/${Image}.png\"
alt=\"employee\"/><div class=\"ename\"> ${name} </div><div class=\"ejob\">
${Job} </div></div>")">
    <e-treeview-fields dataSource="ViewBag.data" id="id" parentId="pid"
text="name" hasChildren="HasChild" expanded="Expanded"></e-treeview-fields>
</ejs-treeview>
<style>
    .custom.e-treeview .e-fullrow {
        height: 72px;
    }
    .custom.e-treeview .e-list-text {
```

```

        line-height: normal;
    }
    .eimage {
        float: left;
        padding: 11px 16px 11px 0;
        height: 48px;
        width: 48px;
        box-sizing: content-box;
    }
    .ename {
        font-size: 16px;
        padding: 14px 0 0;
    }
    .ejob {
        font-size: 14px;
        opacity: .87;
    }
}
</style>

```

### TEMPLATEMODEL.CS

```

### Accessibility in ASP.NET MVC TreeView component

The TreeView component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the TreeView component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

```

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| Accessibility Checker Validation |  |

| Axe-core Accessibility Validation |  |

<style>

.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}

</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

### WAI-ARIA attributes

The TreeView component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the TreeView component:

|   |
|---|
| Attributes   Purpose  |
| ---   ---   |
| <b>role=tree</b>   All tree nodes are contained within the element.   |
| <b>role=treeitem</b>   Specifies the role of each tree node in a selectable TreeView and its containment within the tree. |
| <b>role=group</b>   Specifies the role of each parent node container.   |
| <b>role=checkbox</b>   Indicates checkbox control along with treeitem element.  |
| <b>aria-multiselectable</b>   Indicates whether the TreeView enables multiple selection or not.                           |
| <b>aria-expanded</b>   Indicates whether the parent node has expanded or not.   |
| <b>aria-selected</b>   Indicates the selected node.   |
| <b>aria-grabbed</b>   Indicates the selected state on drag-and-drop of node.  |

- | `aria-level` | Indicates the level of node in TreeView. |
- | `aria-checked` | Indicates the current checked state of TreeView checkbox. |
- | `aria-label` | Indicates the contextual message for the TreeView checkbox. |
- | `aria-activedescendant` | Identifies the currently active element when focusing on the TreeView. |
- | `aria-disabled` | Indicates element is perceivable but disabled. |

### Keyboard interaction

The TreeView component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the TreeView component.

- | Interaction Keys | Description  |
|------------------|--|
| ----- -----      |  |
| Arrow Up         | Goes to the previous node.                                 |
| Arrow Down       | Goes to the next node.                                     |
| Arrow Right      | Expands the current node.                                  |
| Arrow Left       | Collapses the current node.                                |
| Home             | Goes to the first node.                                    |
| End              | Goes to the last node.                                     |
| F2               | Edits the focused node.                                    |
| Esc              | Focuses out the edit state without saving the edited text. |
| Enter            | Selects the focused node/saves the edited text.            |
| Space            | Checks the current node.                                   |
| Ctrl + A         | Selects all nodes.   |

### Ensuring accessibility

The TreeView component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the TreeView component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the TreeView component with accessibility tools.

### How To

#### Customize the expand and collapse icons

You can customize TreeView expand and collapse icons by using the `cssClass` property of TreeView.

Refer to the sample to customize expand/collapse icons.

### CSHTML

```
@using Syncfusion.EJ2
<div>
    <ejs-treeview id="treedata" cssClass="custom">
        <e-treeview-fields child="ViewBag.child"
dataSource="ViewBag.dataSource" id="nodeId" parentId="pid" text="nodeText"
hasChildren="hasChild" expanded="expanded"></e-treeview-fields>
    </ejs-treeview>
</div>
<style>
    .custom .e-list-item .e-icons {
        font-family: "Customize-icon";
    }
    .custom.e-treeview .e-list-item .e-icon-expandable::before, .custom.e-
treeview .e-list-item .e-icon-collapsible::before {
        content: '\e700';
        font-size: 12px;
    }

    public bool expanded;
    public bool selected;
}

```

Output be like the below.

Process the tree node operations using context menu

You can integrate the context menu with 'TreeView' control in order to perform the tree view related operations like add, remove and renaming node.

Following is an example which demonstrates the above cases which are used to manipulate tree view operations in the 'select' event of context menu.

### CSHTML

```
@using Syncfusion.EJ2
<div>
    <ejs-treeview id="treedata" nodeClicked="nodeClicked">
        <e-treeview-fields dataSource="ViewBag.dataSource" id="id"
parentId="pid" text="name" hasChildren="hasChild" expanded="expanded"
htmlAttributes="hasAttribute" selected="is_selected"></e-treeview-fields>
    </ejs-treeview>
    <ejs-contextmenu id="menu" target="#treedata" items="ViewBag.menuItems"
select="menuClick" beforeOpen="beforeOpen"></ejs-contextmenu>
</div>
<script>
    var index = 1;
    function nodeClicked(args) {
        if (args.event.which === 3) {
            var treeObj =
document.getElementById('treedata').ej2_instances[0];
            treeObj.selectedNodes = [args.node.getAttribute('data-uid')];
        }
    }
    function menuClick(args) {
```

```

var treeObj = document.getElementById('treedata').ej2_instances[0];
var menuObj = document.getElementById('menu').ej2_instances[0];
var targetNodeId = treeObj.selectedNodes[0];
if (args.item.text == "Add New Item") {
    var nodeId = "tree_" + index;
    var item = { id: nodeId, name: "New Folder" };
    treeObj.addNodes([item], targetNodeId, null);
    index++;
    treeObj.fields.dataSource.push(item);
    treeObj.beginEdit(nodeId);
}
else if (args.item.text == "Remove Item") {
    treeObj.removeNodes([targetNodeId]);
}
else if (args.item.text == "Rename Item") {
    treeObj.beginEdit(targetNodeId);
}
}
function beforeOpen(args) {
    var treeObj = document.getElementById('treedata').ej2_instances[0];
    var menuObj = document.getElementById('menu').ej2_instances[0];
    var targetNodeId = treeObj.selectedNodes[0];
    var targetNode =
document.getElementById('treedata').querySelector('[data-uid="' +
targetNodeId + '"]');
    if (targetNode.classList.contains('remove')) {
        menuObj.enableItems(['Remove Item'], false);
    }
    else {
        menuObj.enableItems(['Remove Item'], true);
    }
    if (targetNode.classList.contains('rename')) {
        menuObj.enableItems(['Rename Item'], false);
    }
    else {
        menuObj.enableItems(['Rename Item'], true);
    }
}
</script>
<style>
    .control_wrapper {
        max-width: 500px;
        margin: 0 auto;
        border: 1px solid #dddddd;
        border-radius: 3px;
    }
</style>

```

```

Output be like the below.

Check/uncheck the checkbox on clicking the tree node text

You can check and uncheck the checkboxes of tree view by clicking the tree node using the `nodeClicked` event of TreeView.

### CSHTML

```
<ejs-treeview id="treedata" showCheckBox="true" nodeClicked="nodeCheck"
keyPress="nodeCheck">
    <e-treeview-fields dataSource="ViewBag.dataSource" id="id"
parentId="pid" text="name" hasChildren="hasChild" expanded="expanded"
selected="is_selected"></e-treeview-fields>
</ejs-treeview>
<script>
    function nodeCheck(args) {
        var checkedNode = [args.node];
        var treeObj = document.getElementById('treedata').ej2_instances[0];
        if (args.event.target.classList.contains('e-fullrow') ||
args.event.key == "Enter") {
            var getNodeDetails = treeObj.getNode(args.node);
            if (getNodeDetails.isChecked == 'true') {
                treeObj.uncheckAll(checkedNode);
            } else {
                treeObj.checkAll(checkedNode);
            }
        }
    }
</script>
```

### NODECHECK.CS

```
public IActionResult CheckBox()
```

```

```

Output be like the below.

Validate the text when renaming the tree node

You can validate the tree node text while editing using `nodeEdited` event of the TreeView. Following is an example that shows how to validate and prevent empty values in tree node.

#### CSHTML

```
<div id='treeparent'>
  <ejs-treeview id="treedata" nodeEdited="onNodeEdited" allowEditing="true" >
    <e-treeview-fields dataSource="ViewBag.dataSource" id="id"
    parentId="pid" text="name" hasChildren="hasChild" expanded="expanded"></e-
    treeview-fields>
  </ejs-treeview>
</div>
<div id="display"></div>
</div>
<script>
  function onNodeEdited(args) {
    var treeObj = document.getElementById('treedata').ej2_instances[0];
    var displayContent = "";
    if (args.newText.trim() == "") {
      args.cancel=true;
      displayContent = "TreeView item text should not be empty";
    }
    else if (args.newText != args.oldText) {
      displayContent = "TreeView item text edited successfully";
    } else {
      displayContent = "";
    }
    document.getElementById("display").innerHTML = displayContent;
  }
}
```

```
</script>
<style>
    #treeparent {
        display: block;
        max-width: 350px;
        max-height: 350px;
        margin: auto;
        overflow: auto;
        border: 1px solid #dddddd;
        border-radius: 3px;
    }
    #display {
        max-width: 500px;
        margin: auto;
        padding: 10px;
    }
</style>
```

### NODEVALIDATE.CS

```
public IActionResult NodeEdit()
{
    List<object> treedata = new List<object>();
    treedata.Add(new
    {
        id = 1,
        name = "Discover Music",

    return View();
}
```

Output be like the below.

Customize the tree nodes based on levels

You can customize the tree nodes level wise by adding custom cssClass to the control and enabling styles.

#### CSHTML

```
<div id='treeparent'>
  <ejs-treeview id="treedata" cssClass="mytree">
    <e-treeview-fields child="ViewBag.child"
dataSource="ViewBag.dataSource" id="nodeId" parentId="pid" text="nodeText"
hasChildren="hasChild" expanded="expanded"></e-treeview-fields>
  </ejs-treeview>
  <label>Note:</label>
  <div><b>1. The font-weight "Bold" is applied for all the leaf
nodes</b></div>
  <div><i>2. The font-weight "Italic" is applied for first level
nodes</i></div>
  <div style="color: darkmagenta">3. The color "darkmagenta" is applied
for second level nodes</div>
</div>
<style>
  #treeparent {
    display: block;
    max-width: 350px;
    max-height: 350px;
    margin: auto;
    overflow: auto;
    border: 1px solid #dddddd;
    border-radius: 3px;
  }
  .details {
    padding-left: 10px;
  }
</style>
```

```

/*apply custom css to first level*/
.mytree .e-level-1 > .e-text-content .e-list-text {
    font-style: italic;
}
/*apply custom css to second level*/
.mytree .e-level-2 > .e-text-content .e-list-text {
    color: darkmagenta;
}
/*apply custom css to all the leaf nodes*/
.mytree .e-level-3 > .e-text-content .e-list-text {
    font-weight: bold;
}
</style>

```

Output be like the below.

Restrict the drag-and-drop for particular tree nodes

You can able to restrict to drag and drop files under folder only. These can be achieved by using 'nodeDragStop' and 'nodeDragging' event of TreeView.

### CSHTML

```
<div>
    <ejs-treeview id="treedata" sortOrder="Ascending"
allowDragAndDrop="true" nodeDragStop="dragStop" nodeDragging="nodeDrag">
        <e-treeview-fields dataSource="ViewBag.dataSource"
child="ViewBag.child" id="nodeId" text="nodeText" hasChildren="hasChild"
expanded="expanded" iconCss="icon" imageURL="image" ></e-treeview-fields>
    </ejs-treeview>
</div>
<script>
    function nodeDrag(args) {
        if (args.droppedNode != null &&
args.droppedNode.getElementsByClassName('folder') &&
args.droppedNode.getElementsByClassName('folder').length == 0) {
            args.dropIndicator = 'e-no-drop';
        }
    }
    function dragStop(args) {
        if (args.droppedNode != null &&
args.droppedNode.getElementsByClassName('folder') &&
args.droppedNode.getElementsByClassName('folder').length == 0) {
            args.cancel = true;
        }
    }
</script>
```

```

    }
</script>

```

Output be like the below.

## Migration from Essential JS 1

This article describes the API migration process of TreeView component from Essential JS 1 to Essential JS 2.

### Add nodes

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Add node | **Method:** `addNode`  
`<@Html.EJ().TreeView("tree").TreeViewFields(field =>field.Datasource((IEnumerable<LoadData>)ViewBag.datasources).Id("Id").ParentId("Parent").Text("Text"))>`  
`var treeObj = $("#tree").data("ejTreeView");`  
`treeObj.addNode("Node", "#book");` | **Method:** `addNodes`  
`<@Html.EJS().TreeView("tree").Fields(ViewBag.Fields).Render()>`  
`<Script>`  
`var treeObj = document.getElementById('tree').ej2_instances[0];`  
`var object = [{ id: "temp", name: "New node" }, { id: "new", name: "New node 1" }];`  
`treeObj.addNodes(object, "book");` |

| Triggers before adding node | **Event:** `BeforeAdd`  
`<@Html.EJ().TreeView("tree").TreeViewFields(field =>field.Datasource((IEnumerable<LoadData>)ViewBag.datasources).Id("Id").ParentId("Parent").Text("Text"))>`  
`.ClientSideEvents(events =>events.BeforeAdd("beforeAdd"))>`  
`<Script>`  
`function beforeAdd() {}` | Not Applicable |

| Adding node after a particular node | **Method:** *insertAfter*<br /><br />  
 />@Html.EJ().TreeView("tree").TreeViewFields(field =><br />  
 />field.Datasource((IEnumerable<LoadData>)ViewBag.datasources)<br />  
 />.Id("Id").ParentId("Parent").Text("Text"))<br /><br /></Script><br />var treeObj =  
 \$("#tree").data("ejTreeView");<br />treeObj.insertAfter("node", "book"); | **Can be achieved  
 using**<br /><br />@Html.EJS().TreeView("tree").Fields(ViewBag.Fields).Render()<br />var object =  
 [{ id: "1", name: "node" }];<br />var treeObj =  
 document.getElementById('tree').ej2\_instances[0]<br />var child =  
 treeObj.element.querySelector('[data-uid="book"]');<br />var parent =  
 child.parentElement.closest('.e-list-item');<br />var level = parseInt(parent.getAttribute('aria-  
 level'))+1;<br />var childNodes = Array.from(parent.querySelectorAll('.e-list-item.e-level-  
 '+level))<br />var index = childNodes.indexOf(child)<br />treeObj.addNodes(object, "book",  
 index+1); |

| Adding node before a particular node | **Method:** *insertBefore*<br /><br />  
 />@Html.EJ().TreeView("tree").TreeViewFields(field =><br />  
 />field.Datasource((IEnumerable<LoadData>)ViewBag.datasources)<br />  
 />.Id("Id").ParentId("Parent").Text("Text"))<br /><br /></Script><br />var treeObj =  
 \$("#tree").data("ejTreeView");<br />treeObj.insertBefore("node", "book"); | **Can be achieved  
 using**<br /><br />@Html.EJS().TreeView("tree").Fields(ViewBag.Fields).Render()<br />var object =  
 [{ id: "1", name: "node" }];<br />var treeObj =  
 document.getElementById('tree').ej2\_instances[0]<br />var child =  
 treeObj.element.querySelector('[data-uid="book"]');<br />var parent =  
 child.parentElement.closest('.e-list-item');<br />var level = parseInt(parent.getAttribute('aria-  
 level'))+1;<br />var childNodes = Array.from(parent.querySelectorAll('.e-list-item.e-level-  
 '+level))<br />var index = childNodes.indexOf(child)<br />treeObj.addNodes(object, "book",  
 index-1); |

| Triggers when node is added successfully | **Event:** *NodeAdd*<br /><br />  
 />@Html.EJ().TreeView("tree").TreeViewFields(field =><br />  
 />field.Datasource((IEnumerable<LoadData>)ViewBag.datasources)<br />  
 />.Id("Id").ParentId("Parent").Text("Text")).ClientSideEvents(events  
 =>events.NodeAdd("nodeAdd"))<br /><br /></Script><br />function nodeAdd() {} | **Event:  
 DataSourceChanged**<br /><br />  
 />@Html.EJS().TreeView("tree").Fields(ViewBag.Fields).DataSourceChanged("DataSourceChang  
 ed").Render()<br /><br /></Script><br /><br />function DataSourceChanged(args){ |

## Common

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Keyboard Navigation | **Property:** *AllowKeyboardNavigation*<br /><br />  
 />@Html.EJ().TreeView("tree").TreeViewFields(field =><br />  
 />field.Datasource((IEnumerable<LoadData>)ViewBag.datasources)<br />  
 />.Id("Id").ParentId("Parent").Text("Text")).AllowKeyboardNavigation(false)) | **Can be achieved  
 using**,<br /><br />

```

/>@Html.EJS().TreeView("tree").Fields(ViewBag.TemplateFields).KeyPress("onKeyPress").Render()<br /><br /></Script><br /><br />function onKeyPress(args){<br />args.cancel = true<br />} |

```

| Triggers before node is cut | **Event:** *BeforeCut*<br /><br />  

```

/>@Html.EJ().TreeView("tree").TreeViewFields(field =><br />
/>field.Datasource((IEnumerable<LoadData>)ViewBag.datasource)<br />
/>.Id("Id").ParentId("Parent").Text("Text"))<br />.ClientSideEvents(events
=>events.BeforeCut("beforeCut"))<br />function beforeCut() {} | Not Applicable |

```

| Triggers before node is deleted | **Event:** *BeforeDelete*<br /><br />  

```

/>@Html.EJ().TreeView("tree").TreeViewFields(field =><br />
/>field.Datasource((IEnumerable<LoadData>)ViewBag.datasource)<br />
/>.Id("Id").ParentId("Parent").Text("Text"))<br />.ClientSideEvents(events
=>events.BeforeDelete("beforeDelete"))<br />function beforeDelete() {} | Not Applicable |

```

| Triggers before loading nodes | **Event:** *BeforeLoad*<br /><br />  

```

/>@Html.EJ().TreeView("tree").TreeViewFields(field =><br />
/>field.Datasource((IEnumerable<LoadData>)ViewBag.datasource)<br />
/>.Id("Id").ParentId("Parent").Text("Text"))<br />.ClientSideEvents(events
=>events.BeforeLoad("beforeLoad"))<br />function beforeLoad() {} | Not Applicable |

```

| Triggers before node is pasted | **Event:** *BeforePaste*<br /><br />  

```

/>@Html.EJ().TreeView("tree").TreeViewFields(field =><br />
/>field.Datasource((IEnumerable<LoadData>)ViewBag.datasource)<br />
/>.Id("Id").ParentId("Parent").Text("Text"))<br />.ClientSideEvents(events
=>events.BeforePaste("beforePaste"))<br />function beforePaste() {} | Not Applicable |

```

| Triggers when Treeview is created | **Event:** *Create*<br /><br />  

```

/>@Html.EJ().TreeView("tree").TreeViewFields(field =><br />
/>field.Datasource((IEnumerable<LoadData>)ViewBag.datasource)<br />
/>.Id("Id").ParentId("Parent").Text("Text"))<br />.ClientSideEvents(events
=>events.Create("create"))<br />function create() {} | Event: Created<br /><br />
/>@Html.EJS().TreeView("tree").Fields(ViewBag.Fields).Created("onCreated").Render()<br /><br />
/></Script><br /><br />function onCreated(args){} |

```

| Css class | **Property:** *CssClass*<br /><br />  

```

/>@Html.EJ().TreeView("tree").TreeViewFields(field =><br />
/>field.Datasource((IEnumerable<LoadData>)ViewBag.datasource)<br />
/>.Id("Id").ParentId("Parent").Text("Text")).CssClass("custom")) | Property: CssClass<br /><br />
/>@Html.EJS().TreeView("tree").Fields(ViewBag.Fields).CssClass("custom").Render() |

```

| Triggers when Treeview is destroyed | **Event:** *Destroy*<br /><br />  

```

/>@Html.EJ().TreeView("tree").TreeViewFields(field =><br />
/>field.Datasource((IEnumerable<LoadData>)ViewBag.datasource)<br />
/>.Id("Id").ParentId("Parent").Text("Text"))<br />.ClientSideEvents(events
=>events.Destroy("destroy"))<br />function destroy() {} | Event: Destroyed<br /><br />
/>@Html.EJS().TreeView("tree").Fields(ViewBag.Fields).Destroyed("onDestroy").Render()<br />
/><br /></Script><br /><br />function onDestroy(args){} |

```

```

| Destroy Treeview control | Method: destroy<br /><br />
/>@Html.EJ().TreeView("tree").TreeViewFields(field =><br />
/>field.DataSource((IEnumerable<LoadData>)ViewBag.datasource)<br />
/>.Id("Id").ParentId("Parent").Text("Text"))<br /><br /></Script><br />var treeObj =
$("#tree").data("ejTreeView");<br />treeObj.destroy(); | Method: destroy<br /><br />
/>@Html.EJS().TreeView("tree").Fields(ViewBag.Fields).Render()<br /><br /></Script><br /><br />var
treeObj = document.getElementById('tree').ej2_instances[0]<br />treeObj.destroy(); |

| Disable Node | Method: disableNode<br /><br />@Html.EJ().TreeView("tree").TreeViewFields(field
=><br />field.DataSource((IEnumerable<LoadData>)ViewBag.datasource)<br />
/>.Id("Id").ParentId("Parent").Text("Text"))<br /><br /></Script><br />var treeObj =
$("#tree").data("ejTreeView");<br />treeObj.disableNode($("#1")); | Method: disableNodes<br />
/><br />@Html.EJS().TreeView("tree").Fields(ViewBag.Fields).Render()<br /><br /></Script><br /><br />
/>var treeObj = document.getElementById('tree').ej2_instances[0]<br />
/>treeObj.disableNodes(["1", "2"]); |

| Enable Animation | Property: EnableAnimation<br /><br />
/>@Html.EJ().TreeView("tree").TreeViewFields(field =><br />
/>field.DataSource((IEnumerable<LoadData>)ViewBag.datasource)<br />
/>.Id("Id").ParentId("Parent").Text("Text")).EnableAnimation(false)) | Property: Animation<br />
/><br />

/>@Html.EJS().TreeView("tree").Fields(ViewBag.Fields).NodeTemplate("templateData").Render
() |
```

## Uploader

### Getting Started with ASP.NET MVC Uploader Control

#### Prerequisites

#### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add ASP.NET MVC controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it. Alternatively, you can utilize the following package manager command to achieve the same.

#### **PACKAGE MANAGER**

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
```

#### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

##### ~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

#### Register Syncfusion script manager

Also, register the script manager **EJS().ScriptManager()** at the end of **<body>** in the **~/Pages/Shared/\_Layout.cshtml** file as follows.

##### ~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

#### Add ASP.NET MVC Uploader control

Now, add the Syncfusion ASP.NET MVC Uploader control in **~/Views/Home/Index.cshtml** page.

##### CSHTML

```
@Html.EJS().Uploader("UploadFiles").Render()
```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Uploader control will be rendered in the default web browser.

### Adding drop area

By default, the uploader control allows to upload files by drag the files from file explorer, and drop into the drop area. You can configure any other external element as drop target using [DropArea](#) property.

### CSHTML

```
<div id='droparea'>Drop files here to upload</div>
@Html.EJS().Uploader("UploadFiles").DropArea("#droparea").AutoUpload(false).
Render()
<style>
    .fileupload {
        margin: 20px auto;
        width: 400px;
    }
    #droparea {
        padding: 50px 25px;
        margin: 30px auto;
        border: 1px solid #c3c3c3;
        text-align: center;
        width: 20%;
        display: inline-flex;
    }
    .e-file-select,
    .e-file-drop {
        display: none;
    }
    body .e-upload-drag-hover {
        outline: 2px dashed brown;
    }
    #uploadfile {
        width: 60%;
        display: inline-flex;
        margin-left: 5%;
    }
</style>
```

### Configure asynchronous settings

The uploader control process the files to upload in Asynchronous mode by default. Define the properties [SaveUrl](#) and [RemoveUrl](#) to handle the save and remove action as follows.

### CSHTML

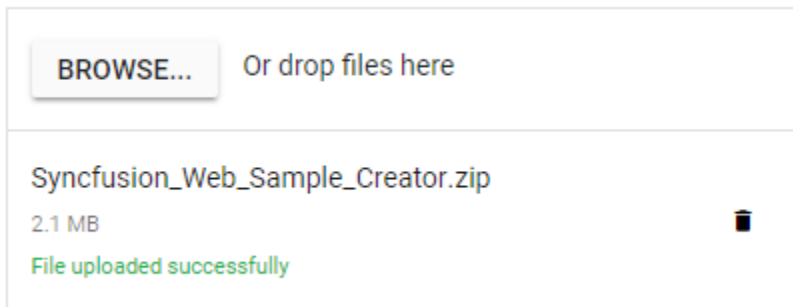

```
@Html.EJS().Uploader("UploadFiles").AsyncSettings(new
Syncfusion.EJ2.Inputs.UploaderAsyncSettings { SaveUrl =
"https://ej2.syncfusion.com/services/api/uploadbox/Save", RemoveUrl =
"https://ej2.syncfusion.com/services/api/uploadbox/Remove"
}).AutoUpload(false).Render()
```

### Handle success and failed upload

You can handle the success and failure actions using the [Success](#) and [Failure](#) events. To handle these events, define the function and assign it to the corresponding event as follows.

#### CSHTML

```
@Html.EJS().Uploader("UploadFiles").Success("onUploadSuccess").Failure("onUploadFailed").AutoUpload(false).AsyncSettings(new
Syncfusion.EJ2.Inputs.UploaderAsyncSettings { SaveUrl =
"https://ej2.syncfusion.com/services/api/uploadbox/Save", RemoveUrl =
"https://ej2.syncfusion.com/services/api/uploadbox/Remove" }).Render()
<script>
    function onUploadSuccess(args) {
        if (args.operation === 'upload') {
            console.log('Success');
        }
    }
    function onUploadFailed(args) {
        console.log('Failed');
    }
</script>
```

**Note:** [View Sample in GitHub](#).

See also

- [How to add additional data on upload](#)
- [Achieve file upload programmatically](#)
- [Achieve invisible upload](#)

### Asynchronous upload

The uploader control allows you to upload the files asynchronously.

The upload process requires save and remove action URL to manage the upload process in the server.

- The save action is necessary to handle the upload operation.
- The remove action is optional, one can handle the removed files from server.

The File can be uploaded automatically or manually. For more information, you can refer to the [Auto Upload](#) section from the documentation.

### Multiple file upload

By Default, the uploader control allows you to select and upload multiple files simultaneously.

The selected files are organized in a list for every file selection until you clear it by clicking clear button that is shown in footer. You can add the multiple attributes to original input element of file by enabling the multiple file selection.

The following example explains about [multiple](#) file upload settings.

#### CSHTML

```
@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
        SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
        RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove" };
}
<ejs-uploader id="uploadFiles" asyncSettings="@asyncSettings"
autoUpload="false"></ejs-uploader>
```

#### MULTIPLE.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes
{
    public partial class UploaderController : Controller
    {
        public ActionResult DefaultFunctionalities()
        {
            return View();
        }
    }
}
```

### Single file upload

You can select and upload a single file by disabling the [multiple](#) file selection property.

The file list item is removed for every selection and it always maintain a single file to upload.

You can remove the multiple attributes form the original input element of file by enabling the single file upload property.

The following example explains about single file upload settings.

#### CSHTML

```
@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
        SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
        RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove" };
}
<ejs-uploader id="uploadFiles" asyncSettings="@asyncSettings"
multiple="false" autoUpload="false"></ejs-uploader>
```

**SINGLE.CS**

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes
{
    public partial class UploaderController : Controller
    {
        public ActionResult DefaultFunctionalities()
        {
            return View();
        }
    }
}
```

**Save action**

The save action handler upload the files that needs to be specified in the [saveUrl](#) property.

The save handler receives the submitted files and manages the save process in server.

After uploading the files to server location, the color of the selected file name changes to green and the remove icon is changed as bin icon.

- When the file is uploaded successfully, the event [success](#) triggers to handle the operation after upload.
- When the file is failed to upload, the event [failure](#) triggers with information, which cause this failure.

You can cancel the upload process by setting the upload event argument [eventargs.cancel](#) to true.

**CSHTML**

```
@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
        SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save" };
}
<ejs-uploader id="uploadFiles" asyncSettings="@asyncSettings"
autoUpload="false"></ejs-uploader>
```

**SAVE.CS**

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes
{
    public partial class UploaderController : Controller
    {
        public ActionResult DefaultFunctionalities()
        {

```

```
        return View();  
    }  
}
```

#### *Server-side configuration for save action*

This section explains how to handle the server-side action for saving the file from server.

```
`csharp  
[AcceptVerbs("Post")]  
public void Save()  
{  
    try  
    {  
        var httpPostedFile = System.Web.HttpContext.Current.Request.Files["UploadFiles"];  
        if (httpPostedFile != null)  
        {  
            var fileSave = System.Web.HttpContext.Current.Server.MapPath("UploadedFiles");  
            var fileSavePath = Path.Combine(fileSave, httpPostedFile.FileName);  
            if (!System.IO.File.Exists(fileSavePath))  
            {  
                HttpResponse Response = System.Web.HttpContext.Current.Response;  
                Response.Clear();  
                Response.ContentType = "application/json; charset=utf-8";  
                Response.StatusDescription = "File uploaded succesfully";  
                Response.End();  
            }  
            else  
            {  
                HttpResponse Response = System.Web.HttpContext.Current.Response;  
                Response.Clear();  
                Response.Status = "204 File already exists";  
                Response.StatusCode = 204;  
                Response.StatusDescription = "File already exists";  
                Response.End();  
            }  
        }  
    }  
}
```

```

}
}
catch (Exception e)
{
    HttpResponseMessage Response = System.Web.HttpContext.Current.Response;
    Response.Clear();
    Response.ContentType = "application/json; charset=utf-8";
    Response.StatusCode = 204;
    Response.Status = "204 No Content";
    Response.StatusDescription = e.Message;
    Response.End();
}
}
,

```

### Remove action

The remove action is optional. Specify the URL to handle remove process from server.

The remove handler receives the posted files and handle the remove operation in server.

- When the files are removed successfully from the server, the [success](#) event triggers to denote the process has completed.
- When remove action fails, the event [failure](#) triggers with information, which cause failure in remove process.

**Note:** You can differentiate the file operation whether the success event triggers from save or remove action in its arguments [eventArgs.operation](#).

You can remove the files which is not uploaded locally by clicking the remove icon. In this case, the success or failure events will not be triggered.

### CSHTML

```

@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
        SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
        RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove" };
}
<ejs-uploader id="uploadFiles" asyncSettings="@asyncSettings"
autoUpload="false"></ejs-uploader>

```

### REMOVE.CS

```

using System;
using System.Collections.Generic;
using System.Linq;

```

```
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes
{
    public partial class UploaderController : Controller
    {
        public ActionResult DefaultFunctionalities()
        {
            return View();
        }
    }
}
```

#### *Server-side configuration for remove action*

This section explains how to handle the server-side action for removing the file from server.

```
`csharp
[AcceptVerbs("Post")]
public void Remove()
{
    try
    {
        HttpResponseMessage Response = System.Web.HttpContext.Current.Response;
        Response.Clear();
        Response.Status = "200 OK";
        Response.StatusCode = 200;
        Response.ContentType = "application/json; charset=utf-8";
        Response.StatusDescription = "File removed succesfully";
        Response.End();
    }
    catch (Exception e)
    {
        HttpResponseMessage Response = System.Web.HttpContext.Current.Response;
        Response.Clear();
        Response.Status = "200 OK";
        Response.StatusCode = 200;
        Response.ContentType = "application/json; charset=utf-8";
        Response.StatusDescription = "File removed succesfully";
        Response.End();
    }
}
```

```
}
}
`
```

### Auto upload

By default, the uploader processes the files to upload once the files are selected and added in upload queue. To upload manually, disable the [autoUpload](#) property. When you disable this property, you can use the action buttons to call upload all or clear all actions manually. You can change those buttons text using the [buttons](#) property in Uploader control.

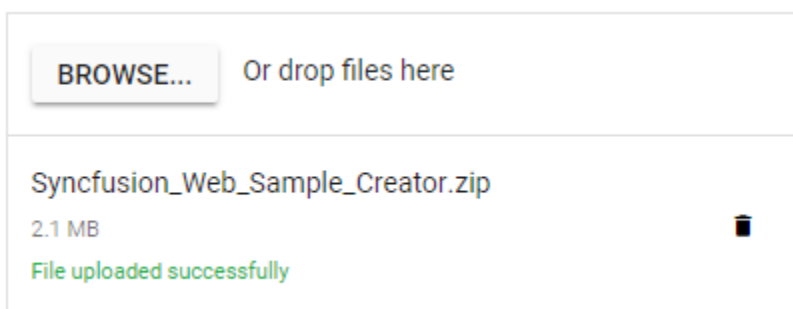

### CSHTML

```
<ejs-uploader id="uploadFiles" autoUpload="false"></ejs-uploader>
```

### AUTO-UPLOAD.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes
{
    public partial class UploaderController : Controller
    {
        public ActionResult DefaultFunctionalities()
        {
            return View();
        }
    }
}
```

Auto upload output be like the below.

Auto upload false output be like the below.

### Sequential upload

By default, the uploader control process multiple files to upload simultaneously. When you enable the [sequentialUpload](#) property, the selected files will process sequentially (one after the other) to the server. If the file uploaded successfully or failed, the next file will upload automatically in this sequential upload. This feature helps to reduce the upload traffic and reduce the failure of file upload.

### CSHTML

```
@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
        SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
        RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove" };
}
<ejs-uploader id="uploadFiles" sequentialUpload="true"
asyncSettings="@asyncSettings"></ejs-uploader>
```

### SEQUENTIAL-UPLOAD.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes
{
    public partial class UploaderController : Controller
    {
        public ActionResult SequentialUpload()
        {
            return View();
        }
    }
}
```

### Preload files

The uploader control allows you to preload the list of files that are uploaded in the server. The preloaded files are useful to view and remove the files from server that can be achieved by the [files](#)

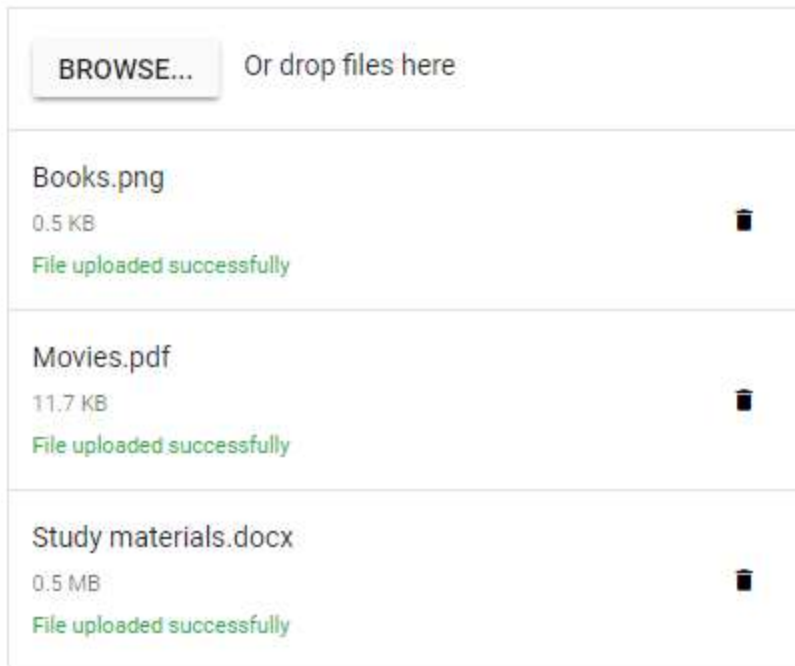

property. By default, the files are configured with uploaded successfully state on rendering file list. The following properties are mandatory to configure the preloaded files:

- Name
- Size
- Type

#### **PRELOAD-FILE.CS**

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes
{
    public partial class UploaderController : Controller
    {
        List<UploaderUploadedFiles> list = new
        List<UploaderUploadedFiles>();
        public ActionResult DefaultFunctionalities()
        {
            list.Add(new UploaderUploadedFiles { Name = "Books", Size =
            500000, Type = ".png" });
            list.Add(new UploaderUploadedFiles { Name = "Movies", Size =
            12000, Type = ".pdf" });
            list.Add(new UploaderUploadedFiles { Name = "Study materials",
            Size = 500000, Type = ".docx" });
            ViewBag.datasource = list;
            return View();
        }
    }
}
```

Output be like the below.

### Adding additional HTTP headers with upload action

The Uploader control allows you to add the additional headers with `save` and `remove` action requests using the `uploading` and `removing` events, which helps to send validation token on file upload. Access the current request and set the request header within these events.

The following code block shows how to add the additional headers with save and remove action request.

```
`html
@Html.EJS().Uploader("UploadFiles").DropArea(".control-
fluid").Uploading("addHeaders").Removing("addHeaders").AsyncSettings(new
Syncfusion.EJ2.Inputs.UploaderAsyncSettings { SaveUrl =
"https://ej2.syncfusion.com/services/api/uploadbox/Save", RemoveUrl =
"https://ej2.syncfusion.com/services/api/uploadbox/Remove" }).Render()
、

function addHeaders(args) {
args.currentRequest.setRequestHeader('custom-header', 'Syncfusion');
}
、
```

- [How to open and edit the uploaded files](#)

## Chunk Upload

The Uploader sends the large file split into small chunks and transmits to the server using AJAX. You can also pause, resume, and retry the failed chunk file.

**Note:** \* The chunk upload works in asynchronous upload only.

- This feature is available from the Essential Studio Vol 2, 2018 release.

To enable the chunk upload, set the size to [chunkSize](#) option of the upload and it receives the value in bytes.

### CSHTML

```
@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
        SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
        RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove",
        ChunkSize = 102400 };
}
<ejs-uploader id="uploadFiles" asyncSettings="@asyncSettings"
autoUpload="false"></ejs-uploader>
```

### CHUNK.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes
{
    public partial class UploaderController : Controller
    {
        public ActionResult DefaultFunctionalities()
        {
            return View();
        }
    }
}
```

Output be like the below.

The chunk upload functionality separates the selected files into blobs of the data or chunks. These chunks are transmitted to the server using an AJAX request.

The chunks are sent in **sequential** order, and the next chunk can be sent to the server according to the [success](#) of the previous chunk. If any one of the chunk failed, then the remaining chunk cannot be sent to the server.

The [chunkSuccess](#) or [chunkFailure](#) event will be triggered when the chunk is sent to the server successfully or failed. If all the chunks are sent to the server successfully, the uploader success event is triggered.

**Note:** Chunk upload will work when the selected file size is greater than the specified chunk size. otherwise, it upload the files normally.

#### Additional configurations

To modify the chunk upload, the following options can be used.

- **RetryAfterDelay** - If error occurs while sending any chunk request from JavaScript, hold the operation for 500 milliseconds (by default), and retry the operation using chunk. This can be achieved by using the [asyncSettings.retryAfterDelay](#) property. You can modify the holding time interval in milliseconds.
- **RetryCount** - Specifies the number of retry actions performed when the file fails to upload. By default, retry action is performed 3 times. If the file fails to upload continuously, the request is aborted and the uploader [failure](#) event will trigger.

The following sample specifies the chunk upload delay with 3000 milliseconds and the retry count is 5. The failure event is triggered as the wrong saveUrl is used.

#### CSHTML

```
@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
        SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
        RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove",
        ChunkSize = 102400, RetryCount = 5, RetryAfterDelay = 3000 };
}
<ejs-uploader id="uploadFiles" asyncSettings="@asyncSettings"
autoUpload="false"></ejs-uploader>
```

#### RETRY.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes
{
    public partial class UploaderController : Controller
    {
        public ActionResult DefaultFunctionalities()
        {
            return View();
        }
    }
}
```

### Resumable upload

Allows you to resume an upload operation after a network failure or manually interrupts (pause) the upload. You can perform pause and resume upload actions using public methods (pause and resume) and UI interaction. The pause icon is enabled after the upload begins.

**Note:** This pause and resume features available only when the chunk upload is enabled.

### CSHTML

```
@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
        SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
        RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove",
        ChunkSize = 102400 };
}
<ejs-uploader id="uploadFiles" asyncSettings="@asyncSettings"
autoUpload="false"></ejs-uploader>
```

### RESUMABLE.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes
{
    public partial class UploaderController : Controller
    {
        public ActionResult DefaultFunctionalities()
        {
            return View();
        }
    }
}
```

Output be like the below.

### Cancel upload

The uploader component allows you to cancel the uploading file. This can be achieved by clicking the cancel icon or using the `cancel` method. The [cancelling](#) event will be fired whenever the file upload request is canceled. While canceling the upload request, the partially uploaded file is removed from the server.

When the request fails, the pause icon is changed to retry icon. By clicking the retry icon, sends the failed chunk request again to the server and upload started from where it is failed. You can retry the canceled upload request again using retry UI or `retry` methods. But, if you retry this, the file upload action again starts from initial.

The following example explains about chunk upload with cancel support.

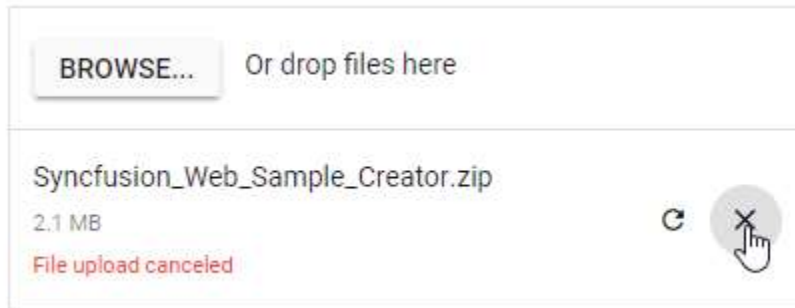

### CSHTML

```
@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
        SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
        RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove",
        ChunkSize = 102400 };
}
<ejs-uploader id="uploadFiles" asyncSettings="@asyncSettings"
autoUpload="false"></ejs-uploader>
```

### CANCEL.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes
{
    public partial class UploaderController : Controller
    {
        public ActionResult DefaultFunctionalities()
        {
            return View();
        }
    }
}
```

Output be like the below.

**Note:** The retry action has different working behavior for chunk upload and default upload.

- Chunk upload - Retries to upload the failed request where it is failed previously.
- Default upload - Retries to upload the failed file again from initial.

### Server-Side configurations

The server-side implementation entirely depends on the application requirements and logic. The following code snippet provides the server-side logic to handle the chunk upload using the uploader components.

```
`csharp
// Server configuration for upload a file.
public void Save()
{
    try
    {
        if (System.Web.HttpContext.Current.Request.Files.AllKeys.Length > 0)
        {
            var httpPostedChunkFile = System.Web.HttpContext.Current.Request.Files["chunkFile"];
            if (httpPostedChunkFile != null)
            {
                var saveFile = System.Web.HttpContext.Current.Server.MapPath("UploadedFiles");
                var SaveFilePath = Path.Combine(saveFile, httpPostedChunkFile.FileName + ".part");
                var chunkIndex = System.Web.HttpContext.Current.Request.Form["chunk-index"];
                if (chunkIndex == "0")
                {
                    //httpPostedChunkFile.SaveAs(SaveFilePath);
                }
            }
        }
    }
}
```

```
else
{
// MergeChunkFile(SaveFilePath, httpPostedChunkFile.InputStream);
var totalChunk = System.Web.HttpContext.Current.Request.Form["total-chunk"];
if (Convert.ToInt32(chunkIndex) == (Convert.ToInt32(totalChunk) - 1))
{
var savedFile = System.Web.HttpContext.Current.Server.MapPath("UploadedFiles");
var originalFilePath = Path.Combine(savedFile, httpPostedChunkFile.FileName);
System.IO.File.Move(SaveFilePath, originalFilePath);
}
}

HttpResponse ChunkResponse = System.Web.HttpContext.Current.Response;
ChunkResponse.Clear();
ChunkResponse.ContentType = "application/json; charset=utf-8";
ChunkResponse.StatusDescription = "File uploaded succesfully";
ChunkResponse.End();
}

var httpPostedFile = System.Web.HttpContext.Current.Request.Files["UploadFiles"];
if (httpPostedFile != null)
{
var fileSave = System.Web.HttpContext.Current.Server.MapPath("UploadedFiles");
var fileSavePath = Path.Combine(fileSave, httpPostedFile.FileName);
if (!System.IO.File.Exists(fileSavePath))
{
// httpPostedFile.SaveAs(fileSavePath);
HttpResponse Response = System.Web.HttpContext.Current.Response;
Response.Clear();
Response.ContentType = "application/json; charset=utf-8";
Response.StatusDescription = "File uploaded succesfully";
Response.End();
}
}
else
{
```

```
HttpResponse Response = System.Web.HttpContext.Current.Response;
Response.Clear();
Response.Status = "204 File already exists";
Response.StatusCode = 204;
Response.StatusDescription = "File already exists";
Response.End();
}
}
}
}
catch (Exception e)
{
    HttpResponse Response = System.Web.HttpContext.Current.Response;
    Response.Clear();
    Response.ContentType = "application/json; charset=utf-8";
    Response.StatusCode = 204;
    Response.Status = "204 No Content";
    Response.StatusDescription = e.Message;
    Response.End();
}
}
// Server configuration for remove a uploaded file
public void Remove()
{
    try
    {
        HttpResponse Response = System.Web.HttpContext.Current.Response;
        Response.Clear();
        Response.Status = "200 OK";
        Response.StatusCode = 200;
        Response.ContentType = "application/json; charset=utf-8";
        Response.StatusDescription = "File removed succesfully";
        Response.End();
    }
}
```

```
}  
catch (Exception e)  
{  
    HttpResponse Response = System.Web.HttpContext.Current.Response;  
    Response.Clear();  
    Response.Status = "200 OK";  
    Response.StatusCode = 200;  
    Response.ContentType = "application/json; charset=utf-8";  
    Response.StatusDescription = "File removed succesfully";  
    Response.End();  
}  
}  
  
// Merge the current chunk file with previous uploaded chunk files  
public void MergeChunkFile(string fullPath, Stream chunkContent)  
{  
    try  
    {  
        using (FileStream stream = new FileStream(fullPath, FileMode.Append, FileAccess.Write,  
            FileShare.ReadWrite))  
        {  
            using (chunkContent)  
            {  
                chunkContent.CopyTo(stream);  
            }  
        }  
    }  
    catch (IOException ex)  
    {  
        throw ex;  
    }  
}  
`
```

## File source

### Paste to upload

The uploader control allows you to upload the files using the select or drop files option from the file explorer. It also supports pasting to upload the image files. You can upload any currently copied images in the clipboard.

**Note:** When you paste the image, it will be saved in the server with the filename as `image.png`. The file name can be renamed in the server end. You can generate a random name for the file name using `getUniqueID` method.

Refer to the following example.

### CSHTML

```
@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
        SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
        RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove" };
}
<ejs-uploader id="uploadFiles" asyncSettings="@asyncSettings"
directoryUpload="true" autoUpload="false" uploading="onUploadBegin"></ejs-
uploader>
<script>
    function onUploadBegin(args) {
        // check whether the file is uploading from paste.
        if (args.fileData.fileSource === 'paste') {
            let newName =
ej.base.getUniqueID(args.fileData.name.substring(0,
args.fileData.name.lastIndexOf('.'))) + '.png';

            args.customFormData = [{ 'fileName': newName }];
        }
    }
</script>
```

### PASTE.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.Uploader
{
    public partial class UploaderController : Controller
    {
        public ActionResult DefaultFunctionalities()
        {
            return View();
        }
    }
}
```

*Server-side configuration for save the paste file*

```

`csharp
[AcceptVerbs("Post")]
public void Save()
{
    var httpPostedFile = HttpContext.Current.Request.Files["UploadFiles"];
    var fileSave = HttpContext.Current.Server.MapPath("UploadedFiles");
    var fileSavePath = Path.Combine(fileSave, httpPostedFile.FileName);
    if (!System.IO.File.Exists(fileSavePath))
    {
        httpPostedFile.SaveAs(fileSavePath);
        // Get the current file name
        var oldName = httpPostedFile.FileName;
        // Get the additional data as name in server end by corresponding key.
        var newName = HttpContext.Current.Request.Form["fileName"];
        // Rename the file
        File.Move(oldName, newName);
        HttpResponse Response = System.Web.HttpContext.Current.Response;
        Response.Clear();
        Response.ContentType = "application/json; charset=utf-8";
        // Sending the file path to client side
        Response.StatusDescription = fileSavePath;
        Response.End();
    }
}
`

```

*Directory upload*

The uploader control allows you to upload all files in the folders to server by using the [directoryUpload](#) property. When this property is enabled, the uploader control processes the files by iterating through the files and sub-directories in a directory. It allows you to select only folders instead of files to upload.

**Note:** The directory upload is available only in browsers that supports **HTML5 directory**. The uploader will process directory upload by dragging and dropping in the Edge browser. Refer to the following example to upload files to the server.

**CHTML**

```
@ {
```

```

var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
    SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
    RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove" };
}
<ejs-uploader id="uploadFiles" asyncSettings="@asyncSettings"
directoryUpload="true" autoUpload="false"></ejs-uploader>

```

## DIRECTORY.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.Uploader
{
    public partial class UploaderController : Controller
    {
        public ActionResult DefaultFunctionalities()
        {
            return View();
        }
    }
}

```

*Server-side configuration for save the files of folders*

`csharp

[AcceptVerbs("Post")]

public void Save()

{

var httpPostedFile = System.Web.HttpContext.Current.Request.Files["UploadFiles"];

var fileSave = System.Web.HttpContext.Current.Server.MapPath("UploadedFiles");

// split the folders by using file name

string[] folders = httpPostedFile.FileName.Split('/');

string fileSavePath = "";

if (folders.Length > 1)

{

for (var i = 0; i < folders.Length - 1; i++)

{

var newFolder = Path.Combine(fileSave, folders[i]);

// create folder

Directory.CreateDirectory(newFolder);

fileSave = newFolder;

```

}
fileSavePath = Path.Combine(fileSave, folders[folders.Length - 1]);
}
else
{
fileSavePath = Path.Combine(fileSave, httpPostedFile.FileName);
}
if (!System.IO.File.Exists(fileSavePath))
{
// save file in the corresponding server location
httpPostedFile.SaveAs(fileSavePath);
HttpResponse Response = System.Web.HttpContext.Current.Response;
Response.Clear();
Response.ContentType = "application/json; charset=utf-8";
// Sending the file path to client side
Response.StatusDescription = fileSavePath;
Response.End();
}
}
,

```

### Drag and drop

The uploader control allows you to drag and drop the files to upload.

You can drag the files from file explorer and drop into the drop area.

By default, the uploader control act as drop area element. The drop area gets highlighted when you drag the files over drop area.

### Custom drop area

The uploader control allows you to set external target element as drop area using the [dropArea](#) property. The element can be represented as HTML element or element's id.

### CSHTML

```

<div id="droparea">
    Drop files here to upload
</div>
<div id="uploadfile">
    <ejs-uploader id="uploadFiles" dropArea="#droparea"
    autoUpload="false"></ejs-uploader>
</div>

```

## INDEX.CSS

```
#droparea {
  padding: 50px 25px;
  margin: 30px auto;
  border: 1px solid #c3c3c3;
  text-align: center;
  width: 20%;
  display: inline-flex;
}
.e-file-select,
.e-file-drop {
  display: none;
}
body .e-upload-drag-hover {
  outline: 2px dashed brown;
}
}
#uploadfile {
  width: 60%;
  display: inline-flex;
  margin-left: 5%;
}
```

Output be like the below.

### Customize drop area

You can customize the appearance of drop area by overriding the default drop area styles.

The class "" and "" is available to handle this customization.

## CSHTML

```
@{
  var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
    SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
    RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove" };
}
<div id="dropArea">
  <span id="drop" class="droparea">Drop files here or<a id="browse"
onclick="browseClick()"><u>Browse</u></a> </span>
  <ejs-uploader id="UploadFiles" dropArea="#dropTarget"
asyncSettings="@asyncSettings">
    </ejs-uploader>
</div>
<script>
```

```
function browseClick() {
    document.getElementsByClassName('e-file-select-wrap')[0].querySelector('button').click(); return false;
}
</script>
<style>
.e-file-select-wrap {
    display: none;
}
#dropArea .e-upload {
    border: 0;
    margin-top: 15px;
}
#drop {
    padding-left: 30%;
}
#dropArea {
    min-height: 18px;
    border: 1px dashed #c3c3cc;
    padding-top: 15px;
    margin: 20px auto;
    width: 400px;
}
</style>
```

### CUSTOMIZE-DROP.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes
{
    public partial class UploaderController : Controller
    {
        public ActionResult DefaultFunctionalities()
        {
            return View();
        }
    }
}
```

Output be like the below.

## Drag and drop in Uploader Control

The uploader component allows you to drag and drop the files to upload. You can drag the files from file explorer and drop into the drop area.

By default, the uploader component act as drop area element. The drop area gets highlighted when you drag the files over drop area.

### Custom drop area

The uploader component allows you to set external target element as drop area using the [dropArea](#) property. The element can be represented as HTML element or element's id.

#### CSHTML

```
<div id="droparea">
  Drop files here to upload
</div>
<div id="uploadfile">
  <ejs-uploader id="uploadFiles" dropArea="#droparea"
  autoUpload="false"></ejs-uploader>
</div>
```

#### INDEX.CSS

```
#droparea {
  padding: 50px 25px;
  margin: 30px auto;
  border: 1px solid #c3c3c3;
  text-align: center;
  width: 20%;
  display: inline-flex;
}
.e-file-select,
.e-file-drop {
  display: none;
}
body .e-upload-drag-hover {
  outline: 2px dashed brown;
}
#uploadfile {
  width: 60%;
  display: inline-flex;
  margin-left: 5%;
}
```

### Customize drop area

You can customize the appearance of drop area by overriding the default drop area styles. The class `""` and `""` is available to handle this customization.

#### CSHTML

```
@{
```

```

var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
    SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
    RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove" };
}
<div id="dropArea">
    <span id="drop" class="droparea">Drop files here or<a id="browse"
onclick="browseClick()" "><u>Browse</u></a> </span>
    <ejs-uploader id="UploadFiles" dropArea="#dropTarget"
asyncSettings="@asyncSettings">
    </ejs-uploader>
</div>
<script>
    function browseClick() {
        document.getElementsByClassName('e-file-select-
wrap')[0].querySelector('button').click(); return false;
    }
</script>
<style>
.e-file-select-wrap {
    display: none;
}
#dropArea .e-upload {
    border: 0;
    margin-top: 15px;
}
#drop {
    padding-left: 30%;
}
#dropArea {
    min-height: 18px;
    border: 1px dashed #c3c3cc;
    padding-top: 15px;
    margin: 20px auto;
    width: 400px;
}
</style>

```

### CUSTOMIZE-DROP.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes
{
    public partial class UploaderController : Controller
    {
        public ActionResult DefaultFunctionalities()
        {
            return View();
        }
    }
}

```

## Validation in Uploader Control

The uploader control validate the selected files size and extension using the [allowedExtensions](#), [minFileSize](#) and [maxFileSize](#) properties. The files can be validated before uploading to the server and can be ignored on uploading. Also, you can validate the files by setting the HTML attributes to the original input element. The validation process occurs on drag-and-drop the files also.

### File type

You can allow the specific files alone to Upload using the [allowedExtensions](#) property. The extension can be represented as collection by comma separators. The uploader control filters the selected or dropped files to match against the specified file types and processes the upload operation. The validation happens when you specify value to inline attribute to accept the original input element.

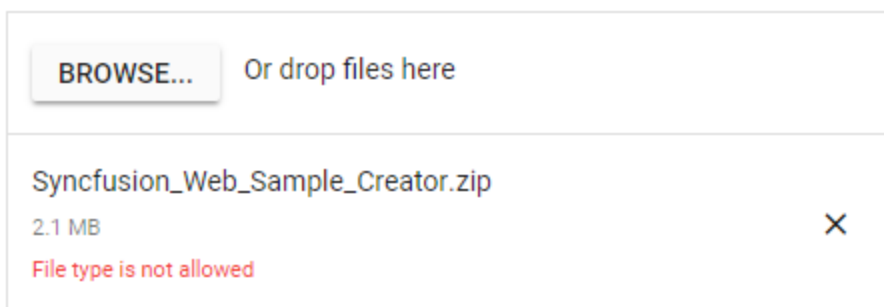

### CSHTML

```
@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
        SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
        RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove" };
}
<ejs-uploader id="uploadFiles" asyncSettings="@asyncSettings"
allowedExtensions=".doc, .docx, .xls, .xlsx" autoUpload="false"></ejs-
uploader>
```

### TYPE-VALIDATION.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes
{
    public class UploaderController : Controller
    {
        public ActionResult DefaultFunctionalities()
        {
            return View();
        }
    }
}
```

Output be like the below.

### File size

The uploader control allows you to validate the files based on its size. The validation helps to restrict uploading large files or empty files to the server. The size can be represented in **bytes**. By default, the uploader control allows you to upload **minimum file size** as 0 byte and **maximum file size** as 28.4 MB using the [minFileSize](#) and [maxFileSize](#) properties.

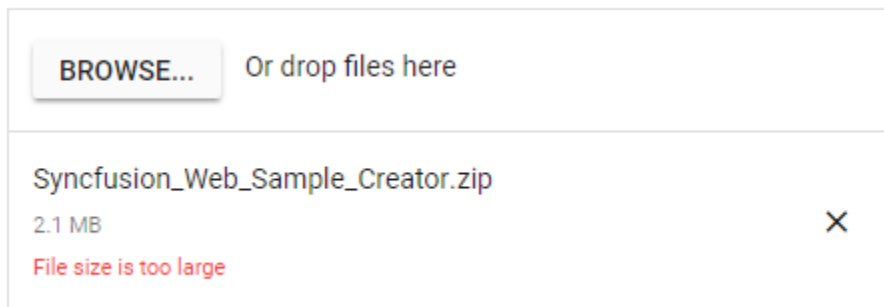

### CSHTML

```
@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
        SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
        RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove" };
}
<ejs-uploader id="uploadFiles" asyncSettings="@asyncSettings"
minFileSize="10000" maxFileSize="1000000" autoUpload="false"></ejs-uploader>
```

### SIZE-VALIDATION.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes
{
    public partial class UploaderController : Controller
    {
        public ActionResult DefaultFunctionalities()
        {
            return View();
        }
    }
}
```

Output be like the below.

### Maximum files count

You can restrict uploading the maximum number of files using the **selected** event. In the selected event arguments, you can get the currently selected files details using the [getFilesData\(\)](#). You can modify the files details and assign the modified file list to the [eventArgs.modifiedFilesData](#).

### CSHTML

```
@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
        SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
        RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove" };
    }

            var uploadObj = document.getElementById("UploadFiles");
            args.filesData.splice(5);
            var filesData = uploadObj.ej2_instances[0].getFilesData();
            var allFiles = filesData.concat(args.filesData);
            if (allFiles.length > 5) {
                for (var i = 0; i < allFiles.length; i++) {
                    if (allFiles.length > 5) {
                        allFiles.shift();
                    }
                }
                args.filesData = allFiles;
                // set the modified custom data
                args.modifiedFilesData = args.filesData;
            }
            args.isModified = true;
        }
        function onUploadSuccess(args) {
            var _this = this;
            var li = this.uploadWrapper.querySelector('[data-file-name="' +
args.file.name + '"');
            if (args.operation === 'upload') {
                li.querySelector('.e-file-delete-btn').onclick = function () {
                    generateSpinner(_this.uploadWrapper);
                };
                li.querySelector('.e-file-delete-btn').onkeydown = function (e)
            {
                if (e.keyCode === 13) {
                    generateSpinner(e.target.closest('.e-upload'));
                }
            };
            }
            else {
                ej.popups.hideSpinner(this.uploadWrapper);
                ej.base.detach(this.uploadWrapper.querySelector('.e-spinner-
pane'));
            }
        }
        function generateSpinner(targetElement) {
            ej.popups.createSpinner({ target: targetElement, width: '25px' });
            ej.popups.showSpinner(targetElement);
        }
    }
    </script>
```

#### MAX-COUNT-VALIDATION.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes
{
    public partial class UploaderController : Controller
    {
        public ActionResult DefaultFunctionalities()
        {
            return View();
        }
    }
}

```

### Duplicate files

You can validate the duplicate files before uploading to server using the selected event.

Compare the selected files with the existing files data and filter the file list by removing the duplicate files.

### CSHTML

```

- [Check file size before uploading it](#)
- [Check the MIME type of file before uploading it](#)

### Forms Support (Synchronous Upload)

The Uploader control works with HTML form like default file input. The following configuration is must to make the Uploader work inside the form.

- `saveUrl` and `removeUrl` must be null.
- `autoUpload` must be disabled.
- `name` attribute must be added in input element.

The selected or dropped files are received as a collection in form action when the form is submitted. The form action handles the server-side operations that manage the file upload process. When you reset the form, the file list and data will be cleared.

### CSHTML

```

## Template

You can customize the default appearance of the uploader using a template along with buttons.

### File list template

The [template](#) property is used to customize the default appearance of each file in the list. It can be represented as the HTML element or string. The selected or dropped files are displayed as per the template layout provided. The remove and progress bar action is handled using the corresponding events when the template is defined.

For example, you can display file type icon along with the default UI elements.

### CSHTML

```

### Custom template

You can design the own template by preventing the default file list including buttons. The [showFileList](#) property is used to display whether the default file list or own file list when you use custom template to upload or remove the files, pass the custom UI argument as true to call `upload/remove` public method as follows:

- `UploaderObj.upload(filesData, true);`
- `UploaderObj.remove(filesData, true);`

Refer to the following code sample.

### CSHTML

```
@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
        SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
        RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove" };
    }
<div class="col-lg-8 control-section">
    <div class="control_wrapper">
        <div id='dropArea'>
```

```

        <span id='drop' class="droparea"> Drop files here or <a href=""
id='browse'><u>Browse</u></a> </span>
        <ejs-uploader id="fileUpload" asyncSettings="@asyncSettings"
selected="onFileSelect" success="onUploadSuccess" failure="onUploadFailed"
progress="onFileUpload" autoUpload="false"></ejs-uploader>
    </div>
    <div style="margin-left: 50px; padding-top:25px;">

## Localization in Uploader Control

The Localization library allows you to localize static text content of the uploader. The static text contains default text content of action buttons, file status, clear icon title, tooltips, and text content of drag area. Define the locale object for a culture and assign it to L10n load method.

The following are the list of keys and its values used in the uploader control:

| Key                   | Description  |
|-----------------------|--|
| -----                 | -----  |
| Browse                | To customize the browse button text.   |
| Clear                 | To customize the clear button text.  |
| Upload                | To customize the upload button text.   |
| dropFilesHint         | To customize the drop area text.   |
| uploadFailedMessage   | To customize the status text when the file is failed to upload.                        |
| uploadSuccessMessage  | To customize the status text when the file is uploaded successfully.                   |
| removedSuccessMessage | To customize the status text when the file is removed the successfully from the serve. |
| removedFailedMessage  | To customize the status text while the file is failed to remove.                       |
| inProgress            | To customize the status text while the upload is in progress.                          |
| pauseUpload           | To customize the status text while the uploading is paused.                            |
| fileUploadCancel      | To customize the status text when uploading is cancelled.                              |
| readyToUploadMessage  | To customize the status text when the file is selected and ready to upload.            |
| invalidMaxFileSize    | To customize the status text when the file size is greater than the maximum file size. |
| invalidFileType       | To customize the status text when the file type is invalid.                            |
| invalidMinFileSize    | To customize the status text when the file size is less than the minimum file size.    |
| remove                | To customize tooltip text for remove icon.   |
| cancel                | To customize tooltip text for cancel icon.   |
| delete                | To customize tooltip text for delete icon.   |
| totalFiles            | To customize tooltip text for total files.   |
| size                  | To customize tooltip text for size.  |

    </script>
```

## LOCALIZATION.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes
{
    public partial class UploaderController : Controller
    {
        public ActionResult DefaultFunctionalities()
        {
            return View();
        }
    }
}
```

Output be like the below.

## Accessibility

The Uploader component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Uploader component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) |  |

| [Section 508 Support](#) |  |

| [Screen Reader Support](#) |  |

| [Right-To-Left Support](#) |  |

| [Color Contrast](#) |  |

| [Mobile Device Support](#) |  |

| [Keyboard Navigation Support](#) |  |

| [Accessibility Checker Validation](#) |  |

| [Axe-core Accessibility Validation](#) |  |

<style>

.post .post-content img {

display: inline-block;

```
margin: 0.5em 0;
```

```
}
```

```
</style>
```

```
<div> - All
features of the component meet the requirement.</div>
```

```
<div> - Some features of the component do not meet the requirement.</div>
```

```
<div> - The component does not meet the requirement.</div>
```

### Keyboard interaction

The uploader control characterized with complete ARIA accessibility support that helps to be accessible by on-screen readers and other assistive technology devices.

The following are the standard keys that works on uploader control:

| **Keyboard shortcuts** | **Actions** |

| --- | --- |

| **Tab** | Moves focus to next element. |

| **Shift + Tab** | Moves focus to previous element. |

| **Enter** | Triggers corresponding action to the button element. |

| **Esc** | Closes the file browser dialog alone and cancels the upload on drop the file. |

### CSHTML

```
@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
        SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
        RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove" };
}
<ejs-uploader id="uploadFiles" asyncSettings="@asyncSettings"
autoUpload="false"></ejs-uploader>
```

### KEYBOARD.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes
{
    public class UploaderController : Controller
    {
        public ActionResult DefaultFunctionalities()
        {
            return View();
        }
    }
}
```

```

}
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes
{
    public class UploaderController : Controller
    {
        public ActionResult DefaultFunctionalities()
        {
            return View();
        }
    }
}

```

### Ensuring accessibility

The Uploader component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Uploader component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Uploader component with accessibility tools.

- [Accessibility in Syncfusion ASP.NET MVC components](#)

### Style and appearance in Uploader Component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

#### Customizing the appearance of File Upload wrapper element

Use the following CSS to customize the appearance of wrapper element.

```

`css
/ To specify height /
.e-upload.e-control-wrapper, .e-bigger.e-small .e-upload.e-control-wrapper {
height: 300px;
width: 300px;
}
`

```

#### Customizing the File Upload browse button

Use the following CSS to customize the File Upload browse button

```

`css
/ To specify font size and color /

```

```
.e-upload .e-file-select-wrap .e-btn, .e-upload .e-upload-actions .e-btn, .e-bigger.e-small .e-upload .e-
file-select-wrap .e-btn, .e-bigger.e-small .e-upload .e-upload-actions .e-btn {
font-family: cursive;
height: 40px;
background-color: aquamarine;
color: coral;
}
`
```

### Customizing the File Upload content

Use the following CSS to customize the File Upload content

```
`css
/ To specify font size and color /
.e-upload .e-file-select-wrap .e-file-drop, .e-bigger.e-small .e-upload .e-file-select-wrap .e-file-drop {
font-size: 20px;
color: aqua;
}
`
```

### Customizing the uploaded file container in File Upload

Use the following CSS to customize the uploaded file container in File Upload

```
`css
/ To specify background color /
.e-upload .e-upload-files .e-upload-file-list {
background-color: beige;
}
`
```

### How To

#### Hide default drop area

You can achieve this behavior by overriding the corresponding uploader styles. Override the following styles to hide the default drop area behavior.

- .e-upload.e-control
- .e-upload .e-file-select
- .e-upload .e-file-drop

**CSHTML**

```
@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
        SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
        RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove" };
}
<ejs-uploader id="UploadFiles" asyncSettings="@asyncSettings"> </ejs-uploader>
```

**INDEX.CSS**

```
#droparea {
padding: 50px 25px;
margin: 30px auto;
border: 1px solid #c3c3c3;
text-align: center;
width: 20%;
display: inline-flex;
}
.e-file-select,
.e-file-drop {
display: none;
}
body .e-upload-drag-hover {
outline: 2px dashed brown;
}
#uploadfile {
width: 60%;
display: inline-flex;
margin-left: 5%;
}
.e-control .e-file-select,
.e-control .e-file-drop {
display: none;
}
```

[Preview images before uploading](#)

The uploader control allows to create preview images before uploading. The preview images can be created by reading the file using [selected](#) event. Also, the user can create preview images after uploading to server using [success](#) event. Refer to the following link to learn about how to create image preview.

[Image Preview in MVC](#)[Achieve invisible upload](#)

You can achieve the invisible upload feature by using the [selected](#) event in uploader control.

Refer to the following example.

**CSHTML**

```
@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
        SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
        RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove" };
}
```

```

}
<div class="control_wrapper">
  <div id='preview'></div>
  <ejs-uploader id="UploadFiles" selected="onSelect"
allowedExtensions=".jpg, .jpeg, .png" asyncSettings="@asyncSettings"></ejs-
uploader>
</div>
<script>
  function onSelect(args) {
    for (var i = 0; i < args.filesData.length; i++) {
      var liparentDiv = ej.base.createElement('div', { className:
'image-list' });
      var liImage = ej.base.createElement('img', { className: 'image'
});
      liparentDiv.appendChild(liImage);
      readURL(liImage, args.filesData[i]);
      document.getElementById('preview').appendChild(liparentDiv);
    }
    args.cancel = true;
  }
  function readURL(liImage, file) {
    var imgPreview = liImage;
    var imageFile = file.rawFile;
    var reader = new FileReader();
    reader.addEventListener('load', () => {
      imgPreview.src = reader.result;
    }, false);
    if (imageFile) {
      reader.readAsDataURL(imageFile);
    }
  }
</script>

```

## INDEX.CSS

```

.control_wrapper {
  max-width: 505px;
  margin: auto;
}
#preview {
  border: 2px dashed #ddd;
  padding: 15px;
}
.image-list {
  width: 134px;
  height: 117px;
  margin-right: 4px;
  border: 1px solid lightgrey;
  display: inline-block;
}
.image {
  width: 134px;
  height: 117px;
  margin-right: 4px;
  display: inline-block;
}

```

```
.e-control ul {
    border: 1px solid #ddd;
}
.e-control .e-file-select,
.e-control .e-file-drop {
    display: none;
}
.e-control {
    margin-top: 10px;
}
```

### Customize progressbar

You can customize the progress bar's size, color, and background by overriding the styles in uploader control. Refer to the following example.

#### CSHTML

```
@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
        SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
        RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove" };
}
<div class="custom_progress">
    <ejs-uploader id="UploadFiles" asyncSettings="@asyncSettings">
    </ejs-uploader>
</div>
```

#### INDEX.CSS

```
.custom_progress {
    max-width: 400px;
    margin: 0 auto;
}
.custom_progress .e-upload .e-upload-files .e-upload-file-list .e-file-
container .e-progress-inner-wrap .e-upload-progress-bar.e-upload-progress {
    background: yellow;
    height: 4px;
}
.custom_progress .e-upload .e-upload-files .e-upload-file-list .e-file-
container .e-progress-inner-wrap {
    height: 4px;
    background-color: lightblue;
}
```

### Sort the selected files

You can sort the selected files in uploader control by using the [selected](#) event. Refer to the following example.

#### CSHTML

```
@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
        SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
        RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove" };
}
```

```

<div class="control_wrapper">
  <ejs-uploader id="UploadFiles" selected="onSelect"
  asyncSettings="@asyncSettings">
  </ejs-uploader>
</div>
<script>
  var initial = true
  function onSelect(args) {
    if (initial) { initial = false; return; }
    args.isModified = true;
    var uploadObj =
document.getElementById("UploadFiles").ej2_instances[0];
    let oldFiles = uploadObj.GetFilesData();
    let filesData = args.filesData.concat(oldFiles);
    let modifiedData = sortFileList(filesData);
    args.modifiedFilesData = modifiedData;
  }
  function sortFileList(filesData) {
    let files = filesData;
    let fileNames = [];
    for (let i = 0; i < files.length; i++) {
      fileNames.push(files[i].name);
    }
    let sortedFileNames = fileNames.sort();
    let sortedFilesData = [];
    let index = 0;
    for (let name of sortedFileNames) {
      for (let i = 0; i < files.length; i++) {
        if (name === files[i].name) {
          sortedFilesData.push(files[i]);
        }
      }
    }
    return sortedFilesData;
  }
</script>

```

### INDEX.CSS

```

.control_wrapper {
  max-width: 400px;
  margin: 0 auto;
}

```

### Get the total size of selected files

You can get the total size of selected files before uploading it to the designated server. This can be achieved by using the [selected](#) event. Refer to the following example to calculate the total file size.

### CSHTML

```

@{
  var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
    SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
    RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove" };
}

```

```
<div class="control_wrapper">
  <ejs-uploader id="UploadFiles" selected="onSelect"
  asyncSettings="@asyncSettings">
  </ejs-uploader>
</div>
<script>
  function onSelect(args) {
    var uploadObj =
document.getElementById("UploadFiles").ej2_instances[0];
    var totalSize = 0;
    for (var i = 0; i < args.filesData.length; i++) {
      var file = args.filesData[i];
      totalSize = totalSize + file.size;
    }
    var size = uploadObj.bytesToSize(totalSize);
    alert("Total select file's size is " + size);
  }
</script>
```

### INDEX.CSS

```
.control_wrapper {
  max-width: 400px;
  margin: 0 auto;
}
```

### Customize button with HTML element

The uploader control allows you to customize the action buttons by using [buttons](#) property. Refer to the following example.

### CSHTML

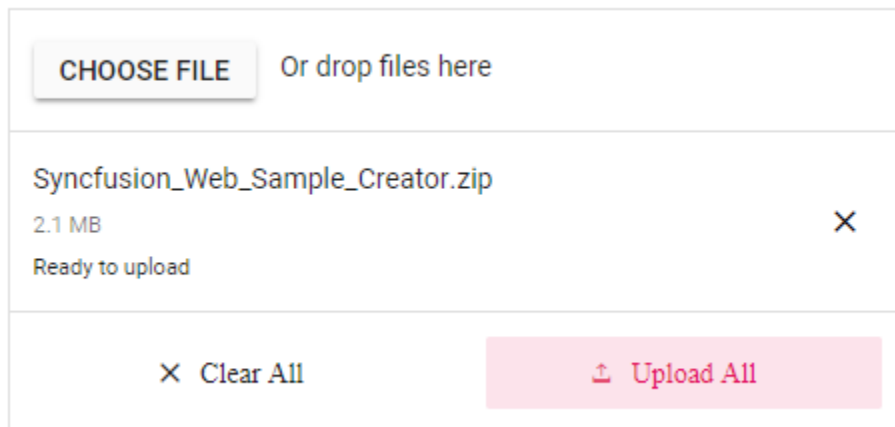

```
<div class="control_wrapper">
  @Html.EJS().Uploader("UploadFiles").AutoUpload(false).AsyncSettings(new
  Syncfusion.EJ2.Inputs.UploaderAsyncSettings { SaveUrl =
  "https://ej2.syncfusion.com/services/api/uploadbox/Save", RemoveUrl =
  "https://ej2.syncfusion.com/services/api/uploadbox/Remove" }).Render()
</div>
<script>
  var uploadEle = ej.base.createElement('span', { className: 'upload e-
  icons' });
  uploadEle.innerHTML = 'Upload All';
  var clearEle = ej.base.createElement('span', { className: 'remove e-
  icons' });
  clearEle.innerHTML = 'Clear All';
  window.onload = function (args) {
    var uploaderObj =
document.getElementById("UploadFiles").ej2_instances[0];
    uploaderObj.setProperties({
      buttons: {
        browse: 'Choose file',
        clear: clearEle,
        upload: uploadEle
      }
    })
  }
</script>
```

```
}
</script>
```

### INDEX.CSS

```
.control_wrapper {
    max-width: 400px;
    margin: 0 auto;
}
.e-upload .e-upload-actions .e-file-clear-btn,
.e-upload .e-upload-actions .e-file-upload-btn {
    -webkit-tap-highlight-color: transparent;
    background-color: #ddd;
    border-color: #c3c3c3;
    color: #000000;
    box-shadow: none;
    width: 50%;
    margin: 0;
    text-transform: none;
    padding: 8px 0;
}
.e-upload .e-upload-actions {
    width: 100%;
}
```

Output be like the below.

Add confirm dialog to remove the files

You can customize the uploader control using confirm dialog before removing the files.

Here, ej2 dialog is used as confirm dialog. Refer to the following example.

### INDEX.CSS

```
.control_wrapper {
    max-width: 400px;
    margin: 0 auto;
}
```

### Add additional data on upload

The uploader control allows to add additional data on file upload, which is used to get in the server-side.

By using [uploading](#) event and its customFormData argument, this behavior can be achieved.

#### CSHTML

```
@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
        SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
        RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove" };
}
<div class="control_wrapper">
    <div id='preview'></div>
    <ejs-uploader id="fileupload" uploading="onFileUpload"
        asyncSettings="@asyncSettings"> </ejs-uploader>
</div>
<script>
    function onFileUpload(args) {
        debugger
        args.customFormData = [{ 'name': 'Syncfusion INC' }];
    }
</script>
```

#### INDEX.CSS

```
.control_wrapper {
    max-width: 505px;
    margin: auto;
}
```

### Validate image/\* on drop

The uploader control allows you to select all types of images using the *image/\** to [allowedExtensions](#) property. You can directly set it to accept the attribute of uploader element.

By default, it is working fine when you select a file by clicking the browse button. But, this behavior is not supported to drag and drop the files for selection.

#### CSHTML

```
@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
        SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
        RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove" };
}
<div class="control_wrapper">
    <div id='preview'></div>
    <ejs-uploader id="fileupload" autoUpload="false"
        allowedExtensions="image/*" selected="onSelect"
        asyncSettings="@asyncSettings">
        </ejs-uploader>
</div>
<script>
    function onSelect(args) {
        var uploadObj =
            document.getElementById("fileupload").ej2_instances[0];
```

```

    if (event.type === 'drop') {
        var allImages = ['png', 'jpg', 'jpeg', 'gif', 'tiff', 'bpg'];
        var files = args.filesData;
        var modifiedFiles = [];
        for (var i = 0; i < files.length; i++) {
            var file = files[i];
            if (allImages.indexOf(file.type) === -1) {
                file.status = 'File type is not allowed';
                file.statusCode = '0';
            }
            modifiedFiles.push(file);
        }
        args.isModified = true;
        args.modifiedFilesData =
        modifiedFiles.concat(uploadObj.filesData);
    }
}
</script>

```

### INDEX.CSS

```

.control_wrapper {
    max-width: 505px;
    margin: auto;
}

```

Determine whether uploader has file input (required validation)

By setting **required** attribute to uploader input element, you can validate the file input has any value in it.

In the below sample, set required attribute to the uploader input element and showcase the validation failure message using `data-required-message` attribute.

### INDEX.CSS

```

.control_wrapper {
    max-width: 400px;
    margin: auto;
}
.control_wrapper .e-upload.e-upload-drag-hover {
    margin: 0;
}
.address-field {
    resize: none;
}

  padding: 10%;
  color: green;
}
#form1 {
  position: relative;
  top: 14%;
}
.form-support td {
  width: 100%;
  padding-top: 4%;
}
.e-upload {
  float: none;
}
.choose-file {
  width: 60%;
}
```

```
#browse {
  float: right;
  margin-right: -113px;
  margin-top: -27px;
}
.form-title {
  text-align: center;
}
```

### Achieve file upload programmatically

You can upload a file programmatically using `upload` method.

The selected files data, get from `getFilesData` public method in uploader.

The upload method behaves differently based on its arguments.

- If this method receives any files as arguments, those files only start to upload.
- If it has no argument then all the selected files are will start to upload.

### CSHTML

```
@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
        SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
        RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove" };
}
<div class="col-lg-8 control-section">
    <div class="control_wrapper">
        <ejs-uploader id="UploadFiles" asyncSettings="@asyncSettings"
        autoUpload="false">
            </ejs-uploader>
        </div>
        <span style=' padding-left: 40px; margin-top: 30px'>
            <button id='first' class='e-btn e-control'>Upload 0th File</button>
        </span>
        <span style=' padding-left: 40px; margin-top: 30px'>
            <button id='full' class='e-btn e-control'>Upload All Files</button>
        </span>
    </div>
    <script>
        window.onload = function () {
            var uploadObj =
            document.getElementById("UploadFiles").ej2_instances[0];
            document.getElementById('first').onclick = (args) => {
                uploadObj.upload(uploadObj.getFilesData()[0]);
            };
            document.getElementById('full').onclick = (args) => {
                uploadObj.upload(uploadObj.getFilesData());
            };
        }
    </script>
```

**INDEX.CSS**

```
.control_wrapper {
    max-width: 500px;
    margin: auto;
}
.e-upload {
    width: 100%;
    position: relative;
    margin-top: 15px;
    margin-bottom: 15px;
}
.e-upload-actions {
    display: none;
}
.e-btn {
    text-transform: none;
}
.control_wrapper .e-upload .e-upload-drag-hover {
    margin: 0;
}
```

**Check file size before uploading it**

By using [uploading](#) event, you can get the file size before upload it to server.

File object contains the file size in bytes only.

You can convert the size to standard formats (KB or MB) using **bytesToSize** method.

**CSHTML**

```
@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
        SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
        RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove" };
}
<div class="col-lg-8 control-section">
    <div class="control_wrapper">
        <ejs-uploader id="UploadFiles" asyncSettings="@asyncSettings"
        autoUpload="false" uploading="onBeforeUpload">
            </ejs-uploader>
        </div>
    </div>
</div>
<script>
    function onBeforeUpload(args) {
        var uploadObj =
        document.getElementById("UploadFiles").ej2_instances[0];
        // get the file size in bytes
        var sizeInBytes = args.fileData.size;
        // get the file size in standard format
        alert("File size is: " + uploadObj.bytesToSize(sizeInBytes))
    }
</script>
```

**INDEX.CSS**

```
.control_wrapper {
    max-width: 500px;
    margin: auto;
}
.control_wrapper .e-upload .e-upload-drag-hover {
    margin: 0;
}
```

### Check the MIME type of file before upload it

By using [uploading](#) event, you can get the file MIME type before uploading it to server.

In the below sample, file MIME type is shown in the alert box before file start to upload.

#### CSHTML

```
@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
        SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
        RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove" };
}
<div class="col-lg-8 control-section">
    <div class="control_wrapper">
        <ejs-uploader id="UploadFiles" dropArea=".control-fluid"
asyncSettings="@asyncSettings" autoUpload="false"
uploading="onBeforeUpload">
        </ejs-uploader>
    </div>
</div>
<script>
    function onBeforeUpload(args) {
        // get the file MIME type
        alert("File MIME type is: " + args.fileData.rawFile.type);
    }
</script>
```

#### INDEX.CSS

```
.control_wrapper {
    max-width: 500px;
    margin: auto;
}
.control_wrapper .e-upload .e-upload-drag-hover {
    margin: 0;
}
```

### Trigger click event of input file from external button

You can trigger the click event of input file from external button using [click](#) event of button. In the below sample, triggered click event of input file from [Essential JavaScript 2 Button](#).

#### CSHTML

```
@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
        SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
        RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove" };
}
```

```

}
<div class="col-lg-8 control-section">
  <div class="control_wrapper">
    <!-- Initialize Uploader -->
    <div id="dropArea">
      <span id="drop"> Drop image (JPG, PNG) files here or <button
class='e-btn e-control' id="browse">Browse</button></span>
    </div>
    <ejs-uploader id="UploadFiles" dropArea="#drop"
asyncSettings="@asyncSettings">
    </ejs-uploader>
  </div>
</div>
<script>
  window.onload = function () {
    document.getElementById('browse').onclick = () => {
      document.getElementsByClassName('e-file-select-
wrap')[0].querySelector('button').click();
    };
  }
</script>

```

## INDEX.CSS

```

.control_wrapper {
  max-width: 500px;
  margin: auto;
}
#dropArea {
  border: 1px dashed #c3c3cc;
  text-align: center;
  padding: 20px 0 10px;
}
.e-file-select-wrap {
  display: none;
}
.control_wrapper .e-upload .e-upload-drag-hover {
  margin: 0;
}

```

## Open and edit the uploaded files

The uploader control allows you to modify the file after uploading to the server, which can be achieved using [success](#) event of the uploader.

You can retrieve the saved file path in the uploader success event and assign it to custom attribute (data-file-name) value of the respective file list element to open the uploaded file. Click the respective file element to create a new request along with saved file path using http header. In the server-side, get the file path from the header and open the file using `process.start` method.

## CSHTML

```

@using Syncfusion.EJ2
@{

```

```

var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {
    SaveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Save",
    RemoveUrl = "https://ej2.syncfusion.com/services/api/uploadbox/Remove" };
}
<div class="control_wrapper">
    <ejs-uploader id="UploadFiles" success="onUploadSuccess"
    asyncSettings="@asyncSettings">
        </ejs-uploader>
    </div>
    <script>
        function onUploadSuccess(args) {
            // fetching the generated li elements
            var liElements = this.uploadWrapper.querySelectorAll('.e-upload-file-
list');
            for (var i = 0; i < liElements.length; i++) {
                if (liElements[i].getAttribute('data-file-name') == args.file.name)
                {
                    liElements[i].addEventListener('click', () => { openFile(args,
event) })
                    // File path have to update from server end in response status
description.
                    liElements[i].setAttribute('file-path',
args.e.target.statusText);
                }
            }
        }
        function openFile(args, e) {
            if (!e.target.classList.contains('e-file-delete-btn') &&
!e.target.classList.contains('e-file-remove-btn'))
            {
                var ajax = new XMLHttpRequest();
                // create new request for open the selected file
                ajax.open("POST", '/Home/openFile');
                var liElements = document.getElementsByClassName('e-
upload')[0].querySelectorAll('.e-upload-file-list');
                for (var i = 0; i < liElements.length; i++) {
                    if (liElements[i].getAttribute('data-file-name') ==
args.file.name) {
                        // Added the file path in header to get it in server side.
                        ajax.setRequestHeader('filePath',
liElements[i].getAttribute('file-path').toString());
                    }
                }
                ajax.send();
            }
        }
    </script>

```

## SERVER-SIDE.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.TextBoxes

```

```

{
    public partial class UploaderController : Controller
    {
        public ActionResult DefaultFunctionalities()
        {
            return View();
        }
        public void Save() {
            if (!System.IO.File.Exists(fileSavePath))
            {
                httpPostedFile.SaveAs(fileSavePath);
                HttpResponseMessage = System.Web.HttpContext.Current.Response;
                Response.Clear();
                Response.ContentType = "application/json; charset=utf-8";
                <!-- Sending the file path to client side -->
                Response.StatusDescription = fileSavePath;
                Response.End();
            }
        }
        [AcceptVerbs("Post")]
        public void openFile()
        {
            // Check whether the file is available in the corresponding location
            if
            (System.IO.File.Exists(Request.Headers.GetValues("filePath").First()))
            {
                // This will open the selected file from server location in desktop
                Process.Start(Request.Headers.GetValues("filePath").First());
            }
        }
    }
}

```

### Resize images before uploading it to the server

You can customize the dimension of the images before uploading it to the server.

By using [selected](#) event, you can get the selected file information as type of an object. From the obtained image file information, create a new canvas and render an image with the custom dimensions. Refer the corresponding code snippet as follows.

### CSHTML

```

@{
    var asyncSettings = new Syncfusion.EJ2.Inputs.UploaderAsyncSettings {

### Convert image into binary format after uploading

By default, the file upload control saves the uploaded image files in physical directories. Also, you can convert the images into binary format at server-side before saving the uploaded images.

To retrieve binary format of image files, convert the posted file's input stream into binary reader and read as bytes using ReadBytes method.

Refer to the below server-side code snippet

```

` csharp
[[AcceptVerbs("Post")]
public IActionResult Save(IList<IFormFile> UploadFiles)

```

```
{
  IFormFile uploadedImage = UploadFiles.FirstOrDefault();
  if (uploadedImage.ContentType.ToLower().StartsWith("image/"))
  // Check whether the selected file is image
  {
    byte[] b;
    using (BinaryReader br = new BinaryReader(uploadedImage.OpenReadStream()))
    {
      b = br.ReadBytes((int)uploadedImage.OpenReadStream().Length);
      // Convert the image in to bytes
    }
    Response.StatusCode = 200;
  }
  return Content("");
}
```

## Migration from Essential JS 1

This article describes the API migration process of File Upload component from Essential JS 1 to Essential JS 2.

### Accessibility

| **Behavior** | **Property in Essential JS 1** | **Property in Essential JS 2** |

|-----|-----|-----|

| Localization | **Property** : locale <br/><br/>

@Html.EJ().Uploadbox("UploadDefault")<br/>.Locale("es-ES") | **Property** : locale <br/><br/>

@Html.EJS().<br/>Uploader("UploadFiles").<br/>Locale("es-ES").Render() |

| Right to left | **Property**: enableRTL <br/><br/>

@Html.EJ().Uploadbox("UploadDefault").<br/>EnableRTL(true) | **Property**: enableRTL <br/><br/>

@Html.EJS().Uploader("UploadFiles").<br/>EnableRtl(true).Render() |

### File list

| **Behavior** | **Property in Essential JS 1** | **Property in Essential JS 2** |

|-----|-----|-----|

| Show/Hide the selected files | **Property** : showFileDetails <br/><br/>

@Html.EJ().Uploadbox("UploadDefault")<br/>.ShowFileDetails(false) | **Property** : showFileList

<br/><br/> @Html.EJS().Uploader("UploadFiles").<br/>ShowFileList(false).Render() |

| Customizing the file list | Not Applicable | **Property** : template <br/><br/>

@Html.EJS().Uploader("UploadFiles").<br/>Template("#Templateid").Render() |

| Get the files in sorted form | Not Applicable | **Method:** SortFileList<br/><br/>  
@Html.EJS().Uploader("UploadFiles").<br/>Render().<br/><br/>var uploadobj =  
document.<br/>getElementById("UploadFiles").<br/>ej2\_instances[0];  
<br/>uploadObj.sortFileList(files); <br/> |

| Clearing File List | Not Applicable | **Method:** ClearAll <br/><br/>  
@Html.EJS().Uploader("UploadFiles").<br/>Render().<br/><br/>var uploadobj =  
document.<br/>getElementById("UploadFiles").<br/>ej2\_instances[0];  
<br/>uploadObj.clearAll();<br/>} <br/> |

| Event triggers when clearing Files | Not Applicable | **Event :** clearing <br/><br/>  
@Html.EJS().Uploader("UploadFiles").<br/>Clearing("onClearing").Render().<br/><br/>function  
onClearing(ClearingEventArgs): void { } <br/> |

## File selection

| **Behavior** | **Property in Essential JS 1** | **Property in Essential JS 2** |

| ----- | ----- | ----- |

| Select multiple files to upload | **Property :** multipleFilesSelection <br/><br/>  
@Html.EJ().Uploadbox("UploadDefault").<br/>MultipleFilesSelection(true) | **Property :** multiple  
<br/><br/> @Html.EJS().Uploader("UploadFiles").<br/>Multiple(true).Render() |

| Set minimum file size to upload | **Not Applicable** | **Property :** minFileSize <br /><br />  
@Html.EJS().Uploader("UploadFiles").<br/>MinFileSize(1024).Render() |

| Set maximum file size to upload | **Property :** fileSize <br/><br/>  
@Html.EJ().Uploadbox("UploadDefault").<br/>FileSize(5000) | **Property :** maxFileSize <br/><br/>  
@Html.EJS().Uploader("UploadFiles").<br/>MaxFileSize(5000).Render() |

| Allowed file types to select | **Property :** extensionsAllow <br/><br/>  
@Html.EJ().Uploadbox("UploadDefault").<br/>ExtensionsAllow(".zip") | **Property:**  
allowedExtensions <br/><br/>  
@Html.EJS().Uploader("UploadFiles").<br/>AllowedExtensions(".pdf").Render() |

| Restricted files types to select | **Property:** extensionsDeny <br/><br/>  
@Html.EJ().Uploadbox("UploadDefault").<br/>ExtensionsDeny(".docx") | **Not Applicable** |

| Display only selected details in File list | **Property :** customFileDetails<br/><br/>  
@Html.EJ().Uploadbox("UploadDefault").<br/>CustomFileDetails(details=>  
details.<br/>Title(false).<br/>Name(true).Size(true).<br/>Status(true).Action(false)) <br/> | **Not**  
**Applicable** |

| Options to customize File list dialog | **Property:** dialogAction <br/><br/>  
@Html.EJ().Uploadbox("UploadDefault").<br/>DialogAction(details=>  
details.<br/>Modal(false).<br/>CloseOnComplete(true).<br/>Resize(true).Drag(false).<br/>conte  
nt("#dialogTarget")) <br/> | **Not Applicable** |

| Customize dialog position | **Property:** dialogPosition<br/><br/>  
@Html.EJ().Uploadbox("UploadDefault").<br/>DialogPosition<br/>{position =>  
position.X(300).Y(100)}<br/> | **Not Applicable** |

| Change file list key values | **Property:** dialogText<br/><br/>  
@Html.EJ().Uploadbox("UploadDefault").<br/>DialogText(details=> details.<br/>Title(Upload  
File List).Name(File Name).<br/>Size(File Size))<br/> | **Not Applicable** |

| Change drop area text | **Property:** dropAreaText<br/><br/>  
@Html.EJ().Uploadbox("UploadDefault").<br/>DropAreaText("Drop files here") | No separate  
Property to change dropAreaText. It can be customize using locale Texts |

| Change drop area height | **Property:** dropAreaHeight<br/><br/>  
@Html.EJ().Uploadbox("UploadDefault").<br/>DropAreaHeight("100%") | Not Applicable |

| Change drop area width | **Property:** dropAreaWidth <br/><br/>  
@Html.EJ().Uploadbox("UploadDefault").<br/>DropAreaWidth("100%") | Not Applicable |

| Dynamically push the file | **Property:** pushFile<br/><br/>  
@Html.EJ().Uploadbox("UploadDefault").<br/>PushFile("files") | Not Applicable |

| Show the files uploader in server already. | **Not Applicable** | **Property:** files <br/><br/>  
@Html.EJS().Uploader("UploadFiles").<br/>Files(@ViewBag.datasources).Render()<br/><br/>publ  
ic ActionResult PreloadFiles()<br/> { list.Add(new UploaderUploadedFiles<br/> { Name =  
"Nature", Size = 500000, <br/>Type = ".png" }); }<br/> |

| Event triggers when select the file successfully | **Event:** fileSelect <br/><br/>  
@Html.EJ().Uploadbox("UploadDefault").<br/>ClientSideEvents(e =>  
e.FileSelect("fileSelect"))<br/><br/>function fileSelect(e) {}<br/> | **Event:** selected<br/><br/>  
@Html.EJS().Uploader("UploadFiles").<br/>Selected("onFileSelect").Render()<br/><br/> function  
onFileSelect(args): void { }<br/> |

## Upload action

| **Behavior** | **Property in Essential JS 1** | **Property in Essential JS 2** |

| ----- | ----- | ----- |

| Save URL | **Property** : saveUrl <br/><br/>  
@Html.EJ().Uploadbox("UploadBox").<br/>SaveUrl("Uploadbox/Save") | **Property** :  
saveUrl<br/><br/> @Html.EJS().Uploader("UploadFiles").<br/>AsyncSettings(new  
Syncfusion.<br/>EJ2.Inputs.<br/>UploaderAsyncSettings <br/>{SaveUrl =  
@Url.Content("/Uploader/Save")})<br/>.Render() |

| Save URL | **Property** : saveUrl <br/><br/>  
@Html.EJ().Uploadbox("UploadBox").<br/>SaveUrl("Uploadbox/Save") | **Property** :  
saveUrl<br/><br/> @Html.EJS().Uploader("UploadFiles").<br/>AsyncSettings(new  
Syncfusion.<br/>EJ2.Inputs.<br/>UploaderAsyncSettings <br/>{SaveUrl =  
@Url.Content("/Uploader/Save")})<br/>.Render() |

| Save URL | **Property** : saveUrl <br/><br/>  
@Html.EJ().Uploadbox("UploadBox").<br/>SaveUrl("Uploadbox/Save") | **Property** :  
saveUrl<br/><br/> @Html.EJS().Uploader("UploadFiles").<br/>AsyncSettings(new  
Syncfusion.<br/>EJ2.Inputs.<br/>UploaderAsyncSettings <br/>{SaveUrl =  
@Url.Content("/Uploader/Save") })<br/>.Render() |

| Save URL | **Property** : saveUrl <br/><br/>

```
@Html.EJ().Uploadbox("UploadBox").<br/>SaveUrl("Uploadbox/Save") | Property :
saveUrl<br/><br/> @Html.EJS().Uploader("UploadFiles").<br/>AsyncSettings(new
Syncfusion.<br/>EJ2.Inputs.<br/>UploaderAsyncSettings <br/>{SaveUrl =
@Url.Content("/Uploader/Save")}).<br/>Render() |
```

| Remove URL | **Property** : removeUrl<br/><br/>

```
@Html.EJ().Uploadbox("UploadBox").<br/>RemoveUrl("UploadBox/Remove") | Property :
removeUrl<br/><br/> @Html.EJS().Uploader("UploadFiles").<br/>AsyncSettings(new
Syncfusion.<br/>EJ2.Inputs.<br/>UploaderAsyncSettings <br/>{RemoveUrl =
@Url.Content<br/>("/Uploader/Remove")}).<br/>Render() |
```

| Automatically upload the file when files added in to upload queue | **Property**: autoUpload <br/><br/>

```
@Html.EJ().Uploadbox("UploadBox").<br/>AutoUpload(false) | Property: autoUpload<br/><br/>
@Html.EJS().Uploader("UploadFiles").<br/>AutoUpload(false).Render() |
```

| Synchronous upload | **Property**: asyncUpload<br/><br/>

```
@Html.EJ().Uploadbox("UploadBox").<br/>AyncUpload(false) | No Separate Property for enabling
synchronous upload. It can be enabling by using below configuration <br/><br/>
@Html.EJS().Uploader("UploadFiles").<br/>AutoUpload(false).Render() |
```

| Key to get the selected files in server side | **Property**: uploadName<br/><br/>

```
@Html.EJ().Uploadbox("UploadBox").<br/>UploadName("Uploadkey") | Id of the element used
as key value |
```

| Upload the files dynamically | **Not Applicable** | Method: upload()<br/><br/>

```
@Html.EJS().Uploader("UploadFiles").<br/>AsyncSettings(new
Syncfusion.EJ2.Inputs.<br/>UploaderAsyncSettings<br/> {SaveUrl =
@Url.Content<br/>("/Uploader/Save"),<br/> RemoveUrl =
@Url.Content<br/>("/Uploader/Remove") }).Render()<br/><br/>var uploadobj =
document.<br/>getElementById("UploadFiles").<br/>ej2_instances[0]; <br/>uploadobj.upload =
filesData;<br/> |
```

| Event triggers before start to upload the action | **Event**: beforeSend<br/><br/>

```
@Html.EJ().Uploadbox("UploadDefault").<br/>ClientSideEvents(e =>
<br/>e.OnBeforeSend("onBeforeSend"))<br/><br/>function onBeforeSend(e) {}<br/> | Event :
uploading<br/><br/>
@Html.EJS().Uploader("UploadFiles").<br/>Uploading("beforeUploadStart").<br/>Render()<br/>
<br/> function beforeUploadStart(args) { }<br/> |
```

| Event triggers when the upload is in progress | **Event**: inProgress<br/><br/>

```
@Html.EJ().Uploadbox("UploadDefault").<br/>ClientSideEvents(e =>
<br/>e.InProgress("uploadInProgress"))<br/><br/>function uploadInProgress(e) {}<br/> | Event :
progress<br/><br/>
@Html.EJS().Uploader("UploadFiles").<br/>Progress("uploadInProgress").<br/>Render()<br/><br/>
/> function uploadInProgress(args) { }<br/> |
```

| Event triggers when upload got success | **Event**: success<br/><br/>

```
@Html.EJ().Uploadbox("UploadDefault").<br/>ClientSideEvents(e =>
<br/>e.Success("uploadSuccess"))<br/><br/>function uploadSuccess(e) {}<br/> | Event :
```

```

success<br/><br/>
@Html.EJS().Uploader("UploadFiles").<br/>Success("uploadSuccess").Render()<br/><br/>
function uploadSuccess(args) { }<br/> |

| Event triggers when upload got failed | Event: error<br/><br/>
@Html.EJ().Uploadbox("UploadDefault").<br/>ClientSideEvents(e =>
<br/>e.Error("onUploadError"))<br/><br/>function onUploadError(e) {}<br/> | Event :
failure<br/><br/>
@Html.EJS().Uploader("UploadFiles").<br/>Failure("onUploadFailure").Render()<br/><br/>
function onUploadFailure(args) { }<br/> |

| Event triggers when the upload got started | Event: begin <br/><br/>
@Html.EJ().Uploadbox("UploadDefault").<br/>ClientSideEvents(e =>
<br/>e.Begin("onUploadBegin"))<br/><br/>function onUploadBegin(e) {}<br/> | Not Applicable |

| Event triggers when cancel the upload | Event: cancel<br/><br/>
@Html.EJ().Uploadbox("UploadDefault").<br/>ClientSideEvents(e =>
<br/>e.Cancel("onUploadCancel"))<br/><br/>function onUploadCancel(e) {} <br/> | Event :
canceling<br/><br/>
@Html.EJS().Uploader("UploadFiles").<br/>Canceling("uploadingCancel").<br/>Render()<br/><br/>
/> function uploadingCancel(args) { }<br/> |

| Event triggers when the upload completed | Event: complete<br/><br/>
@Html.EJ().Uploadbox("UploadDefault").<br/>ClientSideEvents(e =>
<br/>e.Complete("onUploadComplete"))<br/><br/>function onUploadComplete(e) {}<br/> | Not
Applicable |

```

### Chunk upload

| **Behavior** | **Property in Essential JS 1** | **Property in Essential JS 2** |

| ----- | ----- | ----- |

```

| Enabling the chunk upload | Not Applicable | Property: chunkSize<br/><br/>
@Html.EJS().Uploader("UploadFiles").<br/>MaxFileSize(104857600).AsyncSettings(new
Syncfusion.EJ2.Inputs.UploaderAsyncSettings { SaveUrl =
@Url.Content("https://aspnetmvc.syncfusion.com/<br/>services/api/uploadbox/Save"),
<br/>RemoveUrl =
@Url.Content("https://aspnetmvc.syncfusion.com/<br/>services/api/uploadbox/Remove"),
ChunkSize = 500000 }).Render()<br/> |

| Retry the upload automatically when it's get failed | Not Applicable | Property: retryCount,
retryAfterDelay<br/><br/>
@Html.EJS().Uploader("UploadFiles").<br/>MaxFileSize(104857600).AsyncSettings(new
Syncfusion.EJ2.Inputs.UploaderAsyncSettings { SaveUrl =
@Url.Content("https://aspnetmvc.syncfusion.com/<br/>services/api/uploadbox/Save"),
RemoveUrl =
@Url.Content("https://aspnetmvc.syncfusion.com/<br/>services/api/uploadbox/Remove"),
ChunkSize = 500000, retryCount = 3, retryAfterDelay = 1000 }).Render()<br/> |

```

| Pause the uploading file | Not Applicable | **Method:** pause<br/><br/>

```
@Html.EJS().Uploader("UploadFiles").Render()<br/><br/>var uploadobj =
document.<br/>getElementById("UploadFiles").ej2_instances[0]; <br/>uploadObj.pause =
filesData;<br/> |
```

| Event triggers when pausing the file | Not Applicable | **Event:** pausing<br/><br/>

```
@Html.EJS().Uploader("UploadFiles").<br/>Pausing("onPausingUpload").Render()<br/><br/>func
tion onPausingUpload(args): void { }<br/> |
```

| Resuming the paused file | Not Applicable | **Method:** resume<br/><br/>

```
@Html.EJS().Uploader("UploadFiles").Render()<br/><br/>var uploadobj =
document.<br/>getElementById("UploadFiles").ej2_instances[0];<br/> uploadObj.resume =
filesData;<br/> |
```

| Event triggers when resuming the file | Not Applicable | **Event:** resuming<br/><br/>

```
@Html.EJS().Uploader("UploadFiles").<br/>Resuming("onResumingUpload").Render()<br/><br/>
function onResumingUpload(args): void { }<br/> |
```

| Retry the failed file | Not Applicable | **Method:** retry<br/><br/>

```
@Html.EJS().Uploader("UploadFiles").Render()<br/><br/>var uploadobj =
<br/>document.getElementById("UploadFiles").ej2_instances[0]; <br/>uploadObj.retry =
filesData;<br/> |
```

| Cancel the failed file | Not Applicable | **Method:** cancel<br/><br/>

```
@Html.EJS().Uploader("UploadFiles").Render()<br/><br/>var uploadobj =
<br/>document.getElementById("UploadFiles").ej2_instances[0]; <br/>uploadObj.cancel =
filesData;<br/> |
```

| Event triggers when cancel the file | Not Applicable | **Event:** canceling<br/><br/>

```
@Html.EJS().Uploader("UploadFiles").<br/>Canceling("onCancelingUpload").Render()<br/><br/>
function onCancelingUpload(args): void { }<br/> |
```

| Event triggers when chunk file fails | Not Applicable | **Event:** chunkFailure<br/><br/>

```
@Html.EJS().Uploader("UploadFiles").<br/>ChunkFailure("onChunkFailure").Render()<br/><br/>
function onChunkFailure(args): void { }<br/> |
```

| Event triggers when chunk file success | Not Applicable | **Event:** chunkSuccess<br/><br/>

```
@Html.EJS().Uploader("UploadFiles").<br/>ChunkSuccess("onChunkSuccess").Render()<br/><br/>
> function onChunkSuccess(args): void { }<br/> |
```

#### Remove action

| **Behavior** | **Property in Essential JS 1** | **Property in Essential JS 2** |

| ----- | ----- | ----- |

| Remove the uploaded file | Not Applicable | **Method:** remove<br/><br/>

```
@Html.EJS().Uploader("UploadFiles").Render()<br/><br/>var uploadobj =
document.<br/>getElementById("UploadFiles").ej2_instances[0]; <br/>uploadObj.remove =
filesData;<br/> |
```

| Event triggers when the file removing succeed | **Event:** remove<br/><br/>

```
@Html.EJ().<br/>Uploadbox("UploadDefault").<br/>ClientSideEvents(e =>
```

e.Remove("onRemove")<br><br>function onRemove(e) {}<br> | **Event:** success<br><br>  
@Html.EJS().Uploader("UploadFiles").<br>Success("onSuccess").Render()<br><br> function  
onSuccess(args) { }<br> |

| Event triggers when the file removing fails | **Not Applicable** | **Event:** failure<br><br>  
@Html.EJS().Uploader("UploadFiles").<br>Failure("onFailure").Render()<br><br> function  
onFailure(args) { }<br> |

## Buttons

| **Behavior** | **Property in essential JS 1** | **Property in essential JS 2** |

| ----- | ----- | ----- |

| Customize button text | **Property** : buttonText<br><br>  
@Html.EJ().<br>Uploadbox("UploadDefault").<br>Browse(ButtonText.Browse).<br>Upload(B  
uttonText.Upload).<br>Cancel(ButtonText.Cancel)<br> | **Property** : buttons<br><br>  
@Html.EJS().<br>Uploader("UploadFiles").<br>Buttons(ViewBag.UploadButtons).Render()<br>  
><br>public ActionResult DefaultFunctionalities() { List<UploaderButton> buttons = new  
List<UploaderButton>() { }; buttons.Add(new UploaderButton() { browse = "Choose File", clear =  
"Clear Files", upload = "Upload Files" }); ViewBag.UploadButtons = buttons; return View();  
}public class DefaultButtonModel { public string browse { get; set; } public string clear { get; set;  
} public string upload { get; set; } }<br> |

## Drag and drop

| **Behavior** | **Property in Essential JS 1** | **Property in Essential JS 2** |

| ----- | ----- | ----- |

| Enable drag and drop upload | **Property** : allowDragAndDrop<br><br>  
@Html.EJ().<br>Uploadbox("UploadDefault").<br>AllowDragAndDrop(true) | No separate  
Property to disabling drag and drop |

| Set custom drop area | **Not Applicable** | **Property** : dropArea<br><br>  
@Html.EJS().<br>Uploader("UploadFiles").<br>DropArea(".control-fluid").Render() |

## Common

| **Behavior** | **Property in Essential JS 1** | **Property in Essential JS 2** |

| ----- | ----- | ----- |

| Adding custom class to wrapper element | **Property** : cssClass<br><br>  
@Html.EJ().Uploadbox("UploadDefault").<br>CssClass("Custom-Class") | Not Applicable |

| Enable/Disable the control | **Property** : enabled<br><br>  
@Html.EJ().Uploadbox("UploadDefault").<br>Enabled(false).Render()<br> **Method** : enable(),  
disable()<br> | **Property:** enabled<br><br>  
@Html.EJS().<br>Uploader("UploadFiles").<br>Enabled(false).Render() |

| Set height for uploader | **Property:** height<br><br>  
@Html.EJ().Uploadbox("UploadDefault").<br>Height("100%") | **Not Applicable** |

| Set width for uploader | **Property:** width<br><br>  
@Html.EJ().Uploadbox("UploadDefault").<br>Width("100%") | **Not Applicable** |

| Adding HTML attributes | **Property:** htmlAttributes<br/><br/>  
@Html.EJ().Uploadbox("UploadDefault").<br/>HtmlAttribute(attribute => <br/>attribute.Aria-label("Uploadbox"))<br/> | **Not Applicable** |

| Event triggers when control created successfully | **Event:** create<br/><br/>  
@Html.EJ().Uploadbox("UploadDefault").<br/>ClientSideEvents(e =>  
<br/>e.Create("onCreate"))<br/><br/>function onCreate(e) {}<br/> | **Event:** created<br/><br/>  
@Html.EJS().<br/>Uploader("UploadFiles").<br/>Created("onCreated").Render()<br/><br/>  
function onCreated(args) { }<br/> |

| Event triggers when destroy the control | **Event:** destroy<br/><br/>  
@Html.EJ().Uploadbox("UploadDefault").<br/>ClientSideEvents(e =>  
<br/>e.Destroy("onDestroy"))<br/><br/>function onDestroy(e) {}<br/> | **Not Applicable** |

| Keeping the model values in cookies | **Property:** enablePersistence<br/><br/>  
@Html.EJ().Uploadbox("UploadDefault").<br/>EnablePersistence(true) | **Property:**  
enablePersistence<br/><br/>  
@Html.EJS().<br/>Uploader("UploadFiles").<br/>EnablePersistence(false).Render() |

| Get the selected files data | **Not Applicable** | **Method:** getFilesData<br/><br/>  
@Html.EJS().Uploader("UploadFiles").<br/>.Render()<br/><br/>var uploadobj =  
document.<br/>getElementById("UploadFiles").<br/>ej2\_instances[0];  
<br/>uploadObj.getFilesData();<br/> |

| Convert bytes in to MB, GB | **Not Applicable** | **Method:** bytesToSize<br/><br/>  
@Html.EJS().Uploader("UploadFiles").<br/>Render()<br/><br/>var uploadobj =  
document.<br/>getElementById("UploadFiles").<br/>ej2\_instances[0];  
<br/>uploadObj.bytesToSize(5000);<br/> |
