```

Multilevel nesting

The Menu supports multiple level nesting, and it can be achieved by mapping the [items](#) property inside the parent [menuitems](#). In the following sample, three-level nesting of menu has been provided.

INDEX.TS

```

import { Menu, MenuItemModel } from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Menu items definition
let menuItems: MenuItemModel[] = [
    {
        text: 'Fashion',
        items: [
            {
                text: 'Men Fashion',
                items: [
                    {
                        text: 'Personal Care',
                        items: [
                            { text: 'Trimmers' },
                            { text: 'Shavers' }
                        ]
                    }
                ]
            },
            {
                text: 'Clothing',

```

```

        items: [
            { text: 'Shirts' },
            { text: 'Jackets' },
            { text: 'Track Suits' }
        ]
    },
    { text: 'Footwear' }
]
},
{
    text: 'Women Fashion',
    items: [
        {
            text: 'Clothing',
            items: [
                { text: 'Kurtas' },
                { text: 'Salwars' },
                { text: 'Sarees' }
            ]
        },
        {
            text: 'Jewellery',
            items: [
                { text: 'Nosepins' },
                { text: 'Anklets' }
            ]
        }
    ]
}
]
},
{

```

You can achieve multi level nesting with data source by mapping **name** of the child items to the [children](#) sub-property of [fields](#) property. Also, we can specify [id](#) property for menu items. For more information, refer to the [data source binding](#) section. To open sub menu items only on item click, [showItemOnClick](#) should be set as **true**.

The below table represents the MenuItem properties and it's description.

Property Name	Type	Description
iconCss	string	Defines class/multiple classes separated by a space for the menu Item that is used to include an icon. Menu Item can include font icon and sprite image.
id	string	Specifies the id for menu item.

|separator|boolean|Specifies separator between the menu items. Separator are either horizontal or vertical lines used to group menu items.

|items|MenuItemModel[]|Specifies the sub menu items that is the array of MenuItem model/

|text|string|Specifies text for menu item.

|url|string|Specifies url for menu item that creates the anchor link to navigate to the url provided.

Data source binding and custom menu items in EJ2 JavaScript Menu control

Data binding

The Menu supports data source bindings such as array of JavaScript objects that can be structured as either **hierarchical** or **self-referential** data.

Hierarchical data

The Menu can be populated with hierarchical data source by assigning it to the [items](#) property, and the fields with corresponding keys can be mapped to the [fields](#) property.

JSON data

The Menu can generate its menu items through an array of complex data source by mapping fields from the [fields](#) property.

INDEX.TS

```
import { Menu, FieldSettingsModel } from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
//Import an array of JSON data from datasource.ts
import { dataSource } from './datasource.ts';
enableRipple(true);
//Menu fields definition
let menuFields: FieldSettingsModel = {
    text: ['continent', 'country', 'language'],
    children: ['countries', 'languages']
};
//Initialize Menu component.
let menuObj: Menu = new Menu({ items: dataSource, fields: menuFields },
'#menu');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0,
user-scalable=no">
    <meta name="description" content="Essential JS 2">
    <meta name="author" content="Syncfusion">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">

</head>
<body>

    <div id="container">
        <div class="control-section">
            <ul id="menu"></ul>
        </div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Data Service

In application level, remote data binding can be achieved using [DataManager](#). To create Menu, assign `items` property with resultant data from [callback](#) function.

The following example displays five employees' **FirstName** from **Employees** table and **ShipName** details from **Orders** table of the **Northwind** Data Service.

INDEX.TS

```

import { Menu, FieldSettingsModel } from '@syncfusion/ej2-navigations';
import { DataManager, Query, ODataV4Adaptor, ReturnOption } from
 '@syncfusion/ej2-data';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
const SERVICE_URI: string =
 'https://services.odata.org/V4/Northwind/Northwind.svc/';
// Menu fields definition.
let menuFields: FieldSettingsModel = {
    text: ['FirstName', 'ShipName'],
    children: ['Orders']
};
// Getting remote data using DataManager.
new DataManager({ url: SERVICE_URI, adaptor: new ODataV4Adaptor(),
crossDomain: true })
.executeQuery(
new Query().from('Employees').take(5).hierarchy(

```

```

    new Query()
    .foreignKey('EmployeeID')
    .from('Orders').take(13),
    function() {
        return [1, 2, 3, 4, 5]
    }
))
.then((e: ReturnOption) => {
    //Initialize Menu component.
    new Menu({ items: ((Object[]>e.result) as { [key: string]: Object }[]),
fields: menuFields }, '#menu');
});

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0,
user-scalable=no">
    <meta name="description" content="Essential JS 2">
    <meta name="author" content="Syncfusion">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-

<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div class="control-section">
            <ul id="menu"></ul>
        </div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Self-referential data

Menu can be populated from self-referential data structure that contains array of JSON objects with **parentId** mapping.

In the following example, the **id**, **pId**, and **text** columns from self-referential data have been mapped to the **itemId**, **parentId**, and **text** fields, respectively.

INDEX.TS

```
import { Menu, FieldSettingsModel } from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Menu datasource
let data: { [key: string]: Object }[] = [
  { id: 'parent1', text: 'Events' },
  { id: 'parent2', text: 'Movies' },
  { id: 'parent3', text: 'Directory' },
  { id: 'parent4', text: 'Queries', pId: null },
  { id: 'parent5', text: 'Services', pId: null },
  { id: 'parent6', text: 'Conferences', pId: 'parent1' },
  { id: 'parent7', text: 'Music', pId: 'parent1' },
  { id: 'parent8', text: 'Workshops', pId: 'parent1' },
  { id: 'parent9', text: 'Now Showing', pId: 'parent2' },
  { id: 'parent10', text: 'Coming Soon', pId: 'parent2' },
  { id: 'parent10', text: 'Media Gallery', pId: 'parent3' },
  { id: 'parent11', text: 'Newsletters', pId: 'parent3' },
  { id: 'parent12', text: 'Our Policy', pId: 'parent4' },
  { id: 'parent13', text: 'Site Map', pId: 'parent4' },
  { id: 'parent14', text: 'Pop', pId: 'parent7' },
  { id: 'parent15', text: 'Folk', pId: 'parent7' },
  { id: 'parent16', text: 'Classical', pId: 'parent7' }
];
//Menu fields definition
let menuFields: FieldSettingsModel = {
  itemId: 'id',
  text: 'text',
  parentId: 'pId'
};
//Initialize Menu component
let menuObj: Menu = new Menu({ items: data, fields: menuFields }, '#menu');
```

Custom menu items

The Menu can be customized using Essential JS2 [Template engine](#) to render the elements.

To customize menu items in your application, set your customized template string to the [template](#) property. In the following example, the menu has been rendered with customized menu items.

INDEX.TS

```

import { Menu, FieldSettingsModel } from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(false);
//Menu data definition
let data: { [key: string]: Object }[] = [
    {
        category: 'Products',
        options: [
            { value: 'JavaScript', url: 'javascript' },
            { value: 'Angular', url: 'angular' },
            { value: 'ASP.NET Core', url: 'core' },
            { value: 'ASP.NET MVC', url: 'mvc' }
        ]
    },
    {
        category: 'Services',
        options: [
            {
                support: [
                    { value: 'Application Development', count: '1200+' },
                    { value: 'Maintenance & Support', count: '3700+' },
                    { value: 'Quality Assurance' },
                    { value: 'Cloud Integration', count: '900+' }
                ]
            }
        ]
    },
    {
        category: 'About Us',
        options: [
            {
                about: {
                    value: "We are on a mission to provide world-class best software solutions for web, mobile and desktop platforms. Around 900+ applications are desgined and delivered to our customers to make digital & strengthen their businesses."
                }
            }
        ]
    },
    { category: 'Careers' },
    { category: 'Sign In' }
];

```

Use case scenarios in EJ2 JavaScript Menu control

Scrollable menu

The menu component supports horizontal and vertical scrolling to render large menus and submenus in an adaptive way. This can be achieved by enabling the [enableScrolling](#) property and by restricting the corresponding menu/submenu size.

INDEX.TS

```
import { Menu, MenuItemModel, BeforeOpenCloseMenuEventArgs, MenuModel } from
 '@syncfusion/ej2-navigations';
import { enableRipple, closest } from '@syncfusion/ej2-base';
enableRipple(true);
// Menu items definition

Menu in toolbar

The following example demonstrates how to integrate Menu with Toolbar component.

INDEX.TS

```

import { Toolbar, Menu, MenuItemModel } from '@syncfusion/ej2-navigations';
let menuTemplate: string = '<ul id="menu"></ul>';
//Initialize Toolbar component
let toolbarObj: Toolbar = new Toolbar({
  created: create,
  items: [
    { template: menuTemplate },
    { prefixIcon: 'em-icons e-shopping-cart', align: 'Right' }
  ]
}

```

```

});
//Render initialized Toolbar component
toolbarObj.appendTo('#shoppingtoolbar');
function create(): void {
    let data: { [key: string]: Object }[] = [
        {
            header: 'Events',
            subItems: [
                { text: 'Conferences' },
                { text: 'Music' },
                { text: 'Workshops' }
            ]
        },
        {
            header: 'Movies',
            subItems: [
                { text: 'Now Showing' },
                { text: 'Coming Soon' }
            ]
        },
        {
            header: 'Directory',
            subItems: [
                { text: 'Media Gallery' },
                { text: 'Newsletters' }
            ]
        },
        {
            header: 'Queries',
            subItems: [
                { text: 'Our Policy' },
                { text: 'Site Map' },
                { text: '24x7 Support' }

Hamburger menu

The following example demonstrates the use case of menu with Accordion component integrated in SideBar.

INDEX.TS

```

import { Sidebar, Accordion, ExpandEventArgs, AccordionClickArgs } from
'@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let acrdnObj: Accordion;
// Sidebar Initialization
let defaultSidebar: Sidebar = new Sidebar({ width: '220px', type: 'Over',
created: created });
defaultSidebar.appendTo('#default-sidebar');
// Close the Sidebar
document.getElementById('close').onclick = (): void => {
    defaultSidebar.hide();
};

```

```

};
document.getElementById('hamburger').onclick = (): void => {
    defaultSidebar.show();
    acrdnObj.refresh();
};
function created(): void {
    let data: { [key: string]: Object }[] = [
        {
            header: 'Appliances',
            content: '<div id="Appliances_Items"></div>',
            subItems: [
                {
                    header: 'Kitchen',
                    content: '<div id="Appliances_Kitchen_Items"></div>',
                    subItems: [
                        { header: 'Electric Cookers' },
                        { header: 'Coffee Makers' },
                        { header: 'Blenders' },

Accessibility in EJ2 JavaScript Menu control

The Menu component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Menu component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

```
<style>
```

```
.post .post-content img {
```

```
display: inline-block;
```

```
margin: 0.5em 0;
```

```
}
```

```
</style>
```

```
<div> - All features of the component meet the requirement.</div>
```

```
<div> - Some features of the component do not meet the requirement.</div>
```

```
<div> - The component does not meet the requirement.</div>
```

WAI-ARIA attributes

The Menu component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Menu component:

| Attributes | Purpose |

| --- | --- |

| **role** | Indicates Menu component's root menu as **menubar**, popup as **menu**, and the popup items as **menuitem**. |

| **aria-haspopup** | Indicates the availability and type of interactive popup element. |

| **aria-expanded** | Indicates whether the subtree can be expanded or collapsed, and indicates whether its current state can be expanded or collapsed. |

| **aria-orientation** | Indicates whether the orientation is horizontal or vertical. The default orientation is horizontal. |

| **aria-label** | Indicates the menu item text. |

| **aria-disabled** | Indicates the state of menu item whether it is disabled. |

Keyboard interaction

The Menu component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Menu component.

| **Press** | **To do this** |

| --- | --- |

| **Esc** | Closes the sub menu that contains focus and returns focus to the parent element. |

| Enter | Opens the sub menu if focused menu item has sub menu, and places focus on its first item or activates the item and closes the sub menu. |

| Up | Navigates up or to the previous menu item. |

| Down | Navigates down or to the next menu item. |

| Left | Closes the current sub menu and navigates to the parent menu. |

| Right | Navigates and open the next sub menu. |

| Home | Focuses the first item. |

| End | Focuses the last item.

Ensuring accessibility

The Menu component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Menu component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Menu component with accessibility tools.

Style and appearance in EJ2 JavaScript Menu control

To modify the Menu appearance, you need to override the default CSS of Menu component. Please find the list of CSS classes and its corresponding section in Menu component. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

CSS Class | Purpose of Class

|.e-menu-wrapper|To customize the menu wrapper

|.e-menu-wrapper.e-menu-popup|To customize the menu popup wrapper

|.e-menu-wrapper ul .e-menu-item|To customize the menu items

|.e-menu-wrapper.e-menu-popup .e-menu-item|To customize the menu popup items

|.e-menu-wrapper ul .e-menu-item .e-caret|To customize the menu items caret icon

How To

Change orientation in EJ2 JavaScript Menu control

Orientation in menu items can be changed horizontally or vertically using the [orientation](#) property. By default, it is horizontally aligned.

INDEX.TS

```
import { Menu, MenuItemModel } from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Menu items definition
let menuItems: MenuItemModel[] = [
  {
    text: 'File',
```

```

        items: [
            { text: 'Open' },
            { text: 'Save' },
            { text: 'Exit' }
        ]
    },
    {
        text: 'Edit',
        items: [
            { text: 'Cut' },
            { text: 'Copy' },
            { text: 'Paste' }
        ]
    },
    {
        text: 'View',
        items: [
            { text: 'Toolbar' },
            { text: 'Sidebar' },
            { text: 'Full Screen' }
        ]
    },
    {
        text: 'Tools',
        items: [

Customize menu using css in EJ2 JavaScript Menu control

Menu provides a set of css class to enable users to customize it. The following list of CSS class names are used to customize the Menu component.

You can customize the appearance of the Menu by overriding the existing styles. The following list of CSS class names are used to customize the menu component.

Class Name	Description
---	---
e-menu-wrapper	Applied to Menu wrapper element.
e-menu-parent e-menu	Applied to the parent item element.
e-menu-item	Applied to the menu item.
e-menu-icon	Applied to the span element of menu item.
e-menu-url	Applied to the URL menu item.
e-menu-parent e-ul	Applied to the sub menu's parent ul element.
e-menu-popup e-popup	Applied to the element when menu item popups.
e-selected	Applied to the selected menu item.
e-focused	Applied to the focused menu item.
e-menu-caret-icon	Applied to the menu item with caret icon.
e-hamburger	Applied to the element with hamburger mode.
e-disabled	Applied to the disabled menu element.
e-vertical	Applied to the vertically oriented menu element.
e-rtl	Applied to the menu with rtl state.

- | e-bigger | Applied to the bigger menu.
- | e-blankicon | Applied to the menu items with no icons.
- | e-scroll-right-nav | Applied to the element with right scroll .
- | e-scroll-left-nav | Applied to the element with left scroll .

Customize menu using [events](#) in EJ2 JavaScript Menu control

The Menu provides a set of [events](#) to enable users to customize it.

The available events are [beforeOpen](#), [beforeClose](#), [onClose](#), [onOpen](#), and [select](#).

INDEX.TS

```
import { Menu, MenuItemModel, MenuEventArgs } from '@syncfusion/ej2-
navigations';
import { OpenCloseMenuEventArgs, BeforeOpenCloseMenuEventArgs } from
 '@syncfusion/ej2-navigations';
import { Button } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Menu items definition
let menuItems: MenuItemModel[] = [
    {
        text: 'Events',
        items: [
            { text: 'Conferences' },
            { text: 'Music' },
            { text: 'Workshops' }
        ]
    },

            <button id="clear">Clear</button>
        </div>
    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customize menu items in EJ2 JavaScript Menu control

Add or remove menu items

Menu items can be added or removed using the [insertAfter](#), [insertBefore](#) and [removeItems](#) methods.

In the following example, the **Europe** menu items are added before the **Oceania** item, the **Africa** menu items are added after the **Asia**, and the **South America** and **Mexico** items are removed from menu.

INDEX.TS

```

import { Menu, FieldSettingsModel } from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Menu datasource
let data: { [key: string]: Object }[] = [
    {
        continent: 'Asia',
        countries: [
            { country: 'China' },
            { country: 'India' },
            { country: 'Japan' }
        ]
    },
    {
        continent: 'North America',

```

```

        countries: [
            { country: 'Canada' },
            { country: 'Mexico' },
            { country: 'USA' }
        ]
    },
    {
        continent: 'South America',
        countries: [
            { country: 'Brazil' },
            { country: 'Colombia' },
            { country: 'Argentina' }
        ]
    },
    {
        continent: 'Oceania',
        countries: [
            { country: 'Australia' },
            { country: 'New Zealand' },
            { country: 'Samoa' },
        ]
    },
    { continent: 'Antarctica' }
];
//Menu fields definition
let menuFields: FieldSettingsModel = {
    text: ['continent', 'country'],
    children: ['countries']
};
//Initialize Menu component.
let menuObj: Menu = new Menu({ items: data, fields: menuFields }, '#menu');
let insertItem: object[] = [
    {
        continent: 'Europe',
        countries: [
            { country: 'Finland' },
            { country: 'Austria' }
        ]
    }
];
//Add items before to 'Oceania'
menuObj.insertBefore(insertItem, 'Oceania', false);
insertItem = [
    {
        continent: 'Africa',
        countries: [
            { country: 'Nigeria' }
        ]
    }
];
//Add items after to 'Asia'
menuObj.insertAfter(insertItem, 'Asia', false);
//Remove items
menuObj.removeItem(['South America', 'Mexico'], false);

```

  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

To process items with ID values, set `isUnique` to `true`.

Enable or disable menu items

You can enable and disable the menu items using the [enableItems](#) method in Menu. To enable menuItems, set the `enable` property in argument to `true` and vice-versa.

In the following example, the **Directory** header item, **Conferences**, and **Music** sub menu items are disabled.

INDEX.TS

```

import { Menu, MenuItemModel, BeforeOpenCloseMenuEventArgs } from
'@syncfusion/ej2-navigations';
import { Button } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Menu items definition

```

```

let menuItems: MenuItemModel[] = [
    {
        text: 'Events',
        items: [
            { text: 'Conferences' },
            { text: 'Music' },
            { text: 'Workshops' }
        ]
    },
    {
        text: 'Movies',
        items: [
            { text: 'Now Showing' },
            { text: 'Coming Soon' }
        ]
    },
    {
        text: 'Directory',
        items: [
            { text: 'Media Gallery' },
            { text: 'Newsletters' }
        ]
    },
    {
        text: 'Queries',
        items: [
            { text: 'Our Policy' },
            { text: 'Site Map' }
        ]
    },
    { text: 'Services' }
];
// Initialize Menu component.
let menuObj: Menu = new Menu({
    items: menuItems,
    beforeOpen: (args: BeforeOpenCloseMenuEventArgs) => {
        //Handling sub menu items
        for (let i: number = 0; i < args.items.length; i++) {
            if (disableItems.indexOf(args.items[i].text) > -1) {
                menuObj.enableItems([args.items[i].text], false, false);
            }
        }
    },
    '#menu');
let disableItems: string[] = ['Conferences', 'Music', 'Directory'];
//Disable items
menuObj.enableItems(disableItems, false, false);
let buttonObj: Button = new Button();
buttonObj.appendTo('#enableAll');
buttonObj.element.onclick = (): void => {
    menuObj.enableItems(disableItems, true, false);
    disableItems = [];
}

```

</body></html>

```

To disable sub menu items, use the [beforeOpen](#) event.

Hide or show menu items

You can show or hide the menu items using the [showItems](#) and [hideItems](#) methods.

In the following example, the **Movies** header item, **Workshops**, and **Music** sub menu items are hidden in menu.

INDEX.TS

```

import { Menu, MenuItemModel, BeforeOpenCloseMenuEventArgs } from
'@syncfusion/ej2-navigations';

```

```

import { Button } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Menu items definition
let menuItems: MenuItemModel[] = [
    {
        text: 'Events',
        items: [
            { text: 'Conferences' },
            { text: 'Music' },
            { text: 'Workshops' }
        ]
    },
    {
        text: 'Movies',
        items: [
            { text: 'Now Showing' },
            { text: 'Coming Soon' }
        ]
    },
    {
        text: 'Directory',
        items: [
            { text: 'Media Gallery' },
            { text: 'Newsletters' }
        ]
    },
    {
        text: 'Queries',
        items: [
            { text: 'Our Policy' },
            { text: 'Site Map' }
        ]
    },
    { text: 'Services' }
];
// Initialize Menu component.
let menuObj: Menu = new Menu({
    items: menuItems,
    beforeOpen: (args: BeforeOpenCloseMenuEventArgs) => {
        //Handling sub menu items
        for (let i: number = 0; i < args.items.length; i++) {
            if (hiddenItems.indexOf(args.items[i].text) > -1) {
                menuObj.hideItems([args.items[i].text], false);
            }
        }
    },
    '#menu');
let hiddenItems: string[] = ['Workshops', 'Music', 'Movies'];
//Hide items
menuObj.hideItems(hiddenItems, false);
let buttonObj: Button = new Button();
buttonObj.appendTo('#showAll');
buttonObj.element.onclick = (): void => {
    menuObj.showItems(hiddenItems, false);
    hiddenItems = [];
}

```

  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Using the [beforeOpen](#) event, you can hide the sub menu items as in the above example since the menu supports to hide items only for headers initially.

Create mnemonic ui in menuitem in EJ2 JavaScript Menu control

A particular character in a text can be underlined in the [beforeItemRender](#) event by adding `<u>` tag in between the text and assign the innerHTML to the `li` element.

In the following example, the first character in `File`, `Open`, and `Save` menu items are underlined.

INDEX.TS

```

import { Menu, MenuItemModel, MenuEventArgs } from '@syncfusion/ej2-
navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Menu items definition
let menuItems: MenuItemModel[] = [
    {
        text: 'File',
        iconCss: 'em-icons e-file',
        items: [
            { text: 'Open', iconCss: 'em-icons e-open' },
            { text: 'Save', iconCss: 'em-icons e-save' },
            { separator: true },
            { text: 'Exit' }
        ]
    },
    {
        text: 'Edit',
        iconCss: 'em-icons e-edit',
        items: [
            { text: 'Cut', iconCss: 'em-icons e-cut' },
            { text: 'Copy', iconCss: 'em-icons e-copy' },
            { text: 'Paste', iconCss: 'em-icons e-paste' }
        ]
    },
    { text: 'Format' },
    { text: 'View' },
    { text: 'Bookmarks' },
    { text: 'Tools' },
    { separator: true },
    { text: 'Help' }
];
// Initialize Menu component.
let menuObj: Menu = new Menu({
    items: menuItems,
    beforeItemRender: (args: MenuEventArgs) => {
        if ([ 'File', 'Open', 'Save' ].indexOf(args.item.text) > -1) {
            // To underline a First character.
            let underlinedText: string = '<u>' + args.item.text.slice(0, 1)
+ '</u>' + args.item.text.slice(1);
            args.element.innerHTML =
args.element.innerHTML.replace(args.item.text, underlinedText);
        }
    }
}, '#menu');

```

Change sub menu position in EJ2 JavaScript Menu control

The submenu position can be changed by using the [beforeOpen](#) event. Assign the top and left position where you want to open the submenu to the [beforeOpen](#) event arguments `args.top` and `args.left` respectively.

In the below sample, the sub menu opens above the parent menu item.

INDEX.TS

```

import { Menu, MenuItemModel, MenuModel } from '@syncfusion/ej2-
navigations';
import { BeforeOpenCloseMenuEventArgs } from '@syncfusion/ej2-navigations';
import { enableRipple, closest } from '@syncfusion/ej2-base';
enableRipple(true);
// Menu items definition
let menuItems: MenuItemModel[] = [
    {
        text: 'File',
        items: [
            { text: 'Open' },
            { text: 'Save' },
            { text: 'Exit' }
        ]
    },
    {

```

```

        text: 'Edit',
        items: [
            { text: 'Cut' },
            { text: 'Copy' },
            { text: 'Paste' }
        ]
    },
    {
        text: 'View',
        items: [
            { text: 'Toolbar' },
            { text: 'Sidebar' }
        ]
    },
    {

```

Change animation settings in EJ2 JavaScript Menu control

To change the animation of the Menu, [animationSettings](#) property is used. The supported effects for Menu are,

| Effect | Functionality |

| ----- | ----- |

| None | Specifies the sub menu transform with no animation effect. |

| SlideDown | Specifies the sub menu transform with slide down effect. |

| ZoomIn | Specifies the sub menu transform with zoom in effect. |

| FadeIn | Specifies the sub menu transform with fade in effect. |

The following sample illustrates how to open Menu with **FadeIn** [effect](#) with the [duration](#) of **800ms**. Also we can set [easing](#) for menu items.

INDEX.TS

```
import { Menu, MenuItemModel, MenuModel } from '@syncfusion/ej2-
navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Menu items definition
let menuItems: MenuItemModel[] = [
    {
        text: 'Fashion',
        items: [
            {
                text: 'Men Fashion',
                items: [
                    {
                        text: 'Personal Care',
                        items: [
                            { text: 'Trimmers' },
                            { text: 'Shavers' }
                        ]
                    },
                    {
                        text: 'Clothing',
                        items: [
                            { text: 'Shirts' },
                            { text: 'Jackets' },
                            { text: 'Track Suits' }
                        ]
                    },
                    { text: 'Footwear' }
                ]
            }
        ]
    }
];
```

```

    ],
    {
      text: 'Women Fashion',
      items: [
        {
          text: 'Clothing',
          items: [
            { text: 'Kurtas' },
            { text: 'Salwars' },
            { text: 'Sarees' }
          ]
        },
        {
          text: 'Jewellery',
          items: [
            { text: 'Nosepins' },
            { text: 'Anklets' }
          ]
        }
      ]
    }
  ],
},
{
  text: 'Home & Living',
  items: [
    {
      text: 'Washing Machine',
      items: [

Right to left in EJ2 JavaScript Menu control

Menu component has RTL support. This can be achieved by setting [enableRtl](#) as `true`.

The following example illustrates how to enable right-to-left support in Menu component.

INDEX.TS

```

import { Menu, MenuItemModel } from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Menu items definition
let menuItems: MenuItemModel[] = [
  {
    text: 'File',

```

```

        items: [
            { text: 'Open' },
            { text: 'Save' },
            { text: 'Exit' }
        ]
    },
    {
        text: 'Edit',
        items: [
            { text: 'Cut' },
            { text: 'Copy' },
            { text: 'Paste' }
        ]
    },
    {
        text: 'View',
        items: [
            { text: 'Toolbar' },
            { text: 'Sidebar' }
        ]
    },
    {
        text: 'Tools',
        items: [
            { text: 'Spelling & Grammar' },
            { text: 'Customize' },
            { text: 'Options' }
        ]
    },
    { text: 'Go' },
    { text: 'Help' }
];
// Initialize Menu component.
let menuObj: Menu = new Menu({ items: menuItems, enableRtl: true },
'#menu');
```

Set title in EJ2 JavaScript Menu control

In Menu , we can provide title for menu items by using title property in 'beforeItemRender' client-side event in Menu component.

INDEX.TS

```

import { Menu, MenuItemModel, MenuEventArgs } from '@syncfusion/ej2-
navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let menuItems: MenuItemModel[] = [
    {
        id: 'settingIcon',
        iconCss: 'em-icons e-file',
        items:
        { text: 'Open',
            items: [
                { text: 'Sub Option1' },
                { text: 'Sub Option2' },
            ]
        },
        { text: 'Save' },
        { separator: true },
        { text: 'Exit' }
    ]
};
// Initialize Menu component.
let menuObj: Menu = new Menu({ items: menuItems ,
    beforeItemRender: (args: MenuEventArgs) => {
        if (args.item.id == 'settingIcon') {
            args.element.setAttribute('title', 'Settings')
        }
    }}, '#menu');

```

Ej1 api migration in EJ2 JavaScript Menu control

This article describes the API migration process of Menu component from Essential JS 1 to Essential JS 2.

Properties

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Animation type on hover or click on the menu items | **Property:** *animationType*

 \$(("#menu").ejMenu({
animationType: ej.AnimationType.Default
 })); | Not applicable |

| Context menu target | **Property:** *contextMenuTarget*

 \$(("#menu").ejMenu({
menuType: ej.MenuType.ContextMenu,
contextMenuTarget: "#target",
 })); | Not applicable |

| Container element for submenu's collision | **Property:** *container*

 \$(("#menu").ejMenu({
container: "#target",
target: "#target"
 })); | Not applicable |

| Menu items | Not applicable | **Property:** *items*
 var menu = new ej.navigations.Menu({
items: menuItems
});
menu.appendTo("#menu");
 var menuItems = [

 text: 'File'
 },
 {
 text: 'Edit'
 },
 {
 text: 'More'
 },
 {
 text: 'Help'
 }
] |

| Adding custom class | **Property:** *cssClass*

 \$("#menu").ejMenu({
cssClass: "e-custom-class"
 }); | **Property:** *cssClass*

 var menu = new ej.navigations.Menu({
cssClass: "e-custom-class",
 items: menuItems
});
menu.appendTo("#menu"); |

| Enables or disables the animation on hover or click on the menu items | **Property:** *enableAnimation*

 \$("#menu").ejMenu({
enableAnimation: true,
 }); | Not applicable |

| Root menu items to be aligned center in horizontal menu | **Property:** *enableCenterAlign*

 \$("#menu").ejMenu({
enableCenterAlign: true,
 }); | Not applicable |

| Disabled state | **Property:** *enabled*

 \$("#menu").ejMenu({
enabled: false
 }); | **Property:** *disabled*

 var menu = new ej.navigations.Menu({
disabled: true,
 items: menuItems
});
menu.appendTo("#menu"); |

| RTL | **Property:** *enableRTL*

 \$("#menu").ejMenu({
enableRTL: true
 }); | **Property:** *enableRtl*

 var menu = new ej.navigations.Menu({
enableRtl: true,
 items: menuItems
});
menu.appendTo("#menu"); |

| Enables/Disables the separator | **Property:** *enableSeparator*

 \$("#menu").ejMenu({
enableSeparator: true
 }); | Not applicable |

| Exclude target for context menu | **Property:** *excludeTarget*

 \$("#menu").ejMenu({
excludeTarget: ".exclude-target",
menuType: ej.MenuType.ContextMenu,
contextMenuTarget: "#target"
 }); | Not applicable |

| Fields | **Property:** *fields*

 \$("#menu").ejMenu({
fields: menuFields
 }); | **Property:** *fields*

 var menu = new ej.navigations.Menu({
fields: menuFields,
 items: menuItems
});
menu.appendTo("#menu"); |

| Height | **Property:** *height*

 \$("#menu").ejMenu({
height: "25"
 }); | Not applicable |

| HTML Attributes | **Property:** *htmlAttributes*

 \$("#menu").ejMenu({
htmlAttributes: {"aria-label":"menu"}
 }); | Not applicable |

| Responsive | **Property:** *isResponsive*

 \$("#menu").ejMenu({
isResponsive: true
 }); | Not applicable |

| Menu Type | **Property:** *menuType*

 \$("#menu").ejMenu({
menuType: ej.MenuType.ContextMenu,
contextMenuTarget: "#target"
 }); | Not applicable |

| Show item on click | **Property:** *openOnClick*

 \$("#menu").ejMenu({
openOnClick: true
 }); | **Property:** *showItemOnClick*

 var menu = new ej.navigations.Menu({
showItemOnClick: true,
 items: menuItems
});
menu.appendTo("#menu"); |

| Orientation | **Property:** *orientation*

 \$("#menu").ejMenu({
orientation: ej.Orientation.Vertical
 }); | **Property:** *orientation*

 var menu = new ej.navigations.Menu({
orientation: "Vertical",
 items: menuItems
});
menu.appendTo("#menu"); |

| Show root level arrows | **Property:** *showRootLevelArrows*

 \$("#menu").ejMenu({
showRootLevelArrows: false
 }); | Not applicable |

| Show sub level arrows | **Property:** *showSubLevelArrows*

 \$("#menu").ejMenu({
showSubLevelArrows: false
 }); | Not applicable |

| Sub menu direction | **Property:** *subMenuDirection*

 \$("#menu").ejMenu({

subMenuDirection: "left"
 }); | Not applicable |

| Title | **Property:** *titleText*

 \$("#menu").ejMenu({
titleText: "Menu"
 }); | Not applicable |

| Width | **Property:** *width*

 \$("#menu").ejMenu({
width: "800px"
 }); | Not applicable |

| Animation settings | Not applicable | **Property:** *animationSettings*

 let animationSettings: MenuAnimationSettings = { effect: "FadeIn" }
 var menu = new ej.navigations.Menu({

animationSettings: animationSettings,
 items: menuItems
});

menu.appendTo("#menu"); |

| Template | Not applicable | **Property:** *template*

 var menu = new ej.navigations.Menu({
items: [{
 category: 'Services', options: [{
 suport: [
 { value: 'Application Development', count: '1200+' },
{ value: 'Maintenance & Support', count: '3700+' },
{ value: 'Quality Assurance' }
]
}
}
{ category: 'Careers' },
{ category: 'Sign In' }
],
template: "#template"}];
menu.appendTo("#menu"); |

| Pop up menu height | **Property:** *overflowHeight*

 \$("#menu").ejMenu({

overflowHeight: "200px"
 }); | Not applicable |

Methods

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Disable Method | **Method:** *disable*

 \$("#menu").ejMenu({ });
 var menu = \$("#menu").data("ejMenu");
 menu.disable(); | Not applicable |

| Disable menu items | **Method:** *disableItem*

 \$("#menu").ejMenu({ });
 var menu = \$("#menu").data("ejMenu");
 menu.disableItem("Home"); | **Method:** *enableItems*

 var menu = new ej.navigations.Menu({
 items: menuItems
});

menu.appendTo("#menu");
 menu.enableItems("Home", false) |

| Disable menu items by ID | **Method:** *disableItemByID*

 \$("#menu").ejMenu({ });
 var menu = \$("#menu").data("ejMenu");
 menu.disableItemByID("homeid"); | **Method:** *enableItems*

 var menu = new ej.navigations.Menu({
 items: menuItems
});

menu.appendTo("#menu");
 menu.enableItems("homeid", false, true) |

| Enable Method | **Method:** *enable*

 \$("#menu").ejMenu({ });
 var menu = \$("#menu").data("ejMenu");
 menu.enable(); | Not applicable |

| Enable menu items | **Method:** *enableItem*

 \$("#menu").ejMenu({ });
 var menu = \$("#menu").data("ejMenu");
 menu.enableItem("Home"); | **Method:** *enableItems*

 var menu = new ej.navigations.Menu({
 items: menuItems
});

menu.appendTo("#menu");
 menu.enableItems("Home", true); |

| Enable menu items by ID | **Method:** *enableItemByID*

 \$("#menu").ejMenu({ });
 var menu = \$("#menu").data("ejMenu");
 menu.enableItemByID("homeid"); | **Method:** *enableItems*

 var menu = new ej.navigations.Menu({
 items: menuItems
});

menu.appendTo("#menu");
 menu.enableItems("homeid", true, true); |

| Hide Method | **Method:** *hide*

 \$("#menu").ejMenu({ });
 var menu = \$("#menu").data("ejMenu");
 menu.hide(); | Not applicable |

| Hide menu items | **Method:** *hideItems*

 \$("#menu").ejMenu({ });
 var menu = \$("#menu").data("ejMenu");
 menu.hideItems(["#search", "#company"]); | **Method:** *hideItems*

 var menu = new ej.navigations.Menu({
 items: menuItems
});
menu.appendTo("#menu");
 menu.hideItems(["search", "company"], true); |

| Insert menu items | **Method:** *insert*

 \$("#menu").ejMenu({ });
 var menu = \$("#menu").data("ejMenu");
 menu.insert({ id: "More", text: "More" }, "#Home"); | Not applicable |

| Insert menu items after the specified menu item | **Method:** *insertAfter*

 \$("#menu").ejMenu({ });
 menu.insertAfter({ id: "More", text: "More" }, "#Home"); | **Method:** *insertAfter*

 var menu = new ej.navigations.Menu({
 items: menuItems
});
menu.appendTo("#menu");
 menu.insertAfter({ id: "More", text: "More" }, "Home"); |

| Insert menu items before the specified menu item | **Method:** *insertBefore*

 \$("#menu").ejMenu({ });
 var menu = \$("#menu").data("ejMenu");
 menu.insertBefore({ id: "More", text: "More" }, "#Home"); | **Method:** *insertBefore*

 var menu = new ej.navigations.Menu({
 items: menuItems
});
menu.appendTo("#menu");
 menu.insertBefore({ id: "More", text: "More" }, "Home"); |

| Remove menu items | **Method:** *remove*

 \$("#menu").ejMenu({ });
 var menu = \$("#menu").data("ejMenu");
 menu.remove(["#Home"]); | **Method:** *removeItems*

 var menu = new ej.navigations.Menu({
 items: menuItems
});
 menu.appendTo("#menu");
 menu.removeItems(["Home"]); |

| To show menu | **Method:** *show*

 \$("#menu").ejMenu({ });
 var menu = \$("#menu").data("ejMenu");

 }); | Not applicable |

| Triggers when overflow popup menu closes | **Events:** *overflowClose*

\$("#menu").ejMenu({
 overflowClose: function(args) { / code block */ }
 }); | Not applicable |

Message

Severities in EJ2 JavaScript Message control

The severity denotes the importance and context of the message to the user. The message contains different severity types. Use the [severity](#) property to display the messages with different severity levels.

The available severity types are **Normal**, **Success**, **Info**, **Warning** and **Error**. The default severity type for messages is **Normal**.

The following example demonstrates the severity of the messages.

INDEX.TS

```
import { Message } from '@syncfusion/ej2-notifications'
```

```
let msgDefault: Message = new Message({
    content: "Editing is restricted"
});
msgDefault.appendTo('#msg_default');
let msgInfo: Message = new Message({
    content: "Please read the comments carefully",
    severity: "Info"
});
msgInfo.appendTo('#msg_info');
let msgSuccess: Message = new Message({
    content: "Your message has been sent successfully",
    severity: "Success"
});
msgSuccess.appendTo('#msg_success');
let msgWarning: Message = new Message({
    content: "There was a problem with your network connection",
    severity: "Warning"
});
msgWarning.appendTo('#msg_warning');
let msgError: Message = new Message({
    content: "A problem occurred while submitting your data",
    severity: "Error"
});
msgError.appendTo('#msg_error');
```

```

Variants in EJ2 JavaScript Message control

The Message has predefined appearance variants for different visual representations. The variants of the message can be changed based on the [variant](#) property.

The available variants are **Text**, **Outlined** and **Filled**. The default variant type for messages is **Text**.

- **Text** - The severity is differentiated using a text color and a light background color.
- **Outlined** - The severity is differentiated using a text color and a border without a background.
- **Filled** - The severity is differentiated using a text color and a dark background color.

The following example demonstrates the default message with different variant types.

INDEX.TS

```

import { Message } from '@syncfusion/ej2-notifications'
let msgDefault: Message = new Message({});
msgDefault.appendTo('#msg_default');
let msgInfo: Message = new Message({
  severity: "Info"
});
msgInfo.appendTo('#msg_info');
let msgSuccess: Message = new Message({
  severity: "Success"
});
msgSuccess.appendTo('#msg_success');
let msgWarning: Message = new Message({
  severity: "Warning"
});
msgWarning.appendTo('#msg_warning');
let msgError: Message = new Message({
  severity: "Error"
});
msgError.appendTo('#msg_error');
let msgDefaultOutlined: Message = new Message({

```

```

        variant: "Outlined"
    });
    msgDefaultOutlined.appendTo('#msg_default_outlined');
    let msgInfoOutlined: Message = new Message({
        severity: "Info",
        variant: "Outlined"
    });
    msgInfoOutlined.appendTo('#msg_info_outlined');
    let msgSuccessOutlined: Message = new Message({

Icons in EJ2 JavaScript Message control

This section explains the message with no icons, how to show or hide the close icon and add the custom severity icon to the message.

No Icon

By default, severity icons can be displayed according to the severity types to make it more understandable to the user by visual information rather than text. To hide the severity icons, set the [showIcon](#) property to `false`.

The following example demonstrates the different severity messages without the severity icons.

INDEX.TS

```

import { Message } from '@syncfusion/ej2-notifications'
let msgDefault: Message = new Message({
    content: "Editing is restricted",
    showIcon: false
});
msgDefault.appendTo('#msg_default');
let msgInfo: Message = new Message({
    content: "Please read the comments carefully",
    severity: "Info",
    showIcon: false
});
msgInfo.appendTo('#msg_info');
let msgSuccess: Message = new Message({
    content: "Your message has been sent successfully",
    severity: "Success",
    showIcon: false
});
msgSuccess.appendTo('#msg_success');
let msgWarning: Message = new Message({
    content: "There was a problem with your network connection",
    severity: "Warning",
    showIcon: false
});
msgWarning.appendTo('#msg_warning');
let msgError: Message = new Message({
    content: "A problem occurred while submitting your data",

```

```

        severity: "Error",
        showIcon: false
    });
    msgError.appendTo('#msg_error');

```

INDEX.HTML

```

Custom Icon

By default, the severity icons can be displayed according to the severity type to make it more understandable to the user by visual information rather than text. If the user wants to customize these icons, it can be achieved through the `cssClass` property.

The following example demonstrates how the default message is rendered with a custom severity icon.

INDEX.TS

```
import { Message } from '@syncfusion/ej2-notifications'
let msgIcon: Message = new Message({
  cssClass: "custom"
});
msgIcon.appendTo('#msg_icon');
```

INDEX.HTML

```

Close Icon

The message can be rendered with or without the close icon. The close icon is used to hide the message, either by manually clicking the close icon or through keyboard interaction.

By default, the close icon is not rendered in the message. To show the close icon, set the [showCloseIcon](#) property to **true**.

In the following example, the messages are rendered with the close icon.

INDEX.TS

```
import { getComponent } from '@syncfusion/ej2-base';
import { CheckBox, ChangeEventArgs, Button } from '@syncfusion/ej2-buttons';
import { Message } from '@syncfusion/ej2-notifications';
let showButton: Button = new Button({ content: 'Show default message',
cssClass: "e-outline e-primary msg-hidden" });
showButton.appendTo('#btn1');
showButton.element.onclick = (): void => {
    show(msgDefaultIcon, showButton);
}
let infoButton: Button = new Button({ content: 'Show info message',
cssClass: "e-outline e-primary e-info msg-hidden" });
infoButton.appendTo('#btn2');
infoButton.element.onclick = (): void => {
    show(msgInfoIcon, infoButton);
}
let successButton: Button = new Button({ content: 'Show success
message', cssClass: "e-outline e-primary e-success msg-hidden" });
successButton.appendTo('#btn3');
successButton.element.onclick = (): void => {
    show(msgSuccessIcon, successButton);
}
let warningButton: Button = new Button({ content: 'Show warning
message', cssClass: "e-outline e-primary e-warning msg-hidden" });

Customization in EJ2 JavaScript Message control

The Message control allows the user to customize the content display positions and appearance. This section explains the details about changing the content alignments and border styles for messages.

Content Alignment

Normally, the message content is aligned to the **left**. The Message control allows the user to align the message content in the **center** or **right** through the built-in classes `e-content-center` and `e-content-right`.

The following example demonstrates the message with different content alignments.

INDEX.TS

```
import { Message } from '@syncfusion/ej2-notifications'
let msgLeft: Message = new Message({
  content: "Your license has been activated successfully",
  severity: "Success"
});
msgLeft.appendTo('#msg_content_left');
let msgCenter: Message = new Message({
  content: "The license will expire today",
  cssClass: "e-content-center",
  severity: 'Warning'
});
msgCenter.appendTo('#msg_content_center');
let msgRight: Message = new Message({
  content: "The license key is invalid",
  cssClass: "e-content-right",
  severity: 'Error'
});
msgRight.appendTo('#msg_content_right');
```

INDEX.HTML

```
<html><head>
  <title>Essential JS 2 Message control</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Essential JS 2 Message control">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/material.css"
rel="stylesheet">

type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div class="msg-custom-section">
      <div class="content-section">
        <h4>Content Alignment</h4>
        <div id="msg_content_left"></div>
        <div id="msg_content_center"></div>
        <div id="msg_content_right"></div>
      </div>
    </div>
  </div>
  <style>
    /* Sample level styles */
    .msg-custom-section .content-section {
      margin: 0 auto;
      max-width: 400px;
```

```

        padding-top: 10px;
    }
    .msg-custom-section .e-message {
        margin: 10px 0;
    }
</style>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Rounded and Square

To customize the Message control's appearance, add the custom class to the message through the [cssClass](#) property. This custom class will be added to the root element. Based on this custom class, the user can override the message styles at the application level.

The following example shows the rounded and squared appearance of the message, which can be achieved by adding the `cssClass` property.

INDEX.TS

```

import { Message } from '@syncfusion/ej2-notifications'
let msgRounded: Message = new Message({
    content: "The license will expire today",
    severity: 'Warning',
    cssClass: "rounded"
});
msgRounded.appendTo('#msg_rounded');
let msgSquare: Message = new Message({
    content: "The license key is invalid",
    severity: 'Error',
    cssClass: "square"
});
msgSquare.appendTo('#msg_square');

```

```

CSS Message

The Essential JS 2 Message has predefined CSS classes that can be defined in the HTML elements, which renders the message without any script reference. This can display a simple message with content and make the code lighter.

The following DOM structure is required to display the simple message with the content.

```
`bash
```

```

<div class="e-message">
<div class="e-msg-content">..content..</div>
</div>
`

```

The following DOM structure is required to display the simple message with the content and severity icon.

```
`bash
<div class="e-message">
<span class="e-msg-icon"></span>
<div class="e-msg-content">..content..</div>
</div>
`
```

The following is the available list of predefined CSS classes to make the appearance of a message.

Class	Description
-----	-----
e-message	Represents the message wrapper.
e-msg-icon	Represents the severity type icon.
e-msg-content	Represents the message content.
e-msg-close-icon	Represents the close icon.
e-info	Represents the information message.
e-success	Represents the success message.
e-warning	Represents the warning message.
e-error	Represents the error message.
e-content-center	Aligns the message content to the center.
e-content-right	Aligns the message content to the right.

The following example shows the message which renders without any script reference.

                margin: 0 auto;
                max-width: 450px;
                padding-top: 10px;
            }

            .msg-default-section .e-message {
                margin: 10px 0;
            }
        </style>
        <script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
        </script>
        <script src="index.js" type="text/javascript"></script>
    </body></html>

```

Template in EJ2 JavaScript Message control

The message supports templates that allows the user to customize the content with a custom structure. The content can be a string, paragraph, or any other HTML element. The template can be rendered through the [content](#) property or added directly to the HTML element.

In the following sample, the Message control content is customized with HTML elements and JavaScript Button controls, which are directly added to the HTML element.

INDEX.TS

```
import { Message } from '@syncfusion/ej2-notifications';
import { Button } from '@syncfusion/ej2-buttons';
let showButton: Button = new Button({ content: 'Show pull request',
cssClass: "e-outline e-primary e-success msg-hidden" });
showButton.appendTo('#btn');
showButton.element.onclick = (): void => {
    msgTemplate.visible = true;
    showButton.element.classList.add('msg-hidden');
}
let msgTemplate: Message = new Message({
    severity: "Success",
    closed: () => {
        showButton.element.classList.remove('msg-hidden');
    }
});
msgTemplate.appendTo('#msg_template');
let button: Button = new Button({ cssClass: 'e-link', content: 'Dismiss'
});
button.appendTo('#closeBtn');
button.element.onclick = (): void => {
    msgTemplate.visible = false;
}
let commitButton: Button = new Button({ cssClass: 'e-link', content:
'View commit' });
commitButton.appendTo('#commitBtn');
```

```

Accessibility in EJ2 JavaScript Message control

The Message control followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Message control is outlined below.

| Accessibility Criteria | Compatibility |

```
| -- | -- |
| WCAG 2.2 Support |  |
| Section 508 Support |  |
| Screen Reader Support |  |
| Right-To-Left Support |  |
| Color Contrast |  |
| Mobile Device Support |  |
| Keyboard Navigation Support |  |
| Accessibility Checker Validation |  |
| Axe-core Accessibility Validation |  |
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>
<div> - All
features of the control meet the requirement.</div>
<div> - Some features of the control do not meet the requirement.</div>
<div> - The control does not meet the requirement.</div>
```

WAI-ARIA attributes

The Message control followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Message control:

```
| Attributes | Purpose |
| --- | --- |
| role=alert | Used to convey a significant and contextual message to the user. |
```

| **aria-label** | Provides an accessible name for the close icon. |

Keyboard interaction

The Message control followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Message control.

| **Press** | **To do this** |

| --- | --- |

| **Tab / Shift + Tab** | To focus the close icon in the message. |

| **Enter / Space** | Closes the focused close icon's message. |

Ensuring accessibility

The Message control's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Message control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Message control with accessibility tools.

MultiSelect

Tags in EJ2 JavaScript Multi select control

The MultiSelect can be initialized on three different tags as described in below. Though it is initialized in different tags, the UI appearance and built-in features behave in the same way.

Select element

When a MultiSelect is initialized on SELECT element, the list items can be assigned through the option tag of the HTML select element.

- The nested items are wrapped and grouped based on the `group` tag that is available

within the `<select>` element, by default.

- You can preselect the option by setting the `selected` attribute to an option tag.

INDEX.TS

```
import { MultiSelect } from '@syncfusion/ej2-dropdowns';
// initialize MultiSelect component
let msObject: MultiSelect = new MultiSelect({
  placeholder: "Select vegetables"
});
// render initialized MultiSelect
msObject.appendTo('#selectElement');
```

INDEX.HTML

```

</body></html>
```

Input element

The MultiSelect has also be rendered through `<input>` element with an array of either simple or complex data that is set through the [dataSource](#) property. It can retrieve data from local data sources as well as remote data services.

Detailed information about the data binding with an example is available in: [Data Binding to MultiSelect](#)

Data binding in EJ2 JavaScript Multi select control

The MultiSelect loads the data either from local data sources or remote data services using the [dataSource](#) property. It supports the data type of `array` or `DataManager`.

The MultiSelect also supports different kinds of data services such as OData, OData V4, and Web API, and data formats such as XML, JSON, and JSONP with the help of `DataManager` adaptors.

Fields	Type	Description
text	string	Specifies the display text of each list item.
value	number or string	Specifies the hidden data value mapped to each list item that should contain a unique value.
groupBy	string	Specifies the category under which the list item has to be grouped.
iconCss	string	Specifies the icon class of each list item.

When binding complex data to the MultiSelect, fields should be mapped correctly. Otherwise, the selected item remains undefined.

Binding local data

Local data can be represented in two ways as described below.

1. Array of string

The MultiSelect has support to load array of primitive data such as strings and numbers. Here, both value and text field act the same.

INDEX.TS

```
import { MultiSelect } from '@syncfusion/ej2-dropdowns';
// define the array of data
let sportsData: string[] = ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis'];
// initialize MultiSelect component
let msObject: MultiSelect = new MultiSelect({
    //set the data to dataSource property
    dataSource: sportsData,
    // set placeholder to multiSelect input element
    placeholder: "Select games"
});
// render initialized multiSelect
msObject.appendTo('#select');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin:0 auto; width:250px;">
        <input type="text" tabindex="1" id="select">
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

2. Array of object

The MultiSelect can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [fields](#) property.

In the following example, `id` column and `sports` column from complex data have been mapped to the `value` field and `text` field, respectively.

INDEX.TS

```

import { MultiSelect } from '@syncfusion/ej2-dropdowns';
//define the array of complex data
let sportsData: { [key: string]: Object }[] = [
    { id: 'game1', sports: 'Badminton' },
    { id: 'game2', sports: 'Football' },
    { id: 'game3', sports: 'Tennis' }
];
//initiate the MultiSelect
let msObject: MultiSelect = new MultiSelect({
    // bind the sports Data to datasource property
    dataSource: sportsData,
    // maps the appropriate column to fields property
    fields: { text: 'sports', value: 'id' },
    //set the placeholder to MultiSelect input
    placeholder:"Select games"
});
//render the component
msObject.appendTo('#select');

```

INDEX.HTML

```

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

3. Array of complex object

The MultiSelect can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [fields](#) property.

In the following example, **Code.Id** column and **Country.Name** column from complex data have been mapped to the **value** field and **text** field, respectively.

INDEX.TS

```

import { MultiSelect } from '@syncfusion/ej2-dropdowns';
//define the array of complex data
let countriesData: { [key: string]: Object }[] = [
  { Country: { Name: 'Australia' }, Code: { Id: 'AU' } },
  { Country: { Name: 'Bermuda' }, Code: { Id: 'BM' } },
  { Country: { Name: 'Canada' }, Code: { Id: 'CA' } },
  { Country: { Name: 'Cameroon' }, Code: { Id: 'CM' } },

```

```

        { Country:{Name: 'Denmark'}, Code:{ Id: 'DK' }},
        { Country:{Name: 'France'}, Code: { Id:'FR' } }
    ];
    //initiate the MultiSelect
    let msObject: MultiSelect = new MultiSelect({
        // bind the sports Data to datasource property
        dataSource: countriesData,
        // maps the appropriate column to fields property
        fields: { text: 'Country.Name', value: 'Code.Id' },
        //set the placeholder to MultiSelect input
        placeholder:"Select a country"
    });
    //render the component
    msObject.appendTo('#select');

```

INDEX.HTML

```

    <div id="container" style="margin:0 auto; width:250px;">
        <br>
        <!--element which is going to render the MultiSelect-->
        <input type="text" tabindex="1" id="select">
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Binding remote data

The MultiSelect supports retrieval of data from remote data services with the help of DataManager component. The [Query](#) property is used to fetch data from the database and bind it to the MultiSelect.

The following sample displays the first 6 contacts from “Customers” table of the **Northwind** Data Service.

INDEX.TS

```
import { MultiSelect } from '@syncfusion/ej2-dropdowns';
//import DataManager related classes
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
//initiates the component
let customers: MultiSelect = new MultiSelect({
    //bind the DataManager instance to dataSource property
    dataSource: new DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
    }),
    //bind the Query instance to query property
    query: new Query().from('Customers').select(['ContactName',
'CustomerID']).take(6),
    //map the appropriate columns to fields property
    fields: { text: 'ContactName', value: 'CustomerID' },
    //set the placeholder to MultiSelect input
    placeholder: "Select customers",
    //sort the resulted items
    sortOrder: 'Ascending'
});
//render the component
customers.appendTo('#select');
```

INDEX.HTML

```

Templates in EJ2 JavaScript Multi select control

The MultiSelect has been provided with several options to customize each list item, group title, selected value, header, and footer elements. It uses the Essential JS 2 [Template engine](#) to compile and render the elements properly.

Item template

The content of each list item within the MultiSelect can be customized with the help of [itemTemplate](#) property.

In the following sample, each list item is split into two columns to display relevant data's.

INDEX.TS

```

import { MultiSelect } from '@syncfusion/ej2-dropdowns';
//import data manager related classes
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
//initiates the component
let msObject: MultiSelect = new MultiSelect({
    //bind the data manager instance to dataSource property
    dataSource: new DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
    }),
    //bind the Query instance to query property
    query: new Query().from('Employees').select(['FirstName',
'City', 'EmployeeID']).take(6),
    //map the appropriate columns to fields property
    fields: { text: 'FirstName', value: 'EmployeeID' },

```

```
//set the placeholder to MultiSelect input
placeholder:"Select an employee",
//sort the resulted items
sortOrder: 'Ascending',
//set the value to itemTemplate property
itemTemplate:"<div><span class='name'>${FirstName}</span><span class
='city'>${City}</span></div>"
});
//render the component
msObject.appendTo('#select');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Value template

The currently selected value that is displayed by default on the MultiSelect input element can be customized using the [valueTemplate](#) property.

In the following sample, the selected value is displayed as a combined text of both **FirstName** and **City** in the MultiSelect input, which is separated by a hyphen.

INDEX.TS

```
import { MultiSelect } from '@syncfusion/ej2-dropdowns';
//import data manager related classes
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
//initiates the component
let msObject: MultiSelect = new MultiSelect({
    //bind the data manager instance to dataSource property
    dataSource: new DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
    }),
    //bind the Query instance to query property
    query: new Query().from('Employees').select(['FirstName',
'City', 'EmployeeID']).take(6),
    //map the appropriate columns to fields property
    fields: { text: 'FirstName', value: 'EmployeeID' },
    //set the placeholder to MultiSelect input
    placeholder: "Select an employee",
    mode: 'Box',
    //sort the resulted items
    sortOrder: 'Ascending',
    //set the template value to itemTemplate property
    itemTemplate: "<div><span class='name'>${FirstName}</span><span class
='city'>${City}</span></div>",
    //set the value to valueTemplate property
    valueTemplate: "<span>${FirstName} - ${City}</span>"
});
//render the component
msObject.appendTo('#select');
```

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Group template

The group header title under which appropriate sub-items are categorized can also be customize with the help of [groupTemplate](#) property. This template is common for both inline and floating group header template.

In the following sample, employees are grouped according to their city.

INDEX.TS

```

import { MultiSelect } from '@syncfusion/ej2-dropdowns';
//import data manager related classes
import { Query, Predicate , DataManager, ODataV4Adaptor } from
 '@syncfusion/ej2-data';
// form predicate to fetch the grouped data
let groupPredicate = new Predicate('City',
'equal','london').or('City','equal','seattle');
//initiates the component
let msObject: MultiSelect = new MultiSelect({
  //bind the data manager instance to dataSource property
  dataSource: new DataManager({
    url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
    adaptor: new ODataV4Adaptor,
    crossDomain: true
  }),
  //bind the Query instance to query property
  query: new Query().from('Employees').select(['FirstName',
'City','EmployeeID']).take(5)
  .where(groupPredicate),
  //map the appropriate columns to fields property
  fields: { text: 'FirstName', value: 'EmployeeID', groupBy: 'City' },
  //set the placeholder to MultiSelect input
  placeholder: "Select employees",
  //sort the resulted items
  sortOrder: 'Ascending',
  //set the value to groupTemplate
  groupTemplate: "<strong>${City}</strong>"
});
//render the component
msObject.appendTo('#select');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 MultiSelect</title>

  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Footer template

The MultiSelect has options to show a footer element at the bottom of the list items in the popup list. Here, you can place any custom element as a footer element using the [footerTemplate](#) property.

In the following sample, footer element displays the total number of list items present in the MultiSelect.

INDEX.TS

```
import { MultiSelect } from '@syncfusion/ej2-dropdowns';
let sportsData = [ "Basketball", "Cricket", "Football", "Golf"];
//initiates the component
let msObject: MultiSelect = new MultiSelect({
    //bind the data manager instance to dataSource property
    dataSource: sportsData ,
    //set the placeholder to MultiSelect input
    placeholder:"Select games",
    //set the value to footer template
    footerTemplate:"<span class='foot'> Total list items: "+
sportsData.length + "</span>"
});
//render the component
msObject.appendTo('#select');
```

INDEX.HTML

```

No records template

The MultiSelect is provided with support to custom design the popup list content when no data is found and no matches found on search with the help of [noRecordsTemplate](#) property.

In the following sample, popup list content displays the notification of no data available.

INDEX.TS

```

import { MultiSelect } from '@syncfusion/ej2-dropdowns';
//initiates the component
let msObject: MultiSelect = new MultiSelect({
    //bind the data manager instance to dataSource property
    dataSource: [],
    //set the placeholder to MultiSelect input
    placeholder: "Select an item",
    //set the value to noRecords template
    noRecordsTemplate: "<span class='norecord'> NO DATA AVAILABLE</span>"
});
//render the component
msObject.appendTo('#select');

```

INDEX.HTML

```

<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Action failure template

There is also an option to custom design the popup list content when the data fetch request fails at the remote server. This can be achieved using the [actionFailureTemplate](#) property.

In the following sample, when the data fetch request fails, the MultiSelect displays the notification.

INDEX.TS

```

import { MultiSelect } from '@syncfusion/ej2-dropdowns';
//import data manager related classes
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
//initiates the component
let MultiSelectObject: MultiSelect = new MultiSelect({
    //bind the data manager instance to dataSource property
    dataSource: new DataManager({
        // Here, use the wrong url to display the action failure
        template
        url: 'https://services.odata.org/V4/Northwind/Northwind.svcs/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
    }),
    //bind the Query instance to query property
    query: new Query().from('Employees').select(['FirstName']).take(6),
    //map the appropriate columns to fields property
    fields: { text: 'FirstName', value: 'EmployeeID' },
    //set the placeholder to MultiSelect input
    placeholder: "Select an employee",
    //set the value to action failure template
    actionFailureTemplate: "<span class='action-failure'> Data fetch get
fails</span>"
});
//render the component
MultiSelectObject.appendTo('#select');

```

Grouping in EJ2 JavaScript Multi select control

The MultiSelect supports wrapping nested elements into a group based on different categories. The category of each list item can be mapped through the [groupBy](#) field in the data table. The group header is displayed both as inline and fixed headers. The fixed group header content is updated dynamically on scrolling the popup list with its category value.

In the following sample, vegetables are grouped according on its category using `groupBy` field.

INDEX.TS

```

import { MultiSelect } from '@syncfusion/ej2-dropdowns';
//define the data with category
let vegetableData: { [key: string]: Object }[] = [
    { vegetable: 'Cabbage', category: 'Leafy and Salad', id: 'item1' },
    { vegetable: 'Spinach', category: 'Leafy and Salad', id: 'item2' },
    { vegetable: 'Wheat grass', category: 'Leafy and Salad', id: 'item3' },
},
    { vegetable: 'Yarrow', category: 'Leafy and Salad', id: 'item4' },
    { vegetable: 'Pumpkins', category: 'Leafy and Salad', id: 'item5' },
    { vegetable: 'Chickpea', category: 'Beans', id: 'item6' },
    { vegetable: 'Green bean', category: 'Beans', id: 'item7' },

```

```

        { vegetable: 'Horse gram', category: 'Beans', id: 'item8' },
        { vegetable: 'Garlic', category: 'Bulb and Stem', id: 'item9' },
        { vegetable: 'Nopal', category: 'Bulb and Stem', id: 'item10' },
        { vegetable: 'Onion', category: 'Bulb and Stem', id: 'item11' }
    ];
    //initiate the MultiSelect
    let vegetables: MultiSelect = new MultiSelect({
        //set the grouped data to dataSource property
        dataSource: vegetableData,
        // map the groupBy field with category column
        fields: { groupBy: 'category', text: 'vegetable', value: 'id' },
        // set the placeholder to the MultiSelect input
        placeholder: "Select vegetables",
        // Set the popup list height
        popupHeight: '200px'
    });
    //render the MultiSelect component
    vegetables.appendTo('#select');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

    }
    </script>

```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

HTML select

The MultiSelect also supports grouping of list items under specific groups by initiating the `<select>` element using `optgroup`. The nested items are wrapped based on the `<optgroup>` tag that is presents in the `<select>` element

```
<select id="selectElement">
  <optgroup label="Beans">
    <option value="1">Chickpea</option>
    <option value="2">Green bean</option>
    <option value="3">Horse gram</option>
  </optgroup>
  <optgroup label="Leafy and Salad">
    <option value="4">Spinach</option>
    <option value="5" selected="selected">Cabbage</option>
    <option value="6">Wheat grass</option>
  </optgroup>
</select>
```

INDEX.TS

```
import { MultiSelect } from '@syncfusion/ej2-dropdowns';
// initialize MultiSelect component
let msObject: MultiSelect = new MultiSelect({
  placeholder:"Select vegetables"
});
// render initialized MultiSelect
msObject.appendTo('#selectElement');
```

        </select>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customization

The grouping header is also provided with customization option. This allows custom designing using the [groupTemplate](#) property for both inline and fixed headers.

Grouping with CheckBox

Previously, there is no checkbox for group headers. Now, this feature allow to render checkbox in group header to select the group items in single selection. You can enable this feature by setting [enableGroupCheckBox](#) property value as **true** and **mode** property as **CheckBox**.

Inject the **CheckBoxSelection** module in the MultiSelect to use the checkbox.

INDEX.TS

```

import { MultiSelect, CheckBoxSelection } from '@syncfusion/ej2-dropdowns';
MultiSelect.Inject(CheckBoxSelection);
//define the array of complex data
let sportsData: { [key: string]: Object }[] = [
    { vegetable: 'Cabbage', category: 'Leafy and Salad', id: 'item1' },
    { vegetable: 'Spinach', category: 'Leafy and Salad', id: 'item2' },

```

```

        { vegetable: 'Wheat grass', category: 'Leafy and Salad', id: 'item3'
    },
    { vegetable: 'Yarrow', category: 'Leafy and Salad', id: 'item4' },
    { vegetable: 'Pumpkins', category: 'Leafy and Salad', id: 'item5' },
    { vegetable: 'Chickpea', category: 'Beans', id: 'item6' },
    { vegetable: 'Green bean', category: 'Beans', id: 'item7' },
    { vegetable: 'Horse gram', category: 'Beans', id: 'item8' },
    { vegetable: 'Garlic', category: 'Bulb and Stem', id: 'item9' },
    { vegetable: 'Nopal', category: 'Bulb and Stem', id: 'item10' },
    { vegetable: 'Onion', category: 'Bulb and Stem', id: 'item11' }
];
//initiate the MultiSelect
let msObject: MultiSelect = new MultiSelect({
    // bind the sports Data to datasource property
    dataSource: sportsData,
    // maps the appropriate column to fields property
    fields: { groupBy: 'category', text: 'vegetable', value: 'id' },
    //set the placeholder to MultiSelect input
    placeholder:"Select vegetables",
    // set the type of mode for checkbox to visualized the checkbox added in
    // li element.
    mode: 'CheckBox',
    // set true for enable the selectAll support.
    showSelectAll: true,
    // set value for allowFiltering as true
    allowFiltering: true,
    // set placeholder to filterbar
    filterBarPlaceholder: "Search Vegetables",
    // set true for enableGroupCheckBox property
    enableGroupCheckBox: true
});
//render the component
msObject.appendTo('#select');

- [Group Template support to MultiSelect.](#)

Filtering in EJ2 JavaScript Multi select control

The MultiSelect has built-in support to filter data items when [allowFiltering](#) is enabled. The filter operation starts as soon as you start typing characters in the MultiSelect input.

To display filtered items in the popup, filter the required data and return it to the MultiSelect via [updateData](#) method by using the [filtering](#) event.

The following sample illustrates how to query the data source and pass the data to the MultiSelect through the [updateData](#) method in [filtering](#) event.

INDEX.TS

```

import { MultiSelect, FilteringEventArgs } from '@syncfusion/ej2-dropdowns';
import { DataManager, Query } from '@syncfusion/ej2-data';
let searchData: { [key: string]: Object; }[] = [
{ index: "s1", country: "Alaska" }, { index: "s2", country: "California" },
{ index: "s3", country: "Florida" }, { index: "s4", country: "Georgia" }
];
let filter: MultiSelect = new MultiSelect({
    dataSource: searchData,
    // map the appropriate column
    fields: { text: "country", value: "index" },
    // set placeholder to MultiSelect input element
    placeholder: "Select countries",
    // set true to allowFiltering for enable filtering supports
    allowFiltering: true,
    // Bind the filter event
    filtering: function (e: FilteringEventArgs) {
        let query = new Query();
        //frame the query based on search string with filter type.
    }
});

```

```

        query = (e.text != "") ? query.where("country", "startswith",
e.text, true) : query;
        //pass the filter data source, filter query to updateData method.
        e.updateData(searchData, query);
    }
});
filter.appendTo('#select');

```

INDEX.HTML

```

<script src="index.js" type="text/javascript"></script>
</body></html>

```

Limit the minimum filter character

When filtering the list items, you can set the limit for character count to raise remote request and fetch filtered data on the MultiSelect. This can be done by manual validation within the filter event handler.

In the following example, the remote request does not fetch the search data until the search key contains three characters.

INDEX.TS

```
import { MultiSelect, FilteringEventArgs } from '@syncfusion/ej2-dropdowns';
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
let searchData: DataManager = new DataManager({
    url:
    'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
    adaptor: new ODataV4Adaptor,
    crossDomain: true
});
let filter: MultiSelect = new MultiSelect({
    dataSource: searchData,
    query: new Query().select(['ContactName', 'CustomerID']).take(7),
    // map the appropriate column
    fields: { text: 'ContactName', value: 'CustomerID' },
    // set placeholder to MultiSelect input element
    placeholder: "Select customers",
    //sort the resulted items
    sortOrder: 'Ascending',
    // set true to allowFiltering for enable filtering supports
    allowFiltering: true,
    //bind the filtering event handler
    filtering: (e: FilteringEventArgs) => {
        // load overall data when search key empty.
        if(e.text == '') e.updateData(searchData);
        else{
            // restrict the remote request until search key contains 3
            characters.
            if (e.text.length < 3) { return; }
            let query: Query = new Query().select(['ContactName',
            'CustomerID']);
            query = (e.text !== '') ? query.where('ContactName', 'startswith',
            e.text, true) : query;
            e.updateData(searchData, query);
        }
    }
});
filter.appendTo('#select');
```

INDEX.HTML

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Change the filter type

While filtering, you can change the filter type to **contains**, **startsWith**, or **endsWith** for string type within the filter event handler.

In the following examples, data filtering is done with **endsWith** type.

INDEX.TS

```

import { MultiSelect, FilteringEventArgs } from '@syncfusion/ej2-dropdowns';
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
let searchData: DataManager = new DataManager({
    url:
    'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
    adaptor: new ODataV4Adaptor,
    crossDomain: true
});
let filter: MultiSelect = new MultiSelect({
    dataSource: searchData,
    query: new Query().select(['ContactName', 'CustomerID']).take(7),
    // map the appropriate column
    fields: { text: 'ContactName', value: 'CustomerID' },
    // set placeholder to MultiSelect input element
    placeholder: "Select names",
    // set true to allowFiltering for enable filtering supports
    allowFiltering: true,
    //set the height of the popup element
    popupHeight: "250px",
    //sort the resulted items
    sortOrder: 'Ascending',
    //bind the filtering event handler
    filtering: (e: FilteringEventArgs) => {
        // load overall data when search key empty.
        if(e.text == '') e.updateData(searchData);
    }
});

```

```

        else{
            let query: Query = new Query().select(['ContactName',
            'CustomerID']);
            // change the type of filtering
            query = (e.text !== '') ? query.where('ContactName', 'endswith',
            e.text, true) : query;
            e.updateData(searchData, query);
        }
    });
    filter.appendTo('#select');

```

INDEX.HTML

```

```

Case sensitive filtering

Data items can be filtered either with or without case sensitivity using the DataManager. This can be done by passing the fourth optional parameter of the `where` clause.

The following example shows how to perform case-sensitive filter.

INDEX.TS

```
import { MultiSelect, FilteringEventArgs } from '@syncfusion/ej2-dropdowns';
let sportsData: { [key: string]: Object }[] = [
  { id: 'game1', sports: 'Badminton' },
  { id: 'game2', sports: 'Football' },
  { id: 'game3', sports: 'Tennis' },
  { id: 'game4', sports: 'Golf' },
  { id: 'game5', sports: 'Hockey' }
];
let filter: MultiSelect = new MultiSelect({
  dataSource: sportsData,
  // map the appropriate column
  fields: { text: 'sports', value: 'id' },
  // set placeholder to MultiSelect input element
  placeholder: "Select names",
  // set true to allow filtering for enable filtering supports
  allowFiltering: true,
  //set the height of the popup element
  popupHeight: "250px",
  //sort the resulted items
  sortOrder: 'Ascending',
  //bind the filtering event handler
  filtering: (e: FilteringEventArgs) => {
    // load overall data when search key empty.
    if(e.text == '') e.updateData(sportsData);
    else{
      let query: Query = new Query().select(['sports', 'id']);
      //enable the case sensitive filtering by passing false to 4th
      query = (e.text !== '') ? query.where('sports', 'startswith',
        e.text, false) : query;
      e.updateData(sportsData, query);
    }
  }
});
filter.appendTo('#select');
```

INDEX.HTML

```

```

Diacritics Filtering

The MultiSelect supports diacritics filtering which will ignore the [diacritics](#) and makes it easier to filter the results in international characters lists when the [ignoreAccent](#) is enabled.

In the following sample, data with diacritics are bound as dataSource for MultiSelect.

INDEX.TS

```

import { MultiSelect } from '@syncfusion/ej2-dropdowns';
// create local data
let data: string[] = [
    'Aeróbics',
    'Aeróbics en Agua',
    'Aerografía',
    'Aeromodelaje',
    'Águilas',
    'Ajedrez',
    'Ala Delta',
    'Álbumes de Música',
    'Alusivos',
    'Análisis de Escritura a Mano'];
// initialize MultiSelect component
let multiObj: MultiSelect = new MultiSelect({
    //set the local data to dataSource property
    dataSource: data,
    // set the placeholder to MultiSelect input element
    placeholder: 'e.g: aero',
    // enabled the ignoreAccent property for ignore the diacritics
    ignoreAccent: true,
    // set true for enable the filtering support.
    allowFiltering: true
});
multiObj.appendTo('#select');

```

INDEX.HTML

Custom value in EJ2 JavaScript Multi select control

The MultiSelect allows user to add a new non-present option to the component value when [allowCustomValue](#) is enabled. while selecting the new custom value [customValueSelection](#) event will be triggered.

The following sample demonstrates configuration of custom value support with the MultiSelect component.

INDEX.TS

```
import { MultiSelect } from '@syncfusion/ej2-dropdowns';
//define the array of complex data
let sportsData: { [key: string]: Object }[] = [
    { id: 'game1', sports: 'Badminton' },
    { id: 'game2', sports: 'Football' },
    { id: 'game3', sports: 'Tennis' }
];
//initiate the MultiSelect
let msObject: MultiSelect = new MultiSelect({
    // bind the sports Data to datasource property
    dataSource: sportsData,
    // maps the appropriate column to fields property
    fields: { text: 'sports', value: 'id' },
    //set the placeholder to MultiSelect input
    placeholder: "Select games",
    //enable custom Value option with multislect
    allowCustomValue: true
});
// render initialized multiSelect
msObject.appendTo('#select');
```

Checkbox in EJ2 JavaScript Multi select control

The MultiSelect has built-in support to select multiple values through checkbox, when [mode](#) property set as **CheckBox**.

To use checkbox, inject the **CheckBoxSelection** module in the MultiSelect.

INDEX.TS

```

import { MultiSelect, CheckBoxSelection } from '@syncfusion/ej2-dropdowns';
MultiSelect.Inject(CheckBoxSelection);
//define the array of complex data
let sportsData: { [key: string]: Object }[] = [
    { id: 'game1', sports: 'Badminton' },
    { id: 'game2', sports: 'Football' },
    { id: 'game3', sports: 'Tennis' },
    { id: 'game4', sports: 'Golf' },
    { id: 'game5', sports: 'Cricket' },
    { id: 'game6', sports: 'Handball' },
    { id: 'game7', sports: 'Karate' },
    { id: 'game8', sports: 'Fencing' },
    { id: 'game9', sports: 'Boxing' }
];
//initiate the MultiSelect
let msObject: MultiSelect = new MultiSelect({
    // bind the sports Data to datasource property
    dataSource: sportsData,
    // maps the appropriate column to fields property
    fields: { text: 'sports', value: 'id' },
    //set the placeholder to MultiSelect input
    placeholder: "Select games",
    // set the type of mode for checkbox to visualized the checkbox added in
    // li element.
    mode: 'CheckBox',
    //Bind the filter event
    filtering: function (e: FilteringEventArgs) {
        let query = new Query();
        //frame the query based on search string with filter type.
        query = (e.text != "") ? query.where("country", "startswith",
e.text, true) : query;
        //pass the filter data source, filter query to updateData method.
        e.updateData(searchData, query);
    }
});
//render the component
msObject.appendTo('#select');

```

```

Select All

The MultiSelect component has in-built support to select the all list items using **Select All** options in the header.

When the [showSelectAll](#) property is set to true, by default Select All text will show. You can customize the name attribute of the Select All option by using [selectAllText](#).

For the unSelect All option, by default unSelect All text will show. You can customize the name attribute of the unSelect All option by using

[unSelectAllText](#).

INDEX.TS

```

import { MultiSelect, CheckBoxSelection } from '@syncfusion/ej2-dropdowns';
MultiSelect.Inject(CheckBoxSelection);
//define the array of complex data

```

```

let sportsData: { [key: string]: Object }[] = [

Chip customization in EJ2 JavaScript Multi select control

The MultiSelect allows the user to customize the selected chip element through the [tagging](#) event. In that event, you can set the custom classes to chip element via that event argument of `setClass` method.

The following sample demonstrates chip-customization with the MultiSelect component.

INDEX.TS

```
import { MultiSelect, TaggingEventArgs } from '@syncfusion/ej2-dropdowns';
//define the array of complex data
let colorsData: { [key: string]: Object; }[] = [
    { Color: 'Chocolate', Code: '#75523C' },
    { Color: 'CadetBlue', Code: '#3B8289' },
    { Color: 'DarkOrange', Code: '#FF843D' },
    { Color: 'DarkRed', Code: '#CA3832' },
    { Color: 'Fuchsia', Code: '#D44FA3' },
    { Color: 'HotPink', Code: '#F23F82' },
    { Color: 'Indigo', Code: '#2F5D81' },
    { Color: 'LimeGreen', Code: '#4CD242' },
    { Color: 'OrangeRed', Code: '#FE2A00' },
    { Color: 'Tomato', Code: '#FF745C' }
];
//initiate the MultiSelect
let msObject: MultiSelect = new MultiSelect({
    // bind the sports Data to datasource property
    dataSource: colorsData,
    // maps the appropriate column to fields property
    fields: { text: 'Color', value: 'Code' },
    // set the value to MultiSelect
    value: ['#75523C', '#4CD242', '#FF745C'],
    //set the placeholder to MultiSelect input
    placeholder: "Select a color",
    // set the type of mode for how to visualized the selected items in
    // input element.
    mode: 'Box',
    // bind the tagging event
    tagging: (e: TaggingEventArgs) => {
        // set the current selected item text as class to chip element.
        e.setClass((e.itemData as
any) [msObject.fields.text].toLowerCase());
    }
});
// render initialized multiSelect
msObject.appendTo('#select');
```

Localization in EJ2 JavaScript Multi select control

The Localization library allows you to localize static text content of the [noRecordsTemplate](#) and [actionFailureTemplate](#) properties according to the culture currently assigned to the MultiSelect.

| Locale key | en-US (default) |

|-----|-----|

| noRecordsTemplate | No records found |

| actionFailureTemplate | The request failed |

Loading translations

To load translation object to your application, use load function of the **L10n** class.

In the following sample, French culture is set to the MultiSelect and no data is loaded. Hence, the [noRecordsTemplate](#) property displays its text in French culture initially, and if the sample is run offline, the [actionFailureTemplate](#) property displays its text appropriately.

INDEX.TS

```
import { MultiSelect } from '@syncfusion/ej2-dropdowns';
// import L10n class for load function
import { L10n, setCulture } from '@syncfusion/ej2-base';
import { DataManager, ODataV4Adaptor, Query } from '@syncfusion/ej2-data';
// bind remotedata to showcase actionFailureTemplate in offline.
let customerData: DataManager = new DataManager({
    url: 'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
    adaptor: new ODataV4Adaptor,
    crossDomain: true
});
let msObj: MultiSelect = new MultiSelect({
    dataSource: customerData,
    // set locale culture to MultiSelect
    locale: 'fr-BE',
    // map appropriate column
    fields: { text: 'ContactName', value: 'CustomerID' },
    // take 0 item to showcase noRecordsTemplate property.
    query: new Query().select(['ContactName', 'CustomerID']).take(0),
    // set placeholder to MultiSelect input element
    placeholder: 'Sélectionnez un éléments'
});
msObj.appendTo('#select');
L10n.load({
    'fr-BE': {
        'multi-select': {
            'noRecordsTemplate': "Aucun enregistrement trouvé",
            'actionFailureTemplate': "Modèle d'échec d'action"
        }
    }
});
```

Style in EJ2 JavaScript Multi select control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the background color of wrapper element

Use the following CSS to customize the background color of wrapper element.

```

.e-multiselect.e-input-group .e-multi-select-wrapper {
background-color: red;
}

```

Customizing the appearance of the delimiter wrapper element

Use the following CSS to customize the appearance of delimiter wrapper element.

```

.e-multiselect .e-delim-values {
-webkit-text-fill-color: blue;
font-size: 16px;
font-family: cursive;
}

```

Customizing the appearance of chips

Use the following CSS to customize the appearance of selected chips.

```
,  
  
.e-multiselect .e-multi-select-wrapper .e-chips .e-chipcontent {  
font-family: cursive;  
font-size: 20px;  
-webkit-text-fill-color: blue;  
}  
  
.e-multi-select-wrapper .e-chips {  
background-color: aqua;  
height: 26px;  
}  
,
```

Customizing the dropdown icon's color

Use the following CSS to customize the dropdown icon's color.

```
,  
  
.e-multiselect.e-input-group .e-input-group-icon, .e-multiselect.e-input-group.e-control-wrapper .e-input-group-icon:hover {  
color: red;  
font-size: 14px;  
}  
,
```

Customizing the focus color

Use the following CSS to customize the focusing color of input element.

```
,  
  
.e-multiselect.e-input-group.e-control-wrapper.e-input-focus::before, .e-multiselect.e-input-group.e-control-wrapper.e-input-focus::after {  
background: #c000ff;  
}  
,
```

Customizing the disabled component's text color

Use the following CSS to customize the text color when the component is disabled.

```
,  
  
.e-multiselect.e-disabled .e-multi-select-wrapper .e-delim-values {  
-webkit-text-fill-color: red;  
}
```

```
}
,
```

Customizing the color of the placeholder text

Use the following CSS to customize the text color of placeholder.

```
,
```

```
.e-multiselect input.e-dropdownbase::placeholder {
color: red;
}
```

```
,
```

Customizing the placeholder to add mandatory indicator(*)

Use the following CSS to add the mandatory indicator * to the float label element.

```
,
```

```
.e-input-group.e-control-wrapper.e-float-input .e-float-text::after {
content: "*";
color: red;
}
```

```
,
```

Customizing the float label element's focusing color

Use the following CSS to customize the focusing color of float label element.

```
,
```

```
.e-float-input.e-input-group:not(.e-float-icon-left) .e-float-line::before,.e-float-input.e-control-
wrapper.e-input-group:not(.e-float-icon-left) .e-float-line::before,.e-float-input.e-input-group:not(.e-
float-icon-left) .e-float-line::after,.e-float-input.e-control-wrapper.e-input-group:not(.e-float-icon-left)
.e-float-line::after {
background-color: #2319b8;
}
```

```
.e-multiselect.e-input-group.e-control-wrapper.e-float-input.e-input-focus .e-float-text.e-label-top, .e-
float-input.e-control-wrapper:not(.e-error).e-input-focus input ~ label.e-float-text {
color: #2319b8;
}
```

```
,
```

Customizing the outline theme's focus color

Use the following CSS to customize the focusing color of outline theme.

```
,
```

```
.e-outline.e-input-group.e-input-focus: hover: not(.e-success): not(.e-warning): not(.e-error): not(.e-
disabled): not(.e-float-icon-left),.e-outline.e-input-group.e-input-focus.e-control-wrapper: hover: not(.e-
```

```

success):not(.e-warning):not(.e-error):not(.e-disabled):not(.e-float-icon-left),.e-outline.e-input-group.e-
input-focus:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled),.e-outline.e-input-group.e-
control-wrapper.e-input-focus:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled) {
border-color: #b1bd15;
box-shadow: inset 1px 1px #b1bd15, inset -1px 0 #b1bd15, inset 0 -1px #b1bd15;
}

```

Customizing the background color of focus, hover, and active item's

Use the following CSS to customize the background color of focus, hover and active item's.

```

.e-dropdownbase .e-list-item.e-item-focus, .e-dropdownbase .e-list-item.e-active, .e-dropdownbase .e-
list-item.e-active.e-hover, .e-dropdownbase .e-list-item.e-hover {
background-color: #1f9c99;
color: #2319b8;
}

```

Customizing the appearance of pop-up element

Use the following CSS to customize the appearance of popup element.

```

.e-dropdownbase .e-list-item, .e-dropdownbase .e-list-item.e-item-focus {
background-color: #29c2b8;
color: #207cd9;
font-family: emoji;
min-height: 29px
}

```

Customizing the color of the checkbox

Use the following CSS to customize the color of checkbox.

```

.e-popup .e-checkbox-wrapper .e-frame.e-check, .e-popup .e-checkbox-wrapper:hover .e-frame.e-check
{
background-color: green;
color: white;
}

```

Accessibility in EJ2 JavaScript Multi select control

The MultiSelect component has been designed, keeping in mind the WAI-ARIA specifications, and applies the WAI-ARIA roles, states, and properties along with keyboard support. This component is characterized by complete keyboard interaction support and ARIA accessibility support that makes it easy for people who use assistive technologies (AT) or those who completely rely on keyboard navigation.

The MultiSelect component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the MultiSelect component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) | |

| [Section 508 Support](#) | |

| [Screen Reader Support](#) | |

| [Right-To-Left Support](#) | |

| [Color Contrast](#) | |

| [Mobile Device Support](#) | |

| [Keyboard Navigation Support](#) | |

| [Accessibility Checker Validation](#) | |

| [Axe-core Accessibility Validation](#) | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

WAI-ARIA attributes

The MultiSelect component uses the **Listbox** role, and each list item has an **option** role. The following **ARIA attributes** denote the MultiSelect state.

| Properties | Functionalities |

| --- | --- |

| aria-haspopup | Indicates whether the MultiSelect input element has a popup list or not. |

| aria-expanded | Indicates whether the popup list has expanded or not. |

| aria-selected | Indicates the selected option. |

| aria-readonly | Indicates the readonly state of the MultiSelect element. |

| aria-disabled | Indicates whether the MultiSelect component is in a disabled state or not. |

| aria-activedescendent | This attribute holds the ID of the active list item to focus its descendant child element. |

| aria-owns | This attribute contains the ID of the popup list to indicate popup as a child element. |

Keyboard interaction

You can use the following key shortcuts to access the MultiSelect without interruptions.

| Keyboard shortcuts | Actions |

| --- | --- |

| Arrow Down | Set focus at the first item in the MultiSelect when no item selected. Otherwise, moves focus next to the currently selected item. |

| Arrow Up | Moves focus previous to the currently selected one. |

| Page Down | Scrolls down to the next page and set focus to the first item when popup list opens. |

| Page Up | Scrolls up to the previous page and set focus to the first item when popup list opens. |

| Enter | Selects the focused item, and popup list closes when it is in open state. |

| Tab | Focuses on the next TabIndex element on the page when the popup is closed. Otherwise, closes the popup list and remains the focus of the component. |

| Shift + tab | Focuses on the previous TabIndex element on the page when the popup is closed. Otherwise, closes the popup list and remains the focus of the component. |

| Alt + Down | Opens the popup list. |

| Alt + Up | Closes the popup list. |

| Esc(Escape) | Closes the popup list when it is in an open state and the currently selected item remains the same. |

| Home | set focus to the first item. |

| End | set focus to the last item. |

In the below sample, focus the MultiSelect component using alt+t keys.

INDEX.TS

```
import { MultiSelect } from '@syncfusion/ej2-dropdowns';
// defined the array of data
let gameList: { [key: string]: Object }[] = [
    { id: 'Game1', game: 'Badminton' },
    { id: 'Game2', game: 'Basketball' },
    { id: 'Game3', game: 'Cricket' },
    { id: 'Game4', game: 'Football' },
    { id: 'Game5', game: 'Golf' },
    { id: 'Game6', game: 'Hockey' },
    { id: 'Game7', game: 'Rugby' },
    { id: 'Game8', game: 'Snooker' },
    { id: 'Game9', game: 'Tennis' },
];
// initialize MultiSelect component
let msObject: MultiSelect = new MultiSelect({
    //set the data to dataSource property
    dataSource: gameList,
    //map to column to fields
    fields: { text: 'game', value: 'id' },
    // set placeholder to MultiSelect input element
    placeholder: "Select games",
    // set the popup list height
    popupHeight: '200px'
});
// render initialized MultiSelect
msObject.appendTo('#select');
document.onkeyup = function (e) {
    if (e.altKey && e.keyCode === 84 /* t */) {
        // press alt+t to focus the control.
        msObject.focusIn();
    }
};
```

</body></html>

```

Ensuring accessibility

The MultiSelect component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the MultiSelect component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the MultiSelect component with accessibility tools.

How To

Icons support in EJ2 JavaScript Multi select control

You can render **icons** to the list items by mapping the [iconCss](#) field. This [iconCss](#) field create a span in the list item with mapped class name to allow styling as per your need.

In the following sample, icon classes are mapped with [iconCss](#) field.

INDEX.TS

```

import { MultiSelect } from '@syncfusion/ej2-dropdowns';
let sortFormatData: { [key: string]: Object }[] = [
    { class: 'asc-sort', type: 'Sort A to Z', id: '1' },
    { class: 'dsc-sort', type: 'Sort Z to A ', id: '2' },
    { class: 'filter', type: 'Filter', id: '3' },
    { class: 'clear', type: 'Clear', id: '4' }
];
let sortFormat: MultiSelect = new MultiSelect({

```

```

    dataSource: sortFormatData,
    // map the icon column to iconCSS field.
    fields: { text: 'type', iconCss: 'class', value: 'id' },
    placeholder: 'Select a format'
  });
  sortFormat.appendTo('#select');

```

```

Achieve virtual scrolling in EJ2 JavaScript Multi select control

The Virtual Scrolling is used to display a large amount of data without buffering the entire load of a huge database record in the MultiSelect, that is, when scrolling, the request is sent and fetch some amount of data from the server dynamically. Using the `scroll` event, get the data and generate the list add to popup using the `addItem` method.

Refer to the following code sample for virtual scrolling.

INDEX.TS

```

import { MultiSelect } from '@syncfusion/ej2-dropdowns';
import { Query, DataManager, ODataAdaptor } from '@syncfusion/ej2-data';
let data: DataManager = new DataManager({
    url: 'https://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/',
    crossDomain: true
});

// initialize MultiSelect component
let mulObj: MultiSelect = new MultiSelect({
    // bind the DataManager instance to dataSource property
    dataSource: data,
    // bind the Query instance to query property
    query: new Query().from('Customers').select('ContactName').take(7),
    // map the appropriate columns to fields property
    fields: { text: 'ContactName', value: 'ContactName' },
    // set the placeholder to MultiSelect input element
    placeholder: 'Select a customer',
    // sort the resulted items
    sortOrder: 'Ascending',
    // set the height of the popup element
    popupHeight: '200px',
    actionComplete: function (e: any) {
        let operator: Query = new
Query().from('Customers').select('ContactName');
        let start: number = 7;
        let end: number = 12;
        let listElement: HTMLElement = this.list;
        listElement.addEventListener('scroll', () => {
            if ((listElement.scrollTop + listElement.offsetHeight >=
listElement.scrollHeight)) {
                let filterQuery = operator.clone();
                data.executeQuery(filterQuery.range(start,
end)).then((event: any) => {
                    start = end;
                    end += 5;
                    mulObj.addItem(event.result as { [key: string]: Object
}[]);
                }).catch((e: Object) => {
                });
            }
        });
    }
});
mulObj.appendTo('#atcelement');

```

Validation in EJ2 JavaScript Multi select control

MultiSelect component inside form can be validated through **FormValidator**. Add the name attribute of component to be validated inside rules of FormValidator. Error message after validation can be placed in DOM based on the requirement through customPlacement.

In the following sample, validation is added for MultiSelect component.

INDEX.TS

```

import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
import { FormValidator, FormValidatorModel } from '@syncfusion/ej2-inputs';
import { Button } from '@syncfusion/ej2-buttons';
import { MultiSelect } from '@syncfusion/ej2-dropdowns';
let listObj1: MultiSelect = new MultiSelect({
    // set the placeholder to MultiSelect input element
    placeholder: 'Favorite Sports',
    // set the type of mode for how to visualized the selected items in
    input element.
    mode: 'Default'
});
listObj1.appendTo('#default');
// Initialize Submit button
let buttonFormValidate: Button = new Button({ isPrimary: true });
buttonFormValidate.appendTo('#validateSubmit');
// Initialize Reset button
let buttonReset: Button = new Button({});
buttonReset.appendTo('#resetbtn');
// Initialize Custom placement
let option: FormValidatorModel = {
    rules: {

```

```

        // Initialize the CustomPlacement.
        default: { required: true }
    },
    customPlacement: (inputElement: HTMLElement, error: HTMLElement)=>{
inputElement.parentElement.parentElement.parentElement.insertBefore(error,
inputElement.parentElement.parentElement.nextSibling);
    }
    };
    // Initialize Form validation
    let formObj: FormValidator;
    formObj = new FormValidator('#formId', option);
    let formId: HTMLElement =
<HTMLElement>document.getElementById('formId');
    document.getElementById('formId').addEventListener(
        'submit',
        (e: Event) => {
            e.preventDefault();
            if (formObj.validate()) {
                alert('Success');
                formObj.reset();
            }
        }
    );
};

```

NumericTextBox

Formats in EJ2 JavaScript Numerictextbox control

You can format the value of NumericTextBox using [format](#) property. The value will be displayed in the specified format when the component is in focused out state. The format string supports both the [standard numeric format string](#) and [custom numeric format string](#).

Standard formats

From the [standard numeric formats](#), you can use the numeric related format specifiers such as **n**, **p** and **c** in the NumericTextBox component. By using these format specifiers, you can achieve the percentage and currency textbox behavior also.

The below example demonstrates percentage and currency formats.

INDEX.TS

```
import {NumericTextBox} from '@syncfusion/ej2-inputs';
/* 'p' specifier */
let percent: NumericTextBox = new NumericTextBox({
    // sets percentage with 2 numbers of decimal places format
    format: 'p2',
    value: 0.5,
    min: 0,
    max: 1,
    step: 0.01,
    placeholder: 'Percentage format',
    floatLabelType: 'Auto'
});
percent.appendTo('#percent');
/* 'c' specifier */
let currency: NumericTextBox = new NumericTextBox({
    // sets currency with 2 numbers of decimal places format
    format: 'c2'
    value: 10,
    placeholder: 'Currency format',
    floatLabelType: 'Auto'
});
currency.appendTo('#currency');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 NumericTextBox</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
inputs/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div class="wrap">
```

```

        <input id="percent" type="text">
    </div>
    <div class="wrap">
        <input id="currency" type="text">
    </div>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

STYLES.CSS

```

#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    font-family: 'Helvetica Neue', 'calibiri';
    font-size: 14px;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.wrap {
    margin: 35px auto;
    width: 240px;
    padding-top: 30px;
}

```

Custom formats

From the [custom numeric format string](#), you can provide any custom format by combining one or more custom specifiers.

The below examples demonstrate format the value by using currency format string **#** and **0**.

INDEX.TS

```

import {NumericTextBox} from '@syncfusion/ej2-inputs';
/* '#' specifier */
let numeric = NumericTextBox = new NumericTextBox({
    // sets the format using custom format string '#'
    format: '###.##',
    value: 10,
    placeholder: 'Custom format string #',
    floatLabelType: 'Auto'
});
numeric.appendTo('#numeric');
/* '0' specifier */
let numeric1: NumericTextBox = new NumericTextBox({

```

```
// sets the format using custom format string `0`
format: '000.00',
value: 10,
placeholder: 'Custom format string 0',
floatLabelType: 'Auto'
});
numeric1.appendTo('#numeric1');
```

INDEX.HTML

left: 45%;
position: absolute;
top: 45%;
width: 30%;
}
.wrap {
margin: 35px auto;
width: 240px;
padding-top: 30px;
}

```

Globalization in EJ2 JavaScript Numerictextbox control

Localization

[Localization](#) library allows users to localize the default text contents of the NumericTextBox to different cultures using the [locale](#) property. In NumericTextBox, spin buttons title for the tooltip will be localized based on the culture.

| Locale key | en-US (default) |

|-----|-----|

| incrementTitle | Increment value |

| decrementTitle | Decrement value |

Loading translations

To load translation object in your application use `load` function of `L10n` class.

The below example demonstrates the NumericTextBox in **German** culture with the spin buttons tooltip.

INDEX.TS

```

import { NumericTextBox } from '@syncfusion/ej2-inputs';
import { L10n } from '@syncfusion/ej2-base';
// Load `German` culture to override spin buttons tooltip text
L10n.load({
  'de': {
    'numerictextbox': {
      incrementTitle: 'Wert erhöhen', decrementTitle: 'Dekrementwert'
    }
  },
});
let numeric: NumericTextBox = new NumericTextBox({
  // sets `German` culture using the culture value 'de'
  locale: 'de',
  // sets value to the NumericTextBox
  value: 10
});
// renders initialized NumericTextBox
numeric.appendTo('#numeric');

```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
```

```
<title>EJ2 NumericTextBox</title>

</head>
<body>

    <div id="container">
        <div class="wrap">
            <input id="numeric" type="text">
        </div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

STYLES.CSS

```
#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    font-family: 'Helvetica Neue', 'calibiri';
    font-size: 14px;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.wrap {
    margin: 0 auto;
    width: 240px;
    padding-top: 100px;
}
```

Internationalization

Internationalization library provides support for formatting and parsing the number by using the official [Unicode CLDR](#) JSON data and also provides the `loadCldr` method to load the culture specific CLDR JSON data. The NumericTextBox comes with built-in

internationalization support to adapt based on culture. For more information about internationalization, refer to this [link](#).

By default, all the Essential JS 2 component are specific to English culture ('en-US'). If you want to go with the different culture other than `English`, follow the below steps.

- Install the `CLDR-Data` package by using the below command (it installs the CLDR JSON data). For more information about CLDR-Data, refer to this [link](#).

```
npm install cldr-data --save
```

Once the package installed, you can find the culture specific JSON data under the location `/node_modules/cldr-data`.

- Now import the installed CLDR JSON data into the `app.ts` file. To import JSON data we need to install the JSON plugin loader. Here we have used the SystemJS JSON plugin loader.

```
npm install systemjs-plugin-json --save-dev
```

- Once installed, configure the `system.config.js` configuration settings as like below to map the `systemjs-plugin-json` loader.

```
`ts
System.config({
  paths: {
    'syncfusion:': 'npm:@syncfusion/'
  },
  map: {
    app: 'app',
    //Syncfusion packages mapping
    '@syncfusion/ej2-base': 'syncfusion:ej2-base/dist/ej2-base.umd.min.js',
    '@syncfusion/ej2-inputs': 'syncfusion:ej2-inputs/dist/ej2-inputs.umd.min.js',
    'cldr-data': 'npm:cldr-data',
```

```
"plugin-json": "npm:systemjs-plugin-json/json.js"
},
meta: {
  '*.json': { loader: 'plugin-json' }
},
packages: {
  'app': { main: 'app', defaultExtension: 'js' },
  'cldr-data': { main: 'index.js', defaultExtension: 'js' }
}
});
System.import('app');
`
```

- Now import the required culture from the installed location to `app.ts` file as like the below code snippets.

```
`ts
declare var require: any;
loadCldr(
  require('cldr-data/main/de/numbers.json'),
  require('cldr-data/main/de/currencies.json'),
  require('cldr-data/supplemental/numberingSystems.json'),
  require('cldr-data/supplemental/currencyData.json')
);
`
```

- Set the culture by using the [locale](#) property.

The below example demonstrates the NumericTextBox in `German` culture with the `EUR` currency format.

INDEX.TS

```
import { NumericTextBox } from '@syncfusion/ej2-inputs';
import { loadCldr, L10n } from '@syncfusion/ej2-base';
// Here we have referred local json files for preview purpose
import * as numberingSystems from './numberingSystems.json';
import * as currencyData from './currencyData.json';
import * as numbers from './numbers.json';
import * as currencies from './currencies.json';
loadCldr(numberingSystems, currencyData, numbers, currencies);
```

```

L10n.load({
  'de': {
    'numerictextbox': { incrementTitle: 'Wert erhöhen', decrementTitle:
'Dekrementwert' }
  }
});
let currency: NumericTextBox = new NumericTextBox({
  // sets `German` culture using the culture value 'de'
  locale: 'de',
  // sets the 'EUR' currency format
  currency: 'EUR',
  format: 'c2',
  value: 100,
});
currency.appendTo('#numeric');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

  width: 30%;
}
.wrap {
  margin: 0 auto;
  width: 240px;
  padding-top: 100px;
}

```

Right to Left(RTL)

RTL provides an option to switch the text direction and layout of the NumericTextBox component from right to left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Farsi, Urdu, etc.). To enable RTL NumericTextBox, set the [enableRtl](#) to true.

INDEX.TS

```

import { NumericTextBox } from '@syncfusion/ej2-inputs';
import { loadCldr,L10n } from '@syncfusion/ej2-base';
L10n.load({
  'ar-AE': {
    'numerictextbox': { incrementTitle: 'قيمة الزيادة', decrementTitle:
'قيمة تناقص' }
  }
});
let currency: NumericTextBox = new NumericTextBox({
  // sets `Arabic` culture using the culture value 'ar-AE'
  locale: 'ar-AE',
  value: 100,
  placeholder: 'أدخل القيمة',
  enableRtl: true,
  floatLabelType: 'Auto'
});
currency.appendTo('#numeric');

```

Accessibility in EJ2 JavaScript Numerictextbox control

The Numerictextbox component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Numerictextbox component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) | |

| [Section 508 Support](#) | |

| [Screen Reader Support](#) | |

| [Right-To-Left Support](#) | |

| [Color Contrast](#) | |

| [Mobile Device Support](#) | |

| [Keyboard Navigation Support](#) | |

| [Accessibility Checker Validation](#) | |

| [Axe-core Accessibility Validation](#) | |

<style>

```
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
```

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

WAI-ARIA attributes

The NumericTextBox characterized with complete ARIA Accessibility support which helps to accessible by on-screen readers and other assistive technology devices. This component designed with the reference of the guidelines document given in [WAI ARAI Accessibility practices](#).

The NumericTextBox uses the `spinbutton` role and following ARIA properties to its element based on its state.

| Property | Functionality |

| --- | --- |

| aria-live | The `aria-live` attribute indicates the priority of updates to a live region |

| **aria-valuemin** | The **aria-valuemin** property specifies the minimum allowable range of the NumericTextBox. |

| **aria-valuemax** | The **aria-valuemax** property specifies the maximum allowable range of the NumericTextBox. |

| **aria-disabled** | The **aria-disabled** property indicates disabled state of the NumericTextBox. |

| **aria-readonly** | The **aria-readonly** property indicates the read-only state of the NumericTextBox. |

| **aria-valuenow** | The **aria-valuenow** property specifies the current value of the NumericTextBox. |

| **aria-invalid** | The **aria-invalid** property indicates that the user input is incorrect or not within acceptable ranges. |

| **aria-label** | The **aria-label** property indicates a string value that labels the NumericTextBox. |

Keyboard interaction

Keyboard interaction of the NumericTextBox component has been designed based on

[WAI-ARIA Practices](#) described for the NumericTextBox and

it is an alternative to mouse actions to interact with the NumericTextBox.

The below table shows shortcut keys and its corresponding usage.

| **Keyboard shortcuts** | **Actions** |

| --- | --- |

| **Arrow Down** | **Increments the value.** |

| **Arrow Up** | **Decrements the value** |

INDEX.TS

```
import {NumericTextBox} from '@syncfusion/ej2-inputs';
let numeric: NumericTextBox = new NumericTextBox({
    // sets value to the NumericTextBox
    value: 10
});
numeric.appendTo('#numeric');
```

}
```

Ensuring accessibility

The NumericTextBox component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the NumericTextBox component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the NumericTextBox component with accessibility tools.

Style appearance in EJ2 JavaScript Numerictextbox control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the appearance of NumericTextBox wrapper element

Use the following CSS to customize the appearance of wrapper element.

/ To specify height and font size /

```
.e-input-group input.e-input, .e-input-group.e-control-wrapper input.e-input, .e-input-group textarea.e-input, .e-input-group.e-control-wrapper textarea.e-input {
```

```
height: 40px;
```

```
font-size: 20px;
```

```
}
```

Customizing the NumericTextBox icons

Use the following CSS to customize the Numeric TextBox icons

/ To specify font size and background color /

```
.e-numeric.e-control-wrapper.e-input-group .e-input-group-icon {
```

```
font-size: 20px;
```

```
background-color: beige;
```

```
}
```

How To

Customize the ui appearance of the control in EJ2 JavaScript Numerictextbox control

You can change the appearance of the NumericTextBox by adding custom `cssClass` to the component and enabling styles. Refer to the following example to change the appearance of the NumericTextBox.

INDEX.TS

```
import { NumericTextBox } from '@syncfusion/ej2-inputs';
// initializes the NumericTextBox component
let numeric: NumericTextBox = new NumericTextBox({
    // sets value to the NumericTextBox
    value: 10,
    placeholder: 'Enter value ',
    floatLabelType: 'Always',
    //adding custom css class to NumericTextBox
    cssClass: 'e-style'
});
// renders initialized NumericTextBox
numeric.appendTo('#numeric1');
```

INDEX.HTML

```

    width: 240px;
    padding-top: 100px;
}

```

Customize the spin buttons up and down arrow in EJ2 JavaScript Numerictextbox control

This section explains about how to change/customize spin up and down icons. You can customize spin button icons using **e-spin-up** and **e-spin-down** classes of those buttons.

You can override the default icons of **e-spin-up** and **e-spin-down** classes using the following CSS code snippets.

```

.e-numeric .e-input-group-icon.e-spin-up:before {
content: "\e823";
color: rgba(0, 0, 0, 0.54);
}
.e-numeric .e-input-group-icon.e-spin-down:before {
content: "\e934";
color: rgba(0, 0, 0, 0.54);
}

```

```
}  
,
```

INDEX.TS

```
import {NumericTextBox} from '@syncfusion/ej2-inputs';  
// initializes NumericTextBox component  
let numeric: NumericTextBox = new NumericTextBox({  
    // sets value to the NumericTextBox  
    value: 10  
});  
// renders initialized NumericTextBox  
numeric.appendTo('#numeric');
```

INDEX.HTML

```

}
/* csslint ignore:end */

```

Customize the step value and hide spin buttons in EJ2 JavaScript Numerictextbox control

The spin buttons allow you to increase or decrease the value with the predefined [step](#) value. The visibility of spin buttons can be set using the [showSpinButton](#) property.

INDEX.TS

```

import {NumericTextBox} from '@syncfusion/ej2-inputs';
let hideButtons: NumericTextBox = new NumericTextBox({
  // sets the step value as '2' to increase/decrease the value by '2'
  step: 2,
  // sets the showSpinButton value as `false` to hide the spin buttons
  showSpinButton: false
  min: 10,
  max: 100,
  value: 16
});
hideButtons.appendTo('#numeric');

```

INDEX.HTML

```

```

Maintain trailing zeros in numerictextbox in EJ2 JavaScript Numerictextbox control

By default, trailing zeros disappear when the NumericTextBox gets focus. However, you can use the following sample to maintain the trailing zeros while focusing the NumericTextBox.

INDEX.TS

```
import {NumericTextBox} from '@syncfusion/ej2-inputs';
```

```
//maintains trailing zeros while focusing
let numericFocus: function () {
    var numericObj = this.ej2_instances ? this.ej2_instances[0] : this;
    numericObj.element.value =
    numericObj.formattedValue(numericObj.decimals, +numericObj.element.value);
}
// Render the Numeric Textbox
let numeric: NumericTextBox = new NumericTextBox({
    value: 10,
    decimals: 2,
    format: 'n2',
    placeholder: 'NumericTextbox',
    floatLabelType: 'Always' ,
    change: numericFocus
});
numeric.appendTo('#numeric');
document.getElementById('numeric').addEventListener('focus', numericFocus);
```

INDEX.HTML

```

    width: 240px;
    padding-top: 100px;
}
```

Perform custom validation using form validator in EJ2 JavaScript Numerictextbox control

This section explains how to perform custom validation on the NumericTextBox using FormValidator.

The NumericTextBox will be validated when the value changes or the user clicks the submit button.

Validation can be performed by adding custom validation in the rules collection of the FormValidator.

INDEX.TS

```
import { NumericTextBox } from '@syncfusion/ej2-inputs';
import { FormValidator, FormValidatorModel } from '@syncfusion/ej2-inputs';
import { Button } from '@syncfusion/ej2-buttons';
// initializes the NumericTextBox component
let numeric: NumericTextBox = new NumericTextBox({
    min: 10,
    max: 100,
    strictMode : false,
    placeholder: 'NumericTextbox',
    floatLabelType: 'Always',
    change: function(args) {
        if (numeric.value != null)
            formObject.validate("numericRange");
    }
});
numeric.appendTo('#numeric1');
let button: Button = new Button();
button.appendTo('#submit_btn');
// checks the value of NumericTextbox and returns the corresponding boolean value
let customFn: (args: { [key: string]: string }) => boolean = (args: { [key: string]: string }) => {
    if(numeric.value>=10 && numeric.value<=100) {
        return true;
    }
    else {
        return false;
    }
}
```

```

};
// sets required property in the FormValidator rules collection
let options: FormValidatorModel = {
    rules: {
        'numericRange': { required: [true, "Number is required"] },
    }
}
// defines FormValidator to validate the NumericTextBox
let formObject: FormValidator = new FormValidator('#form-element', options);
//rules for validating the NumericTextbox
formObject.addRules('numericRange', { range: [customFn, "Please enter a
number between 10 to 100"] });
// places error label outside the NumericTextBox using the customPlacement
event of FormValidator
let customPlace: (element: HTMLElement, error: HTMLElement) => void =
(element: HTMLElement, error: HTMLElement) => {
    element.parentNode.parentNode.appendChild(error);
};
formObject.customPlacement = customPlace;
let submitBtn: HTMLInputElement =
<HTMLInputElement>document.getElementById('submit_btn');
submitBtn.onclick = () => {
    // validates the NumericTextBox
    formObject.validate("numericRange");
    let ele: HTMLInputElement =
<HTMLInputElement>document.getElementById('numeric1');
    // checks for incomplete value and alerts the formt submit
    if (ele.value !== "" && ele.value >=10 && ele.value<=100) {
        alert("Submitted");
    }
};

```

Prevent nullable input in numerictextbox in EJ2 JavaScript Numerictextbox control

By default, the value of the NumericTextBox sets to null. In some applications, the value of the NumericTextBox should not be null at any instance. In such cases, following sample can be used to prevent nullable input in NumericTextBox.

INDEX.TS

```
import {NumericTextBox} from '@syncfusion/ej2-inputs';
// initializes NumericTextBox component
let numeric: NumericTextBox = new NumericTextBox({
    // sets value to the NumericTextBox
    placeholder: 'NumericTextbox',
    floatLabelType: 'Always' ,
    // prevents nullable value during initialization
    created: function (args) {
        if (this.value==null) {
            this.value=0;
        }
    },
    blur: function (args) {
        // checks for nullable value while focus out
        if (args.value==null)
            numeric1.value=0;
    }
});
// renders initialized NumericTextBox
numeric.appendTo('#numeric1');
```

INDEX.HTML

```

Ej1 api migration in EJ2 JavaScript Numerictextbox control

This article describes the API migration process of NumericTextBox component from Essential JS 1 to Essential JS 2.

Common

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Triggers on creation | **Event:** *create*

\$("#numeric").ejNumericTextBox({
value: 120,
create: function(){}
}); | **Event:** *created*

var numeric = new ej.inputs.NumericTextBox({
value: 120,
created: function(){}
});
numeric.appendTo("#numeric"); |

| Adding custom classes | **property:** *cssClass*

\$("#numeric").ejNumericTextBox({
value: 100,
cssClass: "custom"
}); | **Property:** *cssClass*

var numeric = new ej.inputs.NumericTextBox({
value: 100,
cssClass: "custom"
});
numeric.appendTo("#numeric"); |

| Triggers when editor is destroyed | **Event:** *destroy*

\$("#numeric").ejNumericTextBox({
value: 120,
destroy: function(){}
}); | **Event:** *destroyed*

var numeric = new ej.inputs.NumericTextBox({
value: 120,
destroyed: function(){}
});
numeric.appendTo("#numeric"); |

| Destroys textbox | **Method:** *destroy*

\$("#numeric").ejNumericTextBox({
value: 100
});
var numericObj = \$("#numeric").data("ejNumericTextBox");
numericObj.destroy(); | **Method:** *destroy*

var numeric = new ej.inputs.NumericTextBox({
value: 100,
enabled: false
});
numeric.appendTo("#numeric");
numeric.destroy(); |

| Control state | **property:** *enabled*

\$("#numeric").ejNumericTextBox({
value: 100,
enabled: false
}); | **Property:** *enabled*

var numeric = new ej.inputs.NumericTextBox({
value: 100,
enabled: false
});
numeric.appendTo("#numeric"); |

| Persistence | **property:** *enablePersistence*

\$("#numeric").ejNumericTextBox({
value: 100,
enablePersistence: true
}); | **Property:** *enablePersistence*

var numeric = new ej.inputs.NumericTextBox({
value: 100,
enablePersistence: true
});
numeric.appendTo("#numeric"); |

| Right To Left | **property:** *enableRTL*

\$("#numeric").ejNumericTextBox({
value: 100,
enableRTL: true
}); | **Property:** *enableRtl*

var numeric = new ej.inputs.NumericTextBox({
value: 100,
enableRtl: true
});
numeric.appendTo("#numeric"); |

| Triggers when editor is focused in | **Event:** *focusIn*

\$("#numeric").ejNumericTextBox({
value: 20,
focusIn: function(){}
}); | **Event:** *focus*

var numeric = new ej.inputs.NumericTextBox({
value: 100,
focus: function(){}
});
numeric.appendTo("#numeric"); |

| Triggers when editor is focused out | **Event:** *focusOut*

\$("#numeric").ejNumericTextBox({
value: 100,
focusOut: function(){}
}); | **Event:** *blur*

var numeric = new ej.inputs.NumericTextBox({
value: 100,
blur: function(){}
});
numeric.appendTo("#numeric"); |

| Sets Height | **property:** *height*

\$("#numeric").ejNumericTextBox({
value: 100,
height: "40px"
}); | **Can be achieved using,**

var numeric = new ej.inputs.NumericTextBox({
value: 100,
cssClass: "custom"
});
numeric.appendTo("#numeric");
CSS
.e-numerictextbox.custom{
height: 40px;
}

| HTML Attributes | **property:** *htmlAttributes*

\$("#numeric").ejNumericTextBox({
value: 100,
htmlAttributes: {disabled: "disabled"}
}); | **Can be achieved using,**

<input id="numeric" type="text" name="textbox" />
var numeric = new ej.inputs.NumericTextBox({
value: 100
});
numeric.appendTo("#numeric") |

| Name of editor | **property:** *name*

\$("#numeric").ejNumericTextBox({
value: 100,
name: "Textbox"
}); | **Can be achieved using,**

HTML
<input id="numeric" type="text" name="textbox" />
var numeric = new ej.inputs.NumericTextBox({
value: 100,
});
numeric.appendTo("#numeric"); |

| Read only | **property:** *readOnly*

\$("#numeric").ejNumericTextBox({
value: 80,
readOnly: true
}); | **Property:** *readonly*

var numeric = new ej.inputs.NumericTextBox({
value: 80,
readonly: true
});
numeric.appendTo("#numeric"); |

| Rounded corners | **property:** *showRoundedCorner*

\$("#numeric").ejNumericTextBox({
value: 80,
showRoundedCorner: true
}); | **Can be achieved using**
var numeric = new ej.inputs.NumericTextBox({
value: 100,
cssClass: "e-style"
});
numeric.appendTo("#numeric");
CSS
.e-control-wrapper.e-numeric.e-input-group.e-style {
border: 2.5px solid;
border-radius: 1rem;
padding-left: 12px;
}
.e-control-wrapper.e-numeric.e-float-input.e-style .e-float-line::before, .e-control-wrapper.e-numeric.e-float-

input.e-style .e-float-line::after{
background: none ;

.e-control-wrapper.e-numeric.e-input-group.e-style.e-input-focus{
 border: solid grey !important;
} |

| Spin Button | **property:** *showSpinButton*

\$("#numeric").ejNumericTextBox({
value: 20,
showSpinButton: false
}); | **Property:** *showSpinButton*

var numeric = new ej.inputs.NumericTextBox({
value: 20,
showSpinButton: false
});
numeric.appendTo("#numeric"); |

| Width | **property:** *width*

\$("#numeric").ejNumericTextBox({
value: 20,
width: "220px"
}); | **Property:** *width*

var numeric = new ej.inputs.NumericTextBox({
value: 20,
width: "220px"
});
numeric.appendTo("#numeric"); |

| Clear Button | Not Applicable | **Property:** *showClearButton*

var numeric = new ej.inputs.NumericTextBox({
value: 100,
showClearButton: true
});
numeric.appendTo("#numeric"); |

Globalization

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Localization culture | **property:** *locale*

\$("#numeric").ejNumericTextBox({
value: 80,
locale: "de-DE"
}); | **Property:** *locale*

var numeric = new ej.inputs.NumericTextBox({
value: 80,
locale: "de-DE"
});
numeric.appendTo("#numeric"); |

Group

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Group digits in editor | **property:** *groupSize*

\$("#numeric").ejNumericTextBox({
value: 100,
groupSize: "2"
}); | Not Applicable |

| Group Separator | **property:** *groupSeparator*

\$("#numeric").ejNumericTextBox({
value: 100,
groupSeparator: "-"
}); | Not Applicable |

Numeric configuration

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Triggers on value change | **Event:** *change*

\$("#numeric").ejNumericTextBox({
value: 120,
change: function(){}
}); | **Event:** *change*

var numeric = new ej.inputs.NumericTextBox({
value: 120,
change: function(){}
});
numeric.appendTo("#numeric"); |

| Sets digits allowed after decimal point | **property:** *decimalPlaces*

\$("#numeric").ejNumericTextBox({
value: 100,
decimalPlaces: 2
}); | **Property:** *decimals*

var numeric = new ej.inputs.NumericTextBox({
value: 100,
format: "n2",
decimals: 2
});
numeric.appendTo("#numeric"); |

| Decrement value | Not Applicable | **Method:** *decrement*

var numeric = new ej.inputs.NumericTextBox({
value: 100
});
numeric.appendTo("#numeric");
numeric.decrement(); |

| Disable the textbox | **Method:** *disable*
 <code>\$("#numeric").ejNumericTextBox({value: 200});</code>
 <code>var numericObj = \$("#numeric").data("ejNumericTextBox");</code>
 <code>numericObj.disable();</code> | **Can be achieved using,** **API:** *enabled*
 <code>var numeric = new ej.inputs.NumericTextBox({value: 100});</code>
 <code>numeric.appendTo("#numeric");</code>
 <code>var numObj = document.getElementById("numeric").ej2_instances[0]</code>
 <code>numObj.enabled = false;</code> |

| Enable the textbox | **Method:** *enable*
 <code>\$("#numeric").ejNumericTextBox({value: 200});</code>
 <code>var numericObj = \$("#numeric").data("ejNumericTextBox");</code>
 <code>numericObj.enable();</code> | **Can be achieved using,** **API:** *enabled*
 <code>var numeric = new ej.inputs.NumericTextBox({value: 100});</code>
 <code>numeric.appendTo("#numeric");</code>
 <code>var numObj = document.getElementById("numeric").ej2_instances[0]</code>
 <code>numObj.enabled = true;</code> |

| Gets value of editor | **Method:** *getValue*
 <code>\$("#numeric").ejNumericTextBox({value: 100});</code>
 <code>var numericObj = \$("#numeric").data("ejNumericTextBox");</code>
 <code>numericObj.getValue();</code> | **Method:** *getText*
 <code>var numeric = new ej.inputs.NumericTextBox({value: 100});</code>
 <code>numeric.appendTo("#numeric");</code>
 <code>numeric.getText();</code> |

| Increment value | Not Applicable | **Method:** *increment*
 <code>var numeric = new ej.inputs.NumericTextBox({value: 80});</code>
 <code>numeric.appendTo("#numeric");</code>
 <code>numeric.increment();</code> |

| Step value | **property:** *incrementStep*
 <code>\$("#numeric").ejNumericTextBox({value: 100, incrementStep: 2});</code> | **Property:** *step*
 <code>var numeric = new ej.inputs.NumericTextBox({value: 100, step: 2});</code>
 <code>numeric.appendTo("#numeric");</code> |

| Sets Maximum value | **property:** *maxValue*
 <code>\$("#numeric").ejNumericTextBox({value: 100, maxValue: 200});</code> | **Property:** *max*
 <code>var numeric = new ej.inputs.NumericTextBox({value: 100, max: 200});</code>
 <code>numeric.appendTo("#numeric");</code> |

| Sets Minimum value | **property:** *minValue*
 <code>\$("#numeric").ejNumericTextBox({value: 100, minValue: 20});</code> | **Property:** *min*
 <code>var numeric = new ej.inputs.NumericTextBox({value: 100, min: 20});</code>
 <code>numeric.appendTo("#numeric");</code> |

| Negative pattern for formatting values | **property:** *negativePattern*
 <code>\$("#numeric").ejNumericTextBox({value: -20, negativePattern: "(n)"}</code> | Not Applicable |

| Positive pattern for formatting values | **property:** *positivePattern*
 <code>\$("#numeric").ejNumericTextBox({value: 20, positivePattern: "n kg"}</code> | Not Applicable |

| Specifies value | **property:** *value*
 <code>\$("#numeric").ejNumericTextBox({value: 100});</code> | **Property:** *value*
 <code>var numeric = new ej.inputs.NumericTextBox({value: 100});</code>
 <code>numeric.appendTo("#numeric");</code> |

| Displays hint on editor | **property:** *watermarkText*
 <code>\$("#numeric").ejNumericTextBox({value: 80, watermarkText: "Enter value:"});</code> | **Property:** *placeholder*
 <code>var numeric = new ej.inputs.NumericTextBox({value: 100, placeholder: "Enter value:"});</code>
 <code>numeric.appendTo("#numeric");</code> |

| Placeholder float type | Not Applicable | **Property:** *floatLabelType*
 ej.inputs.NumericTextBox({value: 200,placeholder: "Enter value:",floatLabelType: "Auto"});
 numeric.appendTo("#numeric"); |

Number Formats

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Set Currency symbol | **property:** *currencySymbol*
 ejCurrencyTextBox({value: 100,currencySymbol: "EUR"}); | **Property:** *currency*
 ej.inputs.NumericTextBox({value: 100,format: "c2",currency: "EUR"});
 currency.appendTo("#currency"); |

| Number Format | Not Applicable | **Property:** *format*
 ej.inputs.NumericTextBox({value: 200,format: "n2"});
 numeric.appendTo("#numeric"); |

Validation

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Strict Mode | **property:** *enableStrictMode*
 ejNumericTextBox({value: 80,enableStrictMode: true}); | **Property:** *strictMode*
 ej.inputs.NumericTextBox({value: 80,strictMode: true});
 numeric.appendTo("#numeric"); |

| Validation on typing | **property:** *validateOnType*
 ejNumericTextBox({value: 100,validateOnType: true}); | **Property:** *validateDecimalOnType*
 ej.inputs.NumericTextBox({value: 100,validateDecimalOnType: true});
 numeric.appendTo("#numeric"); |

| Validation Message | **property:** *validationMessage*
 ejNumericTextBox({value: 100,validationRules: {required: true},validationMessage: {required: "Required value"}}); | **Validation in NumericTextBox can be achieved through form validation**
 options = {rules: { 'numericRange': {required: [true, "Number is required"]}},
 formObject = new ej.inputs.FormValidator('#form-element', options);
 var customPlace= function(element, error) {
 element.parentNode.parentNode.appendChild(error);
 formObject.customPlacement = customPlace;
 var numeric = new ej.inputs.NumericTextBox({value: 15});
 numeric.appendTo('#numeric1');
HTML <form id="form-element" class="form-horizontal">
 <input id="numeric1" type="text" name="numericRange" class="form-control" />
 <div id="error"></div></form> |

| Validation Rules | **property:** *validationRules*
 ejNumericTextBox({value: 100,validationRules: {required: true}}); | **Validation in NumericTextBox can be achieved through form validation**
 options = {rules: { 'numericRange': {required: [true]}},
 formObject = new ej.inputs.FormValidator('#form-element', options);
 var customPlace= function(element, error) {
 element.parentNode.parentNode.appendChild(error);
 formObject.customPlacement = customPlace;
 var numeric = new ej.inputs.NumericTextBox({value: 15});
 numeric.appendTo('#numeric1');
HTML <form id="form-element"

```
class="form-horizontal"><br/><input id="numeric1" type="text" name="numericRange" class="form-control" /> <br/><div id="error"></div><br/></form> |
```

Pager

Getting started in EJ2 JavaScript Pager control

This section explains you the steps required to create a simple Essential JS 2 Pager and demonstrate the basic usage of the Pager control in a JavaScript application.

Dependencies

Below is the list of minimum dependencies required to use the Pager.

```
`javascript
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-grids
`
```

Setup for local environment

Refer the following steps for setup your local environment.

Step 1: Create a root folder `myapp` for your application.

Step 2: Create `myapp/resources` folder to store local scripts and styles files.

Step 3: Create `myapp/index.js` and `myapp/index.html` files for initializing Essential JS 2 Pager control.

Adding Syncfusion resources

The Essential JS 2 Pager control can be initialized by using either of the following ways.

- Using local script and style.
- Using CDN link for script and style.

Using local script and style

You can get the global scripts and styles from the [Essential Studio JavaScript \(Essential JS 2\)](#) build installed location.

After installing the Essential JS 2 product build, you can copy the pager and its dependencies scripts and style file into the `resources/scripts` and `resources/styles` folder.

Refer the below code to find location pager's script and style file.

Syntax:

Script: `(installed location)/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/dist/global/{PACKAGE_NAME}.min.js`

Styles: `(installed location)/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/styles/material.css`

Example:

Script: C:/Program Files (x86)/Syncfusion/Essential Studio/15.4.30/Essential JS 2/ej2-grids/dist/global/ej2-grids.min.js

Styles: C:/Program Files (x86)/Syncfusion/Essential Studio/15.4.30/Essential JS 2/ej2-grids/styles/material.css

After copying the files, then you can refer the pager's scripts and styles into the `index.html` file.

```

`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2 Pager</title>
<!-- Essential JS 2 material base style -->
<link href="resources/styles/base/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 material theme -->
<link href="resources/styles/grid/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 Pager's dependent global script -->
<script src="resources/scripts/ej2-base.min.js" type="text/javascript"></script>
<!-- Essential JS 2 Pager's global script -->
<script src="resources/scripts/ej2-grids.min.js" type="text/javascript"></script>
</head>
<body>
</body>
</html>
`

```

Using CDN link for script and style

Using CDN link, you can directly refer the pager control's script and style into the `index.html`.

Refer the pager's CDN links as below

Syntax:

Script: `http://cdn.syncfusion.com/ej2/{PACKAGENAME}/dist/global/{PACKAGENAME}.min.js`

Styles: `http://cdn.syncfusion.com/ej2/{PACKAGE_NAME}/styles/material.css`

Example:

Script: <http://cdn.syncfusion.com/ej2/ej2-grids/dist/global/ej2-grids.min.js>

Styles: <http://cdn.syncfusion.com/ej2/ej2-grids/styles/material.css>

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2 Pager</title>
<!-- Essential JS 2 base material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-base/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 pager material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-grids/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 Pager's dependent global script -->
<script src="http://cdn.syncfusion.com/ej2/ej2-base/dist/global/ej2-base.min.js"
type="text/javascript"></script>
<!-- Essential JS 2 Pager's global script -->
<script src="http://cdn.syncfusion.com/ej2/ej2-grids/dist/global/ej2-grids.min.js"
type="text/javascript"></script>
</head>
<body>
</body>
</html>
`
```

Adding Pager control

Now, you can start adding Pager control in the application. For getting started, add a `div` element for Pager control in `index.html`. Then refer the `index.js` file into the `index.html` file.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2 Pager</title>
<!-- Essential JS 2 base material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-base/styles/material.css" rel="stylesheet"
type="text/css"/>
```

```
<!-- Essential JS 2 pager material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-grids/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 Pager's dependent global script -->
<script src="http://cdn.syncfusion.com/ej2/ej2-base/dist/global/ej2-base.min.js"
type="text/javascript"></script>
<!-- Essential JS 2 Pager's global script -->
<script src="http://cdn.syncfusion.com/ej2/ej2-grids/dist/global/ej2-grids.min.js"
type="text/javascript"></script>
</head>
<body>
<!-- Add the HTML <div> element for pager -->
<div id="Pager"></div>
<script src="index.js" type="text/javascript"></script>
</body>
</html>
```

Place the following pager code in the `index.js`.

```
`javascript
var pager = ej.grids.Pager();
pager.appendTo('#Pager');
```

Page Size

`pageSize` value defines the number records to be displayed per page. The default value for the `pageSize` is 12.

INDEX.JS

```
var pager = new ej.grids.Pager({
    totalRecordsCount: 20,
    pageSize: 1
});
pager.appendTo('#Pager');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Pager</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Pager Component">
  <meta name="author" content="Syncfusion">
```

```

<link href="styles.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
grids/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
navigations/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
dropdowns/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
lists/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
inputs/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
calendars/styles/material.css" rel="stylesheet">

<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
splitbuttons/styles/material.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Pager"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Page Count

pageCount value defines the number of pages to be displayed in the pager component for navigation. The default value for **pageCount** is 10 and value will be updated based on **totalRecordsCount** and **pageSize** values.

INDEX.JS

```

var pager = new ej.grids.Pager({
    totalRecordsCount: 20,

```

```
    pageSize: 1,  
    pageCount: 3  
});  
pager.appendTo('#Pager');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>  
  <title>EJ2 Pager</title>  
  <meta charset="utf-8">  
  <meta name="viewport" content="width=device-width, initial-scale=1.0">  
  <meta name="description" content="Typescript Pager Component">  
  <meta name="author" content="Syncfusion">  
  <link href="styles.css" rel="stylesheet">  
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-  
base/styles/material.css" rel="stylesheet">  
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-  
grids/styles/material.css" rel="stylesheet">  
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-  
buttons/styles/material.css" rel="stylesheet">  
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-  
popups/styles/material.css" rel="stylesheet">  
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-  
navigations/styles/material.css" rel="stylesheet">  
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-  
dropdowns/styles/material.css" rel="stylesheet">  
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-  
lists/styles/material.css" rel="stylesheet">  
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-  
inputs/styles/material.css" rel="stylesheet">  
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-

  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-  
splitbuttons/styles/material.css" rel="stylesheet">  
  
  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"  
type="text/javascript"></script>  
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type  
="text/javascript"></script>  
</head>  
<body>  
  
  <div id="container">  
    <div id="Pager"></div>  
  </div>  
<script>  
var ele = document.getElementById('container');  
if(ele) {  
  ele.style.visibility = "visible";  
}
```

```
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Run the application

Now, run the `index.html` in web browser, it will render the Essential JS 2 Pager control.

Output will be appears as follows.

INDEX.JS

```
var pager = new ej.grids.Pager({
  pageSize: 8,
  pageCount: 3,
  totalRecordsCount: 20,
});
pager.appendTo('#Pager');
```

INDEX.HTML

```

  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
splitbuttons/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
```

```

<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Pager"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Style and appearance in EJ2 JavaScript Pager control

To modify the Pager appearance, you need to override the default CSS of Pager. Please find the CSS structure that can be used to modify the Pager appearance. Also, you have an option to create your own custom theme for all the JavaScript controls using our [Theme Studio](#).

Customizing the Pager

Use the below CSS to customize the Pager root element.

```

,

.e-pager {
background-color: #deecf9;
}
,

```

Customizing the Pager container element

Use the below CSS to customize the pager container element.

```

,

.e-pager .e-pagercontainer {
background-color: #deecf9;
}
,

```

Customizing the Pager navigation elements

Customize the pager navigation elements, using the below selector.

```

,

.e-pager .e-prevpagedisabled,
.e-pager .e-prevpage,
.e-pager .e-nextpage,

```

```
.e-pager .e-nextpagedisabled,  
.e-pager .e-lastpagedisabled,  
.e-pager .e-lastpage,  
.e-pager .e-firstpage,  
.e-pager .e-firstpagedisabled {  
background-color: #deecf9;  
}  
,
```

Customizing the Pager page numeric link elements

Use the below CSS to customize the pager current page numeric link elements.

```
,  
  
.e-pager .e-numericitem {  
border-radius: initial;  
}  
,
```

Customizing the Pager current page numeric element

Using this CSS, you can customize the pager current page numeric item.

```
,  
  
.e-pager .e-currentitem {  
background-color: #0078d7;  
}  
,
```

Accessibility in EJ2 JavaScript Pager control

Accessibility is achieved in the Pager component through WAI-ARIA standard and keyboard navigations. The Pager features can be effectively accessed through assistive technologies such as screen readers.

WAI-ARIA

WAI-ARIA (Accessibility Initiative – Accessible Rich Internet Applications) defines a way to increase the accessibility of web pages, dynamic content, and user interface components developed with Ajax, HTML, JavaScript, and related technologies. ARIA provides additional semantics to describe the role, state, and functionality of web components.

The following ARIA attributes are used in the Pager:

- pager (data-role)
- aria-selected (attribute)
- aria-owns (attribute)
- aria-label (attribute)

Keyboard navigation

Pager functionalities can be interactive with keyboard shortcuts.

The following keyboard shortcuts are supported by the Pager.

Interaction Keys | Description

Pager | |

Alt + J | Focus on the first pager item.

Tab / Shift + Tab | Focus on the next/previous pager item.

Enter / Space | Select the currently focused page.

Right Arrow / PageDown | Navigate to next page.

Left Arrow / PageUp | Navigate to previous page.

Home / End | Navigate to first and last page.

PDF Viewer

Getting Started

Getting started in Standalone PDF Viewer control

The Essential JS 2 for JavaScript (global script) is an ES5 formatted pure JavaScript framework which can be directly used in latest web browsers.

Component Initialization with CDN link for script and style reference

Step 1: Create an app folder `myapp` for the Essential JS 2 JavaScript components.

Step 2: The Essential JS 2 component's global scripts and styles are already hosted in the below CDN link formats.

Syntax:

Script: `https://cdn.syncfusion.com/ej2/{Version}/dist/{PACKAGE_NAME}.min.js`

Styles: `https://cdn.syncfusion.com/ej2/{Version}/{PACKAGE_NAME}/styles/material.css`

Example:

Script: <https://cdn.syncfusion.com/ej2/23.1.36/dist/ej2.min.js>

Styles: <https://cdn.syncfusion.com/ej2/23.1.36/ej2-base/styles/material.css>

Note: While referring the scripts from the downloaded resources in your application, make sure to place the 'ej2-pdfviewer-lib' assets in the same directory as the 'ej2.min.js' script.

Step 3: Create a HTML page (index.html) in `myapp` location and add the CDN link references. Now, add the Div element and initiate the Essential JS 2 PDF Viewer component in the index.html by using following code.

INDEX.HTML

```

<!DOCTYPE html><html xmlns="http://www.w3.org/1999/xhtml"><head>
  <title>Essential JS 2</title>
  <!-- Essential JS 2 material theme -->
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
pdfviewer/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
navigations/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
dropdowns/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
lists/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
inputs/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
splitbuttons/styles/material.css" rel="stylesheet">
  <!-- Essential JS 2 PDF Viewer's script -->
  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
  <body>
    <!--element which is going to render-->
    <div id="container">
      <div id="PdfViewer" style="height:580px;width:100%;"></div>
    </div>
    <script>
      //Initialize PDF Viewer component
      var pdfviewer = new ej.pdfviewer.PdfViewer({
documentPath:'https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf',
resourceUrl:'https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2-pdfviewer-lib'
      });
      ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Print, ej.pdfviewer.Navigation,
ej.pdfviewer.Toolbar,ej.pdfviewer.Magnification, ej.pdfviewer.Annotation,
ej.pdfviewer.FormDesigner, ej.pdfviewer.FormFields);

      //PDF Viewer control rendering starts
      pdfviewer.appendTo('#PdfViewer');
    </script>
    <script>
      var ele = document.getElementById('container');
      if(ele) {
        ele.style.visibility = "visible";
      }
    </script>
  </script>

```

```
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
</body></html>
```

Step 4: Now, run the `index.html` in web browser, it will render the **Essential JS 2 PDF Viewer** component.

Limitation over Server-Backed PDF Viewer to Standalone PDF Viewer control

When comparing a Standalone PDF Viewer to a Server-Backed PDF Viewer control, it's crucial to understand the limitations that the Standalone PDF Viewer may have in comparison. These limitations are important to consider

PNG Image Support

The Standalone PDF Viewer does not have the capability to utilize PNG format for adding images to handwritten annotations ,custom stamp ,signature and initial form fields. It's important to be aware that only certain image formats, such as JPEG, are compatible for these purposes.

Local File Access

- The Standalone PDF Viewer control does not have the capability to directly access and load local physical files from a user's device. As a result, it is not possible to use a `documentPath` to load a PDF file directly from a local server within the viewer.
- The Standalone PDF Viewer allows users to export annotations and form fields from the viewer, it's important to be aware that the viewer does not support the direct import of annotations and form fields from a locally specified file path. In other words, you can extract annotations and form fields from the viewer, but you cannot reintroduce them into the viewer from external sources by specifying a file path located on your local device.

Note: These limitations are temporary and are expected to be addressed in the near future.

Getting started in EJ2 JavaScript PDF Viewer control

The Essential JS 2 for JavaScript (global script) is an ES5 formatted pure JavaScript framework which can be directly used in latest web browsers.

Component Initialization with CDN link for script and style reference

Step 1: Create an app folder `myapp` for the Essential JS 2 JavaScript components.

Step 2: The Essential JS 2 component's global scripts and styles are already hosted in the below CDN link formats.

Syntax:

Script: `https://cdn.syncfusion.com/ej2/{Version}/dist/{PACKAGE_NAME}.min.js`

Styles: `https://cdn.syncfusion.com/ej2/{Version}/{PACKAGE_NAME}/styles/material.css`

Example:

Script: <https://cdn.syncfusion.com/ej2/23.1.36/dist/ej2.min.js>

Styles: <https://cdn.syncfusion.com/ej2/23.1.36/ej2-base/styles/material.css>

Step 3: Create a HTML page (index.html) in myapp location and add the CDN link references. Now, add the Div element and initiate the Essential JS 2 PDF Viewer component in the index.html by using following code.

INDEX.HTML

```
<!DOCTYPE html><html xmlns="http://www.w3.org/1999/xhtml"><head>
  <title>Essential JS 2</title>
  <!-- Essential JS 2 material theme -->
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
pdfviewer/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
navigations/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
dropdowns/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
lists/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
inputs/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
splitbuttons/styles/material.css" rel="stylesheet">
  <!-- Essential JS 2 PDF Viewer's script -->
  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
  <body>
    <!--element which is going to render-->
    <div id="container">
      <div id="PdfViewer" style="height:580px;width:100%;">
      </div>
    </div>
    <script>
      //Initialize PDF Viewer component
      var pdfviewer = new ej.pdfviewer.PdfViewer({
        documentPath:
"https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
        serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'
      });
      ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Print, ej.pdfviewer.Navigation,
ej.pdfviewer.Toolbar,
```

```

ej.pdfviewer.Magnification,
ej.pdfviewer.Annotation, ej.pdfviewer.FormDesigner,
ej.pdfviewer.FormFields);
    //PDF Viewer control rendering starts
    pdfviewer.appendTo('#PdfViewer');
</script>
<script>
    var ele = document.getElementById('container');
    if(ele) {
        ele.style.visibility = "visible";
    }
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
</body></html>

```

Note: We have provided the support to dynamically change the `serviceURL`. So, after changing the `serviceURL` dynamically, you need invoke the `pdfViewer.dataBind()` method to update the `serviceURL` quickly. This will effectively change the `serviceURL` dynamically. Ensure that this step is performed after version 23.1.36.

```

document.getElementById('load').addEventListener('click', function () {
pdfViewer.serviceUrl = "https://services.syncfusion.com/angular/production/api/pdfviewer";
pdfViewer.documentPath = "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf";
pdfViewer.dataBind();
pdfViewer.load(pdfViewer.documentPath, null);
});

```

Step 4: Now, run the `index.html` in web browser, it will render the `Essential JS 2 PDF Viewer` component.

For PDF Viewer `serviceUrl` creation, follow the steps provided in the [link](#)

How to run the PDF Viewer web service

1. Download the sample from the [Web service sample in GitHub](#) link.
2. Navigate to the `ASP.NET Core` folder and open it in the command prompt.
3. Use the below command to restore the required packages.

```
dotnet restore
```

4. Use the below command to run the web service.

dotnet run

5. You can see that the PDF Viewer server instance runs in the localhost with the port number localhost:5001 and navigate to the PDF Viewer Web control localhost:5001/pdfviewer which returns the default get response method. We can bind the link to the `serviceUrl` property of PDF Viewer as below.

```
`javascript
var pdfviewer = new ej.pdfviewer.PdfViewer({
documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
serviceUrl: 'https://localhost:5001/pdfviewer'
});
```

Note: When configuring the server-backed PDF viewer, it's essential to understand that there is no need to include the pdfium.js and pdfium.wasm files. Unlike the standalone PDF viewer, which relies on these files for local rendering, the server-backed PDF viewer fetches and renders PDFs directly from the server. Consequently, you can exclude the copy command for deployment process, as they are not required to load and display PDFs in this context.

Feature module in EJ2 JavaScript Pdfviewer control

The PDF Viewer features are segregated into individual feature-wise modules to enable selectively referencing in the application. The required modules should be injected to extend its functionality. The following are the selective modules of PDF Viewer that can be included as required:

The available PdfViewer modules are:

- **Toolbar:**- Built-in toolbar for better user interaction.
- **Magnification:**- Perform zooming operation for better viewing experience.
- **Navigation:**- Easy navigation across the PDF pages.
- **LinkAnnotation:**- Easy navigation within and outside of the PDF document.
- **ThumbnailView:**- Easy navigation with in the PDF document.
- **BookmarkView:**- Easy navigation based on the bookmark content of the PDF document.
- **TextSelection:**- Select and copy text from a PDF file.
- **TextSearch:**- Search a text easily across the PDF document.
- **Print:**- Print the entire document or a specific page directly from the browser.
- **Annotation:**- Annotations can be added or edited in the PDF document.
- **FormFields:**- Preserve the form fields in the PDF document.
- **FormDesigner:**- Form fields can be added or edited in the PDF document.

In addition to injecting the required modules in your application, enable corresponding properties to extend the functionality for a PDF Viewer instance.

Refer to the following table.

| Module | Dependent modules to be injected for extending the functionality of PDF Viewer in your application | Property to enable the functionality for a PDF Viewer instance |

|---|---|---|

```
|Toolbar|PdfViewer.Inject(Toolbar)|let pdfViewer: PdfViewer = new PdfViewer({ enableToolbar: true });|
```

```
|Magnification|PdfViewer.Inject(Magnification)|let pdfViewer: PdfViewer = new PdfViewer({ enableMagnification: true });|
```

```
|Navigation|PdfViewer.Inject(Navigation)|let pdfViewer: PdfViewer = new PdfViewer({ enableNavigation: true });|
```

```
|LinkAnnotation|PdfViewer.Inject(LinkAnnotation)|let pdfViewer: PdfViewer = new PdfViewer({ enableHyperlink: true });|
```

```
|ThumbnailView|PdfViewer.Inject(ThumbnailView)|let pdfViewer: PdfViewer = new PdfViewer({ enableThumbnail: true });|
```

```
|BookmarkView|PdfViewer.Inject(BookmarkView)|let pdfViewer: PdfViewer = new PdfViewer({ enableBookmark: true });|
```

```
|TextSelection|PdfViewer.Inject(TextSelection)|let pdfViewer: PdfViewer = new PdfViewer({ enableTextSelection: true });|
```

```
|TextSearch|PdfViewer.Inject(TextSearch)|let pdfViewer: PdfViewer = new PdfViewer({ enableTextSearch: true });|
```

```
|Print|PdfViewer.Inject(Print)|let pdfViewer: PdfViewer = new PdfViewer({ enablePrint: true });|
```

```
|Annotation|PdfViewer.Inject(Annotation)|let pdfViewer: PdfViewer = new PdfViewer({ enableAnnotation: true });|
```

```
|FormFields|PdfViewer.Inject(FormFields)|let pdfViewer: PdfViewer = new PdfViewer({ enableFormFields: true });|
```

```
|FormDesigner|PdfViewer.Inject(FormDesigner)|let pdfViewer: PdfViewer = new PdfViewer({ enableFormDesigner: true });|
```

Open PDF files

You might need to open and view the PDF files from various location. In this section, you can find the information about how to open PDF files from URL, database and as base64 string.

Opening a PDF from URL

If you have your PDF files in the web, you can open it in the viewer using URL.

Step 1: Create a Simple PDF Viewer Sample in JavaScript

Start by following the steps provided in this [link](#) to create a simple PDF viewer sample in JavaScript. This will give you a basic setup of the PDF viewer component.

Step 2: Modify the PdfViewerController.cs File in the Web Service Project

1. Create a web service project in .NET Core 3.0 or above. You can refer to this [link](#) for instructions on how to create a web service project.
2. Open the PdfViewerController.cs file in your web service project.
3. Modify the Load() method to open it in the viewer using URL

```
`csharp
public IActionResult Load([FromBody] Dictionary<string, string> jsonData)
{
    // Initialize the PDF viewer object with memory cache object
    PdfRenderer pdfviewer = new PdfRenderer(_cache);
    MemoryStream stream = new MemoryStream();
    object jsonResult = new object();
    if (jsonObject != null && jsonObject.ContainsKey("document"))
    {
        if (bool.Parse(jsonObject["isFileName"]))
        {
            string documentPath = GetDocumentPath(jsonData["document"]);
            if (!string.IsNullOrEmpty(documentPath))
            {
                byte[] bytes = System.IO.File.ReadAllBytes(documentPath);
                stream = new MemoryStream(bytes);
            }
            else
            {
                string fileName = jsonData["document"].Split(new string[] { "://" }, StringSplitOptions.None)[0];
                if (fileName == "http" || fileName == "https")
                {
                    WebClient WebClient = new WebClient();
                    byte[] pdfDoc = WebClient.DownloadData(jsonData["document"]);
                    stream = new MemoryStream(pdfDoc);
                }
            }
        }
    }
}
```

```

else
{
return this.Content(jsonData["document"] + " is not found");
}
}
}
else
{
byte[] bytes = Convert.FromBase64String(jsonObject["document"]);
stream = new MemoryStream(bytes);
}
}
jsonResult = pdfviewer.Load(stream, jsonObject);
return Content(JsonConvert.SerializeObject(jsonResult));
}
`

```

Step 3: Set the PDF Viewer Properties in React PDF viewer component

Modify the `serviceUrl` property of the PDF viewer component with the accurate URL of your web service project, replacing `https://localhost:44396/pdfviewer` with the actual URL of your server. Modify the `documentPath` with the correct PDF Document URL want to load.

```

`javascript
import { PdfViewer, Toolbar, Magnification, Navigation, LinkAnnotation, ThumbnailView,
BookmarkView, TextSelection, Annotation, FormFields, FormDesigner} from '@syncfusion/ej2-
pdfviewer';

PdfViewer.Inject( Toolbar, Magnification, Navigation, LinkAnnotation, ThumbnailView,
BookmarkView, TextSelection, Annotation, FormFields, FormDesigner);

let viewer: PdfViewer = new PdfViewer();

// Replace correct PDF Document URL want to load
viewer.documentPath="https://cdn.syncfusion.com/content/PDFViewer/flutter-succinctly.pdf"

// Replace the "localhost:44396" with the actual URL of your server
viewer.serviceUrl = 'https://localhost:44396/pdfviewer';
viewer.appendTo('#pdfViewer');
`

```

[View sample in GitHub](#)

Opening a PDF from base64 data

The following steps explain how the PDF file can be loaded in PDF Viewer as base64 string.

Step 1: Create a Simple PDF Viewer Sample in Angular

Start by following the steps provided in this [link](#) to create a simple PDF viewer sample in Angular. This will give you a basic setup of the PDF viewer component.

Step 2: Use the following code snippet to load PDF document using base64 string.

```
,
<button id='load'>LoadDocumentFromBase64</button>
,
`javascript
// Load PDF document from Base64 string
document.getElementById('load').addEventListener('click', () => {
viewer.load(
'data:application/pdf;base64,'+ AddBase64String, null);
}
,
```

[View sample in GitHub](#)

Opening a PDF from database

To load a PDF file from SQL Server database in a PDF Viewer, you can follow the steps below

Step 1: Create a Simple PDF Viewer Sample in JavaScript

Start by following the steps provided in this [link](#) to create a simple PDF viewer sample in JavaScript. This will give you a basic setup of the PDF viewer component.

Step 2: Modify the PdfViewerController.cs File in the Web Service Project

1. Create a web service project in .NET Core 3.0 or above. You can refer to this [link](#) for instructions on how to create a web service project.
2. Open the PdfViewerController.cs file in your web service project.
3. Import the required namespaces at the top of the file:

```
`csharp
using System.IO;
using System.Data.SqlClient;
,
```

4. Add the following private fields and constructor parameters to the PdfViewerController class, In the constructor, assign the values from the configuration to the corresponding fields

```
`csharp
```

```

private IConfiguration _configuration;
public readonly string _connectionString;
public PdfViewerController(IWebHostEnvironment hostingEnvironment, IMemoryCache cache,
IConfiguration configuration)
{
    _hostingEnvironment = hostingEnvironment;
    _cache = cache;
    _configuration = configuration;
    connectionString = configuration.GetValue<string>("ConnectionString");
}
`

```

5. Modify the `Load()` method to open it in the viewer using URL

```

`csharp
public IActionResult Load([FromBody] Dictionary<string, string> jsonData)
{
    // Initialize the PDF viewer object with memory cache object
    PdfRenderer pdfviewer = new PdfRenderer(_cache);
    MemoryStream stream = new MemoryStream();
    object jsonResult = new object();
    if (jsonObject != null && jsonObject.ContainsKey("document"))
    {
        if (bool.Parse(jsonObject["isFileName"]))
        {
            string documentPath = GetDocumentPath(jsonData["document"]);
            if (!string.IsNullOrEmpty(documentPath))
            {
                byte[] bytes = System.IO.File.ReadAllBytes(documentPath);
                stream = new MemoryStream(bytes);
            }
            string documentName = jsonObject["document"];
            string connectionString = _connectionString;
            System.Data.SqlClient.SqlConnection connection = new
            System.Data.SqlClient.SqlConnection(connectionString);

```

```
//Searches for the PDF document from the database
string query = "SELECT FileData FROM Table WHERE FileName = '" + documentName + "'";
System.Data.SqlClient.SqlCommand command = new System.Data.SqlClient.SqlCommand(query,
connection);
connection.Open();
using (SqlDataReader reader = command.ExecuteReader())
{
    if (reader.Read())
    {
        byte[] byteArray = (byte[])reader["FileData"];
        stream = new MemoryStream(byteArray);
    }
}
else
{
    byte[] bytes = Convert.FromBase64String(jsonObject["document"]);
    stream = new MemoryStream(bytes);
}
jsonResult = pdfviewer.Load(stream, jsonObject);
return Content(JsonConvert.SerializeObject(jsonResult));
}
```

6. Open the `appsettings.json` file in your web service project, Add the following lines below the existing `"AllowedHosts"` configuration

```
`json
{
  "Logging": {
    "LogLevel": {
      "Default": "Information",
      "Microsoft.AspNetCore": "Warning"
    }
  }
}
```

```

},
"AllowedHosts": "*",
"ConnectionString": "Your connection string for SQL server"
}
`

```

Note: Replace **Your Connection string from SQL server** with the actual connection string for your SQL Server database

Note: The **System.Data.SqlClient** package must be installed in your application to use the previous code example. You need to modify the connectionString variable in the previous code example as per the connection string of your database.

[View sample in GitHub](#)

Saving PDF file

After editing the PDF file with various annotation tools, you will need to save the updated PDF to the server, database, or local file system.

Save PDF file to Server

Need to save the modified PDF back to a server. To achieve this, proceed with the following steps

Step 1: Create a Simple PDF Viewer Sample in JavaScript

Start by following the steps provided in this [link](#) to create a simple PDF viewer sample in JavaScript. This will give you a basic setup of the PDF viewer component.

Step 2: Modify the PdfViewerController.cs File in the Web Service Project

1. Create a web service project in .NET Core 3.0 or above. You can refer to this [link](#) for instructions on how to create a web service project.
2. Open the PdfViewerController.cs file in your web service project.
3. Modify the Download() method to open it in the viewer using URL

```

`csharp
public IActionResult Download([FromBody] Dictionary<string, string> jsonObject)
{
    //Initialize the PDF Viewer object with memory cache object
    PdfRenderer pdfviewer = new PdfRenderer(_cache);
    string documentBase = pdfviewer.GetDocumentAsBase64(jsonObject);
    MemoryStream stream = new MemoryStream();
    string documentName = jsonObject["document"];
    string result = Path.GetFileNameWithoutExtension(documentName);
    string fileName = result + "_downloaded.pdf";
    // Save the file on the server

```

```

string serverFilePath = @"Path to where you need to save your file in the server";
string filePath = Path.Combine(serverFilePath, fileName);
using (FileStream fileStream = new FileStream(filePath, FileMode.Create))
{
    //Saving the new file in root path of application
    stream.CopyTo(fileStream);
    fileStream.Close();
}
return Content(documentBase);
}
`

```

Step 3: Set the PDF Viewer Properties in React PDF viewer component

Modify the `serviceUrl` property of the PDF viewer component with the accurate URL of your web service project, replacing `https://localhost:44396/pdfviewer` with the actual URL of your server. Modify the `documentPath` with the correct PDF Document URL want to load.

```

`javascript
import { PdfViewer, Toolbar, Magnification, Navigation, LinkAnnotation, ThumbnailView,
BookmarkView, TextSelection, Annotation, FormFields, FormDesigner } from '@syncfusion/ej2-
pdfviewer';

PdfViewer.Inject( Toolbar, Magnification, Navigation, LinkAnnotation, ThumbnailView,
BookmarkView, TextSelection, Annotation, FormFields, FormDesigner);

let viewer: PdfViewer = new PdfViewer();

// Replace PDF_Succinctly.pdf with the actual document name that you want to load
viewer.documentPath = "PDF_Succinctly.pdf"
viewer.serviceUrl = 'https://localhost:44396/pdfviewer';
viewer.appendTo('#pdfViewer');
`

```

[View sample in GitHub](#)

Download PDF file as a copy

In the built-in toolbar, you have an option to download the updated PDF to the local file system, you can use it to download the PDF file.

```

`html
<button id="download">Download</button>
`

`javascript

```

```
document.getElementById('download').addEventListener('click', function () {
//API to perform download action.
viewer.download();
});
`
```

Save PDF file to Database

If you have plenty of PDF files stored in database and you want to save the updated PDF file back to the database, use the following code example.

Step 1: Create a Simple PDF Viewer Sample in JavaScript

Start by following the steps provided in this [link](#) to create a simple PDF viewer sample in JavaScript. This will give you a basic setup of the PDF viewer component.

Step 2: Modify the PdfViewerController.cs File in the Web Service Project

1. Create a web service project in .NET Core 3.0 or above. You can refer to this [link](#) for instructions on how to create a web service project.
2. Open the PdfViewerController.cs file in your web service project.
3. Import the required namespaces at the top of the file:

```
`csharp
using System.IO;
using System.Data.SqlClient;
`
```

4. Add the following private fields and constructor parameters to the PdfViewerController class, In the constructor, assign the values from the configuration to the corresponding fields

```
`csharp
private IConfiguration _configuration;
public readonly string _connectionString;
public PdfViewerController(IWebHostEnvironment hostingEnvironment, IMemoryCache cache,
IConfiguration configuration)
{
    _hostingEnvironment = hostingEnvironment;
    _cache = cache;
    _configuration = configuration;
    connectionString = configuration.GetValue<string>("ConnectionString");
}
`
```

5. Modify the `Download()` method to open it in the viewer using URL

```
`csharp
[HttpPost("Download")]
[Microsoft.AspNetCore.Cors.EnableCors("MyPolicy")]
[Route("[controller]/Download")]
//Post action for downloading the PDF documents
public async Task<ActionResult> Download([FromBody] Dictionary<string, string> jsonObject)
{
    //Initialize the PDF Viewer object with memory cache object
    PdfRenderer pdfviewer = new PdfRenderer(_cache);
    string documentBase = pdfviewer.GetDocumentAsBase64(jsonObject);
    byte[] documentBytes = Convert.FromBase64String(documentBase.Split(",")[1]);
    string documentId = jsonObject["documentId"];
    string result = Path.GetFileNameWithoutExtension(documentId);
    string fileName = result + "_downloaded.pdf";
    string connectionString = _connectionString;
    using (SqlConnection connection = new SqlConnection(connectionString))
    {
        connection.Open();
        using (SqlCommand cmd = new SqlCommand("INSERT INTO Table (FileName, fileData) VALUES (@FileName, @fileData)", connection))
        {
            cmd.Parameters.AddWithValue("@FileName", fileName);
            cmd.Parameters.AddWithValue("@fileData", documentBytes);
            cmd.ExecuteNonQuery();
        }
        connection.Close();
    }
    return Content(documentBase);
}
```

6. Open the `appsettings.json` file in your web service project, Add the following lines below the existing `"AllowedHosts"` configuration

```

`json
{
  "Logging": {
    "LogLevel": {
      "Default": "Information",
      "Microsoft.AspNetCore": "Warning"
    }
  },
  "AllowedHosts": "*",
  "ConnectionString": "Your connection string for SQL server"
}
`

```

Note: Replace **Your Connection string from SQL server** with the actual connection string for your SQL Server database

Note: The **System.Data.SqlClient** package must be installed in your application to use the previous code example. You need to modify the connectionString variable in the previous code example as per the connection string of your database.

[View sample in GitHub](#)

Toolbar in EJ2 JavaScript Pdfviewer control

The PDF Viewer comes with a powerful built-in toolbar to execute important actions such as page navigation, text search, view mode, download, print, bookmark, and thumbnails.

The following table shows built-in toolbar items and its actions:-

Option	Description
OpenOption	This option provides an action to load the PDF documents to the PDF Viewer.
PageNavigationTool	This option provides an action to navigate the pages in the PDF Viewer. It contains GoToFirstPage, GoToLastPage, GotoPage, GoToNext, and GoToLast tools.
MagnificationTool	This option provides an action to magnify the pages either with predefined or user defined zoom factors in the PDF Viewer. Contains ZoomIn, ZoomOut, Zoom, FitPage and FitWidth tools.
PanTool	This option provides an action for panning the pages in the PDF Viewer.
SelectionTool	This option provides an action to enable/disable the text selection in the PDF Viewer.
SearchOption	This option provides an action to search a word in the PDF documents.
PrintOption	This option provides an action to print the PDF document being loaded in the PDF Viewer.
DownloadOption	This Download option provides an action to download the PDF document that has been loaded in the PDF Viewer.

| UndoRedoTool | This tool provides options to undo and redo the annotation actions performed in the PDF Viewer. |

| AnnotationEditTool | This tool provides options to enable or disable the edit mode of annotation in the PDF Viewer. |

| FormDesignerEditTool | This tool provides options to enable or disable the edit mode of form fields in the PDF Viewer. |

Show/Hide the default toolbar

The PDF Viewer has an option to show or hide the complete default toolbar. You can achieve this by using following two ways.,

```
`html
{% raw %}
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 fabric theme -->
<link href="{{CDN_LINK}}ej2-pdfviewer/styles/fabric.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 PDF Viewer's global script -->
<script src="{{CDN_LINK}}dist/ej2.min.js" type="text/javascript"></script>
</head>
<body>
<!--element which is going to render-->
<div id='container'>
<div id='PdfViewer' style="height:500px;width:100%;">
</div>
</div>
</body>
</html>
{% endraw %}
`
```

- **Show/Hide toolbar using enableToolbar API as in the following code snippet**

INDEX.HTML

```
<!DOCTYPE html><html xmlns="http://www.w3.org/1999/xhtml"><head>
<title>Essential JS 2</title>
```

```

<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
pdfviewer/styles/material.css" rel="stylesheet">

type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>
<!--element which is going to render-->
<div id="container">
<div id="PdfViewer" style="height:500px;width:100%;">
</div>
</div>
<script>
// Initialize PDF Viewer component.
var pdfviewer = new ej.pdfviewer.PdfViewer({
enableToolbar: false,
documentPath:
"https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
resourceUrl:'https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2-pdfviewer-lib'
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Print, ej.pdfviewer.Navigation,
ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.Annotation, ej.pdfviewer.FormDesigner,
ej.pdfviewer.FormFields);
pdfviewer.appendTo('#PdfViewer');
</script>

<script>
var ele = document.getElementById('container');
if(ele) {
ele.style.visibility = "visible";
}
</script>
</body></html>

```

Note: To set up the **server-backed PDF Viewer**,

Add the below `serviceUrl` in the `index.html` file

`serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'`

- **Show/Hide toolbar using showToolbar as in the following code snippet**

INDEX.HTML

```
<!DOCTYPE html><html xmlns="http://www.w3.org/1999/xhtml"><head>
  <title>Essential JS 2</title>
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
pdfviewer/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-

type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
  <body>
    <button id="set">showToolbarItem</button>
    <!--element which is going to render-->
    <div id="container">
      <div id="PdfViewer" style="height:500px;width:100%;"></div>
    </div>
    <script>
      // Initialize PDF Viewer component.
      var pdfviewer = new ej.pdfviewer.PdfViewer({
        documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-
succinctly.pdf",
        resourceUrl: 'https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2-
pdfviewer-lib'
      });
      ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Print, ej.pdfviewer.Navigation,
ej.pdfviewer.Toolbar,
```

```

ej.pdfviewer.Magnification,
ej.pdfviewer.Annotation, ej.pdfviewer.FormDesigner,
ej.pdfviewer.FormFields);
    pdfviewer.appendTo('#PdfViewer');
    document.getElementById('set').addEventListener('click', ()=> {
        pdfviewer.toolbar.showToolbar(false);
    });
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
</body></html>

```

Note: To set up the **server-backed PDF Viewer**,

Add the below `serviceUrl` in the `index.html` file

`serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'`

Show/Hide the default toolbaritem

The PDF Viewer has an option to show or hide these grouped items in the default toolbar.

- **Show/Hide toolbaritem using toolbarSettings as in the following code snippet.**

INDEX.HTML

```

<!DOCTYPE html><html xmlns="http://www.w3.org/1999/xhtml"><head>
    <title>Essential JS 2</title>
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-

Navigation in EJ2 JavaScript Pdfviewer control

The ASP.NET Core PDF Viewer supports different internal and external navigations.

Toolbar page navigation option

The default toolbar of PDF Viewer contains the following navigation options

- [Go to page](#):- Navigates to the specific page of a PDF document.
- [Show next page](#):- Navigates to the next page of PDF a document.
- [Show previous page](#):- Navigates to the previous page of a PDF document.
- [Show first page](#):- Navigates to the first page of a PDF document.
- [Show last page](#):- Navigates to the last page of a PDF document.

```
`html
{% raw %}
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 fabric theme -->
<link href="{{CDN_LINK}}ej2-pdfviewer/styles/fabric.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 PDF Viewer's global script -->
<script src="{{CDN_LINK}}dist/ej2.min.js" type="text/javascript"></script>
</head>
<body>
<!--element which is going to render-->
<div id='container'>
<div id='PdfViewer' style="height:500px;width:100%;"></div>
</div>
</body>
</html>
{% endraw %}
`
```

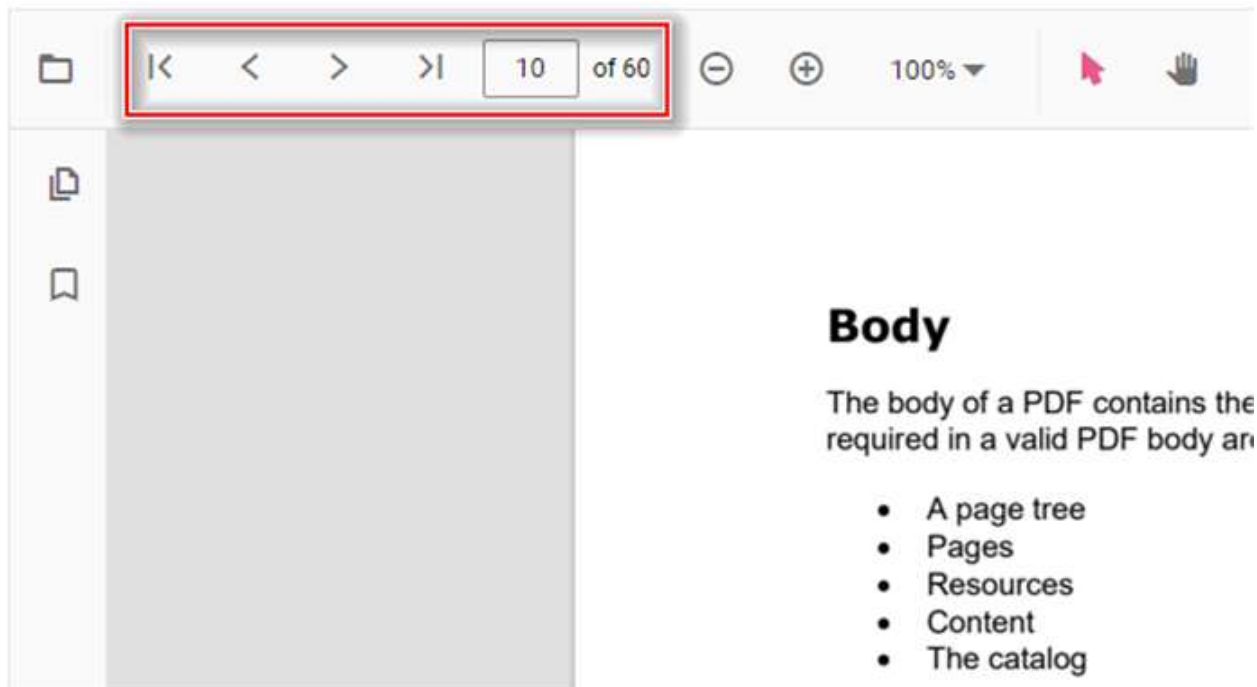

You can enable/disable page navigation option in PDF Viewer using the following code snippet.,

STANDALONE

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
  enableNavigation: true,
  documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation, ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');
```

SERVER-BACKED

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
  enableNavigation: true,
  documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
  serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation, ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');
```

Also, you can programmatically perform page navigation options as follows.

```
`html
{% raw %}
```

```

<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 fabric theme -->
<link href="{{:CDN_LINK}}ej2-pdfviewer/styles/fabric.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 PDF Viewer's global script -->
<script src="{{:CDN_LINK}}dist/ej2.min.js" type="text/javascript"></script>
</head>
<body>
<!--element which is going to render-->
<div id='container'>
<button id="goToFirstPage">Go To First Page</button>
<button id="goToLastPage">Go To last Page</button>
<button id="goToNextPage">Go To Next Page</button>
<button id="goToPage">Go To Page</button>
<button id="goToPreviousPage">Go To Previous Page</button>
<div id='PdfViewer' style="height:500px;width:100%;"></div>
</div>
</body>
</html>
{% endraw %}
`

```

STANDALONE

```

var viewer = new ej.pdfviewer.PdfViewer({
  documentPath: 'https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf',
});
ej.pdfviewer.PdfViewer.Inject(
  ej.pdfviewer.Toolbar,
  ej.pdfviewer.Magnification,
  ej.pdfviewer.BookmarkView,
  ej.pdfviewer.ThumbnailView,
  ej.pdfviewer.TextSelection,
  ej.pdfviewer.TextSearch,
  ej.pdfviewer.Print,
  ej.pdfviewer.Navigation,
  ej.pdfviewer.LinkAnnotation,
  ej.pdfviewer.Annotation,
  ej.pdfviewer.FormFields

```

```
);
viewer.appendTo('#pdfViewer');
// Go To First Page
document.getElementById('goToFirstPage').addEventListener('click', () => {
viewer.navigation.goToFirstPage();
});
// Go To Last Page
document.getElementById('goToLastPage').addEventListener('click', () => {
viewer.navigation.goToLastPage();
});
// Go To Next Page
document.getElementById('goToNextPage').addEventListener('click', () => {
viewer.navigation.goToNextPage();
});
// Go To Page
document.getElementById('goToPage').addEventListener('click', () => {
viewer.navigation.goToPage(4);
});
// Go To Previous Page
document.getElementById('goToPreviousPage').addEventListener('click', () => {
{
viewer.navigation.goToPreviousPage();
});
});
```

SERVER-BACKED

```
var viewer = new ej.pdfviewer.PdfViewer({
documentPath: 'https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf',
serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'
});
ej.pdfviewer.PdfViewer.Inject(
ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.BookmarkView,
ej.pdfviewer.ThumbnailView,
ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch,
ej.pdfviewer.Print,
ej.pdfviewer.Navigation,
ej.pdfviewer.LinkAnnotation,
ej.pdfviewer.Annotation,
ej.pdfviewer.FormFields
);
viewer.appendTo('#pdfViewer');
// Go To First Page
document.getElementById('goToFirstPage').addEventListener('click', () => {
viewer.navigation.goToFirstPage();
});
// Go To Last Page
document.getElementById('goToLastPage').addEventListener('click', () => {
viewer.navigation.goToLastPage();
});
// Go To Next Page
document.getElementById('goToNextPage').addEventListener('click', () => {
viewer.navigation.goToNextPage();
});
});
```

```
// Go To Page
document.getElementById('goToPage').addEventListener('click', () => {
viewer.navigation.goToPage(4);
});
// Go To Previous Page
document.getElementById('goToPreviousPage').addEventListener('click', () => {
{
viewer.navigation.goToPreviousPage();
}});
```

Find the [here](#) to perform the page navigation options programmatically.

Bookmark navigation

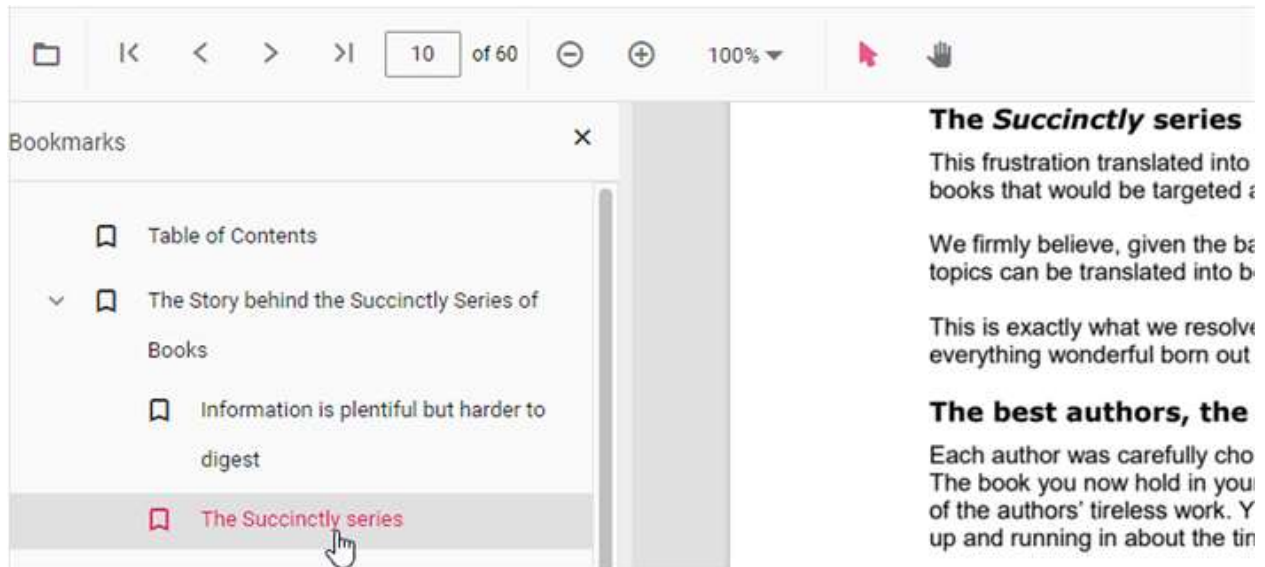

The Bookmarks saved in PDF files are loaded and made ready for easy navigation. You can enable/disable bookmark navigation by using the following code snippet.,

STANDALONE

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
enableBookmark: true,
documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation, ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');
```

SERVER-BACKED

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
enableBookmark: true,
documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation, ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');
```

To perform bookmark navigation, you can use the **goToBookmark** method. It's important to note that the **goToBookmark** method will throw an error if the specified bookmark does not exist in the PDF document.

Here is an example of how to use the **goToBookmark** method:

,

```
<button id="gotobookmark">Specfic Page</button>
```

,

```
`javascript
```

```
document.getElementById('gotobookmark').addEventListener('click', () => {
viewer.bookmark.goToBookmark(x, y);
});
```

,

x - Specifies the pageIndex for Navigate.

y - Specifies the Y coordinates value of the Page.

Also, you can use the **getBookmarks** method to retrieve a list of all the bookmarks in a PDF document. This method returns a List of Bookmark objects, which contain information about each bookmark.

Here is an example of how to use the **getBookmarks** method:

,

```
<button id="getBookmarks">retrieve bookmark</button>
```

,

```
`javascript
```

```
document.getElementById('getBookmarks').addEventListener('click', () => {
var getBookmarks = viewer.bookmark.getBookmarks();
```

```
console.log(getBookmarks)
```

```
});
```

```
,
```

Thumbnail navigation

Thumbnails is the miniature representation of actual pages in PDF files. This feature displays thumbnails of the pages and allows navigation.

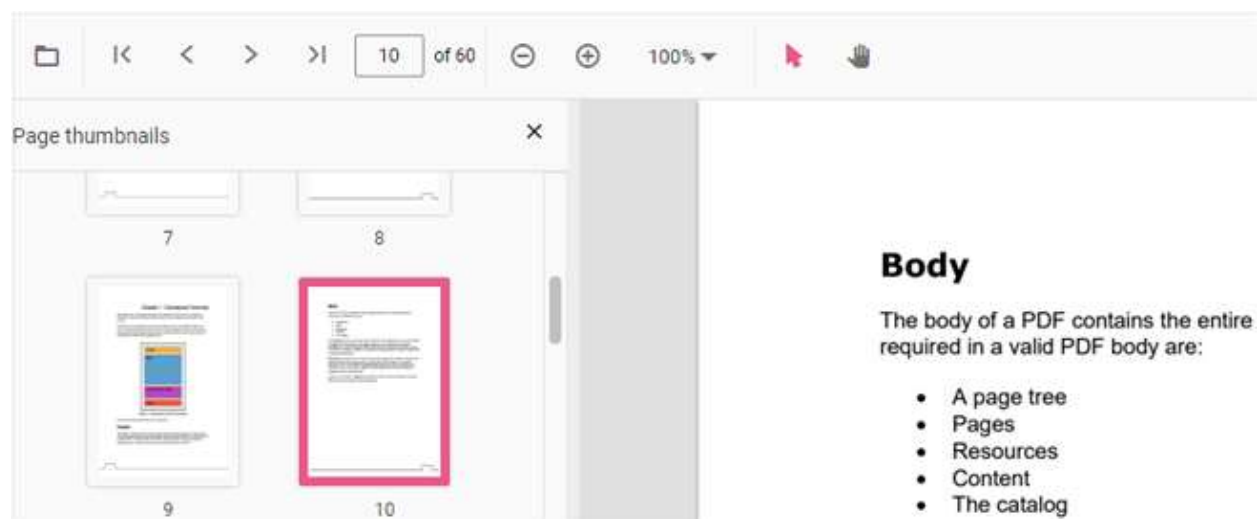

You can enable/disable thumbnail navigation by using the following code snippet.,

STANDALONE

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
  enableThumbnail: true,
  documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation, ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');
```

SERVER-BACKED

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
  enableThumbnail: true,
  documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
  serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation, ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');
```

Hyperlink navigation

Hyperlink navigation features enables navigation to the URLs (website links) in a PDF file.

Table of content navigation

Table of contents navigation allows users to navigate to different parts of a PDF file that are listed in the table of contents section.

You can enable/disable link navigation by using the following code snippet.,

STANDALONE

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
  enableHyperlink: true,
  documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation, ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');
```

SERVER-BACKED

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
  enableHyperlink: true,
  documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
  serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation, ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');
```

You can change the open state of the hyperlink in the PDF Viewer by using the following code snippet,

STANDALONE

```

var pdfviewer = new ej.pdfviewer.PdfViewer({
  enableHyperlink: true,
  documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
  hyperlinkOpenState: 'NewTab',
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation, ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');

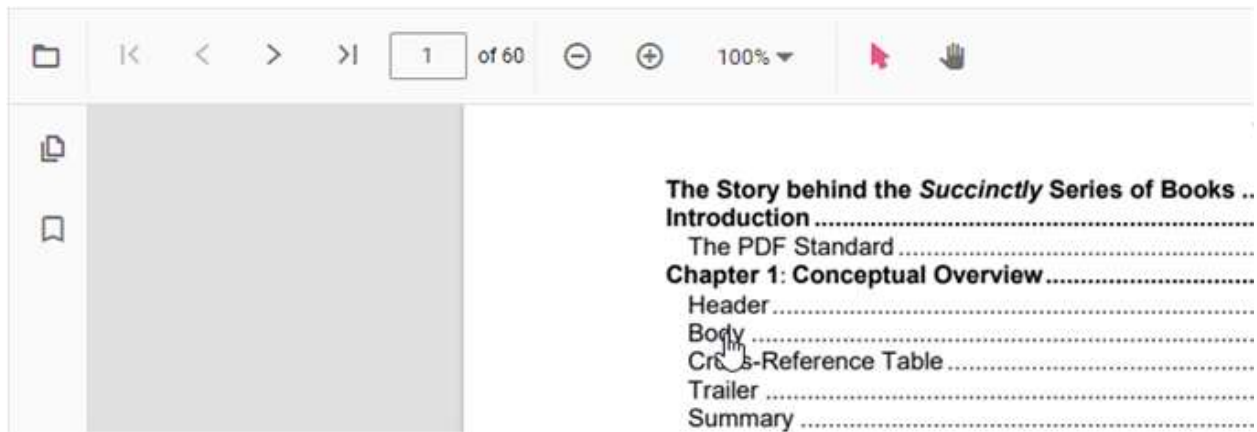

```

SERVER-BACKED

```

var pdfviewer = new ej.pdfviewer.PdfViewer({
  enableHyperlink: true,
  documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
  hyperlinkOpenState: 'NewTab',
  serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation, ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');

```

Magnification in EJ2 JavaScript Pdfviewer control

The magnification tools of the PDF Viewer contains ZoomIn, ZoomOut, Zoom, FitPage, and FitWidth tools in the default toolbar. The PDF Viewer also has an option to show or hide the magnification tools in the default toolbar.

The following code snippet describes how to enable the magnification in PDF Viewer.

```
`html
{% raw %}
<!DOCTYPE html>

<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 fabric theme -->
<link href="{{:CDN_LINK}}ej2-pdfviewer/styles/fabric.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 PDF Viewer's global script -->
<script src="{{:CDN_LINK}}dist/ej2.min.js" type="text/javascript"></script>
</head>
<body>
<!--element which is going to render-->
<div id='container'>
<div id='PdfViewer' style="height:500px;width:100%;">
</div>
</div>
</body>
</html>
{% endraw %}
`
```

STANDALONE

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
  enableMagnification: true,
  documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation, ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');
```

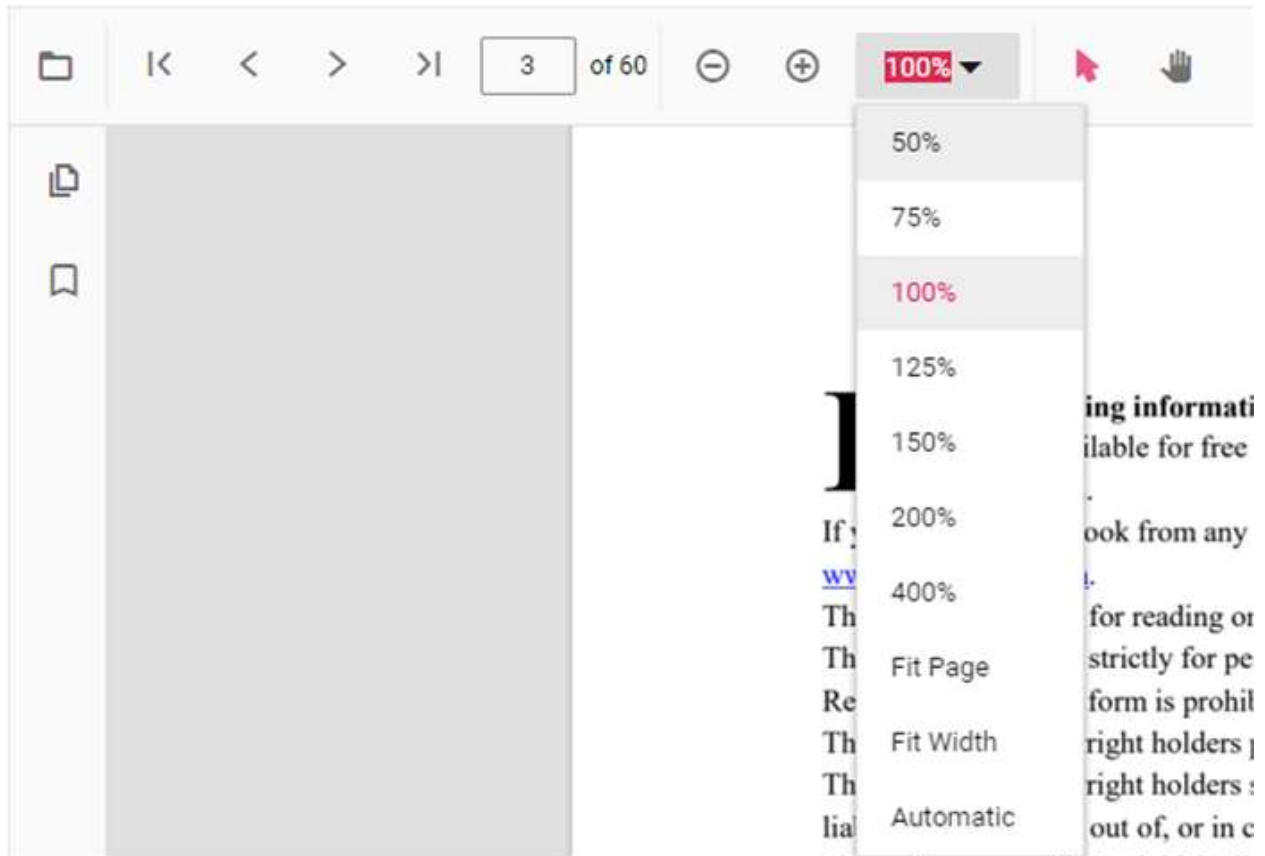

SERVER-BACKED

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
  enableMagnification: true,
  documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
  serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'
```

```
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation, ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');
```

The following magnification options are available in the default toolbar of PDF Viewer,

- [ZoomIn](#):- Zoom in from the current zoom value of PDF pages.
- [ZoomOut](#):- Zoom out from the current zoom value of PDF pages.
- [Zoom](#):- Zoom to specific zoom value of PDF pages.
- [FitPage](#):- Fits the page width with in the available view port size.
- [FitWidth](#):- Fits the view port width based on the page content size.

PDF Viewer can support the zoom value ranges from 50 to 400.

Accessibility in Syncfusion PDF Viewer components

The PDF Viewer component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the PDF Viewer component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) | |

| [Section 508 Support](#) | |

| [Screen Reader Support](#) | |

| [Right-To-Left Support](#) | |

| [Color Contrast](#) | |

| [Mobile Device Support](#) | |

| [Keyboard Navigation Support](#) | |

| [Accessibility Checker Validation](#) | |

| [Axe-core Accessibility Validation](#) | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

WAI-ARIA attributes

[WAI-ARIA](#) (Accessibility Initiative – Accessible Rich Internet Applications) defines a way to increase the accessibility of web pages, dynamic content, and user interface components developed with Ajax, HTML, JavaScript, and related technologies. ARIA provides additional semantics to describe the role, state, and functionality of web components. The following ARIA attributes are used in the PDF Viewer component:

Attributes	Purpose
---	---
<code>aria-disabled</code>	Indicates whether the PDF Viewer component is in a disabled state or not.
<code>aria-expanded</code>	Indicates whether the suggestion list has expanded or not.
<code>aria-readonly</code>	Indicates the readonly state of the PDF Viewer element.
<code>aria-haspopup</code>	Indicates whether the PDF Viewer input element has a suggestion list or not.
<code>aria-label</code>	Indicates the breadcrumb item text.
<code>aria-labelledby</code>	Provides a label for the PDF Viewer. Typically, the "aria-labelledby" attribute will contain the id of the element used as the PDF Viewer's title.
<code>aria-describedby</code>	This attribute points to the PDF Viewer element describing the one it's set on.
<code>aria-orientation</code>	Indicates whether the PDF Viewer element is oriented horizontally or vertically.
<code>aria-valuetext</code>	Returns the current text of the PDF Viewer.
<code>aria-valuemax</code>	Indicates the Maximum value of the PDF Viewer.
<code>aria-valuemin</code>	Indicates the Minimum value of the PDF Viewer.
<code>aria-valuenow</code>	Indicates the current value of the PDF Viewer.
<code>aria-controls</code>	Attribute is set to the button and it points to the corresponding content.

Keyboard interaction

The PDF Viewer component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Message component.

Press (Windows)	Press (Macintosh)	To do this
---	---	---
Shortcuts for page navigation		
Home	Function + Left arrow	Navigate to the first page
End	Function + Right arrow	Navigate to the last page
Up Arrow	Up Arrow	Navigate to the previous page
Down Arrow	Down Arrow	Navigate to the next page
Shortcuts for Zooming		
CONTROL + =	COMMAND + =	Perform zoom-in operation

| CONTROL + - | COMMAND + - | Perform zoom-out operation |

| CONTROL + 0 | COMMAND + 0 | Retain the zoom level to 1 |

|| **Shortcut for Text Search** |

| CONTROL + F | COMMAND + F | Open the search toolbar |

|| **Shortcut for Text Selection** |

| CONTROL + C | COMMAND + C | Copy the selected text or annotation or form field |

| CONTROL + X | COMMAND + X | Cut the selected text or annotation of the form field |

| CONTROL + Y | COMMAND + Y | Paste the selected text or annotation or form field |

|| **Shortcuts for the general operation** |

| CONTROL + Z | COMMAND + Z | Undo the action |

| CONTROL + Y | COMMAND + Y | Redo the action |

| CONTROL + P | COMMAND + P | Print the document |

| Delete | Delete | Delete the annotations and form fields |

</html>
```

Ensuring accessibility

The PDF Viewer component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the PDF Viewer component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the PDF Viewer component with accessibility tools.

Text search in EJ2 JavaScript Pdfviewer control

The Text Search option in PDF Viewer is used to find and highlight the text content from the document. You can enable/disable the text search using the following code snippet.

```
`html  
{% raw %}  
<!DOCTYPE html>  
<html xmlns="http://www.w3.org/1999/xhtml">  
<head>  
<title>Essential JS 2</title>  
<!-- Essential JS 2 fabric theme -->  
<link href="{{CDN_LINK}}ej2-pdfviewer/styles/fabric.css" rel="stylesheet" type="text/css"/>  
<!-- Essential JS 2 PDF Viewer's global script -->  
<script src="{{CDN_LINK}}dist/ej2.min.js" type="text/javascript"></script>  
</head>  
<body>  
<!--element which is going to render-->  
<div id='container'>  
<div id='PdfViewer' style="height:500px;width:100%;">  
</div>  
</div>  
</body>  
</html>
```

```
{% endraw %}
```

```
,
```

STANDALONE

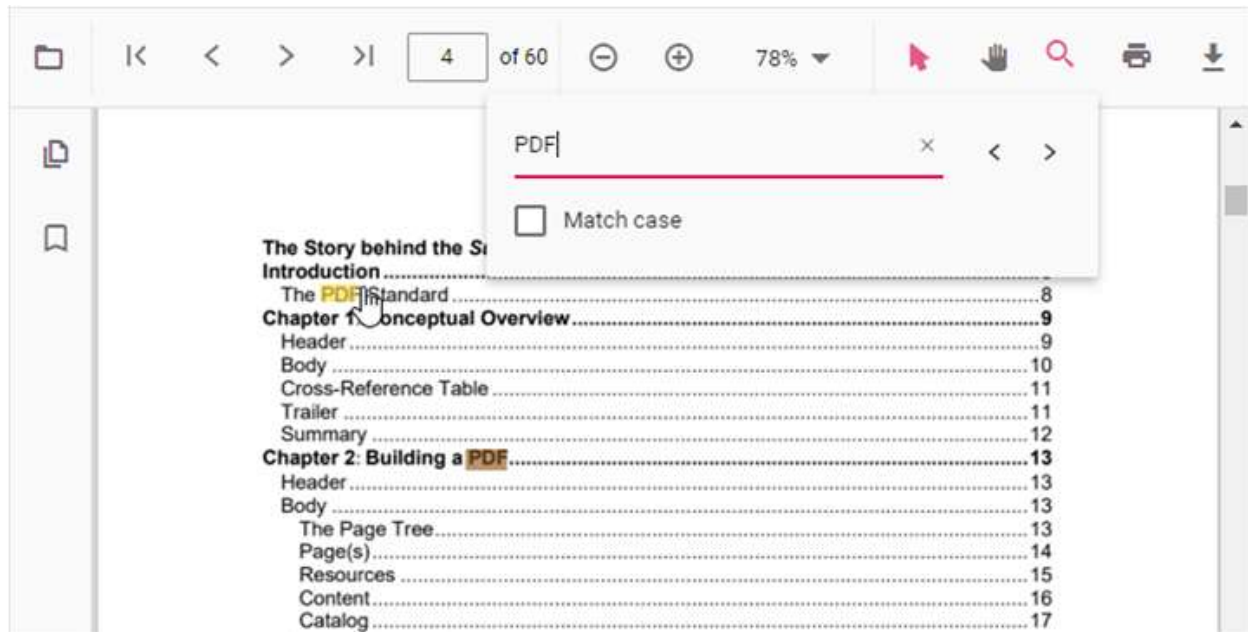

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
  enableTextSearch: true,
  documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation, ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');
```

SERVER-BACKED

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
  enableTextSearch: true,
  documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
  serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation, ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');
```

The following text search methods are available in the PDF Viewer,

- [Search text](#):- Searches the target text in the PDF document and highlights the occurrences in the pages.
- [Search next](#):- Searches the next occurrence of the searched text from the current occurrence of the PdfViewer.
- [Search previous](#):- Searches the previous occurrence of the searched text from the current occurrence of the PdfViewer.
- [Cancel text search](#):- The text search can be cancelled and the highlighted occurrences from the PDF Viewer can be removed .

Annotation

Interaction mode in EJ2 JavaScript Pdfviewer control

The PDF Viewer provides interaction mode for easy interaction with the loaded PDF document. Selection mode and panning mode are the two interactions modes.

Selection mode

In this mode, the text selection can be performed in the PDF document loaded in PDF Viewer. The panning and scrolling of the pages by touch cannot be performed in this mode. It allows users to select and copy text from the PDF files. This is helpful for copying and sharing text content. You can enable/disable the text selection using the following code snippet.

```
`html
{% raw %}
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 fabric theme -->
<link href="{{:CDN_LINK}}ej2-pdfviewer/styles/fabric.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 PDF Viewer's global script -->
<script src="{{:CDN_LINK}}dist/ej2.min.js" type="text/javascript"></script>
```

```
</head>
<body>
<!--element which is going to render-->
<div id='container'>
<div id='PdfViewer' style="height:500px;width:100%;">
</div>
</div>
</body>
</html>

{% enddraw %}
,
```

STANDALONE

```
import { PdfViewer, Toolbar, Magnification, Navigation, Annotation,
LinkAnnotation,ThumbnailView,BookmarkView, TextSelection} from
'@syncfusion/ej2-pdfviewer';
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation,ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
let pdfviewer: PdfViewer = new PdfViewer({
enableTextSelection: true,
documentPath: 'https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf'
});
pdfviewer.appendTo('#PdfViewer');
```

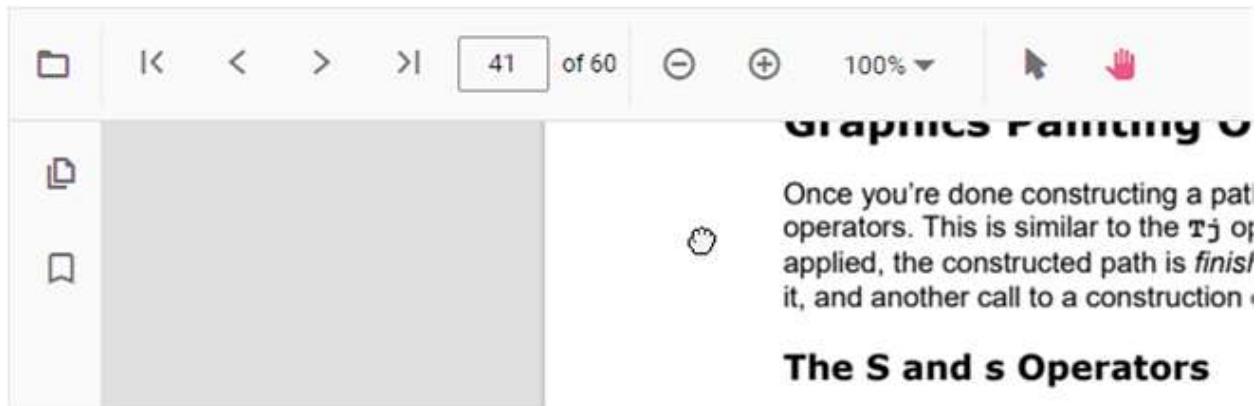

SERVER-BACKED

```
import { PdfViewer, Toolbar, Magnification, Navigation, Annotation,
LinkAnnotation,ThumbnailView,BookmarkView, TextSelection} from
'@syncfusion/ej2-pdfviewer';
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation,ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
let pdfviewer: PdfViewer = new PdfViewer({
enableTextSelection: true,
documentPath: 'https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf',
serviceUrl : 'https://services.syncfusion.com/js/production/api/pdfviewer'
});
pdfviewer.appendTo('#PdfViewer');
```

Panning Mode

In this mode, the panning and scrolling of the pages by touch can be performed in the PDF document loaded in the PDF Viewer, but the text selection cannot be performed.

You can switch the interaction mode of PDF Viewer by using the following code snippet.,

STANDALONE

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
  interactionMode: 'Pan'
  documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation, ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');
```

SERVER-BACKED

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
  interactionMode: 'Pan'
  documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
  serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation, ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');
```

Form Designer

Create programmatically in EJ2 JavaScript Pdfviewer control

The PDF Viewer control provides the option to add, edit and delete the Form Fields. The Form Fields type supported by the PDF Viewer Control are:

- Textbox
- Password
- CheckBox
- RadioButton
- ListBox
- DropDown
- SignatureField
- InitialField

Add a form field to PDF document programmatically

Using addFormField method, the form fields can be added to the PDF document programmatically. We need to pass two parameters in this method. They are Form Field Type and Properties of Form Field Type. To add form field programmatically, Use the following code.

INDEX.JS

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
  documentPath: 'https://cdn.syncfusion.com/content/pdf/form-
designer.pdf',
  resourceUrl: 'https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2-pdfviewer-
lib'
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Print, ej.pdfviewer.Navigation,
ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.Annotation, ej.pdfviewer.FormDesigner,
ej.pdfviewer.FormFields);
pdfviewer.appendTo('#PdfViewer');
pdfviewer.documentLoad = function (args) {
  pdfviewer.formDesignerModule.addFormField("Textbox", { name: "First Name",
  bounds: { X: 146, Y: 229, Width: 150, Height: 24 } });
  pdfviewer.formDesignerModule.addFormField("Textbox", { name: "Middle Name",
  bounds: { X: 338, Y: 229, Width: 150, Height: 24 } });
  pdfviewer.formDesignerModule.addFormField('Textbox', {name: 'Last
  Name',bounds: { X: 530, Y: 229, Width: 150, Height: 24 },});
  pdfviewer.formDesignerModule.addFormField('RadioButton', {bounds: { X: 148,
  Y: 289, Width: 18, Height: 18 },name: 'Gender',isSelected: false,});
  pdfviewer.formDesignerModule.addFormField('RadioButton', {bounds: { X: 292,
  Y: 289, Width: 18, Height: 18 },name: 'Gender',isSelected: false,});
```

```

pdfviewer.formDesignerModule.addFormField('Textbox', {name: 'DOB
Month',bounds: { X: 146, Y: 320, Width: 35, Height: 24 },});
pdfviewer.formDesignerModule.addFormField('Textbox', {name: 'DOB
Date',bounds: { X: 193, Y: 320, Width: 35, Height: 24 },});
pdfviewer.formDesignerModule.addFormField('Textbox', {name: 'DOB
Year',bounds: { X: 242, Y: 320, Width: 35, Height: 24 },});
pdfviewer.formDesignerModule.addFormField('InitialField', {name:
'Agree',bounds: { X: 148, Y: 408, Width: 200, Height: 43 },});
pdfviewer.formDesignerModule.addFormField('InitialField', {name: 'Do Not
Agree',bounds: { X: 148, Y: 466, Width: 200, Height: 43 },});
pdfviewer.formDesignerModule.addFormField('CheckBox', {name: 'Text
Message',bounds: { X: 56, Y: 664, Width: 20, Height: 20 },isChecked:
false,});
pdfviewer.formDesignerModule.addFormField('CheckBox', {name: 'Email',bounds:
{ X: 242, Y: 664, Width: 20, Height: 20 },isChecked: false,});
pdfviewer.formDesignerModule.addFormField('CheckBox', {name: 'Appointment
Reminder',bounds: { X: 56, Y: 740, Width: 20, Height: 20 },isChecked:

```

Note: To set up the **server-backed PDF Viewer**,

Add the below `serviceUrl` in the `index.html` file

`serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'`

Edit/Update form field programmatically

Using `updateFormField` method, Form Field can be updated programmatically. We should get the Form Field object/Id from `FormFieldCollections` property that you would like to edit and pass it as a parameter to `updateFormField` method. The second parameter should be the properties that you would like to update for Form Field programmatically. We have updated the value and background Color properties of Textbox Form Field.

INDEX.JS

```

var pdfviewer = new ej.pdfviewer.PdfViewer({
    documentPath: 'https://cdn.syncfusion.com/content/pdf/form-designer.pdf',
    resourceUrl: 'https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2-pdfviewer-
lib'
});

```

Note: To set up the **server-backed PDF Viewer**,

Add the below `serviceUrl` in the `index.html` file

`serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'`

Saving the form fields

When the download icon is selected on the toolbar, the Form Fields will be saved in the PDF document and this action will not affect the original document. Refer the below GIF for further reference.

You can invoke download action using following code snippet.

```
<button id="download">Download</button>
```

STANDALONE

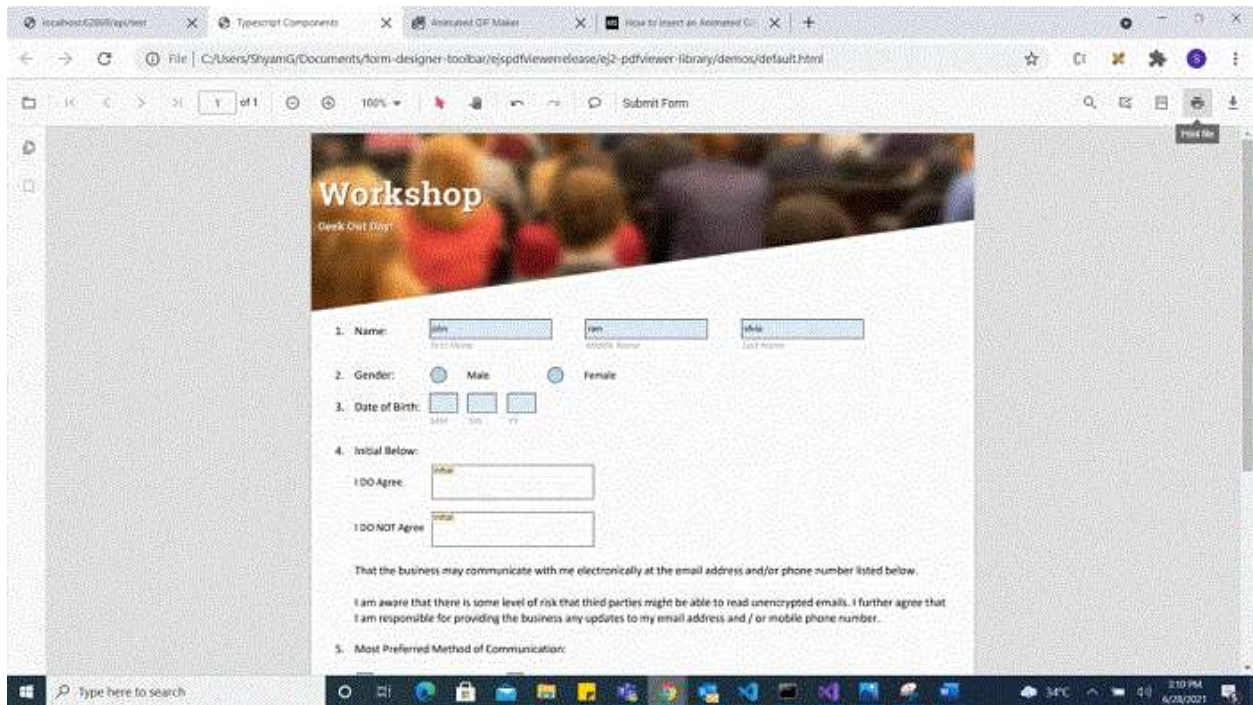

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
  enableDownload: true,
  documentPath: "https://cdn.syncfusion.com/content/pdf/form-designer.pdf",
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Print, ej.pdfviewer.Navigation,
ej.pdfviewer.Toolbar, ej.pdfviewer.Magnification, ej.pdfviewer.Annotation,
ej.pdfviewer.FormDesigner, ej.pdfviewer.FormFields);
pdfviewer.appendTo('#PdfViewer');
document.getElementById('download').addEventListener('click', function () {
  pdfviewer.download()
});
```

SERVER-BACKED

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
  enableDownload: true,
  documentPath: "https://cdn.syncfusion.com/content/pdf/form-designer.pdf",
  serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Print, ej.pdfviewer.Navigation,
ej.pdfviewer.Toolbar, ej.pdfviewer.Magnification, ej.pdfviewer.Annotation,
ej.pdfviewer.FormDesigner, ej.pdfviewer.FormFields);
pdfviewer.appendTo('#PdfViewer');
document.getElementById('download').addEventListener('click', function () {
  pdfviewer.download()
});
```

Printing the form fields

When the print icon is selected on the toolbar, the PDF document will be printed along with the Form Fields added to the pages and this action will not affect the original document. Refer the below GIF for further reference.

You can invoke print action using the following code snippet.,

,

```
<button id="print">Print</button>
```

,

STANDALONE

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
  enablePrint: true,
  documentPath: "https://cdn.syncfusion.com/content/pdf/form-designer.pdf",
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Print, ej.pdfviewer.Navigation,
ej.pdfviewer.Toolbar, ej.pdfviewer.Magnification, ej.pdfviewer.Annotation,
ej.pdfviewer.FormDesigner, ej.pdfviewer.FormFields);
pdfviewer.appendTo('#PdfViewer');
document.getElementById('print').addEventListener('click', function () {
  pdfviewer.print.print();
});
```

SERVER-BACKED

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
  enablePrint: true,
  documentPath: "https://cdn.syncfusion.com/content/pdf/form-designer.pdf",
  serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Print, ej.pdfviewer.Navigation,
ej.pdfviewer.Toolbar, ej.pdfviewer.Magnification, ej.pdfviewer.Annotation,
ej.pdfviewer.FormDesigner, ej.pdfviewer.FormFields);
```

```
pdfviewer.appendTo('#PdfViewer');
document.getElementById('print').addEventListener('click', function () {
pdfviewer.print.print();
});
```

setFormFieldMode programmatically

The **setFormFieldMode** method is a function in the Syncfusion PDF Viewer library that allows you to add a form field dynamically by passing the type of the form field. You can pass the form fields as a parameter like below.

```
<button id="addPasswordField">Add Password Field</button>
```

STANDALONE

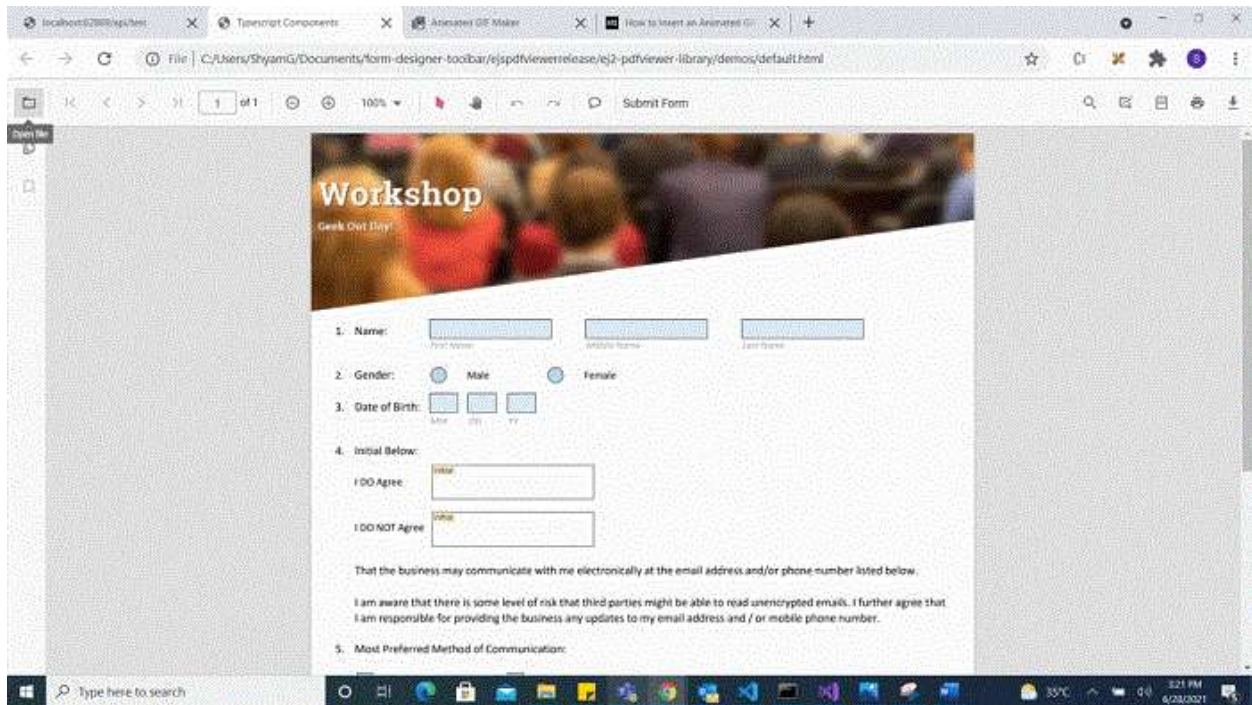

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Print, ej.pdfviewer.Navigation,
ej.pdfviewer.Toolbar, ej.pdfviewer.Magnification, ej.pdfviewer.Annotation,
ej.pdfviewer.FormDesigner, ej.pdfviewer.FormFields);
pdfviewer.appendTo('#PdfViewer');
document.getElementById('addPasswordField').addEventListener('click',
function () {
pdfviewer.formDesignerModule.setFormFieldMode("Password");
});
```

SERVER-BACKED

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Print, ej.pdfviewer.Navigation,
ej.pdfviewer.Toolbar, ej.pdfviewer.Magnification, ej.pdfviewer.Annotation,
ej.pdfviewer.FormDesigner, ej.pdfviewer.FormFields);
pdfviewer.appendTo('#PdfViewer');
document.getElementById('addPasswordField').addEventListener('click',
function () {
pdfviewer.formDesignerModule.setFormFieldMode("Password");
});
```

Open the existing PDF document

We can open the already saved PDF document contains Form Fields in it by clicking the open icon in the toolbar. Refer the below GIF for further reference.

Validate form fields

The form fields in the PDF Document will be validated when the `enableFormFieldsValidation` is set to `true` and hook the `validateFormFields`. The `validateFormFields` will be triggered when the PDF document is downloaded or printed with the non-filled form fields. The non-filled fields will be obtained in the `nonFillableFields` property of the event arguments of `validateFormFields`.

Add the following code snippet to validate the form fields,

STANDALONE

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
  documentPath: "https://cdn.syncfusion.com/content/pdf/form-designer.pdf",
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Print, ej.pdfviewer.Navigation,
ej.pdfviewer.Toolbar, ej.pdfviewer.Magnification, ej.pdfviewer.Annotation,
ej.pdfviewer.FormDesigner, ej.pdfviewer.FormFields);
pdfviewer.appendTo('#PdfViewer');
viewer.enableFormFieldsValidation = true;
viewer.validateFormFields = function (args) {
  var nonfilledFormFields = args.nonFillableFields;
};
```

SERVER-BACKED

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
  documentPath: "https://cdn.syncfusion.com/content/pdf/form-designer.pdf",
  serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Print, ej.pdfviewer.Navigation,
```

```
ej.pdfviewer.Toolbar, ej.pdfviewer.Magnification, ej.pdfviewer.Annotation,
ej.pdfviewer.FormDesigner, ej.pdfviewer.FormFields);
pdfviewer.appendTo('#PdfViewer');
viewer.enableFormFieldsValidation = true;
viewer.validateFormFields = function (args) {
  var nonfilledFormFields = args.nonFillableFields;
};
```

Export and import form fields

The PDF Viewer control provides the support to export and import the form field data in the following formats using the `importFormFields`, `exportFormFields`, and `exportFormFieldsAsObject` methods.

- FDF
- XFDF
- JSON

Export and import as FDF

Using the `exportFormFields` method, the form field data can be exported in the specified data format. This method accepts two parameters:

- The first one must be the destination path for the exported data. If the path is not specified, it will ask for the location while exporting.
- The second parameter should be the format type of the form data.

The following code explains how to export the form field data as FDF.

```
`javascript
<button id="exportFdf">Export FDF</button>
<button id="importFdf">Import FDF</button>
<!--Add the PDF Viewer-->
<div id="pdfViewer" style="height: 640px; width: 100%"></div>
// Event triggers on Export FDF button click.
document.getElementById('exportFdf').addEventListener('click', ()=> {
// Data must be the desired path for the exported document.
viewer.exportFormFields('Data', FormFieldDataFormat.Fdf);
});
// Event triggers on Import FDF button click.
document.getElementById('importFdf').addEventListener('click', ()=> {
// The file for importing the form fields should be placed in the desired location, and the path should be
provided correctly.
viewer.importFormFields('File', FormFieldDataFormat.Fdf);
});
```

`

Export and import as XFDF

The following code explains how to export the form field data as XFDF.

```
`javascript
<button id="exportXfdf">Export XFDF</button>
<button id="importXfdf">Import XFDF</button>
<!--Add the PDF Viewer-->
<div id="pdfViewer" style="height: 640px; width: 100%"></div>
// Event triggers on Export XFDF button click.
document.getElementById('exportXfdf').addEventListener('click', ()=> {
// Data must be the desired path for the exported document.
viewer.exportFormFields('Data', FormFieldDataFormat.Xfdf);
});
// Event triggers on Import XFDF button click.
document.getElementById('importXfdf').addEventListener('click', ()=> {
// The file for importing the form fields should be placed in the desired location, and the path should be
provided correctly.
viewer.importFormFields('File', FormFieldDataFormat.Xfdf);
});
```

`

Export and import as JSON

The following code explains how to export the form field data as JSON.

```
`javascript
<button id="exportJson">Export JSON</button>
<button id="importJson">Import JSON</button>
<!--Add the PDF Viewer-->
<div id="pdfViewer" style="height: 640px; width: 100%"></div>
// Event triggers on Export JSON button click.
document.getElementById('exportJson').addEventListener('click', ()=> {
// Data must be the desired path for the exported document.
viewer.exportFormFields('Data', FormFieldDataFormat.Json);
});
// Event triggers on Import JSON button click.
document.getElementById('importJson').addEventListener('click', ()=> {
```

// The file for importing the form fields should be placed in the desired location, and the path should be provided correctly

```
viewer.importFormFields('File', FormFieldDataFormat.Json);
});
```

Export and import as Object

The PDF Viewer control supports exporting the form field data as an object, and the exported data will be imported into the current PDF document from the object.

The following code shows how to export the form field data as an object and import the form field data from that object into the current PDF document via a button click.

```
`javascript
<button id="exportDataAsObject">Export Object</button>
<button id="importData">Import Data</button>
<!--Add the PDF Viewer-->
<div id="pdfViewer" style="height: 640px; width: 100%"></div>
var exportedData;
// Event triggers on Export Object button click.
document.getElementById('exportDataAsObject').addEventListener('click', ()=> {
// Export the form field data to an FDF object.
viewer.exportFormFieldsAsObject(FormFieldDataFormat.Fdf).then(value => {
exportedData = value;
});
// // Export the form field data to an XFDF object.
// viewer.exportFormFieldsAsObject(FormFieldDataFormat.Xfdf).then(value =>{
//   exportedData = value;
// })
// // Export the form field data to an JSON object.
// viewer.exportFormFieldsAsObject(FormFieldDataFormat.Json).then(value =>{
//   exportedData = value;
// })
});
// Event triggers on Import Data button click.
document.getElementById('importData').addEventListener('click', ()=> {
// Import the form field data from the FDF object into the current PDF document.
```

```
viewer.importFormFields(exportedData, FormFieldDataFormat.Fdf);
//// Import the form field data from the XFDF object into the current PDF document.
//viewer.importFormFields (exportedData, FormFieldDataFormat.Xfdf);
//// Import the form field data from the FDF object into the current PDF document.
//viewer.importFormFields (exportedData, FormFieldDataFormat.Json);
});
`
```

Form field properties

Form field properties in Syncfusion PDF Viewer allow you to customize and interact with form fields embedded within PDF documents. This documentation provides an overview of the form field properties supported by the Syncfusion PDF Viewer and explains how to use them effectively.

- Textbox
- Password
- CheckBox
- RadioButton
- ListBox
- DropDown
- SignatureField
- InitialField

Signature and initial fields settings

Using the `updateFormField` method, the form fields can be updated programmatically.

The following code example explains how to update the signature field properties on a button click.

```
`html
<button id="updateProperties">Update Properties</button>
`

`javascript
document.getElementById('updateProperties').addEventListener('click',function() {
var formField = viewer.retrieveFormFields();
viewer.formDesignerModule.updateFormField(formField[0], {
name: 'Initial',
isReadOnly: true,
visibility: 'visible',
isRequired: false,
isPrint: true,
tooltip: 'Initial',
thickness: 4
});
});
`
```

```
});
});
,
```

The following code example explains how to update the properties of the signature field added to the document from the form designer toolbar.

STANDALONE

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
  documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Print, ej.pdfviewer.Navigation,
ej.pdfviewer.Toolbar, ej.pdfviewer.Magnification, ej.pdfviewer.Annotation,
ej.pdfviewer.FormDesigner, ej.pdfviewer.FormFields);
pdfviewer.appendTo('#PdfViewer');
// Properties to customize the signature field settings
pdfviewer.signatureFieldSettings = {
  // Set the name of the form field element.
  name: 'Signature',
  // Specify whether the signature field is in read-only or read-write mode.
  isReadOnly: false,
  // Set the visibility of the form field.
  visibility: 'visible',
  // Specify whether the field is mandatory or not.
  isRequired: false,
  // Specify whether to print the signature field.
  isPrint: true,
  // Set the text to be displayed as a tooltip.
  tooltip: 'Signature',
  // Set the thickness of the Signature field. To hide the borders, set the
  value to 0 (zero).
  thickness: 4,
  // Specify the properties of the signature Dialog Settings in the signature
  field.
  signatureDialogSettings: {
    displayMode: ej.pdfviewer.DisplayMode.Draw | ej.pdfviewer.DisplayMode.Upload
    | ej.pdfviewer.DisplayMode.Text,
    hideSaveSignature: false,
  },
  // Specify the properties of the signature indicator in the signature field.
  signatureIndicatorSettings: {
    opacity: 1,
    backgroundColor: '#237ba2',
    height: 50,
    fontSize: 15,
    text: 'Signature Field',
    color: 'white'
  },
};
```

SERVER-BACKED

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
```

```

documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'

  hideSaveSignature: false
}
};
```

Textbox field settings

Using the `updateFormField` method, the form fields can be updated programmatically.

The following code example explains how to update the Textbox field properties on a button click.

`html

```
<button id="updateProperties">Update Properties</button>
```

,

`javascript

```
document.getElementById('updateProperties').addEventListener('click',function() {
var formField = viewer.retrieveFormFields();
viewer.formDesignerModule.updateFormField(formField[0], {
name: 'Textbox',
```

```

isReadOnly: true,
visibility: 'visible',
isRequired: false,
isPrint: true,
tooltip: 'Textbox',
thickness: 4,
value: 'Textbox',
fontFamily: 'Courier',
fontSize: 10,
fontStyle: 'None',
color: 'black',
borderColor: 'black',
backgroundColor: 'white',
alignment: 'Left',
maxLength: 0,
isMultiline: false,
bounds: { X: 146, Y: 229, Width: 150, Height: 24 }
});
});
`

```

The following code example explains how to update the properties of the Textbox field added to the document from the form designer toolbar.

STANDALONE

```

var pdfviewer = new ej.pdfviewer.PdfViewer({
  documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Print, ej.pdfviewer.Navigation,
ej.pdfviewer.Toolbar, ej.pdfviewer.Magnification, ej.pdfviewer.Annotation,
ej.pdfviewer.FormDesigner, ej.pdfviewer.FormFields);
pdfviewer.appendTo('#PdfViewer');
// Properties to customize the Textbox field settings
pdfviewer.textFieldSettings = {
  // Set the name of the form field element.
  name: 'Textbox',
  // Specify whether the Textbox field is in read-only or read-write mode.
  isReadOnly: false,
  // Set the visibility of the form field.
  visibility: 'visible',
  // Specify whether the field is mandatory or not.
  isRequired: false,

```

```

// Specify whether to print the Textbox field.
isPrint: true,
// Set the text to be displayed as a tooltip.
tooltip: 'Textbox',
// Set the thickness of the Textbox field. To hide the borders, set the
value to 0 (zero).
thickness: 4,
// Set the value of the form field element.
value: 'Textbox',
// Set the font family of the textbox field.
fontFamily: 'Courier',
// Set the font size of the textbox field.
fontSize: 10,
// Specify the font style
fontStyle: 'None',
// Set the font color of the textbox field.
color: 'black',
// Set the border color of the textbox field.
borderColor: 'black',
// Set the background color of the textbox field.
backgroundColor: 'White',
// Set the alignment of the text.
alignment: 'Left',
// Set the maximum character length.
maxLength: 0,
// Allows multiline input in the text field. FALSE, by default.
isMultiline: false
};

```

SERVER-BACKED

// Specify the font style
fontStyle: 'None',
// Set the font color of the textbox field.
color: 'black',
// Set the border color of the textbox field.
borderColor: 'black',
// Set the background color of the textbox field.
backgroundColor: 'White',
// Set the alignment of the text.
alignment: 'Left',
// Set the maximum character length.
maxLength: 0,
// Allows multiline input in the text field. FALSE, by default.
isMultiline: false
};

```

Password field settings

Using the `updateFormField` method, the form fields can be updated programmatically.

The following code example explains how to update the Password field properties on a button click.

``html`

```
<button id="updateProperties">Update Properties</button>
```

```

``javascript`

```

document.getElementById('updateProperties').addEventListener('click',function() {
var formField = viewer.retrieveFormFields();
viewer.formDesignerModule.updateFormField(formField[0], {
name: 'Password',
isReadOnly: true,
visibility: 'visible',
isRequired: false,
isPrint: true,
tooltip: 'Password',

```

```

thickness: 4,
value:'Password',
fontFamily: 'Courier',
fontSize: 10,
fontStyle: 'None',
color: 'black',
borderColor: 'black',
backgroundColor: 'white',
alignment: 'Left',
maxLength: 0,
bounds: { X: 148, Y: 229, Width: 150, Height: 24 }
});
});
`

```

The following code example explains how to update the properties of the Password field added to the document from the form designer toolbar.

#### **STANDALONE**

```

var pdfviewer = new ej.pdfviewer.PdfViewer({
 documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Print, ej.pdfviewer.Navigation,
ej.pdfviewer.Toolbar, ej.pdfviewer.Magnification, ej.pdfviewer.Annotation,
ej.pdfviewer.FormDesigner, ej.pdfviewer.FormFields);
pdfviewer.appendTo('#PdfViewer');
// Properties to customize the Password field settings
pdfviewer.passwordFieldSettings = {
 // Set the name of the form field element.

thickness: 4,
// Specifies whether the check box is in checked state or not.
isChecked: true,
// Set the background color of the check box in hexadecimal string format.
backgroundColor: 'white',
// Set the border color of the check box field.
borderColor: 'black',
// Set the value of
};
```

#### RadioButton field settings

Using the `updateFormField` method, the form fields can be updated programmatically.

The following code example explains how to update the RadioButton field properties on a button click.

`html

```
<button id="updateProperties">Update Properties</button>
```

,

`javascript

```
document.getElementById('updateProperties').addEventListener('click',function() {
var formField = viewer.retrieveFormFields();
viewer.formDesignerModule.updateFormField(formField[0], {
name: 'RadioButton',
isReadOnly: true,
visibility: 'visible',
isRequired: false,
isPrint: true,
tooltip: 'RadioButton',
```

```

thickness: 4,
isSelected: true,
backgroundColor: 'white',
borderColor: 'black',
value: 'RadioButton'
});
});
`

```

The following code example explains how to update the properties of the RadioButton field added to the document from the form designer toolbar.

### **STANDALONE**

```

var pdfviewer = new ej.pdfviewer.PdfViewer({
 documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Print, ej.pdfviewer.Navigation,
ej.pdfviewer.Toolbar, ej.pdfviewer.Magnification, ej.pdfviewer.Annotation,
ej.pdfviewer.FormDesigner, ej.pdfviewer.FormFields);
pdfviewer.appendTo('#PdfViewer');
// Properties to customize the RadioButton field settings
pdfviewer.radioButtonFieldSettings = {
 // Set the name of the form field element.
 name: 'RadioButton',
 // Specify whether the RadioButton field is in read-only or read-write mode.
 isReadOnly: false,
 // Set the visibility of the form field.
 visibility: 'visible',
 // Specify whether the field is mandatory or not.
 isRequired: false,
 // Specify whether to print the RadioButton field.
 isPrint: true,
 // Set the text to be displayed as a tooltip.
 tooltip: 'RadioButton',
 // Set the thickness of the RadioButton field. To hide the borders, set the
 // value to 0 (zero).
 thickness: 4,
 // Specifies whether the radio button is in checked state or not.
 isSelected: true,
 // Set the background color of the radio button in hexadecimal string
 // format.
 backgroundColor: 'white',
 // Set the border color of the radio button field.
 borderColor: 'black',
 // Set the value of the form field element.
 value: 'RadioButton'
};

```

### **SERVER-BACKED**

```

var pdfviewer = new ej.pdfviewer.PdfViewer({
 documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
 serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Print, ej.pdfviewer.Navigation,
ej.pdfviewer.Toolbar, ej.pdfviewer.Magnification, ej.pdfviewer.Annotation,
ej.pdfviewer.FormDesigner, ej.pdfviewer.FormFields);
pdfviewer.appendTo('#PdfViewer');
// Properties to customize the RadioButton field settings
pdfviewer.radioButtonFieldSettings = {
 // Set the name of the form field element.
 name: 'RadioButton',
 // Specify whether the RadioButton field is in read-only or read-write mode.
 isReadOnly: false,
 // Set the visibility of the form field.
 visibility: 'visible',
 // Specify whether the field is mandatory or not.
 isRequired: false,
 // Specify whether to print the RadioButton field.
 isPrint: true,
 // Set the text to be displayed as a tooltip.
 tooltip: 'RadioButton',
 // Set the thickness of the RadioButton field. To hide the borders, set the
 // value to 0 (zero).
 thickness: 4,
 // Specifies whether the radio button is in checked state or not.
 isSelected: true,
 // Set the background color of the radio button in hexadecimal string
 // format.
 backgroundColor: 'white',
 // Set the border color of the radio button field.
 borderColor: 'black',
 // Set the value of the form field element.
 value: 'RadioButton'
};

```

#### ListBox field settings

Using the `updateFormField` method, the form fields can be updated programmatically.

The following code example explains how to update the ListBox field properties on a button click.

`html

```
<button id="updateProperties">Update Properties</button>
```

`

`javascript

```
document.getElementById('updateProperties').addEventListener('click',function() {
```

```

var formField = viewer.retrieveFormFields();

var customOptions = [{itemName:'item1',itemValue:'item1'}, {itemName:'item2',itemValue:'item2'},
{itemName:'item3',itemValue:'item3'}]

viewer.formDesignerModule.updateFormField(formField[0], {
name: 'ListBox',
isReadOnly: false,
visibility: 'visible',
isRequired: false,
isPrint: true,
tooltip: 'ListBox',
thickness: 4,
fontFamily: 'Courier',
fontSize: 10,
fontStyle: 'None',
color: 'black',
borderColor: 'black',
backgroundColor: 'white',
alignment: 'Left',
options: customOptions,
});
});
`

```

The following code example explains how to update the properties of the Listbox field added to the document from the form designer toolbar.

#### **STANDALONE**

```

var pdfviewer = new ej.pdfviewer.PdfViewer({
documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Print, ej.pdfviewer.Navigation,
ej.pdfviewer.Toolbar, ej.pdfviewer.Magnification, ej.pdfviewer.Annotation,
ej.pdfviewer.FormDesigner, ej.pdfviewer.FormFields);
pdfviewer.appendTo('#PdfViewer');
var customOptions = [{itemName:'item1',itemValue:'item1'},
{itemName:'item2',itemValue:'item2'}, {itemName:'item3',itemValue:'item3'}]
// Properties to customize the Listbox field settings
pdfviewer.listBoxFieldSettings = {
// Set the name of the form field element.
name: 'ListBox',
// Specify whether the Listbox field is in read-only or read-write mode.

```

```

isReadOnly: false,
// Set the visibility of the form field.
visibility: 'visible',
// Specify whether the field is mandatory or not.
isRequired: false,
// Specify whether to print the ListBox field.
isPrint: true,
// Set the text to be displayed as a tooltip.
tooltip: 'ListBox',
// Set the thickness of the ListBox field. To hide the borders, set the
value to 0 (zero).
thickness: 4,
// Set the value of the form field element.
value: 'ListBox',
// Set the font family of the ListBox field.

// Specify the font style
fontStyle: 'None',
// Set the font color of the ListBox field.
color: 'black',
// Set the border color of the ListBox field.
borderColor: 'black',
// Set the background color of the ListBox field.
backgroundColor: 'White',
// Set the alignment of the text.
alignment: 'Left',
// Set the listbox items.
options: customOptions
};

```

#### DropDown field settings

Using the `updateFormField` method, the form fields can be updated programmatically.

The following code example explains how to update the DropDown field properties on a button click.

``html`

```
<button id="updateProperties">Update Properties</button>
```

`,`

``javascript`

```

document.getElementById('updateProperties').addEventListener('click',function() {
var formField = viewer.retrieveFormFields();

var customOptions = [{itemName:'item1',itemValue:'item1'}, {itemName:'item2',itemValue:'item2'},
{itemName:'item3',itemValue:'item3'}]

viewer.formDesignerModule.updateFormField(formField[0], {

```

```

name: 'DropDown',
isReadOnly: false,
visibility: 'visible',
isRequired: false,
isPrint: true,
tooltip: 'DropDown',
thickness: 4,
fontFamily: 'Courier',
fontSize: 10,
fontStyle: 'None',
color: 'black',
borderColor: 'black',
backgroundColor: 'white',
alignment: 'Left',
options: customOptions,
});
});
`

```

The following code example explains how to update the properties of the Dropdown field added to the document from the form designer toolbar.

### **STANDALONE**

```

var pdfviewer = new ej.pdfviewer.PdfViewer({
 documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Print, ej.pdfviewer.Navigation,
ej.pdfviewer.Toolbar, ej.pdfviewer.Magnification, ej.pdfviewer.Annotation,
ej.pdfviewer.FormDesigner, ej.pdfviewer.FormFields);
pdfviewer.appendTo('#PdfViewer');
var customOptions = [{itemName:'item1',itemValue:'item1'},
{itemName:'item2',itemValue:'item2'}, {itemName:'item3',itemValue:'item3'}]
// Properties to customize the DropDown field settings
pdfviewer.DropDownFieldSettings = {
// Set the name of the form field element.
name: 'DropDown',
// Specify whether the DropDown field is in read-only or read-write mode.
isReadOnly: false,
// Set the visibility of the form field.
visibility: 'visible',
// Specify whether the field is mandatory or not.
isRequired: false,
// Specify whether to print the DropDown field.

```

```

isPrint: true,
// Set the text to be displayed as a tooltip.
tooltip: 'DropDown',
// Set the thickness of the DropDown field. To hide the borders, set the
value to 0 (zero).
thickness: 4,
// Set the value of the form field element.
value: 'DropDown',
// Set the font family of the DropDown field.

// Set the font color of the DropDown field.
color: 'black',
// Set the border color of the DropDown field.
borderColor: 'black',
// Set the background color of the DropDown field.
backgroundColor: 'White',
// Set the alignment of the text.
alignment: 'Left',
// Set the DropDown items.
options: customOptions
};
```

### Create with user interface interaction in EJ2 JavaScript Pdfviewer control

The PDF viewer control provides the option for interaction with Form Fields such as Drag and resize. you can draw a Form Field dynamically by clicking the Form Field icon on the toolbar and draw it in the PDF document. The Form Fields type supported by the PDF Viewer Control are:

- Textbox
- Password
- CheckBox
- RadioButton
- ListBox
- DropDown
- SignatureField
- InitialField

### Enable or Disable form designer toolbar

We should inject FormDesigner module and set enableFormDesignerToolbar as true to enable the Form designer icon on the toolbar. By default, enableFormDesignerToolbar is set as true. Use the following code to inject FormDesigner module and to enable the enableFormDesignerToolbar property.

### STANDALONE

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
 documentPath: "https://cdn.syncfusion.com/content/pdf/form-designer.pdf",
 enableFormDesignerToolbar: true
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Print, ej.pdfviewer.Navigation,
```

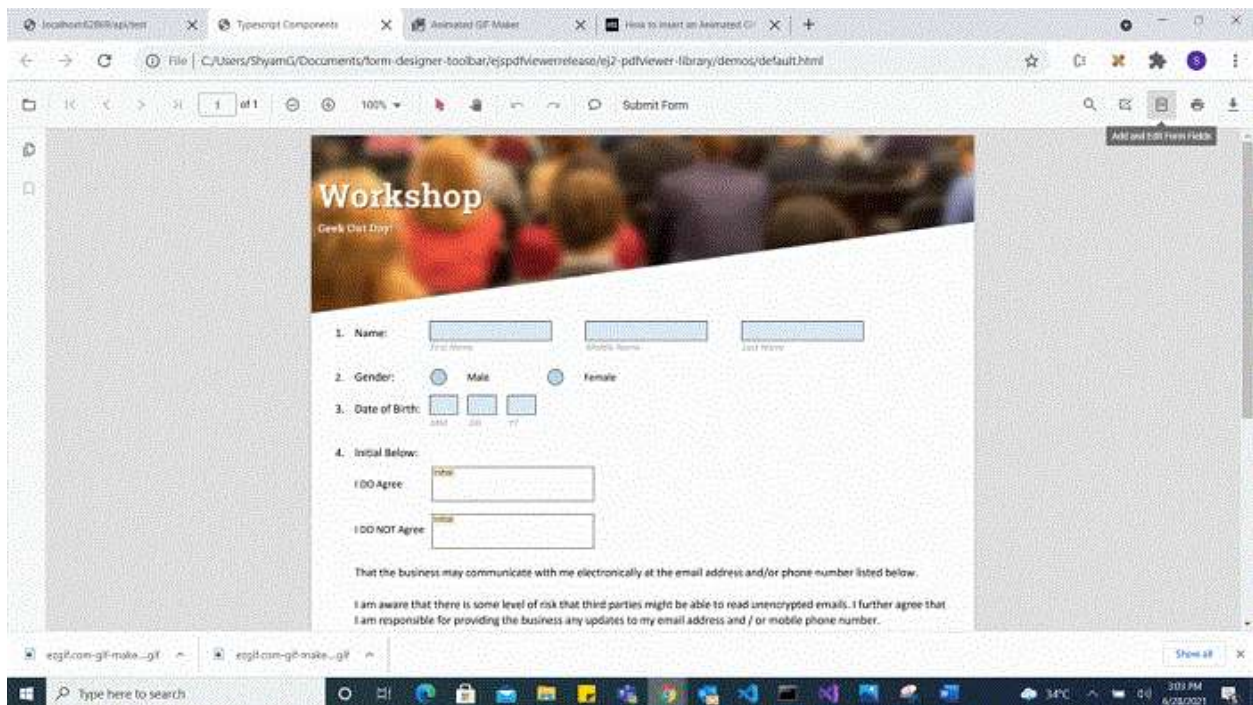

```
ej.pdfviewer.Toolbar, ej.pdfviewer.Magnification, ej.pdfviewer.Annotation,
ej.pdfviewer.FormDesigner, ej.pdfviewer.FormFields);
pdfviewer.appendTo('#PdfViewer');
```

## SERVER-BACKED

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
 documentPath: "https://cdn.syncfusion.com/content/pdf/form-designer.pdf",
 serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer',
 enableFormDesignerToolbar: true
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Print, ej.pdfviewer.Navigation,
ej.pdfviewer.Toolbar, ej.pdfviewer.Magnification, ej.pdfviewer.Annotation,
ej.pdfviewer.FormDesigner, ej.pdfviewer.FormFields);
pdfviewer.appendTo('#PdfViewer');
```

### Add the form field dynamically

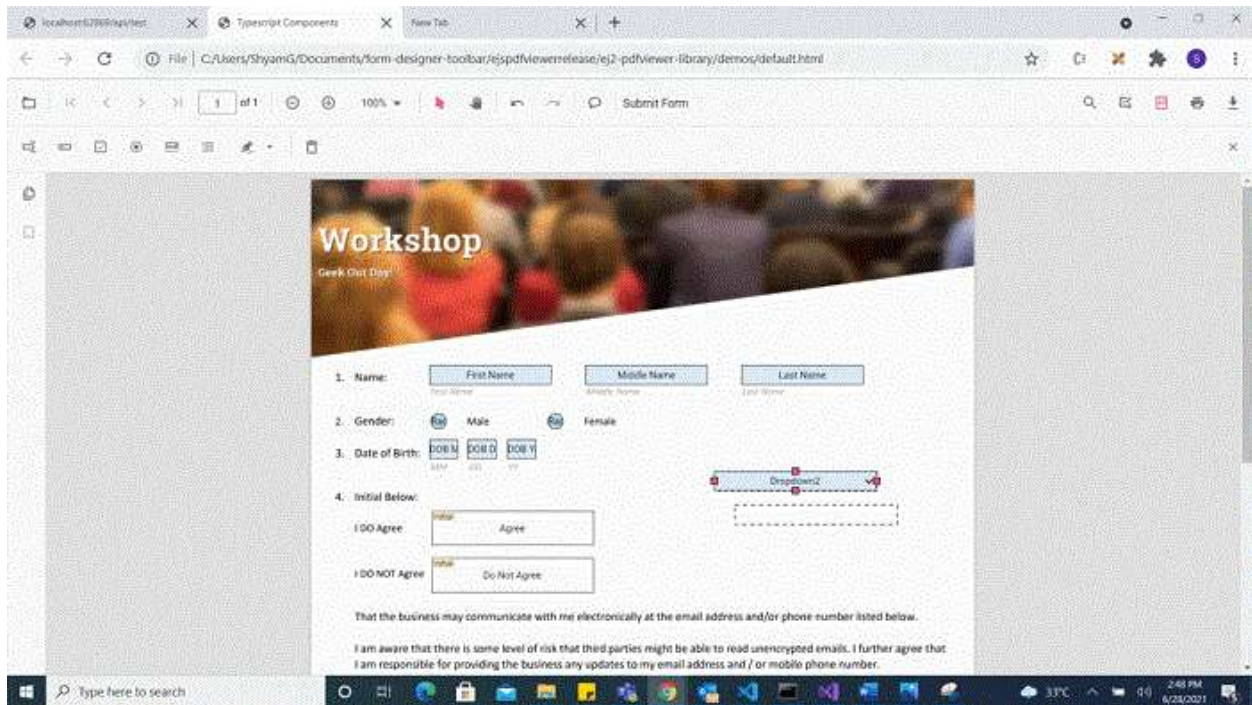

Click the Form Field icon on the toolbar and then click on to the PDF document to draw a Form Field. Refer the below GIF for further reference.

### Drag the form field

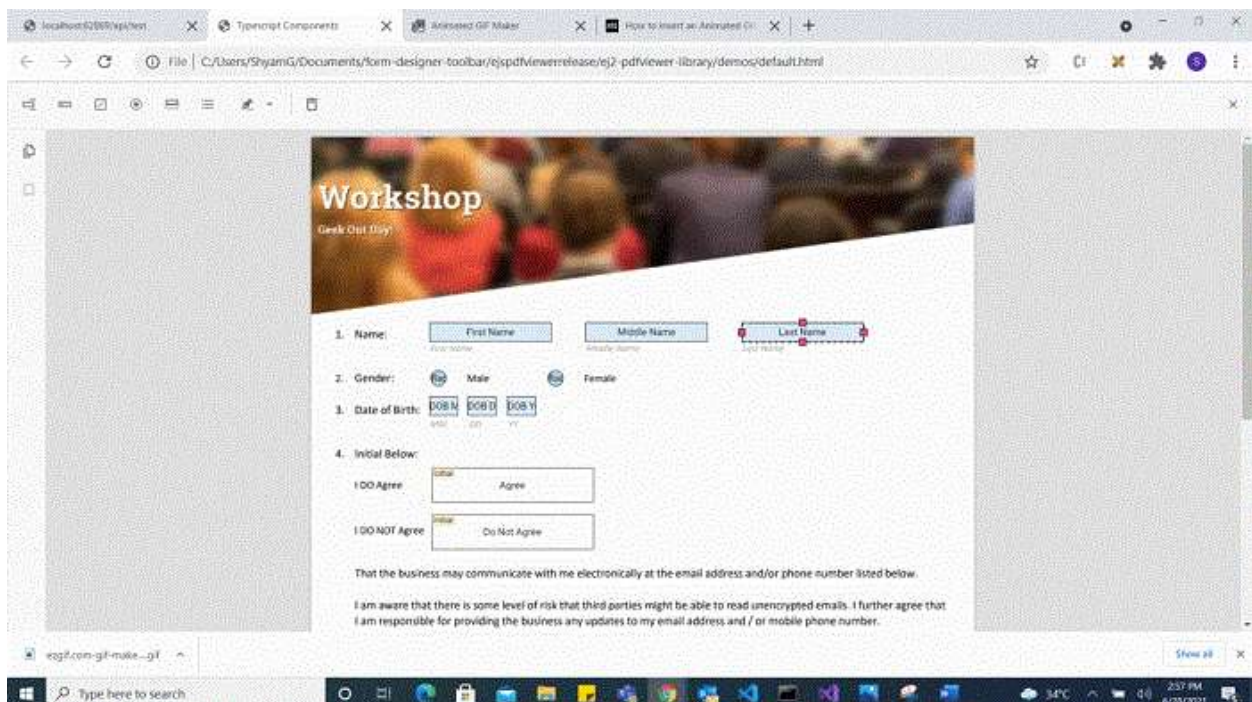

We provide options to drag the Form Field which is currently selected in the PDF document. Refer the below GIF for further reference.

### Resize the form field

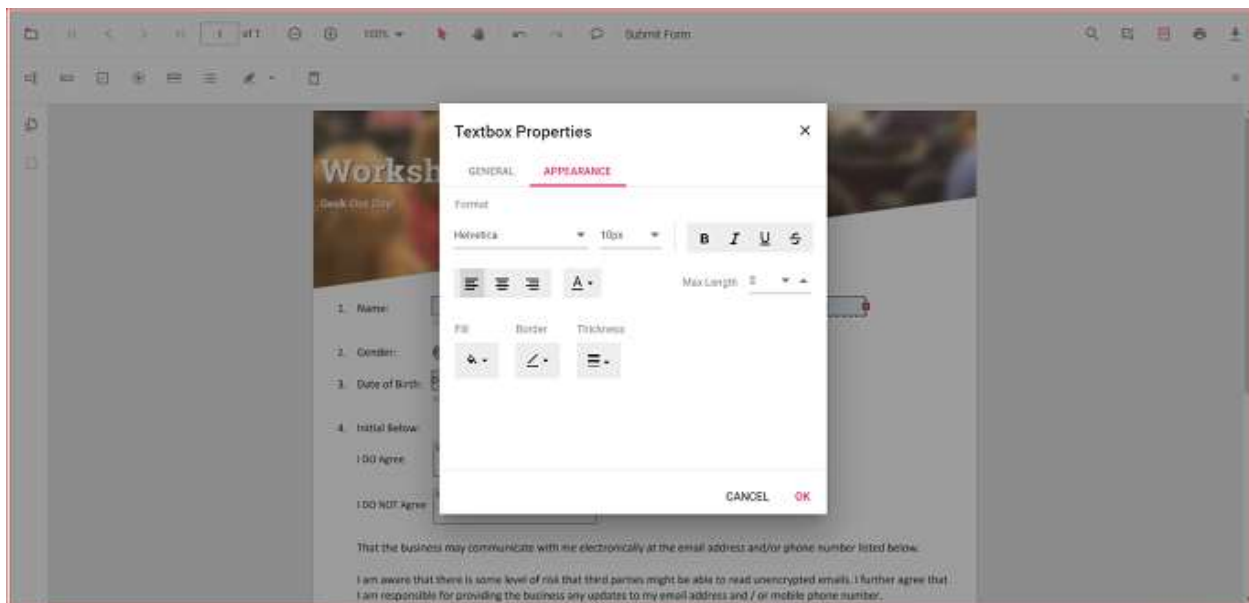

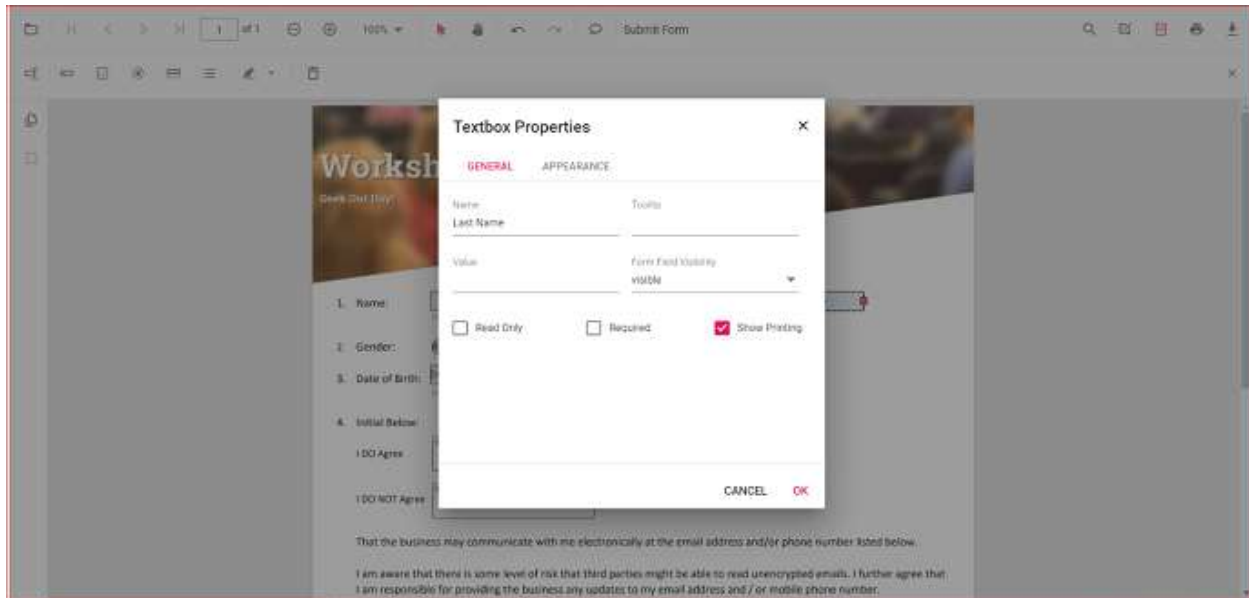

We provide options to resize the Form Field which is currently selected in the PDF document. Refer the below GIF for further reference.

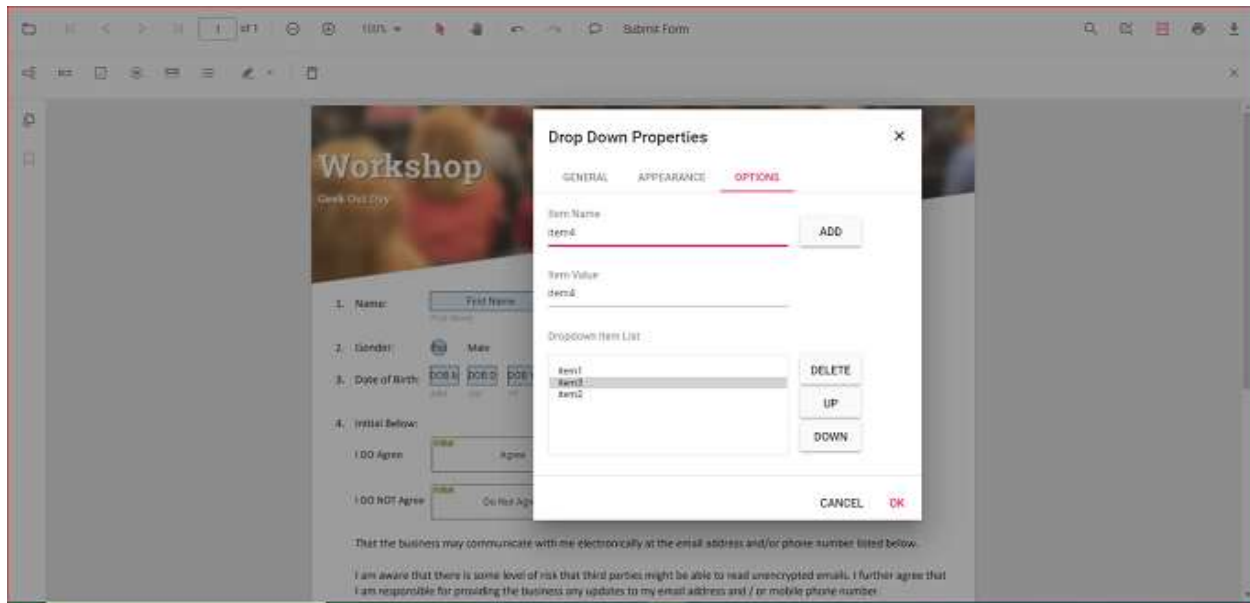

### Edit or Update the form field dynamically

The properties of the Form Fields can be edited using the Form Field Properties window. It can be opened by selecting the Properties option in the context menu that appears on the right by clicking the

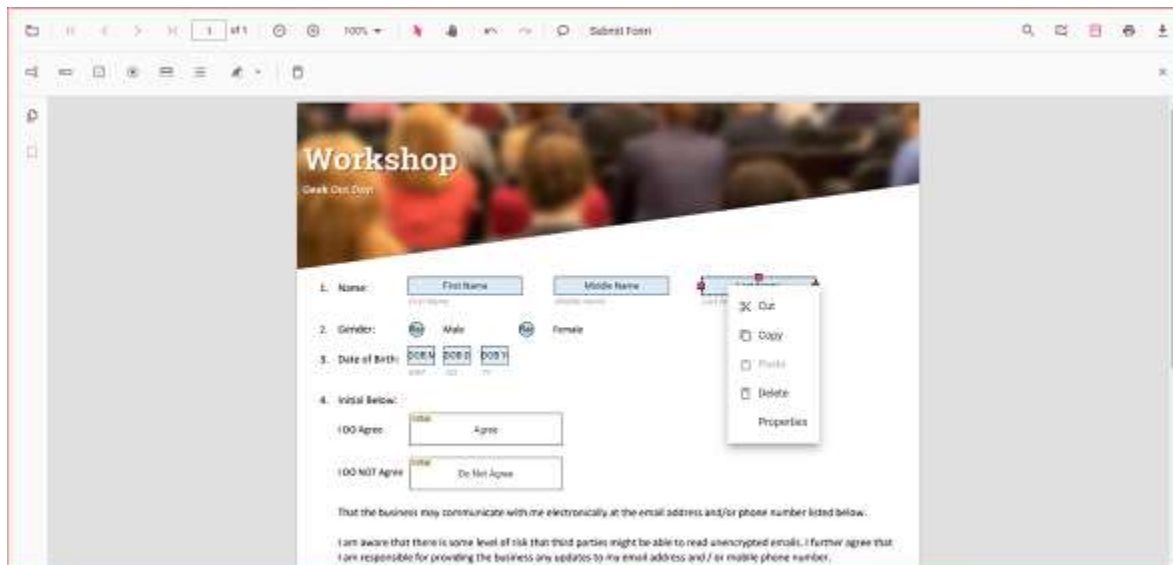

Form Field object. Refer the below image for the properties available to customize the appearance of the Form Field.

### Clipboard operation with form field

The PDF Viewer control supports the clipboard operations such as cut, copy and paste for Form Fields. You can right click on the Form Field object to view the context menu and select to the clipboard options that you would like to perform. Refer the below image for the options in the context menu.

### Undo and Redo

We provided support to undo/redo the Form Field actions that are performed at runtime. Use the following code example to perform undo/redo actions.

```
<button id="undo">Undo</button>
<button id="redo">Redo</button>
```

### STANDALONE

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
 documentPath: "https://cdn.syncfusion.com/content/pdf/form-designer.pdf",
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Print, ej.pdfviewer.Navigation,
ej.pdfviewer.Toolbar, ej.pdfviewer.Magnification, ej.pdfviewer.Annotation,
ej.pdfviewer.FormDesigner, ej.pdfviewer.FormFields);
pdfviewer.appendTo('#PdfViewer');
document.getElementById('undo').addEventListener('click', function () {
 pdfviewer.undo();
});
document.getElementById('redo').addEventListener('click', function () {
 pdfviewer.redo();
});
```

### **SERVER-BACKED**

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
 documentPath: "https://cdn.syncfusion.com/content/pdf/form-designer.pdf",
 serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer',
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Print, ej.pdfviewer.Navigation,
ej.pdfviewer.Toolbar, ej.pdfviewer.Magnification, ej.pdfviewer.Annotation,
ej.pdfviewer.FormDesigner, ej.pdfviewer.FormFields);
pdfviewer.appendTo('#PdfViewer');
document.getElementById('undo').addEventListener('click', function () {
 pdfviewer.undo();
});
document.getElementById('redo').addEventListener('click', function () {
 pdfviewer.redo();
});
```

### Print in EJ2 JavaScript Pdfviewer control

The PDF Viewer supports printing the loaded PDF file. You can enable/disable the print using the following code snippet.

```
`html
{% raw %}
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 fabric theme -->
<link href="{{CDN_LINK}}ej2-pdfviewer/styles/fabric.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 PDF Viewer's global script -->
<script src="{{CDN_LINK}}dist/ej2.min.js" type="text/javascript"></script>
</head>
```

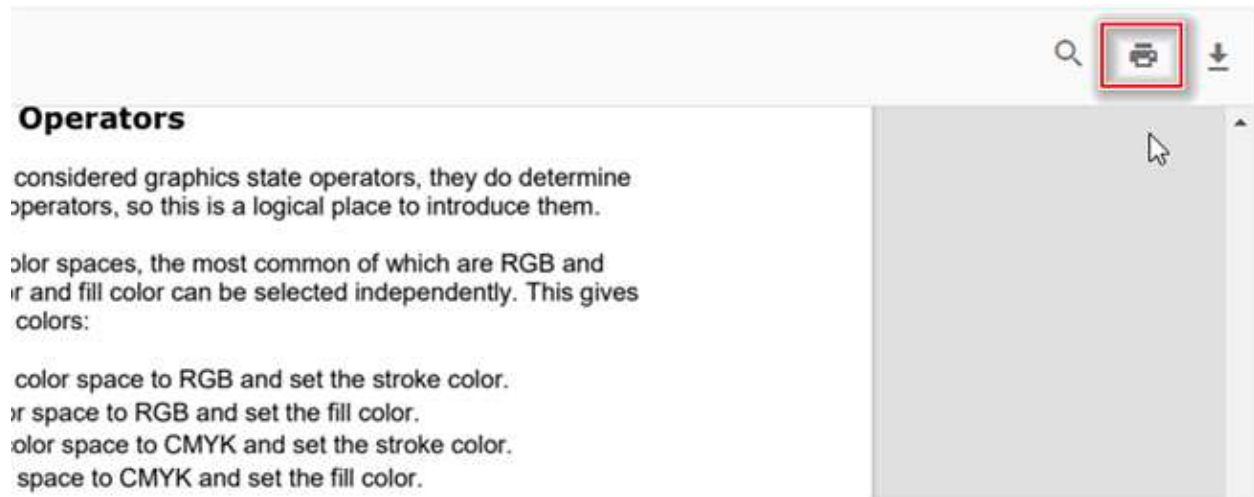

```
<body>
<!--element which is going to render-->
<div id='container'>
<div id='PdfViewer' style="height:500px;width:100%;">
</div>
</div>
</body>
</html>
{% enddraw %}
`
```

### **STANDALONE**

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
enablePrint: true,
documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation,ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');
```

### **SERVER-BACKED**

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
enablePrint: true,
documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation,ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');
```

You can invoke print action using the following code snippet.,

,

```
<button id="print">Print</button>
```

,

### STANDALONE

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
 enablePrint: true,
 documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation, ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');
document.getElementById('print').addEventListener('click', function () {
 pdfviewer.print.print();
});
```

### SERVER-BACKED

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
 enablePrint: true,
 documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
 serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation, ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');
document.getElementById('print').addEventListener('click', function () {
 pdfviewer.print.print();
});
```

 serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation, ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');
```

You can invoke download action using following code snippet.,

```
<button id="download">Download</button>
```

### STANDALONE

```
var pdfviewer = new ej.pdfviewer.PdfViewer({
 enableDownload: true,
 documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation, ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');
document.getElementById('download').addEventListener('click', function () {
 pdfviewer.download()
});
```

### SERVER-BACKED

```

var pdfviewer = new ej.pdfviewer.PdfViewer({
 enableDownload: true,
 documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
 serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation, ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');
document.getElementById('download').addEventListener('click', function () {
 pdfviewer.download()
});

```

### How to get the base64 string while downloading the PDF document

The **downloadEnd** event of the PDF viewer allows you to get the downloaded document as a base64 string.

The following code illustrates how to get the invoke the download action in a button click to get the downloaded document as a base64 string. And load the document from base64 string in another button click.

,

```
<button id="download">Download</button>
```

```
<button id="load">Load</button>
```

,

```
`ts
```

```
var pdfstream;
```

```
document.getElementById('download').addEventListener('click', function () {
```

```
//API to perform download action.
```

```
viewer.download();
```

```
viewer.downloadEnd = function (args) {
```

```
pdfstream = args.downloadDocument;
```

```
//Print the document as a base64 string in the console window.
```

```
console.log(pdfstream);
```

```
};
```

```
});
```

```
document.getElementById('load').addEventListener('click', function () {
```

```
//Load the base64 string in the viewer.
```

```
viewer.load(pdfstream, null);
```

```
});
```

### Globalization in EJ2 JavaScript Pdfviewer control

The text contents provided in the PDF Viewer can be localized using the collection of localized strings for different cultures. By default, the PDF Viewer is localized in “**en-US**”.

The following table shows the default text values used in PDF Viewer in 'en-US' culture:

Keywords	Values
---	---
PdfViewer	PDF Viewer
Cancel	Cancel
Download file	Download file
Download	Download
Enter Password	This document is password protected. Please enter a password.
File Corrupted	File corrupted
File Corrupted Content	The file is corrupted and cannot be opened.
Fit Page	Fit page
Fit Width	Fit width
Automatic	Automatic
Go To First Page	Show first page
Invalid Password	Incorrect password. Please try again.
Next Page	Show next page
OK	OK
Open	Open file
Page Number	Current page number
Previous Page	Show previous page
Go To Last Page	Show last page
Zoom	Zoom
Zoom In	Zoom in
Zoom Out	Zoom out
Page Thumbnails	Page thumbnails

|Bookmarks|Bookmarks|  
|Print|Print file  
Password Protected	Password required
Copy	Copy
Text Selection	Text selection tool
Panning	Pan mode
Text Search	Find text
Find in document	Find in document
Match case	Match case
Apply	Apply
GoToPage	Go to page
No matches	Viewer has finished searching the document. No more matches were found
No Text Found	No Text Found
Undo	Undo
Redo	Redo
Annotation	Add or Edit annotations
Highlight	Highlight Text
Underline	Underline Text
Strikethrough	Strikethrough Text
Delete	Delete annotation
Opacity	Opacity
Color edit	Change Color
Opacity edit	Change Opacity
Highlight context	Highlight
Underline context	Underline
Strikethrough context	Strike through
Server error	Web-service is not listening. PDF Viewer depends on web-service for all it's features.
Please start the web service to continue.	
Open text	Open

<!-- Essential JS 2 fabric theme -->
<link href="{:CDN_LINK}}ej2-pdfviewer/styles/fabric.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 PDF Viewer's global script -->
<script src="{:CDN_LINK}}dist/ej2.min.js" type="text/javascript"></script>
</head>
<body>
<!--element which is going to render-->

```

```

<div id='container'>
<div id='PdfViewer' style="height:500px;width:100%;">
</div>
</div>
</body>
</html>
{% enddraw %}
`

```

### **STANDALONE**

```

var pdfviewer = new ej.pdfviewer.PdfViewer({
 locale: 'ar-AE',
 documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation, ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');

```

### **SERVER-BACKED**

```

var pdfviewer = new ej.pdfviewer.PdfViewer({
 locale: 'ar-AE',
 documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
 serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar,
ej.pdfviewer.Magnification,
ej.pdfviewer.LinkAnnotation, ej.pdfviewer.ThumbnailView,
ej.pdfviewer.BookmarkView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');

```

You have to map the text content based on locale like following script in sample level.,

```

<script>
ej.base.L10n.load({
 'ar-AE': {
 'PdfViewer': {
 'PdfViewer': 'قوات الدفاع الشعبي المشاهد',
 'Cancel': 'إلغاء',
 'Download file': 'تحميل الملف',

```

'Download': 'تحميل',  
'Enter Password': 'هذا المستند محمي بكلمة مرور. يرجى إدخال كلمة مرور',  
'File Corrupted': 'ملف تالف',  
'File Corrupted Content': 'الملف تالف ولا يمكن فتحه',  
'Fit Page': 'لائق بدنيا الصفحة',  
'Fit Width': 'لائق بدنيا عرض',  
'Automatic': 'تلقائي',  
'Go To First Page': 'عرض الصفحة الأولى',  
'Invalid Password': 'كلمة سر خاطئة. حاول مرة أخرى',  
'Next Page': 'عرض الصفحة التالية',  
'OK': 'حسنًا',  
'Open': 'فتح الملف',  
'Page Number': 'رقم الصفحة الحالية',  
'Previous Page': 'عرض الصفحة السابقة',  
'Go To Last Page': 'عرض الصفحة الأخيرة',  
'Zoom': 'تكبير',  
'Zoom In': 'تكبير في',  
'Zoom Out': 'تكبير خارج',  
'Page Thumbnails': 'مصغرات الصفحة',  
'Bookmarks': 'المرجعية',  
'Print': 'اطبع الملف',  
'Password Protected': 'كلمة المرور مطلوبة',  
'Copy': 'نسخ',  
'Text Selection': 'أداة اختيار النص',  
'Panning': 'وضع عموم',  
'Text Search': 'بحث عن نص',  
'Find in document': 'ابحث في المستند',  
'Match case': 'حالة مباراة',  
'Apply': 'تطبيق',  
'GoToPage': 'انتقل إلى صفحة',  
// tslint:disable-next-line:max-line-length  
'No matches': 'انتهى العارض من البحث في المستند. لم يتم العثور على مزيد من التطابقات',  
'No Text Found': 'لم يتم العثور على نص',

'Undo' : 'فك',  
'Redo' : 'فعل ثانية',  
'Annotation': 'إضافة أو تعديل التعليقات التوضيحية',  
'Highlight': 'تسليط الضوء على النص',  
'Underline': 'تسطير النص',  
'Strikethrough': 'نص يتوسطه خط',  
'Delete': 'حذف التعليق التوضيحي',  
'Opacity': 'غموض',  
'Color edit': 'غير اللون',  
'Opacity edit': 'تغيير التعتيم',  
'Highlight context': 'تسليط الضوء',  
'Underline context': 'أكد',  
'Strikethrough context': 'يتوسطه',  
// tslint:disable-next-line:max-line-length  
'Server error': 'خدمة الانترنت لا يستمع. يعتمد قوات الدفاع الشعبي المشاهد على خدمة الويب لجميع ميزاته. يرجى بدء خدمة',  
'Open text': 'افتح',  
'First text': 'الصفحة الأولى',  
'Previous text': 'الصفحة السابقة',  
'Next text': 'الصفحة التالية',  
'Last text': 'آخر صفحة',  
'Zoom in text': 'تكبير',  
'Zoom out text': 'تصغير',  
'Selection text': 'اختيار',  
'Pan text': 'مقلاة',  
'Print text': 'طباعة',  
'Search text': 'بحث',  
'Annotation Edit text': 'تحرير التعليق التوضيحي',  
'General': 'جنرال لواء',  
'Appearance': 'مظهر خارجي',  
'Options': 'والخيارات',  
'Textbox Properties': 'خصائص مربع النص',  
'Tooltip': 'تلميح',

```
'Value': 'القيمة',
'Form Field Visibility': 'رؤية حقل النموذج',
'Read Only': 'يقرأ فقط',
'Required': 'مطلوب',
'Checked': 'التحقق',
'Show Printing': 'عرض الطباعة'
}
}
});
</script>
`
```

## Server Deployment

### Pdfviewer server docker image overview in EJ2 JavaScript Pdfviewer control

The Syncfusion PDF Viewer control allows you to view, print, form-fill, and annotate PDF files in your web applications. This PDF Viewer control requires a server-side backend Web API service to render PDF contents.

This Docker image is the predefined Docker container of Syncfusion's PDF Viewer backend. You can deploy it quickly to your infrastructure.

PDF Viewer is a commercial product, and it requires a valid license to use it in a production environment ([request license or trial key](#)).

PDF Viewer control is supported in the JavaScript, Angular, React, Vue, ASP.NET Core, ASP.NET MVC, and Blazor platforms.

### Prerequisites

Have [Docker](#) installed in your environment:

- On Windows, install [Docker for Windows](#).
- On macOS, install [Docker for Mac](#).

### How to use this PDF Viewer Docker image

**Step 1:** Pull the pdfviewer-server image from Docker Hub.

```
`console
docker pull syncfusion/pdfviewer-server
`
```

**Step 2:** Create the docker-compose.yml file with the following code in your file system.

```
`yaml
version: '3.4'
services:
```

pdfviewer-server:

image: syncfusion/pdfviewer-server:latest

environment:

[Provide your license key for activation](#)

SYNCFUSIONLICENSEKEY: YOURLICENSEKEY

ports:

- "6001:80"

,

**Step 3:** In a terminal tab, navigate to the directory where you've placed the docker-compose.yml file and execute the following.

```
`console
```

```
docker-compose up
```

,

Also, you can run the Docker container along with the license key using this docker run command.

```
`console
```

```
docker run -d -p 6001:80 -e SYNCFUSIONLICENSEKEY= YOURLICENSEKEY syncfusion/pdfviewer-server:latest
```

,

Now the PDF Viewer server Docker instance runs in the localhost with the provided port number `http://localhost:6001`. Open this link in the browser and navigate to the PDF Viewer Web API control `http://localhost:6001/api/pdfviewer`. It returns the default get method response.

**Step 4:** Append the Docker instance running the URL (`http://localhost:6001/api/pdfviewer`) to the service URL in the client-side PDF Viewer control. For more information about how to get started with PDF Viewer control, refer to this [getting started page](#).

```
`html
```

```
<!DOCTYPE html><html xmlns="http://www.w3.org/1999/xhtml"><head>
```

```
<title>Essential JS 2</title>
```

```

<!--element which is going to render-->
<div id="container">
<div id="PdfViewer" style="height:500px;width:100%;">
</div>
</div>
<script>
// Initialize PDF Viewer component.
var pdfviewer = new ej.pdfviewer.PdfViewer({
documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
serviceUrl: "http://localhost:6001/api/pdfviewer"
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection, ej.pdfviewer.TextSearch,
ej.pdfviewer.Navigation,ej.pdfviewer.Print);
//PDF Viewer control rendering starts
pdfviewer.appendTo('#PdfViewer');
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
ele.style.visibility = "visible";
}
}
```

```
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

#### [How to configure the distributed Redis Cache in this Docker image](#)

The PDF Viewer server library internally caches the loaded document instance and you can extend the cache option to a distributed cache environment. Please follow these steps to configure the Azure Cache for a Redis instance to the PDF Viewer server library using a Docker compose file.

**Step 1:** Create the [Azure Cache for the Redis instance](#) and copy the connection string.

**Step 2:** Provide the connection string to the `REDISCACHECONNECTIONSTRING` environment variable in the `pdfviewer-server docker-compose file`. The default cache sliding expiration time is 10 minutes. You can also configure it by setting the value to the `DOCUMENTSLIDINGEXPIRATIONTIME` environment variable.

```
`yaml
```

```
version: '3.4'
```

```
services:
```

```
pdfviewer-server:
```

```
image: syncfusion/pdfviewer-server:latest
```

```
environment:
```

[Provide your license key for activation](#)

```
SYNCFUSIONLICENSEKEY: YOURLICENSEKEY
```

```
REDISCACHECONNECTIONSTRING: YOURREDISCACHECONNECTION_STRING
```

```
DOCUMENTSLIDINGEXPIRATION_TIME: "20"
```

```
ports:
```

- "6001:80"

Refer to these getting started pages to create a PDF Viewer in [Angular](#), [React](#), [Vue](#), [ASP.NET MVC](#), [ASP.NET Core](#), and [Blazor](#).

How to deploy docker image in azure app service for container in EJ2 JavaScript Pdfviewer control

#### [Prerequisites](#)

- Have [Azure account](#) and [Azure CLI](#) setup in your environment.
- Run the following command to open the Azure login page. Sign into your [Microsoft Azure account](#).

az login

,

**Step 1:** Create a resource group.

Create a resource group using the [az group create](#) command.

The following example creates a resource group named pdfviewerresourcegroup in the eastus location.

,

```
az group create --name pdfviewerresourcegroup --location "East US"
```

,

**Step 2:** Create an Azure App Service plan.

Create an App Service plan in the resource group with the [az appservice plan create](#) command.

The following example creates an App Service plan named pdfviewerappservice in the Standard pricing tier (--sku S1) and in a Linux container (--is-linux).

,

```
az appservice plan create --name pdfviewerappservice --resource-group pdfviewerresourcegroup --sku S1 --is-linux
```

,

**Step 3:** Create a Docker Compose app.

Create a multi-container [web app](#) in the pdfviewerappservice App Service plan with the [az webapp create](#) command. The following command creates the web app using the provided Docker compose file. Please look into the section for getting started with Docker compose to create the Docker compose file for the PDF Viewer server and use the created Docker compose file here.

,

```
az webapp create --resource-group pdfviewerappservice --plan pdfviewerappservice --name pdfviewer-server --multicontainer-config-type compose --multicontainer-config-file pdfviewer-server-compose.yml
```

,

**Step 4:** Browse to the app.

Browse to the deployed app at `http://<app_name>.azurewebsites.net`, i.e.

`http://pdfviewerappservice.azurewebsites.net`. Open this link in a browser and navigate to the PDF Viewer Web API control `http://pdfviewerappservice.azurewebsites.net/api/pdfviewer`. It returns the default get method response.

Append the app service running the URL

`http://pdfviewerappservice.azurewebsites.net/api/pdfviewer` to the service URL in the client-side PDF Viewer control. For more information about how to get started with the PDF Viewer control, refer to this [getting started page](#).

For more information about the app container service, please look deeper into the [Microsoft Azure Container Service](#) for a production-ready setup.

## How to deploy docker image in azure kubernetes service in EJ2 JavaScript Pdfviewer control

### Prerequisites

- Have [Azure account](#) and [Azure CLI](#) setup in your environment.
- Run the following command to open the Azure login page. Sign into your [Microsoft Azure account](#).

,

```
az login
```

,

#### Step 1: Create a resource group.

Create a resource group using the [az group create](#) command.

The following example creates a resource group named pdfviewerresourcegroup in the eastus location.

,

```
az group create --name pdfviewerresourcegroup --location "East US"
```

,

#### Step 2: Create AKS cluster.

Use the [az aks create](#) command to create an AKS cluster. The following example creates a cluster named pdfviewercluster with one node.

,

```
az aks create --resource-group pdfviewerresourcegroup --name pdfviewercluster --node-count 1
```

,

#### Step 3: Connect to the cluster.

Install the [kubectl](#) into the workspace using the following command.

,

```
az aks install-cli
```

,

To configure kubectl to connect to your Kubernetes cluster, use the [az aks get-credentials](#) command. This command downloads credentials and configures the Kubernetes CLI to use them.

,

```
az aks get-credentials --resource-group pdfviewerresourcegroup --name pdfviewercluster
```

,

#### Step 4: Create services and deployments.

[Kubernetes Services](#) and [Deployments](#) can be configured in a file. To run the PDF Viewer server, you have to define a Service and a Deployment pdfviewerserver. To do this, create the pdfviewer-server.yaml file in the current directory using the following code.

```
`yaml
apiVersion: apps/v1
kind: Deployment
metadata:
 labels:
 app: pdfviewerserver
 name: pdfviewerserver
spec:
 replicas: 1
 selector:
 matchLabels:
 app: pdfviewerserver
 strategy: {}
 template:
 metadata:
 labels:
 app: pdfviewerserver
 spec:
 containers:
 - image: syncfusion/pdfviewerserver:latest

name: pdfviewerserver
ports:
 - containerPort: 80

env:
 - name: SYNCFUSIONLICENSEKEY
 value: "YOURLICENSEKEY"
apiVersion: v1
kind: Service
metadata:
 labels:
 app: pdfviewerserver
```

```
name: pdfviewerserver
```

```
spec:
```

```
ports:
```

- port: 80

```
targetPort: 80
```

```
selector:
```

```
app: pdfviewerserver
```

```
type: LoadBalancer
```

```
,
```

**Step 5:** To create all Services and Deployments needed to run the PDF Viewer server, execute the following.

```
`console
```

```
kubectl create -f ./pdfviewer-server.yaml
```

```
,
```

Run the following command to get the Kubernetes cluster deployed with service details and copy the external IP address of the PDF Viewer service.

```
`console
```

```
kubectl get all
```

```
,
```

Browse the copied external IP address and navigate to the PDF Viewer Web API control `http://<external-ip>/api/pdfviewer`. It returns the default get method response.

**Step 6:** Append the Kubernetes service running the URL `http://<external-ip>/api/pdfviewer` to the service URL in the client-side PDF Viewer control. For more information about how to get started with the PDF Viewer control, refer to this [getting started page](#).

For more details about the Azure Kubernetes service, please look deeper into [Microsoft Azure Kubernetes Service](#) for a production-ready setup.

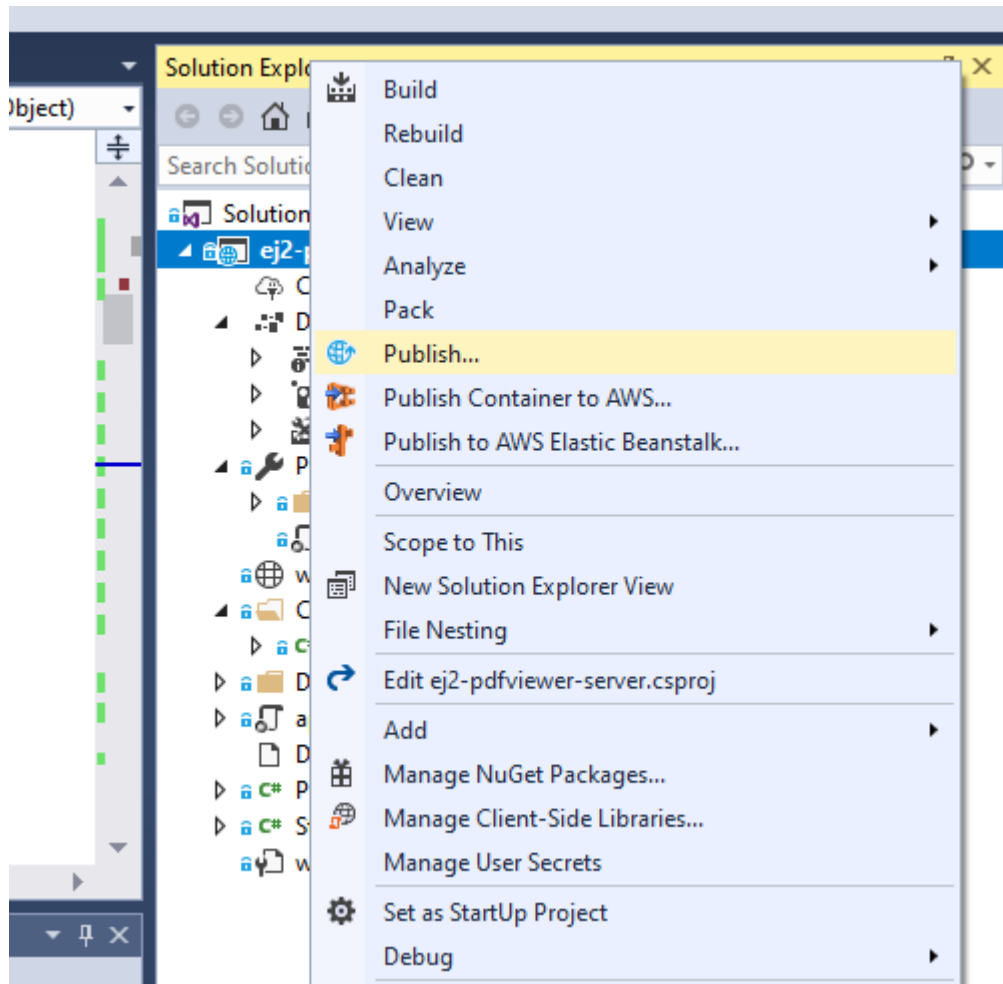

How to deploy pdfviewer server app in azure app service from visual studio in EJ2 JavaScript Pdfviewer control

*Prerequisites*

- Visual Studio 2017 or Visual Studio 2019.
- An [Azure subscription](#).
- Create the [PDF Viewer Web API application](#).
- Make sure you've built the project using the Build > Build Solution menu command before following the deployment steps.

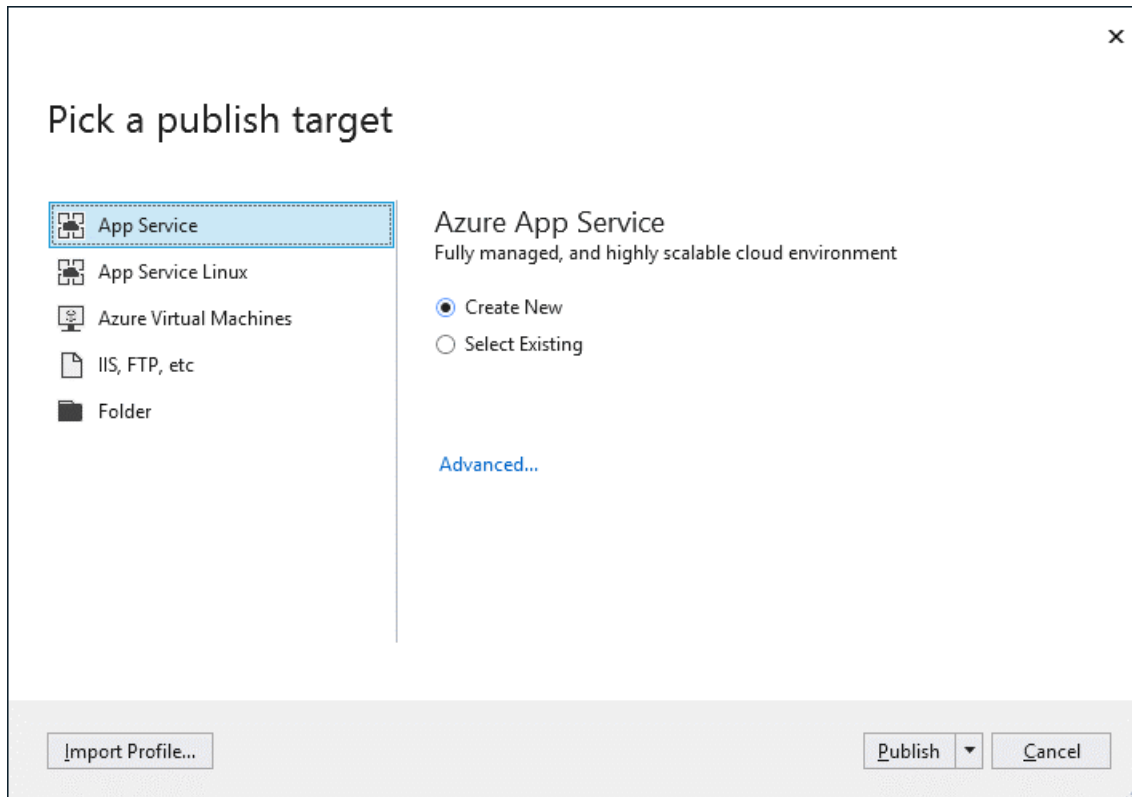

*Publish to Azure App Service*

**Step 1:** In Solution Explorer, right-click the project and choose Publish (or use the Build > Publish menu item).

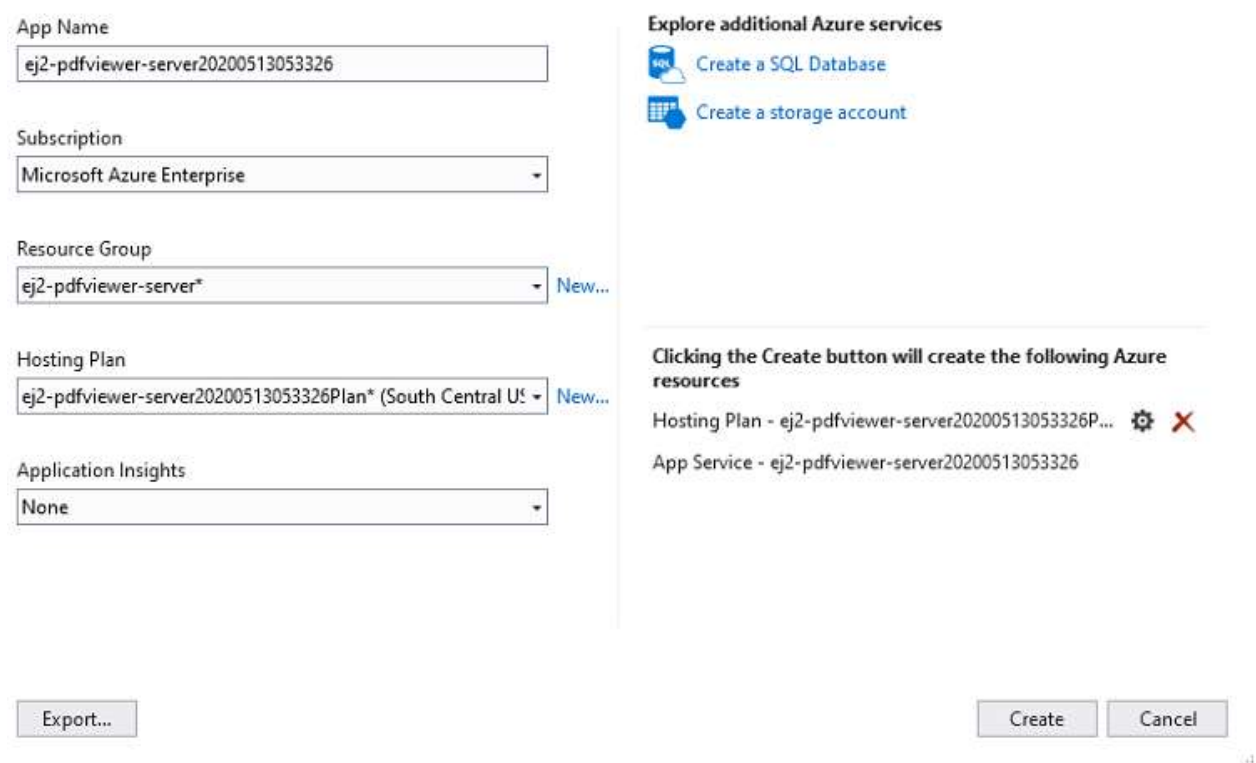

**Step 2:** If you have previously configured any publishing profiles, the Publish pane appears, in which case, select Create new profile.

**Step 3:** In the Pick a publish target dialog box, choose App Service.

**Step 4:** Select Publish. The Create App Service dialog box appears. Sign in with your Azure account, if necessary, then the default app service settings populate the fields.

**Step 5:** Select Create. Visual Studio deploys the app to your Azure App Service, and the web app loads in your browser at `http://<app_name>.azurewebsites.net`. (i.e. `http://ej2-pdfviewer-server20200513053326.azurewebsites.net`).

**Step 6:** Navigate to the PDF Viewer Web API control `http://ej2-pdfviewer-server20200513053326.azurewebsites.net/api/pdfviewer`. It returns the default get method response.

Append the app service running the URL `http://ej2-pdfviewer-server20200513053326.azurewebsites.net/api/pdfviewer` to the service URL in the client-side PDF Viewer control. For more information about how to get started with the PDF Viewer control, refer to this [getting started page](#).

For more information about the app container service, please look deeper into the [Microsoft Azure App Service](#) for a production-ready setup.

## How To

### Create pdfviewer service in EJ2 JavaScript Pdfviewer control

The Essential JavaScript PDF Viewer have server side dependency to get the details from PDF Documents for rendering. This section explains how to create the service for PDF Viewer to perform server-side preprocessing of the PDF document to be rendered in client side.

#### Prerequisites

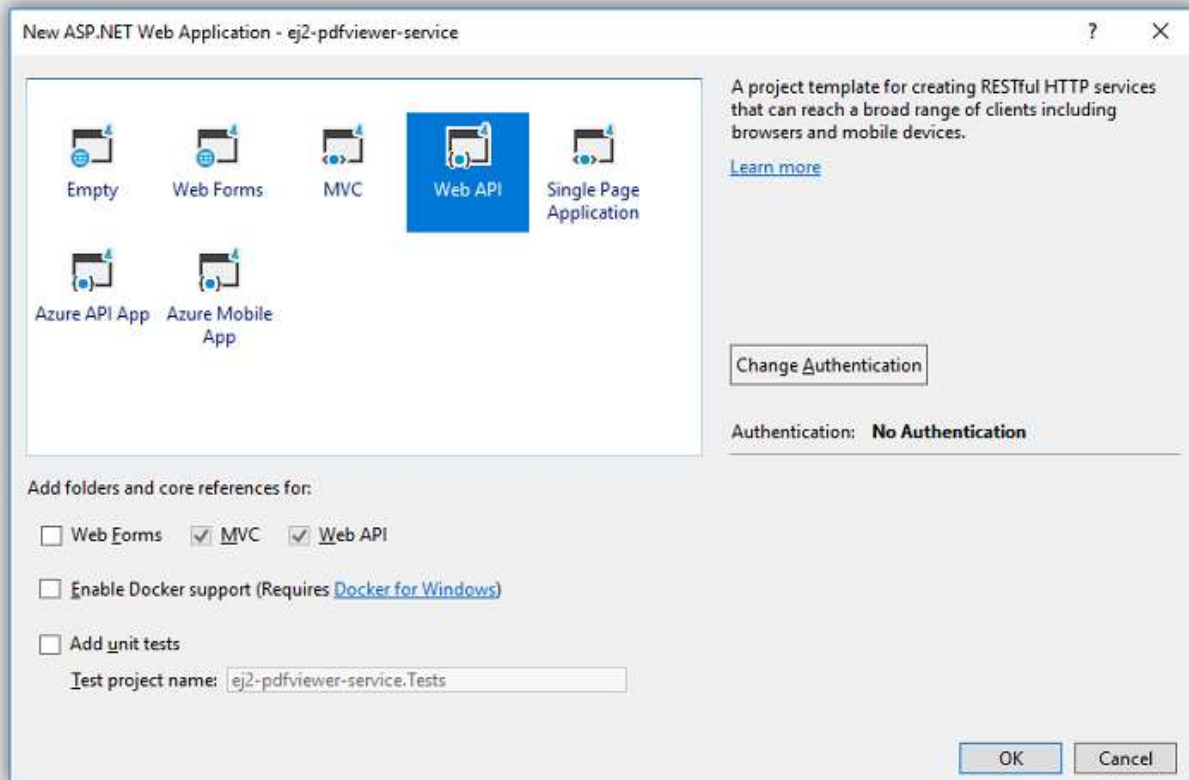

To get started with ASP.NET MVC Web API service, ensure that the following software is installed on the machine.

- .Net Framework 4.5 and above.
- ASP.NET MVC 4 or ASP.NET MVC 5
- Web API
- Visual Studio

#### Setup ASP.NET MVC application with Web API for PDF Viewer service

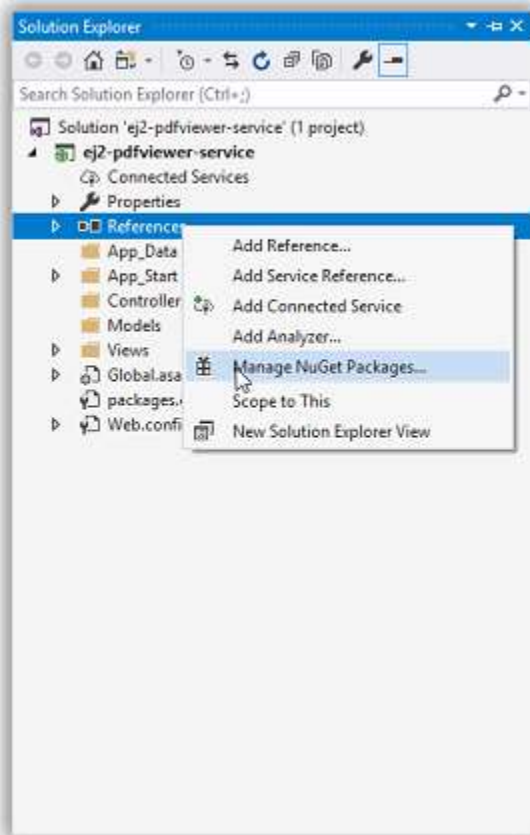

The following steps are used to create PDF Viewer service

**Step 1:** Create an ASP.NET web application with the default template project in Visual Studio 2017.

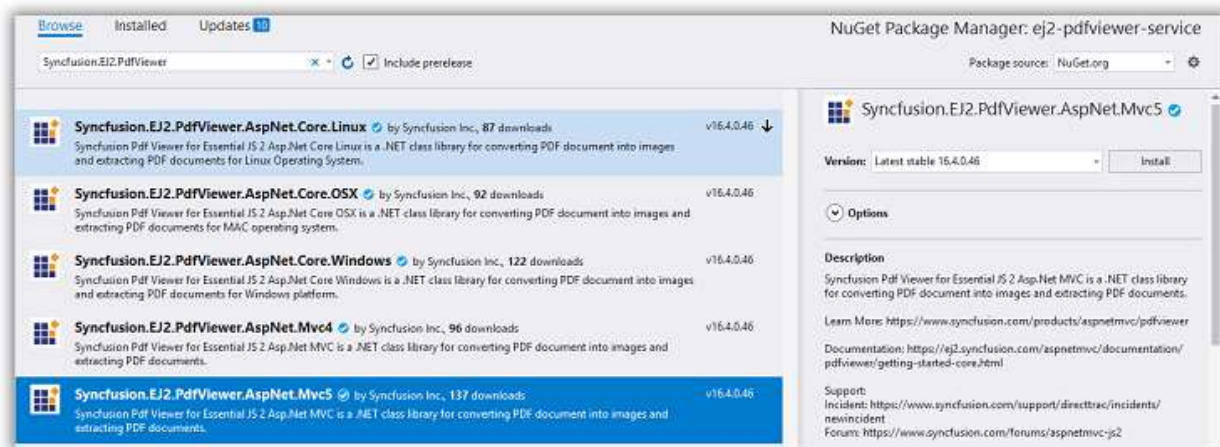

**Step 2:** After creating the project, add the `Syncfusion.EJ2.PdfViewer.AspNet.MVC5` dependency to your project by using 'NuGet Package Manager'.

Open the `NuGet` package manager.

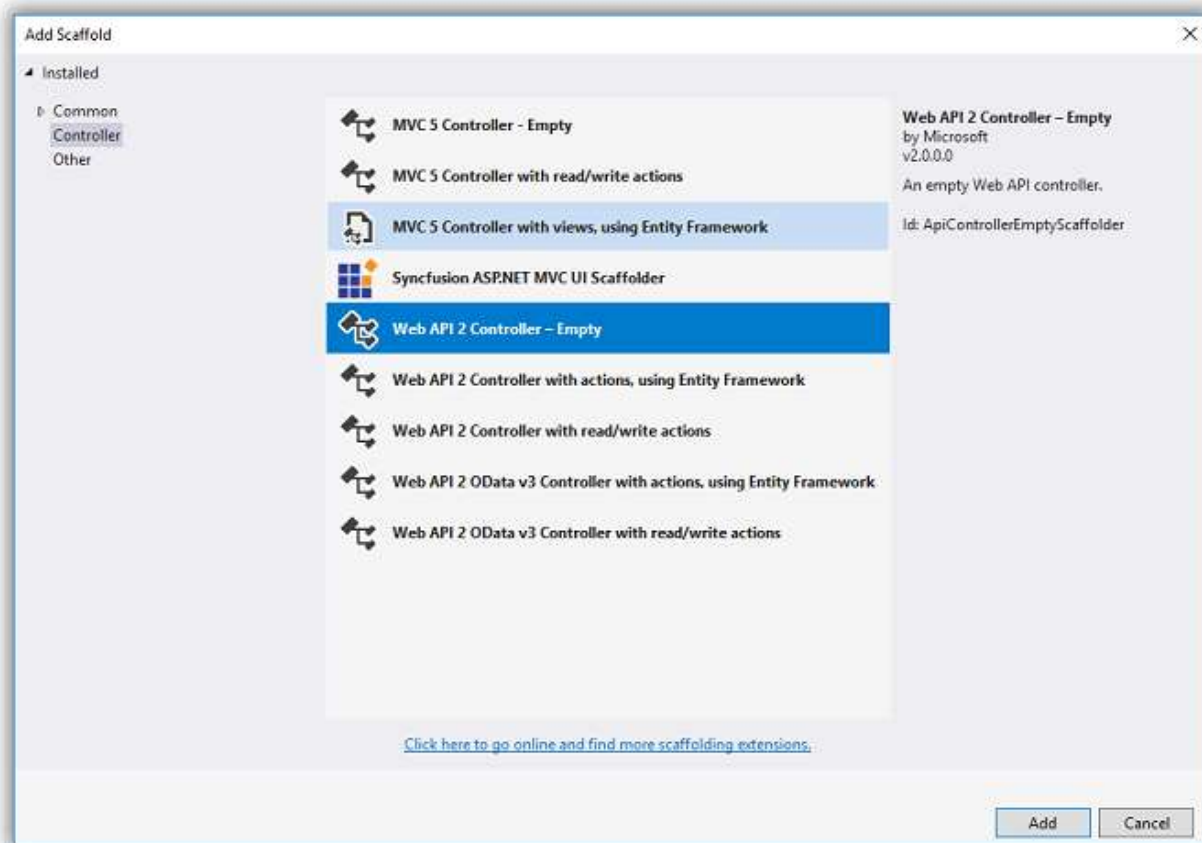

Install the **Syncfusion.EJ2.PdfViewer.AspNet.Mvc5** package to the application.

**Step 3:** Add the Web API 2 Controller to the project and named it as PdfViewerController .

**Step 4:** Add the following code to the PdfViewerController.cs controller.

```
`ts
using Newtonsoft.Json;
using Syncfusion.EJ2.PdfViewer;
using System;
using System.Collections.Generic;
using System.IO;
using System.Linq;
using System.Net;
using System.Net.Http;
using System.Web;
using System.Web.Http;
namespace MvcWebService.webapi
{
 public class PdfViewerController : ApiController
 {
```

```
[System.Web.Mvc.HttpPost]
public object Load(Dictionary<string, string> jsonObject)
{
 PdfRenderer pdfviewer = new PdfRenderer();
 MemoryStream stream = new MemoryStream();
 object jsonResult = new object();
 if (jsonObject != null && jsonObject.ContainsKey("document"))
 {
 if (bool.Parse(jsonObject["isFileName"]))
 {
 string documentPath = GetDocumentPath(jsonObject["document"]);
 if (!string.IsNullOrEmpty(documentPath))
 {
 byte[] bytes = System.IO.File.ReadAllBytes(documentPath);
 stream = new MemoryStream(bytes);
 }
 else
 {
 string fileName = jsonObject["document"].Split(new string[] { "://" }, StringSplitOptions.None)[0];
 if (fileName == "http" || fileName == "https")
 {
 WebClient WebClient = new WebClient();
 byte[] pdfDoc = WebClient.DownloadData(jsonObject["document"]);
 stream = new MemoryStream(pdfDoc);
 }
 else
 {
 return (jsonObject["document"] + " is not found");
 }
 }
 }
 else
 {
 return (jsonObject["document"] + " is not found");
 }
 }
}
```

```
byte[] bytes = Convert.FromBase64String(jsonObject["document"]);
stream = new MemoryStream(bytes);
}
}
jsonResult = pdfviewer.Load(stream, jsonObject);
return (JsonConvert.SerializeObject(jsonResult));
}
[System.Web.Mvc.HttpPost]
public object Bookmarks(Dictionary<string, string> jsonObject)
{
 PdfRenderer pdfviewer = new PdfRenderer();
 var jsonResult = pdfviewer.GetBookmarks(jsonObject);
 return (jsonResult);
}
[System.Web.Mvc.HttpPost]
public object RenderPdfPages(Dictionary<string, string> jsonObject)
{
 PdfRenderer pdfviewer = new PdfRenderer();
 object jsonResult = pdfviewer.GetPage(jsonObject);
 return (JsonConvert.SerializeObject(jsonResult));
}
[System.Web.Mvc.HttpPost]
public object RenderThumbnaillImages(Dictionary<string, string> jsonObject)
{
 PdfRenderer pdfviewer = new PdfRenderer();
 object result = pdfviewer.GetThumbnaillImages(jsonObject);
 return (JsonConvert.SerializeObject(result));
}
[System.Web.Mvc.HttpPost]
public object RenderPdfTexts(Dictionary<string, string> jsonObject)
{
 PdfRenderer pdfviewer = new PdfRenderer();
 object result = pdfviewer.GetDocumentText(jsonObject);
```

```
return (JsonConvert.SerializeObject(result));
}

[System.Web.Mvc.HttpPost]
public object RenderAnnotationComments(Dictionary<string, string> jsonObject)
{
 PdfRenderer pdfviewer = new PdfRenderer();
 object jsonResult = pdfviewer.GetAnnotationComments(jsonObject);
 return (JsonConvert.SerializeObject(jsonResult));
}

[System.Web.Mvc.HttpPost]
public object Unload(Dictionary<string, string> jsonObject)
{
 PdfRenderer pdfviewer = new PdfRenderer();
 pdfviewer.ClearCache(jsonObject);
 return ("Document cache is cleared");
}

[System.Web.Mvc.HttpPost]
public HttpResponseMessage Download(Dictionary<string, string> jsonObject)
{
 PdfRenderer pdfviewer = new PdfRenderer();
 string documentBase = pdfviewer.GetDocumentAsBase64(jsonObject);
 return (GetPlainText(documentBase));
}

[System.Web.Mvc.HttpPost]
public object PrintImages(Dictionary<string, string> jsonObject)
{
 PdfRenderer pdfviewer = new PdfRenderer();
 object pageImage = pdfviewer.GetPrintImage(jsonObject);
 return (pageImage);
}

private HttpResponseMessage GetPlainText(string pageImage)
{
 var responseText = new HttpResponseMessage(HttpStatusCode.OK);
```

```
responseText.Content = new StringContent(pagelImage, System.Text.Encoding.UTF8, "text/plain");
return responseText;
}

private string GetDocumentPath(string document)
{
 string documentPath = string.Empty;
 if (!System.IO.File.Exists(document))
 {
 var path = HttpContext.Current.Request.PhysicalApplicationPath;
 if (System.IO.File.Exists(path + "/Data/" + document))
 documentPath = path + "/Data/" + document;
 }
 else
 {
 documentPath = document;
 }
 return documentPath;
}

// GET api/values
[System.Web.Mvc.HttpPost]
public IEnumerable<string> Get()
{
 return new string[] { "value1", "value2" };
}

[System.Web.Mvc.HttpPost]
//Post action to export annotations
[System.Web.Mvc.Route("{id}/ExportAnnotations")]
public HttpResponseMessage ExportAnnotations(Dictionary<string, string> jsonObject)
{
 PdfRenderer pdfviewer = new PdfRenderer();
 string jsonResult = pdfviewer.ExportAnnotation(jsonObject);
 return (GetPlainText(jsonResult));
}
```

```
[System.Web.Mvc.HttpPost]
//Post action to import annotations
public object ImportAnnotations(Dictionary<string, string> jsonObject)
{
 PdfRenderer pdfviewer = new PdfRenderer();
 string jsonResult = string.Empty;
 object JsonResult;
 if (jsonObject != null && jsonObject.ContainsKey("fileName"))
 {
 string documentPath = GetDocumentPath(jsonObject["fileName"]);
 if (!string.IsNullOrEmpty(documentPath))
 {
 jsonResult = System.IO.File.ReadAllText(documentPath);
 }
 else
 {
 return (jsonObject["document"] + " is not found");
 }
 }
 else
 {
 string extension = Path.GetExtension(jsonObject["importedData"]);
 if (extension != ".xdf")
 {
 JsonResult = pdfviewer.ImportAnnotation(jsonObject);
 return (GetPlainText((JsonConvert.SerializeObject(JsonResult))));
 }
 else
 {
 string documentPath = GetDocumentPath(jsonObject["importedData"]);
 if (!string.IsNullOrEmpty(documentPath))
 {
 byte[] bytes = System.IO.File.ReadAllBytes(documentPath);
```

```

jsonObject["importedData"] = Convert.ToBase64String(bytes);
JsonResult = pdfviewer.ImportAnnotation(jsonObject);
return (GetPlainText((JsonConvert.SerializeObject(JsonResult))));
}
else
{
return (jsonObject["document"] + " is not found");
}
}
}
return (GetPlainText((JsonResult)));
}
}
}
,

```

**Step 5:** Configure the CORS policy in the `web.config` file.

```

<?xml
<system.webServer>
<httpProtocol>
<customHeaders>
<add name="Access-Control-Allow-Headers" value="accept, maxdataserviceversion, origin, x-requested-
with, dataserviceversion,content-type" />
<add name="Access-Control-Allow-Origin" value="*" />
<add name="Access-Control-Max-Age" value="1728000" />
</customHeaders>
</httpProtocol>
</system.webServer>
,

```

**Step 6:** Set the Global configuration in the `Global.asax` file:

```

,
System.Web.Http.GlobalConfiguration.Configuration.Routes.MapHttpRoute(
name: "DefaultApi",
routeTemplate: "api/{controller}/{action}/{id}",

```

```
defaults: new { id = RouteParameter.Optional };
```

```
AppDomain.CurrentDomain.SetData("SQLServerCompactEditionUnderWebHosting", true);
```

```
,
```

Download the sample to create PDF Viewer web service [here](#)

Create pdfviewer service in EJ2 JavaScript Pdfviewer control

The Essential JavaScript PDF Viewer have server side dependency to get the details from PDF Documents for rendering. This section explains how to create the service for PDF Viewer to perform server-side preprocessing of the PDF document to be rendered in client side.

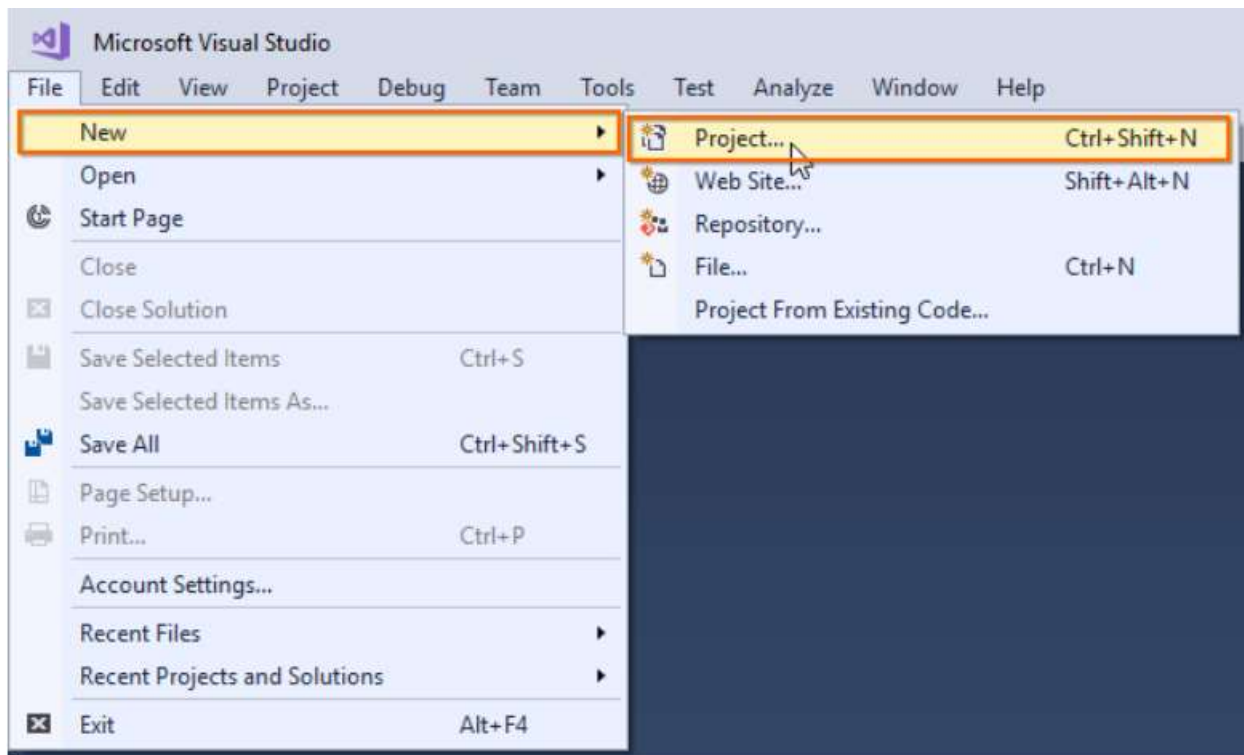

#### *Prerequisites*

To get started with ASP.NET CORE Web API service, refer [System requirements for ASP.NET Core controls](#).

*Setup ASP.NET CORE application with Web API for PDF Viewer service*

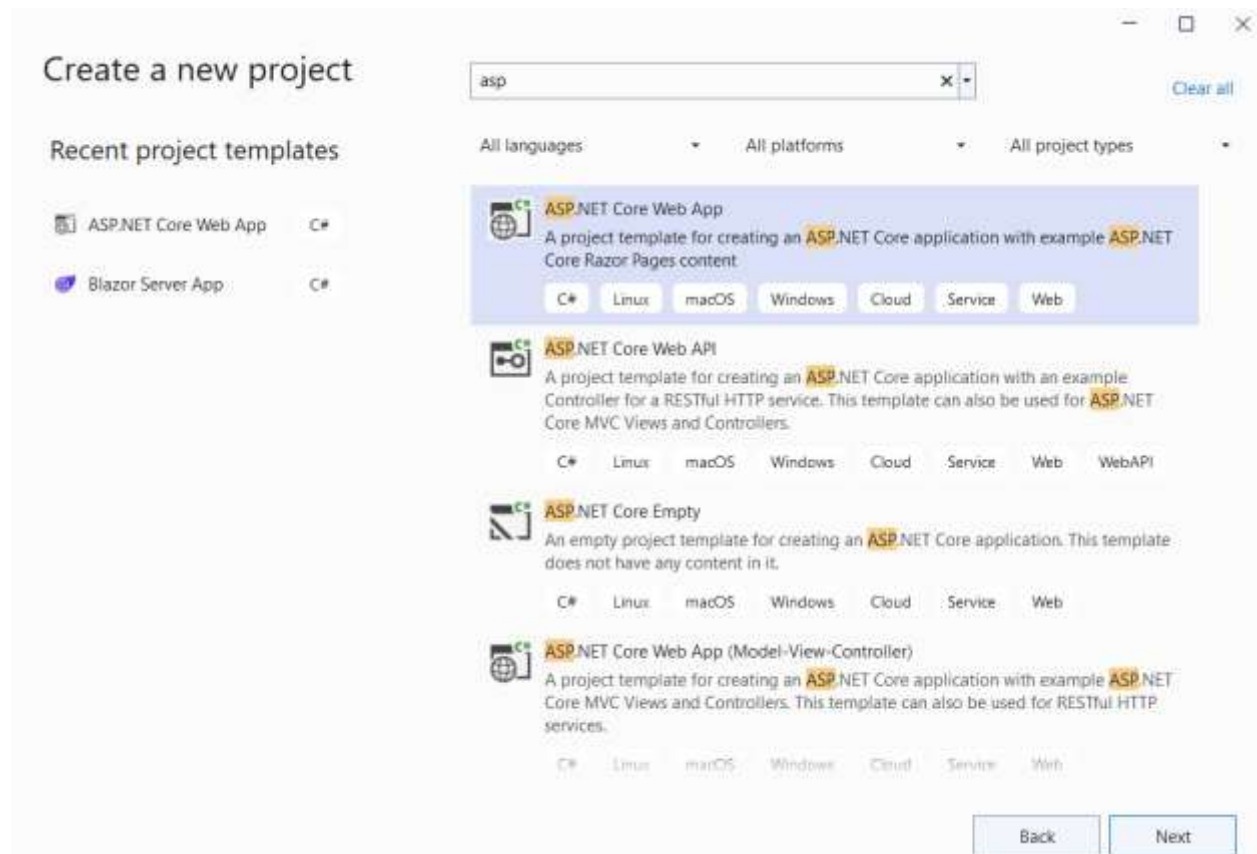

The following steps are used to create PDF Viewer service

**Step 1:** Select File > New > Project, in the Visual Studio menu bar.

**Step 2:** Select ASP.NET Core Web Application and then click **Next**.

**Step 3:** In the Configure your new project dialog, enter Project Name and select **Next**.

Configure your new project

ASP.NET Core Web App C# Linux macOS Windows Cloud Service Web

Project name

PdfViewerWebService

Location

D:\webservice-aspnetcore\

Solution name ⓘ

PdfViewerWebService

☒ Place solution and project in the same directory

Project will be created in "D:\webservice-aspnetcore\PdfViewerWebService\"

Back Next

**Step 4:** In the Additional information dialog, select .NET 6.0 (Long-term Support) and then select **Create**.

Additional information

ASP.NET Core Web App C# Linux macOS Windows Cloud Service Web

Framework ⓘ  
.NET 6.0 (Long Term Support)

Authentication type ⓘ  
None

☒ Configure for HTTPS ⓘ

☐ Enable Docker ⓘ

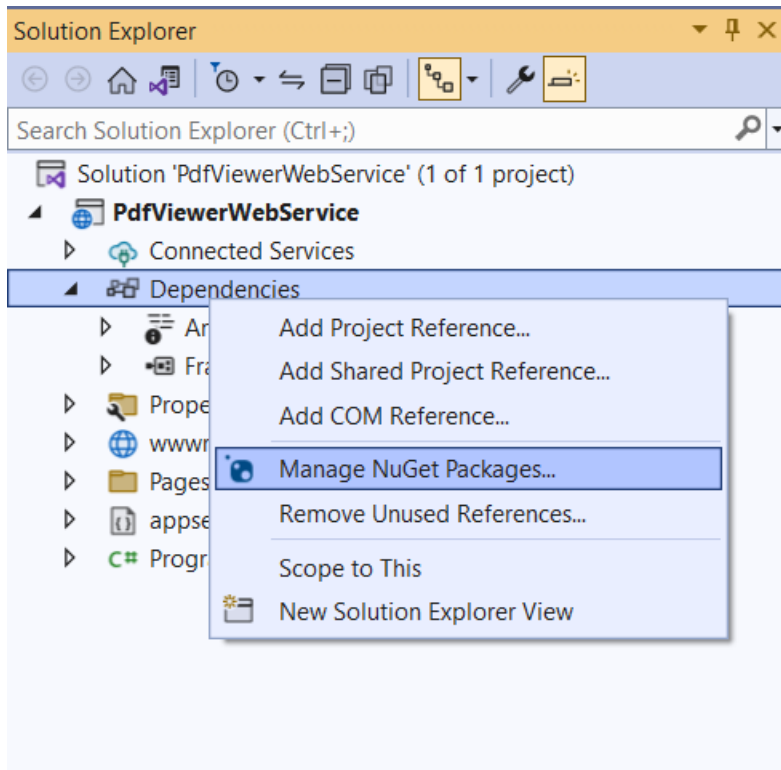

Docker OS ⓘ  
Linux

☐ Do not use top-level statements ⓘ

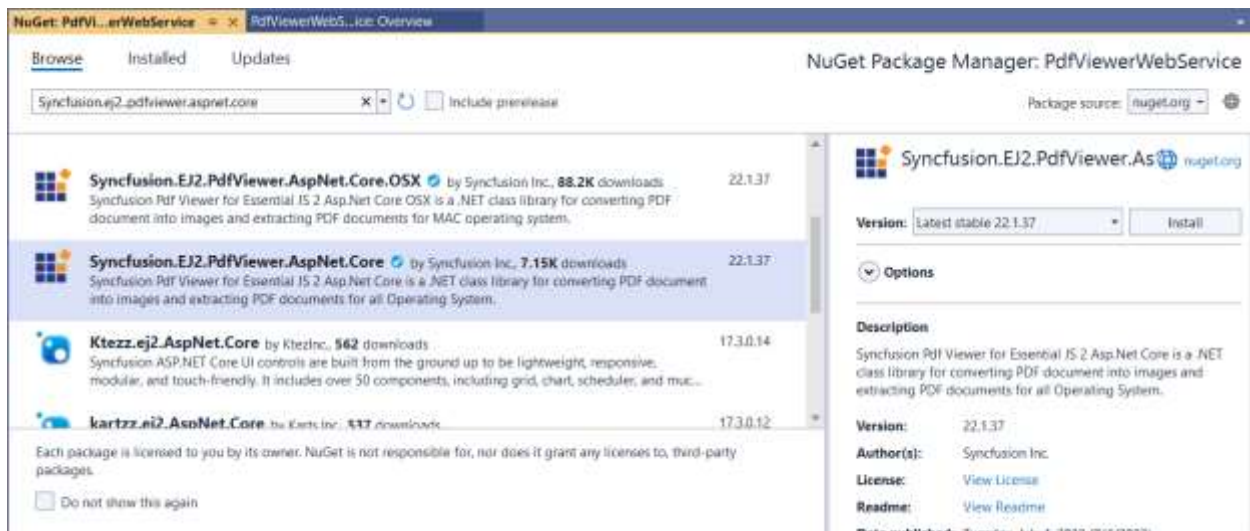

Back Create

**Step 5:** After creating the project, add the [Syncfusion.EJ2.PdfViewer.AspNet.Core](#) dependency to your project by using 'NuGet Package Manager'.

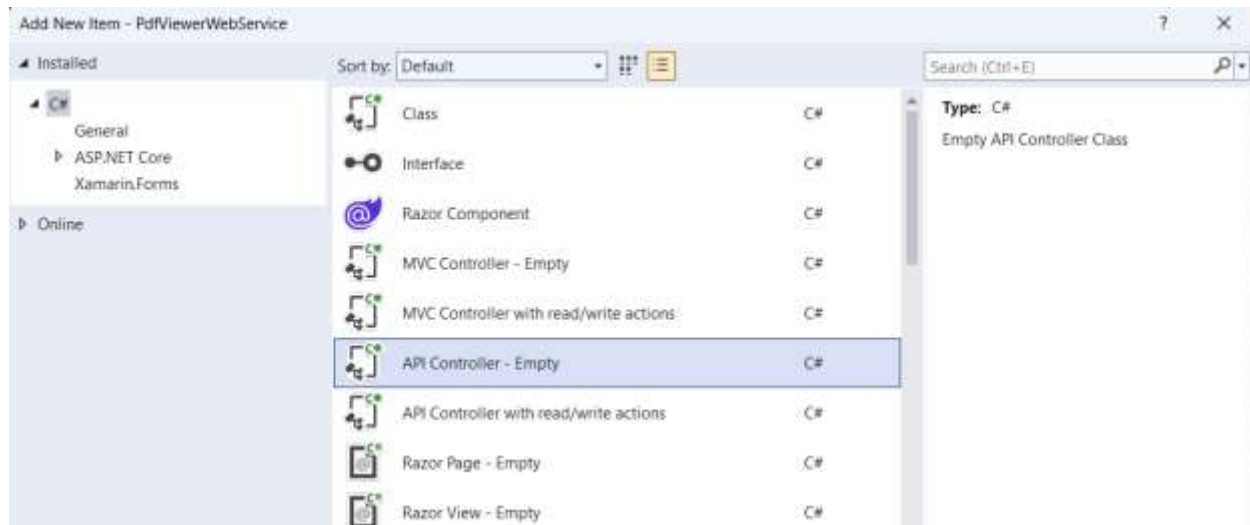

Open the **NuGet** package manager.

Install the **Syncfusion.EJ2.PdfViewer.AspNet.Core** package to the application.

**Step 6:** Add the API Controller to the project and named it as PdfViewerController .

**Step 7:** Add the following code to the PdfViewerController.cs controller.

```
`ts
using Microsoft.AspNetCore.Hosting;
using Microsoft.AspNetCore.Mvc;
using Microsoft.Extensions.Caching.Memory;
using Newtonsoft.Json;
using Syncfusion.EJ2.PdfViewer;
using System;
using System.Collections.Generic;
using System.IO;
using System.Net;
namespace PdfViewerWebService
{
 [Route("[controller]")]
 [ApiController]
 public class PdfViewerController : ControllerBase
 {
 private IWebHostEnvironment _hostingEnvironment;
 //Initialize the memory cache object
 public IMemoryCache _cache;
 public PdfViewerController(IWebHostEnvironment hostingEnvironment, IMemoryCache cache)
 {
 _hostingEnvironment = hostingEnvironment;
 }
 }
}
```

```
_cache = cache;
Console.WriteLine("PdfViewerController initialized");
}
[HttpPost("Load")]
[Microsoft.AspNetCore.Cors.EnableCors("MyPolicy")]
[Route("[controller]/Load")]
//Post action for Loading the PDF documents
public IActionResult Load([FromBody] Dictionary<string, string> jsonObject)
{
 Console.WriteLine("Load called");
 //Initialize the PDF viewer object with memory cache object
 PdfRenderer pdfviewer = new PdfRenderer(_cache);
 MemoryStream stream = new MemoryStream();
 object jsonResult = new object();
 if (jsonObject != null && jsonObject.ContainsKey("document"))
 {
 if (bool.Parse(jsonObject["isFileName"]))
 {
 string documentPath = GetDocumentPath(jsonObject["document"]);
 if (!string.IsNullOrEmpty(documentPath))
 {

 PdfRenderer pdfviewer = new PdfRenderer(_cache);
 string documentBase = pdfviewer.GetDocumentAsBase64(jsonObject);
 return Content(documentBase);
}

[HttpPost("PrintImages")]
[Microsoft.AspNetCore.Cors.EnableCors("MyPolicy")]
[Route("[controller]/PrintImages")]
//Post action for printing the PDF documents
public IActionResult PrintImages([FromBody] Dictionary<string, string> jsonObject)
{
 //Initialize the PDF Viewer object with memory cache object
 PdfRenderer pdfviewer = new PdfRenderer(_cache);
 object pageImage = pdfviewer.GetPrintImage(jsonObject);
 return Content(JsonConvert.SerializeObject(pageImage));
}

//Gets the path of the PDF document
private string GetDocumentPath(string document)
{
 string documentPath = string.Empty;
 if (!System.IO.File.Exists(document))
 {
 var path = _hostingEnvironment.ContentRootPath;
 if (System.IO.File.Exists(path + "/Data/" + document))
 documentPath = path + "/Data/" + document;
 }
}
```

```

 }
 else
 {
 documentPath = document;
 }
 Console.WriteLine(documentPath);
 return documentPath;
}
// GET api/values
[HttpGet]
public IEnumerable<string> Get()
{
 return new string[] { "value1", "value2" };
}
// GET api/values/5
[HttpGet("{id}")]
public string Get(int id)
{
 return "value";
}
}
,

```

**Step 8:** Change the launchUrl to pdfviewer (name of the controller) in the lauchSettings.json as follows.

```

`json
{
 "iisSettings": {
 "windowsAuthentication": false,
 "anonymousAuthentication": true,
 "iisExpress": {
 "applicationUrl": "http://localhost:2270",
 "sslPort": 44396
 }
 }
}

```

```

},
"profiles": {
 "PdfViewerWebService": {
 "commandName": "Project",
 "dotnetRunMessages": true,
 "launchBrowser": true,
 "launchUrl": "pdfviewer",
 "applicationUrl": "https://localhost:7255;http://localhost:5262",
 "environmentVariables": {
 "ASPNETCORE_ENVIRONMENT": "Development"
 }
 },
 "IIS Express": {
 "commandName": "IISExpress",
 "launchBrowser": true,
 "launchUrl": "pdfviewer",
 "environmentVariables": {
 "ASPNETCORE_ENVIRONMENT": "Development"
 }
 }
}

```

### Step 9: Configuring CORS policy and add Newtonsoft.Json for JSON format support

- Browser security prevents a webpage from making requests to a different domain than the one that served the webpage. This restriction is called the same-origin policy. Cross Origin Resource Sharing (CORS) allows a server to relax the same-origin policy. Using CORS, a server can explicitly allow some cross-origin. Configure a CORS policy at application Startup.ConfigureServices.
- Prior to ASP.NET Core 3.0, the default JSON formatters implemented using the Newtonsoft.Json package. In ASP.NET Core 3.0 or later, the default JSON formatters are based on System.Text.Json. Support for Newtonsoft.Json based formatters and features is available by installing the Microsoft.AspNetCore.Mvc.NewtonsoftJson NuGet package and configuring it in Startup.ConfigureServices.

```
`cs
```

```
using Microsoft.AspNetCore.ResponseCompression;
```

```
using Newtonsoft.Json.Serialization;
var builder = WebApplication.CreateBuilder(args);
var MyAllowSpecificOrigins = "MyPolicy";
builder.Services.AddControllers().AddNewtonsoftJson(options =>
{
// Use the default property (Pascal) casing
options.SerializerSettings.ContractResolver = new DefaultContractResolver();
});
builder.Services.AddCors(options =>
{
options.AddPolicy(name: MyAllowSpecificOrigins,
builder => {
builder.AllowAnyOrigin()
.AllowAnyMethod()
.AllowAnyHeader();
});
});
builder.Services.AddMemoryCache();
builder.Services.AddEndpointsApiExplorer();
builder.Services.Configure<GzipCompressionProviderOptions>(options => options.Level =
System.IO.Compression.CompressionLevel.Optimal);
builder.Services.AddResponseCompression();
var app = builder.Build();
//Register Syncfusion license
string licenseKey = string.Empty;
Syncfusion.Licensing.SyncfusionLicenseProvider.RegisterLicense(licenseKey);
app.UseHttpsRedirection();
app.UseCors(MyAllowSpecificOrigins);
app.UseAuthorization();
app.UseResponseCompression();
app.MapControllers();
app.Run();
`
```

### Change author name using annotation settings in EJ2 JavaScript Pdfviewer control

The Essential JavaScript PDF Viewer supports to customize a single property of the annotation settings by exposing an API for the properties common to all the annotations.

**API Name :** annotationSettings

Property Name	Data type & Default Value	Description
---	---	---
author	String("Guest")	specifies the author of the annotation.
minWidth	Number(0)	specifies the minWidth of the annotation.
maxWidth	Number(0)	specifies the maxWidth of the annotation.
minHeight	Number(0)	specifies the minHeight of the annotation.
maxHeight	Number(0)	specifies the maxHeight of the annotation.
isLock	Boolean(false)	specifies the locked action of the annotations. [If set true unable to select the annotations]
isPrint	Boolean(true)	specifies whether the annotations are included or not in Print actions.
isDownload	Boolean(true)	specifies whether the annotations are included or not in Download actions.
Free Text Settings		
allowOnlyTextInput	Boolean(false)	specifies the allow only text action of the free text annotation. [If set true unable to move or resize the annotations]

You can change the author name and the other properties using the annotationSettings API as in the following code sample.

### STANDALONE

```

`ts
import { PdfViewer, Toolbar, Magnification, Navigation, LinkAnnotation,
ThumbnailView, BookmarkView, TextSelection, TextSearch, Print, Annotation,
FormFields } from "../src/index";
PdfViewer.Inject(Toolbar, Magnification, Navigation, LinkAnnotation,
ThumbnailView, BookmarkView, TextSelection, TextSearch, Print, Annotation,
FormFields);
let viewer: PdfViewer = new PdfViewer();
viewer.load('https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf',
null);
viewer.annotationSettings = { author: 'syncfusion', minHeight: 30,
maxHeight: 500, minWidth: 30, maxWidth: 500, isLock: false, isPrint: true,
isDownload: true };
viewer.freeTextSettings = { allowTextOnly : true };
viewer.appendTo("#pdfViewer");
`

```

### SERVER-BACKED

```

`ts

```

```
import { PdfViewer, Toolbar, Magnification, Navigation, LinkAnnotation,
ThumbnailView, BookmarkView, TextSelection, TextSearch, Print, Annotation,
FormFields } from "../src/index";
PdfViewer.Inject(Toolbar, Magnification, Navigation, LinkAnnotation,
ThumbnailView, BookmarkView, TextSelection, TextSearch, Print, Annotation,
FormFields);
let viewer: PdfViewer = new PdfViewer();
viewer.serviceUrl =
"https://services.syncfusion.com/js/production/api/pdfviewer";
viewer.load('https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf',
null);
viewer.annotationSettings = { author: 'syncfusion', minHeight: 30,
maxHeight: 500, minWidth: 30, maxWidth: 500, isLock: false, isPrint: true,
isDownload: true };
viewer.freeTextSettings = { allowTextOnly : true };
viewer.appendTo("#pdfViewer");
`
```

### Customization in EJ2 JavaScript Pdfviewer control

The PDF Viewer provides API for user interactions options provided in it's built-in toolbar. Using this we can create our own User Interface for toolbar actions in application level by hiding the default toolbar. The following steps are used to create the custom toolbar for PDF Viewer,

**Step 1:** Follow the steps provided in the [link](#) to create simple PDF Viewer sample.

**Step 2:** Now, add an HTML div element to render the PDF Viewer with custom toolbar using the following code.

```
`html
{% raw %}
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<link href="{{CDN_LINK}}ej2-base/styles/material.css" rel="stylesheet" />
<link href="{{CDN_LINK}}ej2-pdfviewer/styles/material.css" rel="stylesheet" />
<link href="{{CDN_LINK}}ej2-buttons/styles/material.css" rel="stylesheet" />
<link href="{{CDN_LINK}}ej2-popups/styles/material.css" rel="stylesheet" />
<link href="{{CDN_LINK}}ej2-navigations/styles/material.css" rel="stylesheet" />
<link href="{{CDN_LINK}}ej2-dropdowns/styles/material.css" rel="stylesheet" />
<link href="{{CDN_LINK}}ej2-lists/styles/material.css" rel="stylesheet" />
<link href="{{CDN_LINK}}ej2-inputs/styles/material.css" rel="stylesheet" />
<link href="{{CDN_LINK}}ej2-splitbuttons/styles/material.css" rel="stylesheet" />
<link href="{{CDN_LINK}}ej2-notifications/styles/material.css" rel="stylesheet" />
```

```

<link href="index.css" rel="stylesheet" />
<script src="index.js" type="text/javascript"></script>
</head>
<body>
<div id="container" style="top:0px">...</div>
<div id="topToolbar" style="top:0px"></div>
<div id="magnificationToolbar" ></div>
<div id='viewerParent' style="height:640px; width:100%;">
<div id="pdfViewer" style="height:640px; width:100%;"></div>
</div>
<input type ="file" id="fileUpload" accept=".pdf"
style="display:block;visibility:hidden;width:0;height:0;"/>
<div id='popup'></div>
<div id='textSearchBox'>
<div id='searchContainer'>

<input type="text" id="searchInput" placeholder="Find in document" class="e-input" />

<button id="previousSearch" class="search-button" style="margin-left:5px"></button>
<button id="nextSearch" class="search-button"></button>
</div>
<div id="matchCaseContainer" style="margin-top:8px">
<input id="matchCase" type="checkbox" />
</div>
</div>
</body>
</html>
{% enddraw %}
`

```

**Step 3:** Hide the default toolbar of PDF Viewer using below code snippet,

#### **STANDALONE**

```

` javascript
var pdfviewer = new ej.pdfviewer.PdfViewer({

```

```
enableToolbar: false,
enableThumbnail: false,
documentPath: "https://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf"
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');
````
```

SERVER-BACKED

```
````javascript
var pdfviewer = new ej.pdfviewer.PdfViewer({
enableToolbar: false,
enableThumbnail: false,
documentPath: "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'
});
ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Navigation, ej.pdfviewer.Print);
pdfviewer.appendTo('#PdfViewer');
````
```

Step 4: Add EJ2 Toolbar for perform primary actions like Open, Previous page, Next page, Go to page, Print and Download using the following code snippet,

```
`javascript
var toolbarObj = new ej.navigations.Toolbar({
items: [
{ prefixIcon: 'e-pv-open-document', tooltipText: 'Open', id: 'openButton', click: openClicked },
{ prefixIcon: 'e-pv-bookmark-icon', tooltipText: 'Bookmark', id: 'bookmarkButton', click:
bookmarkClicked },
{ prefixIcon: 'e-pv-previous-page-navigation-icon', id: 'previousPage', tooltipText: 'Previous Page', align:
'Center', click: previousClicked.bind(this) },
{ prefixIcon: 'e-pv-next-page-navigation-icon', id: 'nextPage', tooltipText: 'Next Page', align: 'Center',
click: nextClicked.bind(this) },
{ template: inputTemplate, tooltipText: 'Page Number', align: 'Center' },
{ template: ele, tooltipText: 'Page Number', align: 'Center' },
{ prefixIcon: 'e-pv-search-icon', tooltipText: 'Text Search', align: 'Right', click: searchClicked.bind(this) },
{ prefixIcon: 'e-pv-print-document-icon', tooltipText: 'Print', align: 'Right', click: printClicked.bind(this) },
{ prefixIcon: 'e-pv-download-document-icon', tooltipText: 'Download', align: 'Right', click:
downloadClicked.bind(this) }
]
});
toolbarObj.appendTo('#topToolbar');
```

```

var magnificationToolbar = new ej.navigations.Toolbar({
items: [
{ prefixIcon: 'e-pv-fit-page-icon', id: 'fitPage', tooltipText: 'Fit to page', click: pageFitClicked.bind(this) },
{ prefixIcon: 'e-pv-zoom-in-icon', id: 'zoomIn', tooltipText: 'Zoom in', click: zoomInClicked.bind(this) },
{ prefixIcon: 'e-pv-zoom-out-icon', id: 'zoomOut', tooltipText: 'Zoom out', click:
zoomOutClicked.bind(this) },
]
});
magnificationToolbar.appendTo('#magnificationToolbar');

```

Step 5: Add the following style to achieve the custom toolbar styling,

```

<style>
magnificationToolbar {
background: transparent;
height: auto;
min-height: 56px;
width: 200px;
border: none;
position: absolute;
z-index: 1001;
top: calc(100% - 110px);
left: calc(100% - 120px);
transform: rotate(90deg);
}
div#magnificationToolbar.e-toolbar .e-toolbar-items {
background: transparent;
}
magnificationToolbar.e-toolbar .e-tbar-btn {
border-radius: 50%;
min-height: 30px;
min-width: 30px;
border: 1px solid #c8c8c8;
transform: rotate(90deg);
}

```

```
}  
topToolbar {  
  top: 0px;  
  z-index: 1001;  
}  
.e-bookmark-popup {  
  height: 300px;  
  max-width: 300px;  
}  
.e-text-search-popup {  
  height: 104px;  
  max-width: 367px;  
}  
.e-text-search-popup .e-footer-content button.e-btn, .e-bookmark-popup .e-footer-content button.e-  
btn {  
  padding: 0;  
  border: 0;  
}  
.e-custom-search-input {  
  width: 234px;  
}  
.e-text-search-popup .e-footer-content, .e-bookmark-popup .e-footer-content {  
  padding: 0;  
  height: 0;  
}  
.search-button, .search-button:disabled, .search-button:focus, .search-button:hover {  
  background: transparent;  
  box-shadow: none;  
  border: 0px;  
}  
popup .e-dlg-content {  
  padding-left: 0;  
  padding-bottom: 0;  
}
```

```
.e-pv-bookmarks {  
min-width: 234px;  
}  
.e-pv-current-page-number {  
width: 46px;  
height: 28px;  
text-align: center;  
}  
.material .e-pv-current-page-number {  
border-width: 1px;  
}  
.e-icons {  
font-family: "e-icons";  
font-style: normal;  
font-variant: normal;  
font-weight: normal;  
line-height: 1;  
text-transform: none;  
}  
.e-pv-icon::before {  
font-family: 'e-icons';  
}  
.e-pv-icon-search::before {  
font-family: 'e-icons';  
font-size: 12px;  
}  
.e-pv-download-document-icon::before {  
content: '\e914';  
}  
.e-pv-print-document-icon::before {  
content: '\e917';  
}  
.e-pv-previous-page-navigation-icon::before {
```

```
content: '\e910';
}
.e-pv-next-page-navigation-icon::before {
content: '\e911';
}
.e-pv-zoom-out-icon::before {
content: '\e912';
}
.e-pv-zoom-in-icon::before {
content: '\e91d';
}
.e-pv-fit-page-icon::before {
content: '\e91b';
}
.e-pv-bookmark-icon::before {
content: '\e915';
}
.e-pv-text-search-icon::before {
content: '\e916';
}
.e-pv-search-icon::before {
content: '\e916';
font-family: 'e-icons';
}
.e-pv-previous-search::before {
content: '\e918';

Highlight underline strikethrough text in EJ2 JavaScript Pdfviewer control

The PDF Viewer library allows you to highlight, underline and strikethrough text in the loaded PDF document programmatically using the **setAnnotationMode()** method.

Step 1: Follow the steps provided in the [link](#) to create simple PDF Viewer sample.

Step 2: Add the following code snippet to highlight, underline, and strikethrough text in index.ts file with button click events.

```

`ts
document.getElementById('setHighlight').addEventListener('click', ()=> {
viewer.annotation.setAnnotationMode('Highlight');
});
document.getElementById('setUnderline').addEventListener('click', ()=> {
viewer.annotation.setAnnotationMode('Underline');
});
document.getElementById('setStrikethrough').addEventListener('click', ()=> {
viewer.annotation.setAnnotationMode('Strikethrough');
});

```

```
document.getElementById('setNone').addEventListener('click', ()=> {
viewer.annotation.setAnnotationMode('None');
});
`ts
```

Find the Sample [how to highlight, underline and strikethrough text programmatically](#)

Enable resize in EJ2 JavaScript Pdfviewer control

To enable the resizer for the text markup annotation in Syncfusion PDF viewer, you can use the **enableTextMarkupResizer** property. Default value of the property is false.

Here is an example of how you can enable the resizer for the text markup annotation:

```
`ts
//Enable TextMarkup Resizer.
viewer.enableTextMarkupResizer = true;
`ts
```

Find the sample [how to enable the resizer for the Text Markup annotation](#)

Customize text search color in EJ2 JavaScript Pdfviewer control

To change the text search color in the Syncfusion PDF viewer, you can use the **searchColor** property of the searchModule object. This property accepts a string value that represents the color in hexadecimal format.

```
`ts
viewer.textSearchColorSettings.searchColor = "#FF0000";
`ts
```

This will set the text search color to red. You can use any valid hexadecimal color code to set the text search color to the desired color.

You can also use the **searchHighlightColor** property of the searchModule object to change the highlight color of the search results. This property also accepts a string value in hexadecimal format.

```
`ts
viewer.textSearchColorSettings.searchHighlightColor = "#0000FF";
`ts
```

This will set the highlight color of the search results to blue.

- [searchColor](#)
- [searchHighlightColor](#)

Here is an example of how you can use the searchHighlightColor property and searchColor property:

```
`ts
<button id="search">SearchText</button>
<button id="searchNext">SearchNext</button>
`ts
```

```

<button id="searchPervious">searchPervious</button>
<button id="searchCancel">CancelSearch</button>
,
`ts
viewer.enableTextSearch = true;
// customize the textSeach color
viewer.textSearchColorSettings.searchColor = "#FF0000";
// customize the highlight color of the search results
viewer.textSearchColorSettings.searchHighlightColor = "#0000FF";
document.getElementById("search").addEventListener("click", () => {
viewer.textSearchModule.searchText("pdf", false);
});
document.getElementById("searchNext").addEventListener("click", () => {
viewer.textSearchModule.searchNext();
});
document.getElementById("searchPervious").addEventListener("click", () => {
viewer.textSearchModule.searchPrevious();
});
document.getElementById("searchCancel").addEventListener("click", () => {
viewer.textSearchModule.cancelTextSearch();
});
,

```

Find the sample [how to customize the text search color](#)

Disable context menu in EJ2 JavaScript Pdfviewer control

To disable the context menu in the Syncfusion PDF viewer control, you can use the **ContextMenuOption** property as **'None'** to hide all context menu options. Default value of the **ContextMenuOption** is **'RightClick'**.

Here is an example of how you can use the **ContextMenuOption** to disable context menu in the PDF Viewer:

```

,
<button id='disable'>Disable ContextMenuOption</button>
,
`ts
// Disable ContextMenuOption

```

```
document.getElementById('disable').addEventListener('click', ()=> {
viewer.contextMenuOption = 'None';
});
`ts
```

This will hide the context menu and prevent the user from right-clicking on the PDF viewer.

Find the sample [how to disable Context Menu](#)

Extract texts in EJ2 JavaScript Pdfviewer control

To extract text in Syncfusion PDF viewer, you can use the **isExtractText** property and **extractTextCompleted** event. This allows you to extract the text from a page along with the bounds.

Here is an example of how you can use the **isExtractText** property and **extractTextCompleted** event:

```
`ts
viewer.isExtractText = true;
viewer.extractTextCompleted = args => {
//Extract the Complete text of load document
console.log(args);
console.log(args.documentTextCollection[1]);
//Extract the Text data.
console.log(args.documentTextCollection[1][1].textData);
//Extract Text in the Page.
console.log(args.documentTextCollection[1][1].pageText);
//Extracts the first text of the PDF document along with its bounds
console.log(args.documentTextCollection[1][1].textData[0].Bounds);
};
`ts
```

Find the sample [how to extract Text](#)

Import annotations in EJ2 JavaScript Pdfviewer control

To import annotations into a Syncfusion PDF Viewer when loading a PDF document, you can use the **importAnnotations()** method of the PDF Viewer. This method allows you to import annotations from a file or a string in the PDF Viewer.

Here is an example of how you can use the **importAnnotations()** method to import annotations when loading a PDF document:

Step 1: Follow the steps provided in the [link](#) to create simple PDF Viewer sample.

Step 2: Add the following code snippet to import annotations on load PDF document.

```
`ts
document.getElementById('importAnnot').addEventListener('click', ()=> {
```

```
viewer.importAnnotation({
  pdfAnnotation: {
    '0': {
      shapeAnnotation: [
        {
          ShapeAnnotationType: 'Square',
          Author: 'Guest',
          AnnotationSelectorSettings: {
            selectionBorderColor: '',
            resizerBorderColor: 'black',
            resizerFillColor: '#FF4081',
            resizerSize: 8,
            selectionBorderThickness: 1,
            resizerShape: 'Square',
            selectorLineDashArray: [],
            resizerLocation: 3,
            resizerCursorType: null
          },
          ModifiedDate: '4/22/2021, 10:33:04 AM',
          Subject: 'Rectangle',
          Note: '',
          IsCommentLock: false,
          StrokeColor: 'rgba(255,0,0,1)',
          FillColor: 'rgba(255,255,255,0)',
          Opacity: 1,
          Bounds: {
            X: 124,
            Y: 76,
            Width: 202,
            Height: 154,
            Location: { X: 124, Y: 76 },
            Size: { IsEmpty: false, Width: 202, Height: 154 },
            Left: 124,
```

Top: 76,
Right: 326,
Bottom: 230
,
Thickness: 2,
BorderStyle: 'Solid',
BorderDashArray: 0,
RotateAngle: 'RotateAngle0',
IsCloudShape: false,
CloudIntensity: 0,
RectangleDifference: null,
VertexPoints: null,
LineHeadStart: null,
LineHeadEnd: null,
IsLocked: false,
AnnotName: 'e9a14dbe-5d09-4226-329e-c6edab201284',
Comments: null,
State: "",
StateModel: "",
AnnotType: 'shape',
EnableShapeLabel: false,
LabelContent: null,
LabelFillColor: null,
LabelBorderColor: null,
FontColor: null,
FontSize: 0,
CustomData: null,
LabelBounds: {
X: 0,
Y: 0,
Width: 0,
Height: 0,
Location: { X: 0, Y: 0 },

```

Size: { IsEmpty: true, Width: 0, Height: 0 },
Left: 0,
Top: 0,
Right: 0,
Bottom: 0
},
LabelSettings: null,
AnnotationSettings: {
  minWidth: 0,
  maxWidth: 0,
  minHeight: 0,
  maxHeight: 0,
  isLock: false,
  isPrint: true
},
AllowedInteractions: ['None'],
IsPrint: true,
ExistingCustomData: null
},
]
}
}
});
});
,

```

In this example, the PDF Viewer is first used to load the PDF document from a file. The **importAnnotations()** method is then used to import annotations from a string. The imported annotations will be added to the PDF Viewer and displayed along with the document.

Alternatively, we can import annotations from a file in JSON or XFDF format.

```

`ts
document.getElementById('import').addEventListener('click', function() {
viewer.importAnnotation('F# Succinctly.xfdf');
});
,

```

Find the sample [how to import annotations on loading a PDF Document](#)

Identify added annotation mode in EJ2 JavaScript Pdfviewer control

The PDF Viewer library allows you to identify whether the added annotations in PDF document is UI drawn, imported or existing annotation. Annotation mode can be identified using the **annotationAddMode** property of **annotationSelect** event.

Step 1: Follow the steps provided in the [link](#) to create simple PDF Viewer sample.

Step 2: The following code snippet explains how to identify added annotation mode.

```
`ts
viewer.annotationSelect =(args) =>{
console.log(args.annotationAddMode);
}
`
```

Find the Sample [how to identify added annotation mode](#)

Overlapped annotation in EJ2 JavaScript Pdfviewer control

To get the overlapped annotations on a mouse click in a Syncfusion PDF Viewer, you can use the **annotationCollection** property of **annotationSelect** event. This event is triggered when the user clicks on an annotation in the PDF document.

Here is an example of how you can use the **annotationSelect** event to get the overlapped annotations on a mouse click in a Syncfusion PDF Viewer:

```
`ts
// Get overlapped annotation collections.
viewer.annotationSelect =(args) =>{
console.log(args.annotationCollection);
}
`
```

Find the sample [how to get the overlapped annotations on mouse click](#)

Display custom tool tip for annotation in EJ2 JavaScript Pdfviewer control

To display a custom tooltip for annotations using the mouseover event in the Syncfusion PDF Viewer, you can use the **annotationMouseover** and **annotationMouseLeave** events .

Here is an example that demonstrates how to display a custom tooltip for annotations using the mouseover event in the Syncfusion PDF Viewer:

```
`ts
viewer.annotationSettings.author = "syncfusion";
let tooltip: Tooltip = new Tooltip({
mouseTrail: true,
opensOn: "Custom"
```

```

});
viewer.annotationMouseOver = args => {
  tooltip.appendTo("#pdfViewerpageDiv" + (viewer.currentPageNumber - 1));
  tooltip.content = args.annotation.author;
  tooltip.open();
  let ele: any = document.getElementsByClassName("e-tooltip-wrap")[0];
  ele.style.top = args.Y + 100 + "px";
  ele.style.left = args.X + "px";
};
viewer.annotationMouseLeave = args => {
  tooltip.close();
};
`

```

Find the sample [how to display custom tooltip for annotations using MouseOver event](#)

Select multi page annotations in EJ2 JavaScript Pdfviewer control

To select a multi-page TextMarkup annotation as a single annotation in a Syncfusion PDF viewer, you can use by enabling the **enableMultiPageAnnotation** property. By default it is **false**.

Here is an example of how you can use the **enableMultiPageAnnotation** property to select the multi page TextMarkup annotation as a single annotation, export and import multi page annotation:

```

`ts
// Enable multi-page TextMarkup Annotation.
viewer.enableMultiPageAnnotation = true;
// Export Annotation
document.getElementById('export').addEventListener('click', () => {
  viewer.exportAnnotation();
});
// Import Annotation.
document.getElementById('import').addEventListener('click', () => {
  viewer.importAnnotation("Add Export annotation file content");
});
`

```

Find the sample [how to select multi-page TextMarkup annotation as single annotation](#)

Disable tile rendering in EJ2 JavaScript Pdfviewer control

To disable the tile rendering feature in the Syncfusion PDF viewer control, you can use the **enableTileRendering** property. This property allows you to enable or disable the tile rendering feature, which is used to improve the performance of the PDF viewer when displaying large documents.

To disable the tile rendering feature, you can set the **enableTileRendering** property to **false**.

By default, the tile rendering feature is enabled in the PDF viewer. Disabling it may improve the performance of the PDF viewer when displaying small documents, but it may also reduce the performance when displaying large documents.

Here is an example of how you can use the **enableTileRendering** property:

```
,
<button id="disable">disable tile rendering</button>
,
`ts
// Disable tile rendering.
document.getElementById('disable').addEventListener('click', () => {
viewer.tileRenderingSettings.enableTileRendering = false;
});
,
```

Find the sample [how to disable the tile rendering](#)

Add header value in EJ2 JavaScript Pdfviewer control

To add header values to an AJAX request made by a Syncfusion PDF Viewer, you can use the **ajaxHeaders** property available in the **ajaxRequestSettings** module of the PDF Viewer. This property allows you to specify custom headers for the AJAX request.

Here is an example of how you can use the **ajaxRequestSettings** property to add a custom header to an AJAX request made by the PDF Viewer:

```
`ts
viewer.ajaxRequestSettings = {
  ajaxHeaders: [
    {
      headerName: "Authorization",
      headerValue: "Bearer 64565dfgfdsjweiuvbiuyhiueygf"
    }
  ],
  withCredentials: false
};
,
```

Find the sample [how to add custom headers in AjaxRequestSettings](#)

Print document in EJ2 JavaScript Pdfviewer control

The PDF Viewer library allows you to print the PDF document programmatically using the **print()** method in the **PrintModule**.

The following steps are used to print the PDF document programmatically.

Step 1: Follow the steps provided in the [link](#) to create a simple PDF Viewer sample.

Step 2: Add the following code snippet to perform the print operation.

```
,  
  
<button id="print">Print</button>  
  
,  
  
`ts  
document.getElementById('print').addEventListener('click', ()=> {  
//Print the loaded document.  
viewer.printModule.print();  
});  
,
```

Find the Sample, [how to print the PDF document programmatically](#)

Unload document in EJ2 JavaScript Pdfviewer control

The PDF Viewer library allows you to unload the PDF document being display in the PDF Viewer control programmatically using the [unload\(\)](#) method.

The following steps are used to unload the PDF document programmatically.

Step 1: Follow the steps provided in the [link](#) to create a simple PDF Viewer sample.

Step 2: Add the following code snippet to perform the unload operation.

```
,  
  
<button id="unload">Unload Document</button>  
  
,  
  
`ts  
document.getElementById('unload').addEventListener('click', () => {  
// Unload the document.  
viewer.unload();  
});  
,
```

Find the Sample, [how to unload the PDF document programmatically](#)

Load document in EJ2 JavaScript Pdfviewer control

The PDF Viewer library allows to switch or load the PDF documents dynamically after the initial load operation. To achieve this, load the PDF document as a base64 string or file name in PDF Viewer control using the [Load\(\)](#) method dynamically.

The following steps are used to load the PDF document dynamically.

Step 1: Follow the steps provided in the [link](#) to create a simple PDF Viewer sample.

Step 2: Use the following code snippet to load PDF document using base64 string.

```
<button id='load1'>LoadDocumentFromBase64</button>

`ts
// Load PDF document from Base64 string
document.getElementById('load1').addEventListener('click', () => {
viewer.load(
'data:application/pdf;base64,'+ AddBase64String, null);
})
```

Step 3: Use the following code snippet to load PDF document using document name.

```
<button id='load2'>LoadDocument</button>

`ts
// Load PDF document using file name
document.getElementById('load2').addEventListener('click', () => {
viewer.load('https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf', null);
});
```

Find the sample, [how to load PDF documents dynamically](#)

Import export annotation object in EJ2 JavaScript Pdfviewer control

The PDF Viewer library allows you to import annotations from objects or streams instead of loading it as a file. To import such annotation objects, the PDF Viewer control must export the PDF annotations as objects using the [ExportAnnotationsAsObject\(\)](#) method. Only the annotations objects that are exported from the PDF Viewer can be imported.

The following steps are used to import and export annotation as object.

Step 1: Follow the steps provided in the [link](#) to create a simple PDF Viewer sample.

Step 2: Use the following code snippet to perform import and export annotation.

```
,
<button id="export">Export Annotation</button>
<button id="import">Import Annotation</button>
,
`ts
//Export annotation as object.
document.getElementById('export').addEventListener('click', () => {
viewer.exportAnnotationsAsObject().then(function(value) {
exportObject = value;
});
});
//Import annotation that are exported as object.
document.getElementById('import').addEventListener('click', () => {
viewer.importAnnotation(JSON.parse(exportObject));
});
,
```

Find the Sample, [how to import and export annotation as object](#)

Delete annotation in EJ2 JavaScript Pdfviewer control

The PDF Viewer library allows you to delete a specific annotation from a PDF document. Deleting a specific annotation can be done using the **deleteAnnotationById()** method. This method is used to delete a specific annotation using its id.

The following steps are used to delete a specific annotation from PDF Document.

Step 1: Follow the steps provided in the [link](#) to create simple PDF Viewer sample.

Step 2: Use the following code snippet to delete a specific annotation using `deleteAnnotationById()` method.

```
,
<button id="deleteAnnotationbyId">Delete Annotation By Id</button>
,
`ts
// Delete Annotation by ID.
document.getElementById('deleteAnnotationbyId').addEventListener('click', () => {
viewer.annotationModule.deleteAnnotationById(
viewer.annotationCollection[0].annotationId
```

```
);
});
`
```

Find the sample [how to delete a specific annotation using deleteAnnotationById](#)

Open thumbnail in EJ2 JavaScript Pdfviewer control

The PDF Viewer library allows you to open the thumbnail pane programmatically using the [openThumbnailPane\(\)](#) method.

The following steps are used to open the thumbnail.

Step 1: Follow the steps provided in the [link](#) to create a simple PDF Viewer sample.

Step 2: Use the following code snippet to open thumbnail.

```
`
<button id="openThumbnail">Open Thumbnail Pane</button>
`
`ts
document.getElementById('openThumbnail').addEventListener('click', () => {
// Open Thumbnail pane
viewer.thumbnailViewModule.openThumbnailPane();
});
`
```

Find the sample, [how to open the thumbnail pane programmatically](#)

Annotation selectors in EJ2 JavaScript Pdfviewer control

To customize the annotation selector in Syncfusion PDF Viewer, you can use the **annotationSelectorSettings** property of the PdfViewer control.

Here is an example of how you can customize the selector of the shape annotation:

```
`
<button id="annotationSelector">annotationSelector</button>
`
`ts
document.getElementById('annotationSelector').addEventListener('click', () => {
viewer.rectangleSettings.annotationSelectorSettings.resizerShape = 'Circle';
viewer.annotationModule.editAnnotation(viewer.annotationCollection[0]);
});
`
```

Find the sample [how to customize the annotation selector](#)

Clear annotations in EJ2 JavaScript Pdfviewer control

To clear all the annotations in a PDF document using the Syncfusion PDF Viewer, you can use the **deleteAnnotations** method. This method is used to clear all the annotations present in the currently loaded document.

Here is an example of how you can clear all the annotations present in the currently loaded document:

```
,
<button id="deleteAnnotations">Delete Annotations</button>
,
`ts
//clear Annotations.
document.getElementById('deleteAnnotations').addEventListener('click',()=> {
viewer.deleteAnnotations();
})
,
```

We can also delete specific annotations with the **deleteAnnotationById()** method. This method is used to delete a specific annotation using its id.

Here is an example of how you can delete specific annotations with the **deleteAnnotationById** method:

```
,
<button id="deleteAnnotationbyId">Delete Annotation By Id</button>
,
`ts
//Delete Annotation by ID.
document.getElementById('deleteAnnotationbyId').addEventListener('click', () => {
viewer.annotationModule.deleteAnnotationById(
viewer.annotationCollection[0].annotationId
);
});
,
```

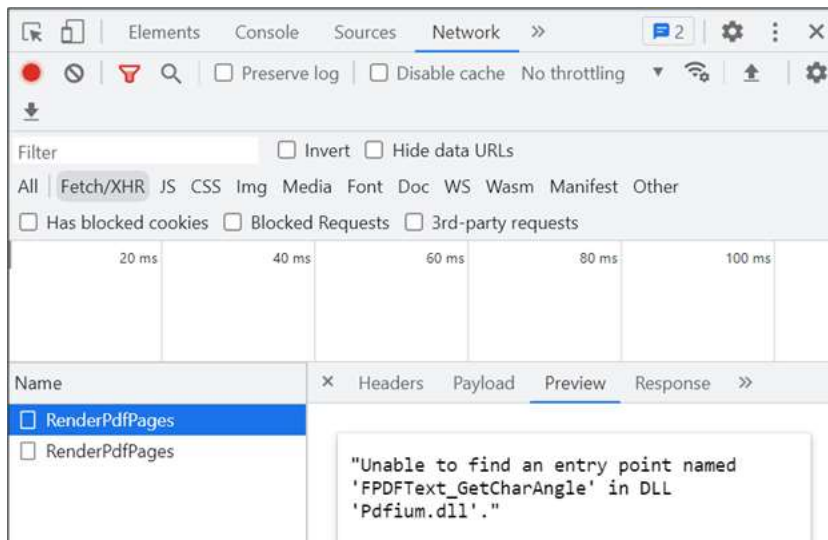

Find the sample [how to clear annotations using deleteAnnotations](#)

Resolve unable to find an entry point error in EJ2 JavaScript Pdfviewer control

From the release of version **21.1.0.35 (2023 Volume 1)** of Essential Studio, the Pdfium package has been upgraded to improve various functionalities like text search, text selection, rendering, and even performance. If you are updating your project to this version of the Syncfusion PDF Viewer, you may encounter the “**Web-Service is not listening**” error. The Network tab can help you identify the root cause of the issue, which is typically caused by an old version of pdfium assembly being referenced in

the local web service project. Below are the assemblies to be referred to in the respective operating systems.

- Windows – pdfium.dll
- Linux – libpdfium.so
- OSX – libpdfium.dylib

To solve this issue, you should follow the below steps

1. Clear the bin and object files of the web-service project.
2. Re-publish the web-service project.

Note: Note: If you are hosting your application in Azure, AWS, or in Linux environments, delete the older published files and republish the application.

Customize toolbar in PDF Viewer component

How to customize existing toolbar in PDF Viewer component

PDF Viewer allows you to customize(add, show, hide, enable, and disable) existing items in a toolbar.

- Add - New items can be defined by [CustomToolbarItemModel](#) and with existing items in [ToolbarSettings](#) property. Newly added item click action can be defined in [toolbarclick](#).
- Show, Hide - Existing items can be shown or hidden using the [ToolbarSettings](#) property. Pre-defined toolbar items are available with [ToolbarItem](#).
- Enable, Disable - Toolbar items can be enabled or disable using [enabletoolbaritem](#)

OnCreateSearch })
}
let pdfviewer: PdfViewer = new PdfViewer();
pdfviewer.documentPath = "https://cdn.syncfusion.com/content/pdf/pdf-
succinctly.pdf";
pdfviewer.resourceUrl = "https://cdn.syncfusion.com/ej2/23.1.43/dist/ej2-
pdfviewer-lib";
pdfviewer.toolbarSettings = { toolbarItems: [toolItem1, toolItem2,
'OpenOption', 'PageNavigationTool', 'MagnificationTool', toolItem3,
'PanTool', 'SelectionTool', 'SearchOption', 'PrintOption', 'DownloadOption',
'UndoRedoTool', 'AnnotationEditTool', 'FormDesignerEditTool', toolItem4,
'CommentTool', 'SubmitForm']}
pdfviewer.appendTo('#PdfViewer');
//To handle custom toolbar click event.
pdfviewer.toolbarClick = function (args) {
if (args.item && args.item.id === 'print') {
pdfviewer.print.print();
}
else if (args.item && args.item.id === 'download') {
pdfviewer.download();
}
};
function OnCreateSearch(this: any): any {
this.addIcon('prepend', 'e-icons e-search');
}

```

SERVER-BACKED

```

import { PdfViewer, Toolbar, Magnification, Navigation, Annotation,
LinkAnnotation, ThumbnailView, BookmarkView, TextSelection, TextSearch,
FormFields, FormDesigner, Print, CustomToolbarItemModel } from
'@syncfusion/ej2-pdfviewer';
import { ComboBox } from "@syncfusion/ej2-dropdowns";
import { TextBox } from "@syncfusion/ej2-inputs";
PdfViewer.Inject(Toolbar, Magnification, Navigation, Annotation,
LinkAnnotation, ThumbnailView, BookmarkView, TextSelection, TextSearch,
FormFields, FormDesigner, Print);
let toolItem1: CustomToolbarItemModel = {
prefixIcon: 'e-icons e-paste',
id: 'print',
tooltipText: 'Custom toolbar item',
};
let toolItem2: CustomToolbarItemModel = {
id: 'download',
text: 'Save',
tooltipText: 'Custom toolbar item',
align: 'right'
};
let LanguageList: string[] = ['Typescript', 'Javascript', 'Angular', 'C#',
'C', 'Python'];
let toolItem3: CustomToolbarItemModel = {
type: 'Input',
tooltipText: 'Language List',
cssClass: 'percentage',
align: 'Left',
id: 'dropdown',
template: new ComboBox({ width: 100, value: 'TypeScript', dataSource:
LanguageList, popupWidth: 85, showClearButton: false, readonly: false })
};
let toolItem4: CustomToolbarItemModel = {
type: 'Input',
tooltipText: 'Text',
align: 'Right',
cssClass: 'find',
id: 'textbox',
template: new TextBox({ width: 125, placeholder: 'Type Here', created:
OnCreateSearch })
}
let pdfviewer: PdfViewer = new PdfViewer();
pdfviewer.documentPath = "https://cdn.syncfusion.com/content/pdf/pdf-
succinctly.pdf";
pdfviewer.serviceUrl =
'https://services.syncfusion.com/js/production/api/pdfviewer';
pdfviewer.toolbarSettings = { toolbarItems: [toolItem1, toolItem2,
'OpenOption', 'PageNavigationTool', 'MagnificationTool', toolItem3,
'PanTool', 'SelectionTool', 'SearchOption', 'PrintOption', 'DownloadOption',
'UndoRedoTool', 'AnnotationEditTool', 'FormDesignerEditTool', toolItem4,
'CommentTool', 'SubmitForm']}
pdfviewer.appendTo('#PdfViewer');
//To handle custom toolbar click event.
pdfviewer.toolbarClick = function (args) {

```

```
if (args.item && args.item.id === 'print') {  
  pdfviewer.print.print();  
}  
else if (args.item && args.item.id === 'download') {  
  pdfviewer.download();  
}  
};  
function OnCreateSearch(this: any): any {  
  this.addIcon('prepend', 'e-icons e-search');  
}
```

Note: Default value of toolbar items is ['OpenOption', 'PageNavigationTool', 'MagnificationTool', 'PanTool', 'SelectionTool', 'SearchOption', 'PrintOption', 'DownloadOption', 'UndoRedoTool', 'AnnotationEditTool', 'FormDesignerEditTool', 'CommentTool', 'SubmitForm']

Align Property

The align property is used to specify the alignment of a toolbar item within the toolbar.

Left: Aligns the item to the left side of the toolbar.

Right: Aligns the item to the right side of the toolbar.

Tooltip Property

The tooltip property is used to set the tooltip text for a toolbar item. Tooltip provides additional information when a user hovers over the item.

CssClass Property

The cssClass property is used to apply custom CSS classes to a toolbar item. It allows custom styling of the toolbar item.

Prefix Property

The prefix property is used to set the CSS class or icon that should be added as a prefix to the existing content of the toolbar item.

ID Property

The id property within a CustomToolbarItemModel is a compulsory attribute that plays a vital role in toolbar customization. It serves as a unique identifier for each toolbar item, facilitating distinct references and interactions.

When defining or customizing toolbar items, it is mandatory to assign a specific and descriptive id to each item.

These properties are commonly used when defining custom toolbar items with the CustomToolbarItemModel in the context of Syncfusion PDF Viewer. When configuring the toolbar using the ToolbarSettings property, you can include these properties to customize the appearance and behavior of each toolbar item.

Note: When customizing toolbar items, you have the flexibility to include either icons or text based on your design preference.

Troubleshooting

Document Loading Issues in Version 23.1 or Newer

If you're experiencing problems with your document not rendering in the viewer, especially when using version 23.1 or a newer version, follow these troubleshooting steps to resolve the issue:

1. **Check for viewer.dataBind() Requirement:** Ensure that you have called `viewer.dataBind()` as required in version 23.1 or newer. This explicit call is essential for initializing data binding and document rendering correctly. It is must to call the `dataBind()` method before load.

```
`javascript
```

```
var viewer = new ej.pdfviewer.PdfViewer ({
  serviceUrl: 'https://services.syncfusion.com/js/production/api/pdfviewer'});

ej.pdfviewer.PdfViewer.Inject(ej.pdfviewer.Toolbar, ej.pdfviewer.Magnification,
ej.pdfviewer.BookmarkView, ej.pdfviewer.ThumbnailView, ej.pdfviewer.TextSelection,
ej.pdfviewer.TextSearch, ej.pdfviewer.Print, ej.pdfviewer.Navigation, ej.pdfviewer.LinkAnnotation,
ej.pdfviewer.Annotation, ej.pdfviewer.FormFields, ej.pdfviewer.FormDesigner);

viewer.appendTo('#pdfViewer');

viewer.dataBind();

viewer.load('https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf', null);
`
```

2. **Verify Document Source:** Confirm that the document source or URL you're trying to display is valid and accessible. Incorrect URLs or document paths can lead to loading issues.
3. **Network Connectivity:** Ensure that your application has a stable network connection. Document rendering may fail if the viewer can't fetch the document due to network issues.
4. **Console Errors:** Use your browser's developer tools to check for any error messages or warnings in the console. These messages can provide insights into what's causing the document not to load.
5. **Loading Sequence:** Make sure that you're calling `viewer.dataBind()` and initiating document loading in the correct sequence. The viewer should be properly initialized before attempting to load a document.
6. **Update Viewer:** Ensure that you're using the latest version of the viewer library or framework. Sometimes, issues related to document loading are resolved in newer releases.
7. **Cross-Origin Resource Sharing (CORS):** If you're loading documents from a different domain, ensure that CORS headers are correctly configured to allow cross-origin requests.
8. **Content Security Policies (CSP):** Check if your application's Content Security Policy allows the loading of external resources, as this can affect document loading. Refer [here](#) to troubleshoot.

By following these troubleshooting steps, you should be able to address issues related to document loading in version 23.1 or newer, ensuring that your documents render correctly in the viewer.

Pivot Table

Getting started in EJ2 JavaScript Pivotview control

This section explains the steps to create a simple Essential JS 2 **Pivot Table** and demonstrates the basic usage of the [pivot table](#) control in a JavaScript application.

Dependencies

The following list of dependencies are required to use the pivot table component in your application.

```
`javascript
|-- @syncfusion/ej2-pivotview
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-excel-export
|-- @syncfusion/ej2-file-utils
|-- @syncfusion/ej2-compression
|-- @syncfusion/ej2-pdf-export
|-- @syncfusion/ej2-file-utils
|-- @syncfusion/ej2-compression
|-- @syncfusion/ej2-calendars
|-- @syncfusion/ej2-charts
|-- @syncfusion/ej2-svg-base
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-buttons
|-- @syncfusion/ej2-dropdowns
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-grids
`,`
```

Setup for local environment

Refer the following steps for setup your local environment.

Step 1: Create a root folder `myapp` for your application.

Step 2: Create `myapp/resources` folder to store local scripts and styles files.

Step 3: Create `myapp/index.js` and `myapp/index.html` files for initializing Essential JS 2 pivot table control.

Adding Syncfusion resources

The Essential JS 2 pivot table control can be initialized by using either of the following ways.

- Using local script and style.
- Using CDN link for script and style.

Using local script and style

You can get the global scripts and styles from the [Essential Studio JavaScript \(Essential JS 2\)](#) build installed location.

After installing the Essential JS 2 product build, you can copy the pivot table scripts and style file into the `resources/scripts` and `resources/styles` folder.

Refer the below code to find location pivot table's script and style file.

Syntax:

Script: **(installed location)/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/dist/global/{PACKAGE_NAME}.min.js**

Styles: **(installed location)/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/styles/material.css**

Example:

Script: **C:/Program Files (x86)/Syncfusion/Essential Studio/15.4.30/Essential JS 2/ej2-pivotview/dist/global/ej2-pivotview.min.js**

Styles: **C:/Program Files (x86)/Syncfusion/Essential Studio/15.4.30/Essential JS 2/ej2-pivotview/styles/material.css**

After copying the files, then you can refer the pivot table and its [dependency](#) scripts and styles into the **index.html** file.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 pivot table's dependent material theme -->
<link href="resources/ej2-base/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/ej2-buttons/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/ej2-calendars/styles/material.css" rel="stylesheet" type="text/css"/>

<link href="resources/ej2-popups/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/ej2-navigations/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/ej2-grids/styles/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 pivot table's material theme -->
<link href="resources/ej2-pivotview/styles/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 pivot table's dependent scripts -->
<script src="resources/scripts/ej2-base.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-buttons.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-data.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-file-utils.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-compression.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-excel-export.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-lists.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-pdf-export.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-popups.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-svg-base.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-inputs.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-calendars.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-dropdowns.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-navigations.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-charts.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-grids.min.js" type="text/javascript"></script>
<!-- Essential JS 2 pivot table's global script -->
<script src="resources/scripts/ej2-pivotview.min.js" type="text/javascript"></script>
</head>
<body>
</body>
</html>

```

In this illustration, we have referred **material** theme. You can also refer other themes like bootstrap, fabric, high-contrast etc.,

Using CDN link for script and style

Using CDN link, you can directly refer the pivot table control's script and style into the `index.html`.

Refer the pivot table's CDN links as below

Syntax:

Script: <http://cdn.syncfusion.com/ej2/{PACKAGENAME}/dist/global/{PACKAGENAME}.min.js>

Styles: http://cdn.syncfusion.com/ej2/{PACKAGE_NAME}/styles/material.css

Example:

Script: <http://cdn.syncfusion.com/ej2/ej2-pivotview/dist/global/ej2-pivotview.min.js>

Styles: <http://cdn.syncfusion.com/ej2/ej2-pivotview/styles/material.css>

```
`html

type="text/javascript"></script>
<!-- Essential JS 2 pivot table's global script -->
<script src="http://cdn.syncfusion.com/ej2/ej2-pivotview/dist/global/ej2-pivotview.min.js"
type="text/javascript"></script>
</head>
<body>
```

```
</body>
```

```
</html>
```

```
,
```

```
<!-- markdownlint-disable MD028 -->
```

In this illustration, we have referred **material** theme. You can also refer other themes like bootstrap, fabric, high-contrast etc.,

Browser compatibility

Polyfills are required to use the Pivot Table in Internet Explorer 11 browser. Refer the [documentation](#) for more details.

Initializing pivot table component in the application

Pivot Table component can be initialized using the following code. To get started, add the pivot table component in **index.js** and **index.html** files using the following code.

To get started, add **div** element for pivot table control in **index.html**. Then refer the **index.js** file into the **index.html** file.

```
`html
```

```
<!DOCTYPE html>
```

```
<html xmlns="http://www.w3.org/1999/xhtml">
```

```
<head>
```

```
<title>Essential JS 2</title>
```

```
<!-- Essential JS 2 pivot table's dependent material theme -->
```

```
<link href="http://cdn.syncfusion.com/ej2/ej2-base/styles/material.css" rel="stylesheet" type="text/css"/>
```

```
<link href="http://cdn.syncfusion.com/ej2/ej2-buttons/styles/material.css" rel="stylesheet" type="text/css"/>
```

```
<link href="http://cdn.syncfusion.com/ej2/ej2-calendars/styles/material.css" rel="stylesheet" type="text/css"/>
```

```
<link href="http://cdn.syncfusion.com/ej2/ej2-dropdowns/styles/material.css" rel="stylesheet" type="text/css"/>
```

```
<link href="http://cdn.syncfusion.com/ej2/ej2-inputs/styles/material.css" rel="stylesheet" type="text/css"/>
```

```
<link href="http://cdn.syncfusion.com/ej2/ej2-lists/styles/material.css" rel="stylesheet" type="text/css"/>
```

```
<link href="http://cdn.syncfusion.com/ej2/ej2-popups/styles/material.css" rel="stylesheet" type="text/css"/>
```

```
<link href="http://cdn.syncfusion.com/ej2/ej2-navigations/styles/material.css" rel="stylesheet" type="text/css"/>
```

```
<link href="http://cdn.syncfusion.com/ej2/ej2-grids/styles/material.css" rel="stylesheet" type="text/css"/>
```

```
<!-- Essential JS 2 pivot table's material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-pivotview/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 Pivot table's dependent scripts -->
<script src="http://cdn.syncfusion.com/ej2/ej2-base/dist/global/ej2-base.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-buttons/dist/global/ej2-buttons.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-data/dist/global/ej2-data.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-file-utils/dist/global/ej2-file-utils.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-compression/dist/global/ej2-compression.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-excel-export/dist/global/ej2-excel-export.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-lists/dist/global/ej2-lists.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-pdf-export/dist/global/ej2-pdf-export.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-popups/dist/global/ej2-popups.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-svg-base/dist/global/ej2-svg-base.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-inputs/dist/global/ej2-inputs.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-calendars/dist/global/ej2-calendars.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-dropdowns/dist/global/ej2-dropdowns.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-navigations/dist/global/ej2-navigations.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-charts/dist/global/ej2-charts.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-grids/dist/global/ej2-grids.min.js"
type="text/javascript"></script>
<!-- Essential JS 2 pivot table's global script -->
<script src="http://cdn.syncfusion.com/ej2/ej2-pivotview/dist/global/ej2-pivotview.min.js"
type="text/javascript"></script>
```

```

</head>
<body>
<!-- Add the HTML <div> element for pivot table -->
<div id="PivotTable"></div>
<script src="index.js" type="text/javascript"></script>
</body>
</html>
`

```

Next we need to initialize pivot table component using **`ej.pivotview.PivotView()`** instance as follows.

```

`javascript
var pivotTableObj = new ej.pivotview.PivotView();
`

```

Assigning sample data to pivot table component

The sample data is assigned to the pivot table component through `dataSource` property under `dataSourceSettings`.

Place the following pivot table code in the `index.js`.

```

`javascript
var pivotData = [
{ 'Sold': 31, 'Amount': 52824, 'Country': 'France', 'Products': 'Mountain Bikes', 'Year': 'FY 2015', 'Quarter': 'Q1' },
{ 'Sold': 51, 'Amount': 86904, 'Country': 'France', 'Products': 'Mountain Bikes', 'Year': 'FY 2015', 'Quarter': 'Q2' },
{ 'Sold': 90, 'Amount': 153360, 'Country': 'France', 'Products': 'Mountain Bikes', 'Year': 'FY 2015', 'Quarter': 'Q3' },
{ 'Sold': 25, 'Amount': 42600, 'Country': 'France', 'Products': 'Mountain Bikes', 'Year': 'FY 2015', 'Quarter': 'Q4' },
{ 'Sold': 27, 'Amount': 46008, 'Country': 'France', 'Products': 'Mountain Bikes', 'Year': 'FY 2016', 'Quarter': 'Q1' }];
var pivotTableObj = new ej.pivotview.PivotView({
dataSourceSettings: {
dataSource: pivotData,
}
});
pivotTableObj.appendTo('#PivotTable');
`

```

Adding fields to row, column, values and filters axes

Pivot Table component initialized and sample data assigned. Now add the fields to row, column, values and filters axes using following code.

- **rows**: Collection of fields that needs to be displayed in row axis of pivot table.
- **columns**: Collection of fields that needs to be displayed in column axis of pivot table.
- **values**: Collection of fields that needs to be displayed as aggregated numeric values in pivot table.
- **filters**: Filter the values in other axis based on the collection of filter fields in pivot table.

In-order to define each field in the respective axis, the following basic properties should be set.

- **name**: It allows to set the field name from the bound data source. It's casing should match exactly like in the data source and if not set properly, the pivot table will not be rendered.
- **caption**: It allows to set the field caption, which is the alias name of the field that needs to be displayed in the pivot table.
- **type**: It allows to set the summary type of the field. By default, SummaryType Sum is applied.

Place the following pivot table code in the `index.js`.

```
`javascript
var pivotData = [
  { 'Sold': 31, 'Amount': 52824, 'Country': 'France', 'Products': 'Mountain Bikes', 'Year': 'FY 2015', 'Quarter': 'Q1' },
  { 'Sold': 51, 'Amount': 86904, 'Country': 'France', 'Products': 'Mountain Bikes', 'Year': 'FY 2015', 'Quarter': 'Q2' },
  { 'Sold': 90, 'Amount': 153360, 'Country': 'France', 'Products': 'Mountain Bikes', 'Year': 'FY 2015', 'Quarter': 'Q3' },
  { 'Sold': 25, 'Amount': 42600, 'Country': 'France', 'Products': 'Mountain Bikes', 'Year': 'FY 2015', 'Quarter': 'Q4' },
  { 'Sold': 27, 'Amount': 46008, 'Country': 'France', 'Products': 'Mountain Bikes', 'Year': 'FY 2016', 'Quarter': 'Q1' }];
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name: 'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount', caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }]
  }
});
```

```
pivotTableObj.appendTo('#PivotTable');
`
```

Apply formatting to value fields

Formatting defines a way in which values should be displayed. For example, format “C” denotes the values should be displayed in currency pattern. To do so, define the name and format properties to formatSettings tag. In this illustration, the name property is set as Amount, a field from value section and its format is set as currency. Likewise, we can set format for other value fields as well and add it to formatSettings tag.

Only fields from value axis, which is in the form of numeric data values are applicable for formatting.

Place the following pivot table code in the `index.js`.

```
`javascript
var pivotData = [
  { 'Sold': 31, 'Amount': 52824, 'Country': 'France', 'Products': 'Mountain Bikes', 'Year': 'FY 2015', 'Quarter': 'Q1' },
  { 'Sold': 51, 'Amount': 86904, 'Country': 'France', 'Products': 'Mountain Bikes', 'Year': 'FY 2015', 'Quarter': 'Q2' },
  { 'Sold': 90, 'Amount': 153360, 'Country': 'France', 'Products': 'Mountain Bikes', 'Year': 'FY 2015', 'Quarter': 'Q3' },
  { 'Sold': 25, 'Amount': 42600, 'Country': 'France', 'Products': 'Mountain Bikes', 'Year': 'FY 2015', 'Quarter': 'Q4' },
  { 'Sold': 27, 'Amount': 46008, 'Country': 'France', 'Products': 'Mountain Bikes', 'Year': 'FY 2016', 'Quarter': 'Q1' }];
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name: 'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount', caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
  }
});
pivotTableObj.appendTo('#PivotTable');
`
```

Enable Grouping Bar

The Grouping Bar feature automatically populates fields from the bound data source and allows end users to drag fields between different axes such as columns, rows, values, and filters, and create pivot table at runtime. It can be enabled by setting the [showGroupingBar](#) property to **true**. To know more about grouping bar, [refer](#) here.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    allowLabelFilter: true,
    allowValueFilter: true,
    enableSorting: true,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  height: 350,
  showGroupingBar: true
});
pivotTableObj.appendTo('#PivotTable');
```

INDEX.HTML

Enable Pivot Field List

The component provides a built-in Field List similar to Microsoft Excel. It allows you to add or remove fields and also rearrange the fields between different axes, including column, row, value, and filter along with filter and sort options dynamically at runtime. It can be enabled by setting the [showFieldList](#) property to **true**.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        allowLabelFilter: true,
        allowValueFilter: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 350,
    showFieldList: true

```

```
});
pivotTableObj.appendTo('#PivotTable');
```

<script src="index.js" type="text/javascript"></script>
</body></html>
```

Calculated field

The calculated field feature allows user to insert or add a new calculated field based on the available fields from the bound data source. It can be customized using the [calculatedFieldsSettings](#) property through code behind. The setting required for calculate field feature at code behind are:

- [name](#): it allows to indicate the given calculated field with unique name.
- [formula](#): it allows to set the formula base on the given data source.

Also calculated fields can be added at run time through the built-in dialog. The dialog can be enabled by setting the [allowCalculatedField](#) property to **true**.

Calculated field is applicable only for value fields.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }, { name: 'Total', caption: 'Total Amount', type:
'CalculatedField' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }, { name: 'Total',
format: 'C2' }],
    filters: [],
    calculatedFieldSettings: [{ name: 'Total', formula:
'"Sum(Amount)"+"Sum(Sold)"' }]
  },
  showFieldList: true,
  height: 350,
  allowCalculatedField: true
});
pivotTableObj.appendTo('#PivotTable');
var btn = new ej.buttons.Button({ isPrimary: true });
btn.appendTo('#CalculatedField');
document.getElementById('CalculatedField').addEventListener('click', () => {
  pivotTableObj.calculatedFieldModule.createCalculatedFieldDialog();
});
```

</body></html>

```

Exploring Filter axis

The filter axis contains collection of fields that would act as master filter over the data bound in row, column and value axes of the pivot table. The fields along with filter members could be set to filter axis either through report via code behind or by dragging and dropping fields from other axes to filter axis via grouping bar or field list at runtime.

Place the following pivot table code in the `index.js`.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Products' }],
    filters:[{ name: 'Country' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }]
  },
  height: 350,
  showFieldList: true,
  showGroupingBar:true
});
pivotTableObj.appendTo('#PivotTable');

```

INDEX.HTML

```

</body></html>

```

Run the application

Now, run the `index.html` in web browser, it will render the **Essential JS 2 pivot table** control.

Output will be displayed as follows.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: [],
        calculatedFieldSettings: [{ name: 'Total', formula:
'"Sum(Amount)"+"Sum(Sold) "' }],
    },
    height: 350,
    showFieldList: true,
});
pivotTableObj.appendTo('#PivotTable');

```

</body></html>

```

Deploy the Application

The Essential JS 2 pivot table control features are segregated into individual feature-wise modules. The [Essential Studio JavaScript \(Essential JS 2\)](#) build and [CDN](#) scripts contains code for all features used in pivot table and hence we suggest to not to use them in production. We strongly recommend you to generate script files to use in production using our [Custom Resource Generator\(CRG\)](#) for Essential JS 2. CRG will allow you to generate the bundled script for the currently enabled features in pivot table.

You can also explore our [JavaScript Pivot Table example](#) that shows how to rendering of the pivot table with drill-up and drill-down functionality bound to a relational report.

Data binding in EJ2 JavaScript Pivotview control

JSON

For JSON data binding, the `type` property under [dataSourceSettings](#) needs to be set as `JSON`. By default, the default value is assumed as `JSON`.

Binding JSON data via local

In-order to bind local JSON data to the pivot table user can assign the local variable holding the JSON data to the [dataSource](#) property under [dataSourceSettings](#).

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    filters: []
  },
  height: 350,
});
pivotTableObj.appendTo('#PivotTable');
```

INDEX.HTML

var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Using local variable, the JSON data can also be bound to the pivot table using [DataManager](#) option with the help of [JsonAdaptor](#). Here the instance of [DataManager](#) holding JSON data is assigned to [dataSource](#) property under [dataSourceSettings](#). The use of [DataManager](#) is optional here.

INDEX.JS

```

var data = new ej.data.DataManager({ json: pivotData, adaptor: new
ej.data.JsonAdaptor });
var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: data,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        filters: [],
    },
    height: 350
});
pivotTableObj.appendTo('#PivotTable');

```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

      <div id="PivotTable"></div>
    </div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

In the meantime, the JSON data from the local *.json file type can also be connected to the pivot table via the file uploader option. Here, the resulting string after uploading the file needs to be converted to JSON data that can be assigned to the [dataSource](#) property under [dataSourceSettings](#). The following code example illustrates the same.

```
`javascript
import { PivotView } from '@syncfusion/ej2-pivotview';
import { Uploader } from '@syncfusion/ej2-inputs';
// Step 1: Initiate the file uploader
let uploadObj: Uploader = new Uploader({
});
uploadObj.appendTo('#fileupload');
let input = document.querySelector('input[type="file"]');
// Step 2: Add the event listener which fires when the *.JSON file is uploaded.
input.addEventListener('change', function (e: Event) {
// Step 3: Initiate the file reader
let reader: FileReader = new FileReader();
reader.onload = function () {
// Step 4: Getting the string output which is to be parsed as JSON.
let result: any = JSON.parse(reader.result as string);
let pivotGridObj: PivotView = new PivotView({
dataSourceSettings: {
// Step 5: The JSON result to be bound as data source.
dataSource: result
// Step 6: The appropriate report needs to be provided here.
},
});
pivotGridObj.appendTo('#PivotTable');
};
reader.readAsText((input as any).files[0]);
});
`
```

Binding JSON data via remote

In-order to bind remote JSON data, mention the endpoint [URL](#) under [dataSourceSettings](#) property. The [URL](#) property supports both direct downloadable file (*.json) and web service URL.

INDEX.JS

```
var pivotGridObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    url: 'https://cdn.syncfusion.com/data/sales-analysis.json',
    expandAll: false,
    rows: [
      { name: 'EnerType', caption: 'Energy Type' }
    ],
    columns: [
      { name: 'EneSource', caption: 'Energy Source' }
    ],
    values: [
      { name: 'PowUnits', caption: 'Units (GWh)' },
      { name: 'ProCost', caption: 'Cost (MM)' }
    ],
    filters: []
  }
});
pivotGridObj.appendTo('#PivotTable');
```

INDEX.HTML

```

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

CSV

For CSV data binding, the **type** property under [dataSourceSettings](#) needs to be set as **CSV** mandatorily.

The CSV format is considered to be the most compact format compared to JSON since it is half the size of JSON. This helps to reduce the bandwidth while transferring to the browser.

Binding CSV data via local

In-order to bind local CSV data to the pivot table, user needs to convert it as string array and then directly assign it to the [dataSource](#) property under [dataSourceSettings](#).

INDEX.JS

```

var pivotObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: getCSVDData(),
        type: 'CSV',
        expandAll: false,
        formatSettings: [{ name: 'Total Cost', format: 'C0' }, { name: 'Total Revenue', format: 'C0' }, { name: 'Total Profit', format: 'C0' }],
        drilledMembers: [{ name: 'Item Type', items: ['Baby Food'] }],
        rows: [
            { name: 'Country' },
            { name: 'Region' }
        ],
        columns: [
            { name: 'Sales Channel' },
            { name: 'Item Type' }
        ],
        values: [
            { name: 'Total Profit' },
            { name: 'Total Cost' },
            { name: 'Total Revenue' }
        ],
        filters: []
    },
    height: 290,

```

```

        width: '100%'
    });
    pivotObj.appendTo('#PivotTable');
    function getCSVData() {
        var dataSource = [];
        var jsonObject = csvdata.split(/\r?\n|\r/);
        for (var i = 0; i < jsonObject.length; i++) {
            dataSource.push(jsonObject[i].split(','));
        }
        return dataSource;
    }
}

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Pivot Grid</title>
    <meta charset="utf-8">

awesome.min.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="es5-datasource.js" type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">

```

```

        <div>
            <div id="PivotTable"></div>
        </div>
    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

In the meantime, the CSV data from the local *.csv file type can also be connected to the pivot table via the file uploader option. Here, the resulting string after uploading the file needs to be converted to string array that can be assigned to the [dataSource](#) property under [dataSourceSettings](#). The following code example illustrates the same.

```

`javascript
import { PivotView } from '@syncfusion/ej2-pivotview';
import { Uploader } from '@syncfusion/ej2-inputs';
// Step 1: Initiate the file uploader
let uploadObj: Uploader = new Uploader({
});
uploadObj.appendTo('#fileupload');
// Step 2: Add the event listener which fires when the *.CSV file is uploaded.
let input = document.querySelector('input[type="file"]');
input.addEventListener('change', function (e: Event) {
// Step 3: Initiate the file reader
let reader: FileReader = new FileReader();
reader.onload = function () {
// Step 4: Getting the string output which is to be converted as string[][].
let result: string[][] = (reader.result as string).split('\n').map(function (line) {
return line.split(',');
});
let pivotGridObj: PivotView = new PivotView({
dataSourceSettings: {
// Step 5: The string[][] result to be bound as data source.
dataSource: result,
type: 'CSV',

```

// Step 6: The appropriate report needs to be provided here.

```

},
});
pivotGridObj.appendTo('#PivotTable');
};
reader.readAsText((input as any).files[0]);
});
`

```

Binding CSV data via remote

In-order to bind remote CSV data, mention the endpoint [URL](#) under [dataSourceSettings](#) property. The [URL](#) property supports both direct downloadable file (*.csv) and web service URL.

INDEX.JS

```

var pivotObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    url: 'https://bi.syncfusion.com/productservice/api/sales',
    type: 'CSV',
    expandAll: false,
    enableSorting: true,
    formatSettings: [{ name: 'Total Cost', format: 'C0' }, { name:
'Total Revenue', format: 'C0' }, { name: 'Total Profit', format: 'C0' }],
    drilledMembers: [{ name: 'Item Type', items: ['Baby Food' ]}],
    rows: [
      { name: 'Region' },
      { name: 'Country' }
    ],
    columns: [
      { name: 'Item Type' },
      { name: 'Sales Channel' }
    ],
    values: [
      { name: 'Total Cost' },
      { name: 'Total Revenue' },
      { name: 'Total Profit' }
    ],
    filters: []
  },
  height: 300,
  width: '100%'
});
pivotObj.appendTo('#PivotTable');

```

INDEX.HTML

```

```

Remote Data Binding

To interact with remote data source, provide the endpoint [URL](#) within [DataManager](#) along with appropriate [adaptor](#). By default, [DataManager](#) uses [ODataAdaptor](#) for remote data-binding.

INDEX.JS

```
var data = new ej.data.DataManager({
```

```

url: 'https://bi.syncfusion.com/northwindservice/api/orders',
adaptor: new ej.data.WebApiAdaptor,
crossDomain: true
});
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: [],
    expandAll: true,
    filters: [],
    columns: [{ name: 'ProductName', caption: 'Product Name' }],
    rows: [{ name: 'ShipCountry', caption: 'Ship Country' }, { name:
'ShipCity', caption: 'Ship City' }],
    formatSettings: [{ name: 'UnitPrice', format: 'C0' }],
    values: [{ name: 'Quantity' }, { name: 'UnitPrice', caption: 'Unit
Price' }]
  },
  height: 350,
  width: '100%',
  gridSettings: { columnWidth: 120 }
});
pivotTableObj.appendTo('#PivotTable');
data.executeQuery(new ej.data.Query().take(8)).then(function (e) {
  pivotTableObj.dataSourceSettings.dataSource = e.result;
});

```

INDEX.HTML

```

```

Binding with OData services

OData is a standardized protocol for creating and consuming data. User can retrieve data from OData service using the [DataManager](#). Refer to the following code example for remote data binding using OData service.

INDEX.JS

```

var data = new ej.data.DataManager({
    url:
    'https://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/Orders/',
    adaptor: new ej.data.ODataAdaptor,
    crossDomain: true
});
var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: data,
        expandAll: true,
        filters: [],
        columns: [{ name: 'CustomerID', caption: 'Customer Name' }],
        rows: [{ name: 'OrderID', caption: 'Order ID' }],
        values: [{ name: 'Freight' }]
    },
    height: 350,
    width: '100%',
    gridSettings: { columnWidth: 120 }
});
pivotTableObj.appendTo('#PivotTable');

```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Pivot Grid</title>
  <meta charset="utf-8">

Binding with OData V4 services

The OData V4 is an improved version of OData protocols, and the [DataManager](#) can be used to retrieve and consume OData V4 services. For more details on OData V4 services, refer to the [OData documentation](#). To bind OData V4 service, use the [ODataV4Adaptor](#).

INDEX.JS

```
var data = new ej.data.DataManager({
  url: 'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/',
  adaptor: new ej.data.ODataV4Adaptor,
  crossDomain: true
});
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: data,
    expandAll: true,
    filters: [],
    columns: [{ name: 'CustomerID', caption: 'Customer Name' }],
    rows: [{ name: 'OrderID', caption: 'Order ID' }],
    values: [{ name: 'Freight' }]
  },
  height: 350,
  width: '100%',
  gridSettings: { columnWidth: 120 }
});
pivotTableObj.appendTo('#PivotTable');
```

INDEX.HTML

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Web API

User can use [WebApiAdaptor](#) to bind pivot table with Web API created using OData endpoint.

`ts

```

import { PivotView, IDataset } from '@syncfusion/ej2-pivotview';
import { DataManager, WebApiAdaptor, Query, ReturnOption } from '@syncfusion/ej2-data';
let data: DataManager = new DataManager({
    url: 'https://bi.syncfusion.com/northwindservice/api/orders',
    adaptor: new WebApiAdaptor,
    crossDomain: true
});
let pivotTableObj: PivotView = new PivotView({
    dataSourceSettings: {
        dataSource: data,
        expandAll: true,
        filters: [],
        columns: [{ name: 'ProductName', caption: 'Product Name' }],
        rows: [{ name: 'ShipCountry', caption: 'Ship Country' }, { name: 'ShipCity', caption: 'Ship City' }],

```

```

formatSettings: [{ name: 'UnitPrice', format: 'C0' }],
values: [{ name: 'Quantity' }, { name: 'UnitPrice', caption: 'Unit Price' }]
},
height: 350
});
pivotTableObj.appendTo('#PivotTable');

```

Querying in Data Manager

By default, the data manager retrieves all the data from the provider which is mapped in it. The data from the provider can be filtered, sorted, paged, etc. by setting the own query in [defaultQuery](#) property in the data manager instance.

INDEX.JS

```

var remoteData = new ej.data.DataManager({
  url:
  'https://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/Orders',
  adaptor: new ej.data.ODataAdaptor(),
  crossDomain: true
});
remoteData.defaultQuery = new ej.data.Query().take(2);
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: remoteData,
    expandAll: false,
    columns: [{ name: 'CustomerID', caption: 'Customer ID' }],
    rows: [{ name: 'ShipCountry', caption: 'Ship Country' }, { name:
'ShipCity', caption: 'Ship City' }],
    values: [{ name: 'Freight' }]
  },
  height: 350,
  width: '100%',
  gridSettings: { columnWidth: 120 }
});
pivotTableObj.appendTo('#PivotTable');

```

INDEX.HTML

Mapping

One can define field information like alias name (caption), data type, aggregation type, show and hide subtotals etc. using the [fieldMapping](#) property under [dataSourceSettings](#). The available options are,

- [name](#) - It is to specify the appropriate field name.
- [caption](#) - It is to set the alias name (caption) to the specific field. Instead of actual field name, the alias name (caption) will be set in the UI of the pivot table.
- [type](#) - It is to display values in the pivot table with appropriate aggregation such as sum, product, count, average, minimum, maximum, etc. Its default value is **sum**. This option is applicable only for relational data source.
- [axis](#) - It will help to display the field in specified axis such as row/column/value/filter axis of the pivot table.

- [showNoDataItems](#) - It is to show all the members of a specific field to the pivot table, even if there are no data in the intersection of the row and column. The default value is **false**. This option is applicable only for relational data source.
- [baseField](#) - For the aggregate types like "DifferenceFrom" or "PercentageOfDifferenceFrom" or "PercentageOfParentTotal", selective field is assigned for comparison via this property.
- [baseItem](#) - For the aggregate types like "DifferenceFrom" or "PercentageOfDifferenceFrom" or "PercentageOfParentTotal", selective member in a field is assigned for comparison via this property.
- [expandAll](#) - It is to expand or collapse all headers of a specific field in row and column axes of the pivot table. The default value is **false**.
- [showSubTotals](#) - It is to show or hide sub-totals of a specific field in row and column axis of the pivot table. The default value is **true**.
- [isNamedSet](#) - It is to set whether the specified field is named set or not. In general, the named set is a set of dimension members or a set expression (MDX query) to be created as a dimension in the SSAS OLAP cube itself. The default value is **false** and this option is applicable only for OLAP data source.
- [isCalculatedField](#) - It is to set whether the specified field is a calculated field or not. In general, a calculated field is created from the bound data source or using simple formula with basic arithmetic operators in the pivot table. The default value is **false** and this option is applicable only for OLAP data source.
- [showFilterIcon](#) - It is to show or hide the filter icon of a specific field which will be displayed on the button of the grouping bar and field list UI. This filter icon is used to filter the members of a specified field at runtime in the pivot table. The default value is **true**.
- [showSortIcon](#) - It is to show or hide the sort icon of a specific field which will be displayed on the button of the grouping bar and field list UI. This sort icon is used to order members of a specified field either in ascending or descending at runtime. The default value is **true**.
- [showRemoveIcon](#) - It is to show or hide the remove icon of a specific field which will be displayed on the button of the grouping bar and field list UI. This remove icon is used to remove the specified field during runtime. The default value is **true**.
- [showValueTypeIcon](#) - It is to show or hide the value type icon of a specific field which will be displayed on the button of the grouping bar and field list UI. This value type icon helps to select the appropriate aggregation type to specified value field at runtime. The default value is **true**.
- [showEditIcon](#) - It is to show or hide the edit icon of a specific field which will be displayed on the button of the grouping bar and field list UI. This edit icon is used to modify caption, formula, and format of a specified calculated field at runtime. The default value is **true**.
- [allowDragAndDrop](#) - It is to restrict specific field's button from being dragged on runtime in the grouping bar and field list UI. This will prevent from altering the current report. The default value is **true**.
- [dataType](#) - It is to specify the type of the field like 'string', 'number', 'datetime', 'date', and 'boolean'.
- [groupName](#) - It is to display fields in the field list UI by grouping them under the desired folder name.

The main purpose of these mapping options is to configure each field that is not part of the initial pivot report. Even if any field that is part of this mapping is defined here, the value set in the initial report will have the highest preceding.

This option is applicable only for relational data source.

In the below code sample, visibility of the field button icons are configured.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    allowLabelFilter: true,
    allowValueFilter: true,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: [],
    fieldMapping: [
      { name: 'Year', showFilterIcon: false },
      { name: 'Quarter', showSortIcon: false },
      { name: 'Country', allowDragAndDrop: false },
      { name: 'Products', showFilterIcon: false, showRemoveIcon:
false },
      { name: 'Sold', showValueTypeIcon: false },
      { name: 'Amount', showValueTypeIcon: false },
    ]
  },
  height: 350,
  showGroupingBar: true,
  showFieldList: true,
});
pivotTableObj.appendTo('#PivotTable');
```

INDEX.HTML

```

Values in row axis

By default, the value fields are plotted in column axis. To plot those fields in row axis, use the [valueAxis](#) property by setting its value as **row**. By default, it holds the value **column**.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        filters: [],
        valueAxis: 'row'
    },
    height: 350
});
pivotTableObj.appendTo('#PivotTable');

  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Values at different positions

By default, the value fields are placed at the end of the row or column axis. To place those value fields in different positions, use the [valueIndex](#) property and set the value to an appropriate index position. Its default value is -1, which denotes the last position. The [valueIndex](#) property is dependent on the [valueAxis](#) property.

This support is only available for relational data sources. Also, enable the [showValuesButton](#) property in the [grouping bar](#) and [field list](#) UI to **true** to re-arrange the values fields at different positions via user interaction.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: true,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    filters: [],
    valueIndex: 1
  },
  height: 350
});
pivotTableObj.appendTo('#PivotTable');
```

INDEX.HTML

<script src="index.js" type="text/javascript"></script>
</body></html>

```

Show 'no data' items

By default, the pivot table only shows the field item if it has data in its row or column combination. To show all items that do not have data in row and column combination in the pivot table, use the [showNoDataItems](#) property by settings its value to true for the desired fields. In the following code sample, rows of the "Country" and "State" fields do not have data in all combination with "Date" column field.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: nodata,
        expandAll: true,
        formatSettings: [{ name: 'Amount', format: 'C0' }],

Customize empty value cells

User can show custom string in empty value cells using the [emptyCellsTextContent](#) property in [dataSourceSettings](#) of the pivot table. Since the property is of string data type, user can fill empty value cells with any value like "0", "-", "*", "(blank)", etc. Its common for all value fields and can be configured through code behind.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: nodata,
        expandAll: true,
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        columns: [{ name: 'Date', showNoDataItems: true}],
        values: [{ name: 'Quantity', caption: 'Units Sold' }, { name:
'Amount', caption: 'Sold Amount' }],
        rows: [{ name: 'Country', showNoDataItems: true }, { name: 'State',
showNoDataItems: true }],
        filters: [],
        emptyCellsTextContent: '**'
    },
    height: 350
});
pivotTableObj.appendTo('#PivotTable');

```

Events

Load

The event [load](#) fires before initiate rendering of pivot table. It holds following parameters like **dataSourceSettings**, **fieldsType** and **pivotView**. In this event user can customize data source settings before initiating pivot table render module.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: nodata,
    expandAll: true,
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    columns: [{ name: 'Date', showNoDataItems: true }],
    values: [{ name: 'Quantity', caption: 'Units Sold' }, { name:
'Amount', caption: 'Sold Amount' }],
    rows: [{ name: 'Country', showNoDataItems: true }, { name: 'State',
showNoDataItems: true }],
    filters: [],
    emptyCellsTextContent: '**'
  },
  height: 350,
  showGroupingBar: true,
  load: function (args) {
    args.dataSourceSettings.columns[0].caption = 'Order Date';
    args.dataSourceSettings.emptyCellsTextContent = '###'
  },
});
pivotTableObj.appendTo('#PivotTable');

```

INDEX.HTML

```

```

EnginePopulated

The event [enginePopulated](#) is triggered after engine is populated. It has following parameters - `dataSourceSettings`, `pivotFieldList` and `pivotValues`.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        allowLabelFilter: true,
        allowValueFilter: true,
        columns: [{ name: 'Year', caption: 'Production Year' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 350,
    showFieldList: true,
    enginePopulated: function (args) {
        args.dataSourceSettings.columns[0].caption = 'Total Population';
        args.dataSourceSettings.emptyCellsTextContent = '###'
    },
});
pivotTableObj.appendTo('#PivotTable');

```

INDEX.HTML

```

  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

EnginePopulating

The event [enginePopulating](#) triggers before the pivot engine starts to populate and allows to customize the pivot datasource settings. It has following parameter `dataSourceSettings`.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    allowLabelFilter: true,
    allowValueFilter: true,
    columns: [{ name: 'Year', caption: 'Production Year' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  height: 350,
  showFieldList: true,
  enginePopulated: function (args) {
    args.dataSourceSettings.columns[0].caption = 'Total Population';
    args.dataSourceSettings.emptyCellsTextContent = '###'
  },
});
pivotTableObj.appendTo('#PivotTable');
```

INDEX.HTML

Connecting To Data Source

MySQL in EJ2 JavaScript Pivotview control

This section describes how to retrieve data from a MySQL database using [MySqlClient](#) and bind it to the Pivot Table via a Web API controller.

Create a Web API service to fetch MySQL data

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document [link](#).

Configure your new project

ASP.NET Core Web App C# Linux macOS Windows Cloud Service Web

Project name

MyWebService

Location

C:\Users\username\source\repos

Solution name ⓘ

MyWebService

☐ Place solution and project in the same directory

Back Next

2. To connect a MySQL Server using the **MySqlClient** in our application, we need to install the [MySql.Data](#) NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **MySql.Data** and install it.

3. Create a Web API controller (aka, PivotController.cs) file under **Controllers** folder that helps to establish data communication with the Pivot Table.

4. In the Web API controller (aka, PivotController), **MySQLConnection** helps to connect the MySQL database. Next, using **MySQLCommand** and **MySQLDataAdapter** you can process the desired query string and retrieve data from the MySQL database. The **Fill** method of the **MySQLDataAdapter** is used to populate the retrieved data into a **DataTable** as shown in the following code snippet.

```
`c#
using Microsoft.AspNetCore.Mvc;
using MySQL.Data.MySqlClient;
using Newtonsoft.Json;
using System.Data;
namespace MyWebService.Controllers
{
    [ApiController]
    [Route("[controller]")]
    public class PivotController : ControllerBase
    {
        public dynamic GetMySQLResult()
        {
```

```
// Replace with your own connection string.
MySQLConnection connection = new MySqlConnection("<Enter your valid connection string here>");
connection.Open();
MySQLCommand command = new MySQLCommand("SELECT * FROM orders", connection);
MySQLDataAdapter dataAdapter = new MySQLDataAdapter(command);
DataTable dataTable = new DataTable();
dataAdapter.Fill(dataTable);
connection.Close();
return dataTable;
}
}
}
```

5. In the **Get()** method of the **PivotController.cs** file, the **GetMySQLResult** method is used to retrieve the MySQL data as a **DataTable**, which is then serialized into JSON string using **JsonConvert.SerializeObject()**.

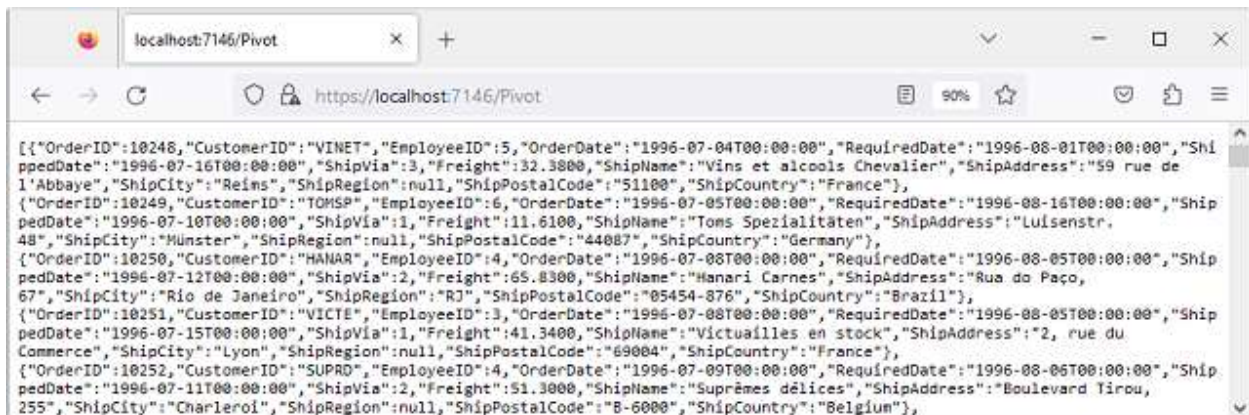

```
`c#
using Microsoft.AspNetCore.Mvc;
using MySql.Data.MySqlClient;
using Newtonsoft.Json;
using System.Data;
namespace MyWebService.Controllers
{
    [ApiController]
    [Route("[controller]")]
    public class PivotController : ControllerBase
    {
        [HttpGet(Name = "GetMySQLResult")]
        public object Get()
        {
            return JsonConvert.SerializeObject(GetMySQLResult());
        }
        public dynamic GetMySQLResult()
        {

```

```
// Replace with your own connection string.
MySQLConnection connection = new MySqlConnection("<Enter your valid connection string here>");
connection.Open();
MySQLCommand command = new MySqlCommand("SELECT * FROM orders", connection);
MySQLDataAdapter dataAdapter = new MySQLDataAdapter(command);
DataTable dataTable = new DataTable();
dataAdapter.Fill(dataTable);
connection.Close();
return dataTable;
}
}
}
```

6. Run the application and it will be hosted within the URL <https://localhost:7146>.

7. Finally, the retrieved data from MySQL database which is in the form of JSON can be found in the Web API controller available in the URL link <https://localhost:7146/Pivot>, as shown in the browser page below.

Connecting the Pivot Table to a MySQL database using the Web API service

1. Create a simple Javascript Pivot Table by following the **"Getting Started"** documentation [link](#).

2. Map the hosted Web API's URL link <https://localhost:7146/Pivot> to the Pivot Table in **index.js** by using the **url** property under **dataSourceSettings**.

```
`Javascript
var pivotObj = new ej.pivotview.PivotView({
dataSourceSettings: {
url: 'https://localhost:7146/Pivot',
//Other codes here...
```

```

},
});
pivotObj.appendTo('#PivotView');
`

```

3. Frame and set the report based on the data retrieved from the MySQL database.

```

`Javascript
var pivotObj = new ej.pivotview.PivotView({
dataSourceSettings: {
url: 'https://localhost:7146/Pivot',
columns: [{ name: 'ShipName' }],
values: [{ name: 'Freight', caption: 'Sum of Freight' }],
rows: [{ name: 'ShipCity' }],
},
showFieldList: true,
width: '100%',
height: 350,
});
pivotObj.appendTo('#PivotView');
`

```

When you run the sample, the resulting pivot table will look like this:

	Alfred's Futterkist	Alfreds Futterkist	Ana Trujillo Empa	Antonio Moreno	Around the Horn	B's
Aachen						
Albuquerque						
Anchorage						
Barcelona						
Barquisimeto						
Bergamo						
Berlin	196.12000000...	29.46				
Bern						

Explore our Javascript Pivot Table sample and ASP.NET Core Web Application to extract data from a MySQL database and bind to the Pivot Table in [this](#) GitHub repository.

Microsoft SQL server in EJ2 JavaScript Pivotview control

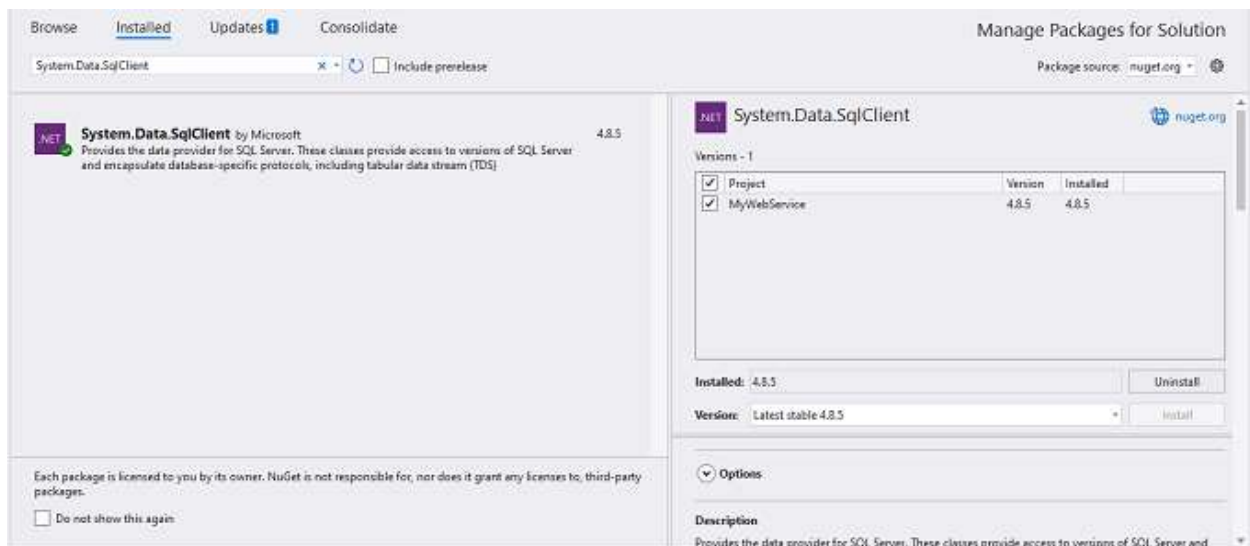

This section describes how to retrieve data from Microsoft SQL Server using [Microsoft SqlClient](#) and bind it to the Pivot Table via a Web API controller.

Create a Web API service to fetch SQL Server data

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document [link](#).

2. To connect a SQL Server using the **SqlClient** in our application, we need to install the [System.Data.SqlClient](#) NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **System.Data.SqlClient** and install it.

3. Create a Web API controller (aka, PivotController.cs) file under **Controllers** folder that helps to establish data communication with the Pivot Table.

4. In the Web API controller (aka, PivotController), **SqlConnection** helps to connect the SQL database (that is, Database1.mdf). Next, using **SqlCommand** and **SqlDataAdapter** you can process the desired SQL query string and retrieve data from the database. The **Fill** method of the DataAdapter is used to populate the SQL data into a **DataTable** as shown in the following code snippet.

```
`c#
using Microsoft.AspNetCore.Mvc;
using System.Data;
using System.Data.SqlClient;
namespace MyWebService.Controllers
{
    [ApiController]
    [Route("[controller]")]
    public class PivotController : ControllerBase
    {
        private static DataTable FetchSQLResult()
        {
            // Replace with your own connection string.
            string conSTR = @"<Enter your valid connection string here>";
            SqlConnection sqlConnection = new(conSTR);
            sqlConnection.Open();
            SqlCommand cmd = new(xquery, sqlConnection);
            SqlDataAdapter dataAdapter = new(cmd);
            DataTable dataTable = new();
            dataAdapter.Fill(dataTable);
            return dataTable;
        }
    }
}
```

5. In the **Get()** method of the **PivotController.cs** file, the **FetchSQLResult** method is used to retrieve the SQL data as a **DataTable**, which is then serialized into JSON using **JsonConvert.SerializeObject()**.

```
`c#
using Microsoft.AspNetCore.Mvc;
```

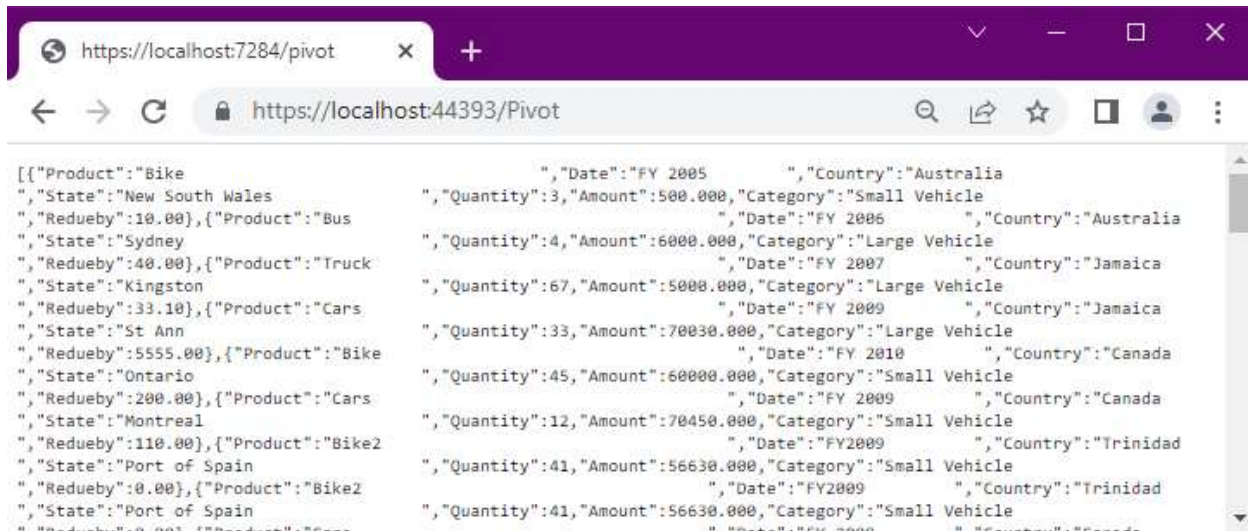

```

using Newtonsoft.Json;
using System.Data;
using System.Data.SqlClient;
namespace MyWebService.Controllers
{
    [ApiController]
    [Route("[controller]")]
    public class PivotController : ControllerBase
    {
        [HttpGet(Name = "GetSQLResult")]
        public object Get()
        {
            return JsonConvert.SerializeObject(FetchSQLResult());
        }
        private static DataTable FetchSQLResult()
        {
            string conSTR = @"<Enter your valid connection string here>";
            string xquery = "SELECT * FROM table1";
            SqlConnection sqlConnection = new(conSTR);
            sqlConnection.Open();
            SqlCommand cmd = new(xquery, sqlConnection);
            SqlDataAdapter dataAdapter = new(cmd);
            DataTable dataTable = new();
            dataAdapter.Fill(dataTable);
            return dataTable;
        }
    }
}

```

6. Run the web application and it will be hosted within the URL <https://localhost:44393>.

7. Finally, the retrieved data from SQL Server which is in the form of JSON can be found in the Web API controller available in the URL link <https://localhost:44393/Pivot>, as shown in the browser page below.

Connecting the Pivot Table to a SQL database using the Web API service

1. Create a simple Javascript Pivot Table by following the **"Getting Started"** documentation [link](#).
2. Map the hosted Web API's URL link `https://localhost:44393/Pivot` to the Pivot Table in `index.js` by using the `url` property under `dataSourceSettings`.

```
`javascript
var pivotObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    url: 'https://localhost:44393/Pivot',
    //Other codes here...
  }
});
pivotObj.appendTo('#PivotView');
```

3. Frame and set the report based on the data retrieved from the SQL database.

```
`javascript
var pivotObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    url: 'https://localhost:44393/Pivot',
    expandAll: false,
    enableSorting: true,
    columns: [{ name: 'Product' }],
    values: [{ name: 'Quantity' }, { name: 'Amount', caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'State' }],
```

```

formatSettings: [{ name: 'Amount', format: 'C0' }],
filters: []
},
showFieldList: true,
width: '100%'
});
pivotObj.appendTo('#PivotView');
`

```

When you run the sample, the resulting pivot table will look like this:

	Large Vehicle		Small Vehicle		Grand Total	
	Quantity	Amount	Quantity	Amount	Quantity	Amount
▶ Australia	16	24000	12	2000	28	
▶ Canada			420	1649000	420	
▶ Jamaica	400	300120			400	
▶ Trinidad			328	453040	328	
Grand Total	416	324120	760	2104040	1176

3. Create a Web API controller (aka, PivotController.cs) file under **Controllers** folder that helps to establish data communication with the Pivot Table.

4. In the Web API controller (aka, PivotController), **NpgsqlConnection** helps to connect the PostgreSQL database. Next, using **NpgsqlCommand** and **NpgsqlDataAdapter** you can process the desired PostgreSQL query string and retrieve data from the database. The **Fill** method of the **NpgsqlDataAdapter** is used to populate the retrieved data into a **DataTable** as shown in the following code snippet.

```
`c#  
using Microsoft.AspNetCore.Mvc;  
using Newtonsoft.Json;  
using System.Data;  
using Npgsql;  
namespace MyWebService.Controllers  
{  
    [ApiController]  
    [Route("[controller]")]  
    public class PivotController : ControllerBase  
    {  
        public dynamic GetPostgreSQLResult()  
        {  
            // Replace with your own connection string.  
            NpgsqlConnection connection = new NpgsqlConnection("<Enter your valid connection string here>");  
            connection.Open();  
            NpgsqlCommand cmd = new NpgsqlCommand("SELECT * FROM tablename", connection);  
            NpgsqlDataAdapter da = new NpgsqlDataAdapter(cmd);  
            DataTable dt = new DataTable();  
            da.Fill(dt);  
            connection.Close();  
            return dt;  
        }  
    }  
}
```

5. In the **Get()** method of the **PivotController.cs** file, the **GetPostgreSQLResult** method is used to retrieve the PostgreSQL data as a **DataTable**, which is then serialized into JSON using **JsonConvert.SerializeObject()**.

```
`c#
```

```

using Microsoft.AspNetCore.Mvc;
using Newtonsoft.Json;
using System.Data;
using Npgsql;
namespace MyWebService.Controllers
{
    [ApiController]
    [Route("[controller]")]
    public class PivotController : ControllerBase
    {
        [HttpGet(Name = "GetPostgreSQLResult")]
        public object Get()
        {
            return JsonConvert.SerializeObject(GetPostgreSQLResult());
        }
        public dynamic GetPostgreSQLResult()
        {
            // Replace with your own connection string.
            NpgsqlConnection connection = new NpgsqlConnection("<Enter your valid connection string here>");
            connection.Open();
            NpgsqlCommand cmd = new NpgsqlCommand("SELECT * FROM tablename", connection);
            NpgsqlDataAdapter da = new NpgsqlDataAdapter(cmd);
            DataTable dt = new DataTable();
            da.Fill(dt);
            connection.Close();
            return dt;
        }
    }
}

```

6. Run the web application and it will be hosted within the URL <https://localhost:44378/>.

7. Finally, the retrieved data from PostgreSQL database which is in the form of JSON can be found in the Web API controller available in the URL link <https://localhost:44378/Pivot>, as shown in the browser page below.

Connecting the Pivot Table to a PostgreSQL database using the Web API service

1. Create a simple Javascript Pivot Table by following the **"Getting Started"** documentation [link](#).
2. Map the hosted Web API's URL link `https://localhost:44378/Pivot` to the Pivot Table component in `index.js` by using the `url` property under `dataSourceSettings`.

```
`javascript
import { PivotView, FieldList } from '@syncfusion/ej2-pivotview';
PivotView.Inject(FieldList);
let pivotObj: PivotView = new PivotView({
  dataSourceSettings: {
    url: 'https://localhost:44378/Pivot',
    //Other codes here...
  }
});
pivotObj.appendTo('#PivotView');
```

3. Frame and set the report based on the data retrieved from the PostgreSQL database.

```
`javascript
import { PivotView, FieldList } from '@syncfusion/ej2-pivotview';
PivotView.Inject(FieldList);
let pivotObj: PivotView = new PivotView({
  dataSourceSettings: {
    url: 'https://localhost:44378/Pivot',
    enableSorting: true,
    columns: [{ name: 'openinghourspractice' }, { name: 'closinghourspractice' }],
    values: [{ name: 'revenue' }],
    rows: [{ name: 'servicetype' }, { name: 'servicecategory' }],
  },
  showFieldList: true,
```

```
width: '100%',
height: 350,
});
pivotObj.appendTo('#PivotView');
`
```

When you run the sample, the resulting pivot table will look like this:

	▶ 08:21:03	▶ 10:13:04	▶ 11:14:06	Grand Total
▶ Non-Surgical			67300	67300
▶ Retail	56300			56300
▶ Surgical		75400		75400
Grand Total	56300	75400	67300	199000

Description
Oracle Data Provider for .NET (ODP.NET) Core is an ADO.NET driver that provides fast data access from Microsoft .NET Core clients to Oracle databases. ODP.NET Core consists of a single 100% managed code dynamic-link library.

3. Create a Web API controller (aka, PivotController.cs) file under **Controllers** folder that helps to establish data communication with the Pivot Table.

4. In the Web API controller (aka, PivotController), **OracleConnection** helps to connect the Oracle database. Next, using **OracleCommand** and **OracleDataAdapter** you can process the desired Oracle query string and retrieve data from the database. The **Fill** method of the **OracleDataAdapter** is used to populate the retrieved data into a **DataTable** as shown in the following code snippet.

```
`c#  
using Microsoft.AspNetCore.Mvc;  
using Newtonsoft.Json;  
using Oracle.ManagedDataAccess.Client;  
using System.Data;  
namespace MyWebService.Controllers  
{  
    [ApiController]  
    [Route("[controller]")]  
    public class PivotController : ControllerBase  
    {  
        private static DataTable FetchOracleResult()  
        {  
            // Replace with your own connection string.  
            string connectionString = "<Enter your valid connection string here>";  
            OracleConnection oracleConnection = new OracleConnection(connectionString);  
            oracleConnection.Open();  
            OracleCommand command = new OracleCommand("SELECT * FROM EMPLOYEES", oracleConnection);  
            OracleDataAdapter dataAdapter = new OracleDataAdapter(command);  
            DataTable dataTable = new DataTable();  
            dataAdapter.Fill(dataTable);  
            oracleConnection.Close();  
            return dataTable;  
        }  
    }  
}
```

5. In the **Get()** method of the **PivotController.cs** file, the **FetchOracleResult()** method is used to retrieve the Oracle data, which is then serialized into JSON using **JsonConvert.SerializeObject()**.

```
`c#
using Microsoft.AspNetCore.Mvc;
using Newtonsoft.Json;
using Oracle.ManagedDataAccess.Client;
using System.Data;
namespace MyWebService.Controllers
{
    [ApiController]
    [Route("[controller]")]
    public class PivotController : ControllerBase
    {
        [HttpGet(Name = "GetOracleResult")]
        public object Get()
        {
            return JsonConvert.SerializeObject(FetchOracleResult());
        }
        private static DataTable FetchOracleResult()
        {
            // Replace with your own connection string.
            string connectionString = "<Enter your valid connection string here>";
            OracleConnection oracleConnection = new OracleConnection(connectionString);
            oracleConnection.Open();
            OracleCommand command = new OracleCommand("SELECT * FROM EMPLOYEES", oracleConnection);
            OracleDataAdapter dataAdapter = new OracleDataAdapter(command);
            DataTable dataTable = new DataTable();
            dataAdapter.Fill(dataTable);
            oracleConnection.Close();
            return dataTable;
        }
    }
}
```

6. Run the web application (aka, PivotController) and it will be hosted within the URL <https://localhost:44346>.

7. Finally, the retrieved data from Oracle database which is in the form of JSON can be found in the Web API controller available in the URL link <https://localhost:44346/Pivot>, as shown in the browser page below.

Connecting the Pivot Table to a Oracle database using the Web API service

1. Create a simple Javascript Pivot Table by following the **"Getting Started"** documentation [link](#).

2. Map the hosted Web API's URL link <https://localhost:44346/Pivot> to the Pivot Table component in `index.js` by using the `url` property under `dataSourceSettings`.

```
`javascript
var pivotObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    url: 'https://localhost:44346/Pivot',
    //Other codes here...
  }
});
pivotObj.appendTo('#PivotView');
```

3. Frame and set the report based on the data retrieved from the Oracle database.

```
`javascript
var pivotObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    url: 'https://localhost:44346/Pivot',
    enableSorting: true,
    expandAll: false,
```

```

dataSource: [],
columns: [
{ name: 'DEPARTMENT_ID', caption: 'Department ID' },
{ name: 'EMPLOYEE_NAME', caption: 'Employee Name' },
],
rows: [
{ name: 'JOB', caption: 'Job' },
{ name: 'SALARY', caption: 'Salary' }
],
values: [
{ name: 'EMPLOYEE_ID', caption: 'Employee ID' },
{ name: 'CC_EMPLOYEES', caption: 'Employees' },
{ name: 'CCTAXPERCENTAGE', caption: 'Percentage' },
],
filters: []
},
showFieldList: true,
width: '100%'
});
pivotObj.appendTo('#PivotView');
`

```

When you run the sample, the resulting pivot table will look like this:

	▶ 10	▶ 20	▶ 30	Grand Total
▶ ANALYST		15690		15690
▶ CLERK	7934	15245	7900	31079
▶ MANAGER	7782	7566	7698	23046
▶ PRESIDENT	7839			7839
▶ SALESMAN			30518	30518
Grand Total	23555	38501	46116	108172

MongoDB in EJ2 JavaScript Pivotview control

This section describes how to consume data from MongoDB database using [MongoDB Driver](#) and [MongoDB Bson](#) libraries and bind it to the Pivot Table via a Web API controller.

Create a Web API service to fetch MongoDB data

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document [link](#).

Configure your new project

ASP.NET Core Web App C# Linux macOS Windows Cloud Service Web

Project name

MyWebService

Location

C:\Users\username\source\repos

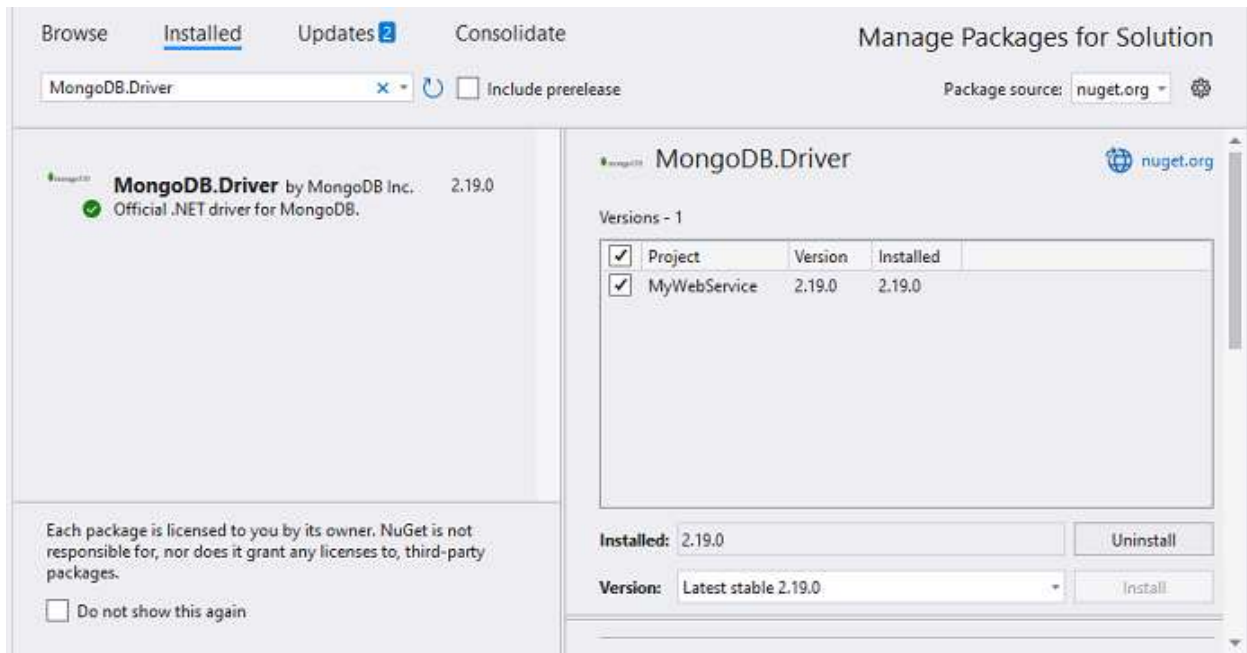

Solution name ⓘ

MyWebService

☐ Place solution and project in the same directory

Back Next

2. To connect a MongoDB Server using the **MongoDB.Driver** and **MongoDB.Bson** in our application, we need to install the [MongoDB.Driver](#) NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **MongoDB.Driver** and install it.

3. Create a Web API controller (aka, PivotController.cs) file under **Controllers** folder that helps to establish data communication with the Pivot Table.

4. In the Web API controller (aka, PivotController), **MongoClient** helps to connect the MongoDB database. Next, using the **GetDatabase** and **GetCollection** methods, you can retrieve data from the database. The **Find** method of the **IMongoDatabase** is used to populate the retrieved data into a **List**, as shown in the following code snippet.

```
`c#
using Microsoft.AspNetCore.Mvc;
using Newtonsoft.Json;
using MongoDB.Driver;
using MongoDB.Bson;
namespace MyWebService.Controllers
{
    [ApiController]
    [Route("[controller]")]
    public class PivotController : ControllerBase
    {
        private static List<ProductDetails> FetchMongoDbResult()
        {
            // Replace with your own connection string.
            string connectionString = "<Enter your valid connection string here>";
```

```

MongoClient client = new MongoClient(connectionString);
IMongoDatabase database = client.GetDatabase("sample_training");
var collection = database.GetCollection<ProductDetails>("ProductDetails");
return collection.Find(new BsonDocument()).ToList();
}

public class ProductDetails
{
    public ObjectId Id { get; set; }
    public int Sold { get; set; }
    public double Amount { get; set; }
    public string? Country { get; set; }
    public string? Products { get; set; }
    public string? Year { get; set; }
    public string? Quarter { get; set; }
}
}
}
`

```

5. In the **Get()** method of the **PivotController.cs** file, the **FetchMongoDbResult()** method is used to retrieve the MongoDB data as a **List**, which is then serialized into JSON using **JsonConvert.SerializeObject()**.

```

`c#
using Microsoft.AspNetCore.Mvc;
using Newtonsoft.Json;
using MongoDB.Bson;
using MongoDB.Driver;
namespace MyWebService.Controllers
{
    [ApiController]
    [Route("[controller]")]
    public class PivotController : ControllerBase
    {
        [HttpGet(Name = "GetMongoDbResult")]
        public object Get()
    }
}

```

```
{
return JsonConvert.SerializeObject(FetchMongoDbResult());
}
private static List<ProductDetails> FetchMongoDbResult()
{
// Replace with your own connection string.
string connectionString = "<Enter your valid connection string here>";
MongoClient client = new MongoClient(connectionString);
IMongoDatabase database = client.GetDatabase("sample_training");
var collection = database.GetCollection<ProductDetails>("ProductDetails");
return collection.Find(new BsonDocument()).ToList();
}
public class ProductDetails
{
public ObjectId Id { get; set; }
public int Sold { get; set; }
public double Amount { get; set; }
public string? Country { get; set; }
public string? Products { get; set; }
public string? Year { get; set; }
public string? Quarter { get; set; }
}
}
}
```

6. Run the web application and it will be hosted within the URL <https://localhost:44346>.

7. Finally, the retrieved data from MongoDB database which is in the form of JSON can be found in the Web API controller available in the URL link <https://localhost:44346/Pivot>, as shown in the browser page below.

Connecting the Pivot Table to a MongoDB database using the Web API service

1. Create a simple Javascript Pivot Table by following the **"Getting Started"** documentation [link](#).
2. Map the hosted Web API's URL link `https://localhost:44346/Pivot` to the Pivot Table component in `index.js` by using the `url` property under `dataSourceSettings`.

```
`javascript
var pivotObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    url: 'https://localhost:44346/Pivot',
    //Other codes here...
  },
  showFieldList: true,
  width: '100%'
});
pivotObj.appendTo('#PivotView');
`
```

3. Frame and set the report based on the data retrieved from the MongoDB database.

```
`javascript
var pivotObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    url: 'https://localhost:44346/Pivot',
    enableSorting: true,
    columns: [
      { name: 'Year' }
    ],
    values: [
      { name: 'Sold', caption: "Units Sold"},
      { name: 'Amount', caption: "Sold Amount"}
    ]
  }
});
```

```

],
rows: [
{ name: 'Country' },
{ name: 'Products' }
],
showFieldList: true,
width: '100%'
});
pivotObj.appendTo('#PivotView');

```

When you run the sample, the resulting pivot table will look like this:

	FY 2015		FY 2016		F
	Units Sold	Sold Amount	Units Sold	Sold Amount	U
> France	729	1160099.5	609	983317	
> Germany	528	845472	667	1067220	
> United Kingdom	782	1263109.5	640	1031630.5	
> United States	682	1085398.5	480	770362	
Grand Total	2721	4354079.5	2396	3852529.5	

Explore our Javascript Pivot Table sample and ASP.NET Core Web Application to extract data from a MongoDB database and bind to the Pivot Table in [this](#) GitHub repository.

Elasticsearch in EJ2 JavaScript Pivotview control

This section describes how to retrieve data from Elasticsearch database using [Nest](#) and bind it to the Pivot Table via a Web API controller.

Create a Web API service to fetch Elasticsearch data

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document [link](#).

Configure your new project

ASP.NET Core Web App C# Linux macOS Windows Cloud Service Web

Project name
MyWebService

Location
C:\Users\username\source\repos

Solution name
MyWebService

☐ Place solution and project in the same directory

Back Next

2. To connect a Elasticsearch Server using the **NEST** in our application, we need to install the [NEST](#) NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **NEST** and install it.

Browse Installed Updates Consolidate Manage Packages for Solution

NEST x Include prerelease Package source: nuget.org

NEST by Elastic and contributors 7.17.5
Strongly typed interface to Elasticsearch. Fluent and classic object initializer mappings of requests and

Each package is licensed to you by its owner. NuGet is not responsible for, nor does it grant any licenses to, third-party packages.
☐ Do not show this again

NEST

Versions - 1

Project	Version	Is Installed
MyWebService	7.17.5	7

Installed: 7.17.5 Uninstall

Version: Latest stable 7.17.5 Install

3. Create a Web API controller (aka, PivotController.cs) file under **Controllers** folder that helps to establish data communication with the Pivot Table.

4. In the Web API controller (aka, PivotController), **ElasticClient** helps to connect the Elasticsearch database. Next, using **Search** method you can query your Elasticsearch index and retrieve results from the database.

5. In the **Get()** method of the **PivotController.cs** file, the **FetchElasticsearchData** method is used to retrieve the Elasticsearch data, which is then serialized into JSON using **JsonConvert.SerializeObject()**.

```
`c#  
using Microsoft.AspNetCore.Mvc;  
using Nest;  
using Newtonsoft.Json;  
namespace MyWebService.Controllers  
{  
    [ApiController]  
    [Route("[controller]")]  
    public class PivotController : ControllerBase  
    {  
        [HttpGet(Name = "GetElasticSearchData")]  
        public object Get()  
        {  
            return JsonConvert.SerializeObject(FetchElasticsearchData());  
        }  
        private static object FetchElasticsearchData()  
        {  
            // Replace with your own connection string.  
            var connectionString = "<Enter your valid connection string here>";  
            var uri = new Uri(connectionString);  
            var connectionSettings = new ConnectionSettings(uri);  
            var client = new ElasticClient(connectionSettings);  
            var searchResponse = client.Search<object>(s => s  
                .Index("product")  
                .Size(1000)  
            );  
            return searchResponse.Documents;  
        }  
    }  
}
```

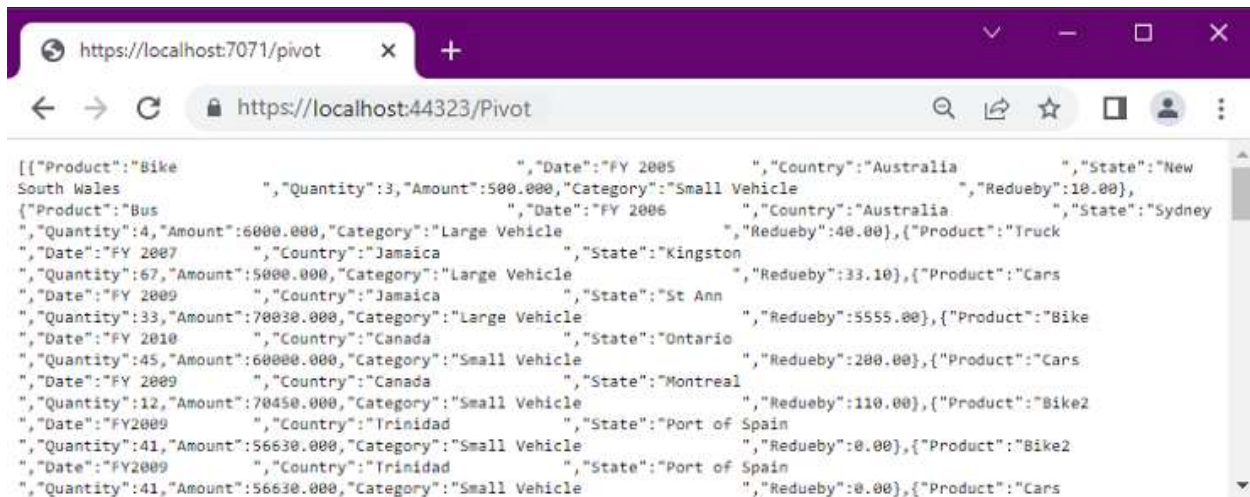

```

}
}
}
,

```

6. Run the web application and it will be hosted within the URL <https://localhost:44323>.

7. Finally, the retrieved data from Elasticsearch database which is in the form of JSON can be found in the Web API controller available in the URL link <https://localhost:44323/Pivot>, as shown in the browser page below.

Connecting the Pivot Table to an Elasticsearch database using the Web API service

1. Create a simple Javascript Pivot Table by following the **"Getting Started"** documentation [link](#).

2. Map the hosted Web API's URL link <https://localhost:44323/Pivot> to the Pivot Table in **index.js** by using the **url** property under **dataSourceSettings**.

```

`javascript
var pivotObj = new ej.pivotview.PivotView({
dataSourceSettings: {
url: 'https://localhost:44323/Pivot',
//Other codes here...
}
});
pivotObj.appendTo('#PivotView');
,

```

3. Frame and set the report based on the data retrieved from the Elasticsearch database.

```

`javascript
var pivotObj = new ej.pivotview.PivotView({

```

```

dataSourceSettings: {
  url: 'https://localhost:44323/Pivot',
  expandAll: false,
  enableSorting: true,
  columns: [{ name: 'Product' }],
  values: [{ name: 'Quantity' }, { name: 'Amount', caption: 'Sold Amount' }],
  rows: [{ name: 'Country' }, { name: 'State' }],
  formatSettings: [{ name: 'Amount', format: 'C0' }],
  filters: []
},
showFieldList: true,
width: '100%'
});
pivotObj.appendTo('#PivotView');

```

When you run the sample, the resulting pivot table will look like this:

	▶ Large Vehicle		▶ Small Vehicle		Grand Total	
	Quantity	Amount	Quantity	Amount	Quantity	Am
▶ Australia	16	24000	12	2000	28	
▶ Canada			420	1649000	420	
▶ Jamaica	400	300120			400	
▶ Trinidad			328	453040	328	
Grand Total	416	324120	760	2104040	1176	

Explore our Javascript Pivot Table sample and ASP.NET Core Web Application to extract data from a Elasticsearch database and bind to the Pivot Table in [this](#) GitHub repository.

Snowflake in EJ2 JavaScript Pivotview control

This section describes how to retrieve data from Snowflake database using [Snowflake Data](#) library and bind it to the Pivot Table via a Web API controller.

Create a Web API service to fetch Snowflake data

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document [link](#).

Configure your new project

ASP.NET Core Web App C# Linux macOS Windows Cloud Service Web

Project name
MyWebService

Location
C:\Users\username\source\repos

Solution name
MyWebService

☐ Place solution and project in the same directory

Back Next

2. To connect a Snowflake Server using the **Snowflake.Data.Client** in our application, we need to install the [Snowflake.Data](#) NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **Snowflake.Data** and install it.

Manage Packages for Solution

Browse Installed Updates Consolidate

Snowflake.Data x Include prerelease Package source: nuget.org

Snowflake.Data by howryu, tchen 2.0.22
Snowflake Connector for .NET

Each package is licensed to you by its owner. NuGet is not responsible for, nor does it grant any licenses to, third-party packages.
☐ Do not show this again

Snowflake.Data nuget.org

Versions - 1

Project	Version	Installed
MyWebService	2.0.22	2.0.22

Installed: 2.0.22 Uninstall

Version: Latest stable 2.0.22 Install

Options

Description
Snowflake Connector for .NET

3. Create a Web API controller (aka, PivotController.cs) file under **Controllers** folder that helps to establish data communication with the Pivot Table.

4. In the Web API controller (aka, PivotController), **SnowflakeDbConnection** helps to connect the Snowflake database. Next, using **SnowflakeDbDataAdapter** you can process the desired Snowflake query string and retrieve data from the database. The **Fill** method of the **SnowflakeDbDataAdapter** is used to populate the retrieved data into a **DataTable** as shown in the following code snippet.

```
`c#
using Microsoft.AspNetCore.Mvc;
using Snowflake.Data.Client;
using Newtonsoft.Json;
using System.Data;
namespace MyWebService.Controllers
{
    [ApiController]
    [Route("[controller]")]
    public class PivotController : ControllerBase
    {
        public static DataTable FetchSnowflakeResult()
        {
            using (SnowflakeDbConnection snowflakeConnection = new SnowflakeDbConnection())
            {
                // Replace with your own connection string.
                snowflakeConnection.ConnectionString = "<Enter your valid connection string here>";
                snowflakeConnection.Open();
                SnowflakeDbDataAdapter adapter = new SnowflakeDbDataAdapter("select * from CALL_CENTER",
                    snowflakeConnection);
                DataTable dataTable = new DataTable();
                adapter.Fill(dataTable);
                snowflakeConnection.Close();
                return dataTable;
            }
        }
    }
}
```

5. In the **Get()** method of the **PivotController.cs** file, the **FetchSnowflakeResult** method is used to retrieve the Snowflake data as a **DataTable**, which is then serialized into JSON using **JsonConvert.SerializeObject()**.

```
`c#  
using Microsoft.AspNetCore.Mvc;  
using Snowflake.Data.Client;  
using Newtonsoft.Json;  
using System.Data;  
namespace MyWebService.Controllers  
{  
    [ApiController]  
    [Route("[controller]")]  
    public class PivotController : ControllerBase  
    {  
        [HttpGet(Name = "GetSnowflakeResult")]  
        public object Get()  
        {  
            return JsonConvert.SerializeObject(FetchSnowflakeResult());  
        }  
        public static DataTable FetchSnowflakeResult()  
        {  
            using (SnowflakeDbConnection snowflakeConnection = new SnowflakeDbConnection())  
            {  
                // Replace with your own connection string.  
                snowflakeConnection.ConnectionString = "<Enter your valid connection string here>";  
                snowflakeConnection.Open();  
                SnowflakeDbDataAdapter adapter = new SnowflakeDbDataAdapter("select * from CALL_CENTER",  
                    snowflakeConnection);  
                DataTable dataTable = new DataTable();  
                adapter.Fill(dataTable);  
                snowflakeConnection.Close();  
                return dataTable;  
            }  
        }  
    }  
}
```

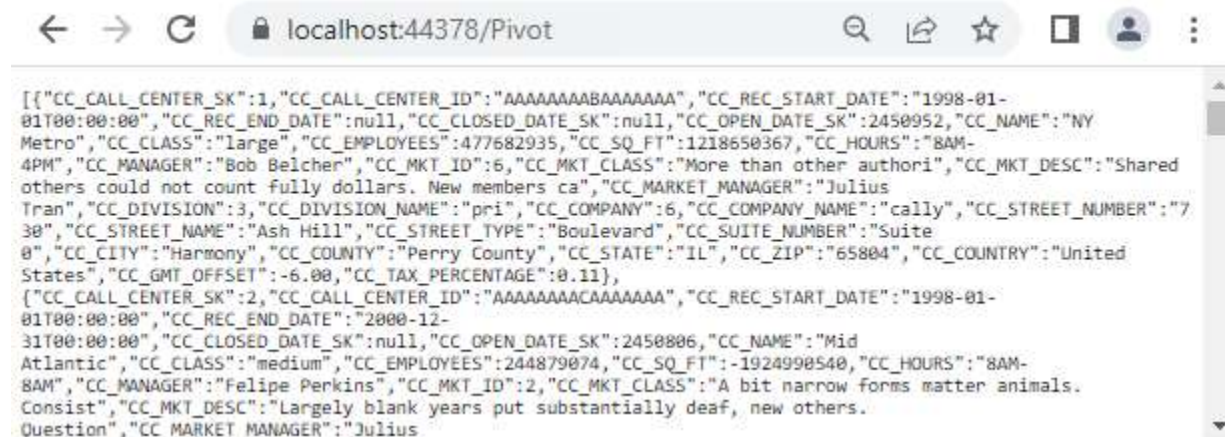

```

}
}
,

```

6. Run the web application and it will be hosted within the URL <https://localhost:44378/>.

7. Finally, the retrieved data from Snowflake database which is in the form of JSON can be found in the Web API controller available in the URL link <https://localhost:44378/Pivot>, as shown in the browser page below.

Connecting the Pivot Table to a Snowflake database using the Web API service

1. Create a simple Javascript Pivot Table by following the “Getting Started” documentation [link](#).
2. Map the hosted Web API's URL link <https://localhost:44378/Pivot> to the Pivot Table component in `index.js` by using the `url` property under `dataSourceSettings`.

```

`javascript
var pivotObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    url: 'https://localhost:44378/Pivot',
    //Other codes here...
  }
});
pivotObj.appendTo('#PivotView');
,

```

3. Frame and set the report based on the data retrieved from the Snowflake database.

```

`javascript
var pivotObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    url: 'https://localhost:44378/Pivot',

```

```

enableSorting: true,
expandAll: false,
dataSource: [],
columns: [
{ name: 'CC_COUNTRY', caption: 'Country' }
],
rows: [
{ name: 'CC_STATE', caption: 'State' },
{ name: 'CC_CITY', caption: 'City' }
],
values: [
{ name: 'CC_COMPANY', caption: 'Company' },
{ name: 'CC_EMPLOYEES', caption: 'Employees' },
{ name: 'CCTAXPERCENTAGE', caption: 'Tax percentage' },
],
filters: []
},
showFieldList: true,
width: '100%'
});
pivotObj.appendTo('#PivotView');
`

```

When you run the sample, the resulting pivot table will look like this:

	United States			Grand Total		
	Company	Employees	Percentage	Company	Employees	Percentage
▶ CA	16	413279139	0.4800000000...	16	413279139	0.480000...
▶ CO	5	1160903623	0.18	5	1160903623	
▶ FL	15	1162362540	0.33	15	1162362540	
▶ GA	20	2358562323	0.12	20	2358562323	
▶ IL	8	707852970	0.1699999999...	8	707852970	0.169999...
▶ KS	9	1842349179	0.19	9	1842349179	
▶ LA	6	528468075	0.16	6	528468075	

Explore our Javascript Pivot Table sample and ASP.NET Core Web Application to extract data from a Snowflake database and bind to the Pivot Table in [this](#) GitHub repository.

Olap in EJ2 JavaScript Pivotview control

Getting Started

This section explain steps to create a simple Essential JS 2 **Pivot Table** with OLAP data source in a JavaScript application.

Dependencies

The following list of dependencies are required to use the pivot table component in your application.

```
`javascript
|-- @syncfusion/ej2-pivotview
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-excel-export
|-- @syncfusion/ej2-file-utils
|-- @syncfusion/ej2-compression
|-- @syncfusion/ej2-pdf-export
|-- @syncfusion/ej2-file-utils
|-- @syncfusion/ej2-compression
|-- @syncfusion/ej2-calendars
|-- @syncfusion/ej2-charts
|-- @syncfusion/ej2-svg-base
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-buttons
|-- @syncfusion/ej2-dropdowns
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-grids
`
```

Setup for local environment

Refer the following steps for setup your local environment.

Step 1: Create a root folder **myapp** for your application.

Step 2: Create **myapp/resources** folder to store local scripts and styles files.

Step 3: Create **myapp/index.js** and **myapp/index.html** files for initializing Essential JS 2 pivot table control.

Adding Syncfusion resources

The Essential JS 2 pivot table control can be initialized by using either of the following ways.

- Using local script and style.
- Using CDN link for script and style.

Using local script and style

You can get the global scripts and styles from the [Essential Studio JavaScript \(Essential JS 2\)](#) build installed location.

After installing the Essential JS 2 product build, you can copy the pivot table and its [dependency](#) scripts and styles file into the **resources/scripts** and **resources/styles** folder respectively.

Refer the below location to find pivot table's script and style file.

Syntax:

Script: **(installed location)/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/dist/global/{PACKAGE_NAME}.min.js**

Styles: **(installed location)/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/styles/material.css**

Example:

Script: C:/Program Files (x86)/Syncfusion/Essential Studio/15.4.30/Essential JS 2/ej2-pivotview/dist/global/ej2-pivotview.min.js

Styles: C:/Program Files (x86)/Syncfusion/Essential Studio/15.4.30/Essential JS 2/ej2-pivotview/styles/material.css

After copying the files, then you can refer the pivot table and its [dependency](#) scripts and styles into the **index.html** file.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 pivot table's dependent material theme -->
<link href="resources/ej2-base/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/ej2-buttons/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/ej2-calendars/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/ej2-dropdowns/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/ej2-inputs/styles/material.css" rel="stylesheet" type="text/css"/>
```

```

<link href="resources/ej2-lists/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/ej2-popups/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/ej2-navigations/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/ej2-grids/styles/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 pivot table's material theme -->
<link href="resources/ej2-pivotview/styles/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 pivot table's dependent scripts -->
<script src="resources/scripts/ej2-base.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-buttons.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-data.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-file-utils.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-compression.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-excel-export.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-lists.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-pdf-export.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-popups.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-svg-base.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-inputs.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-calendars.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-dropdowns.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-navigations.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-charts.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-grids.min.js" type="text/javascript"></script>
<!-- Essential JS 2 pivot table's global script -->
<script src="resources/scripts/ej2-pivotview.min.js" type="text/javascript"></script>
</head>
<body>
</body>
</html>

```

In this illustration, we have referred **material** theme. You can also refer other themes like bootstrap, fabric, high-contrast etc.,

Using CDN link for script and style

Using CDN link, you can directly refer the pivot table and its [dependency](#) scripts and styles into the **index.html**.

Refer the pivot table's CDN links as below

Syntax:

Script: `http://cdn.syncfusion.com/ej2/{PACKAGENAME}/dist/global/{PACKAGENAME}.min.js`

Styles: `http://cdn.syncfusion.com/ej2/{PACKAGE_NAME}/styles/material.css`

Example:

Script: <http://cdn.syncfusion.com/ej2/ej2-pivotview/dist/global/ej2-pivotview.min.js>

Styles: <http://cdn.syncfusion.com/ej2/ej2-pivotview/styles/material.css>

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 pivot table's dependent material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-base/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-buttons/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-calendars/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-dropdowns/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-inputs/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-lists/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-popups/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-navigations/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-grids/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 pivot table's material theme -->
```

```
<link href="http://cdn.syncfusion.com/ej2/ej2-pivotview/styles/material.css" rel="stylesheet"
type="text/css"/>

<!-- Essential JS 2 pivot table's dependent scripts -->

<script src="http://cdn.syncfusion.com/ej2/ej2-base/dist/global/ej2-base.min.js"
type="text/javascript"></script>

<script src="http://cdn.syncfusion.com/ej2/ej2-buttons/dist/global/ej2-buttons.min.js"
type="text/javascript"></script>

<script src="http://cdn.syncfusion.com/ej2/ej2-data/dist/global/ej2-data.min.js"
type="text/javascript"></script>

<script src="http://cdn.syncfusion.com/ej2/ej2-file-utils/dist/global/ej2-file-utils.min.js"
type="text/javascript"></script>

<script src="http://cdn.syncfusion.com/ej2/ej2-compression/dist/global/ej2-compression.min.js"
type="text/javascript"></script>

<script src="http://cdn.syncfusion.com/ej2/ej2-excel-export/dist/global/ej2-excel-export.min.js"
type="text/javascript"></script>

<script src="http://cdn.syncfusion.com/ej2/ej2-lists/dist/global/ej2-lists.min.js"
type="text/javascript"></script>

<script src="http://cdn.syncfusion.com/ej2/ej2-pdf-export/dist/global/ej2-pdf-export.min.js"
type="text/javascript"></script>

<script src="http://cdn.syncfusion.com/ej2/ej2-popups/dist/global/ej2-popups.min.js"
type="text/javascript"></script>

<script src="http://cdn.syncfusion.com/ej2/ej2-svg-base/dist/global/ej2-svg-base.min.js"
type="text/javascript"></script>

<script src="http://cdn.syncfusion.com/ej2/ej2-inputs/dist/global/ej2-inputs.min.js"
type="text/javascript"></script>

<script src="http://cdn.syncfusion.com/ej2/ej2-calendars/dist/global/ej2-calendars.min.js"
type="text/javascript"></script>

<script src="http://cdn.syncfusion.com/ej2/ej2-dropdowns/dist/global/ej2-dropdowns.min.js"
type="text/javascript"></script>

<script src="http://cdn.syncfusion.com/ej2/ej2-navigations/dist/global/ej2-navigations.min.js"
type="text/javascript"></script>

<script src="http://cdn.syncfusion.com/ej2/ej2-charts/dist/global/ej2-charts.min.js"
type="text/javascript"></script>

<script src="http://cdn.syncfusion.com/ej2/ej2-grids/dist/global/ej2-grids.min.js"
type="text/javascript"></script>

<!-- Essential JS 2 pivot table's global script -->

<script src="http://cdn.syncfusion.com/ej2/ej2-pivotview/dist/global/ej2-pivotview.min.js"
type="text/javascript"></script>

</head>
```

```
<body>
</body>
</html>
`
```

In this illustration, we have referred **material** theme. You can also refer other themes like bootstrap, fabric, high-contrast etc.,

Adding pivot table control

Next you can start adding pivot table control to the application. To get started, add **div** element for pivot table control in **index.html**. Then refer the **index.js** file into the **index.html** file.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 pivot table's dependent material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-base/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-buttons/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-calendars/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-dropdowns/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-inputs/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-lists/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-popups/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-navigations/styles/material.css" rel="stylesheet"
type="text/css"/>

type="text/javascript"></script>

</head>

<body>

<!-- Add the HTML <div> element for pivot table -->
```

```
<div id="PivotTable"></div>
<script src="index.js" type="text/javascript"></script>
</body>
</html>
```

Next we need to initialize pivot table component using **`ej.pivotview.PivotView()`** instance as follows.

```
`javascript
var pivotTableObj = new ej.pivotview.PivotView();
```

After initialization, add the the following code in **`index.js`** file to populate pivot table with a sample OLAP data source. Refer [here](#) to know the more details about OLAP data binding.

```
`javascript
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    catalog: 'Adventure Works DW 2008 SE',
    cube: 'Adventure Works',
    providerType: 'SSAS',
    enableSorting: true,
    url: 'https://bi.syncfusion.com/olap/msmdpump.dll',
    localeIdentifier: 1033
  }
});
pivotTableObj.appendTo('#PivotTable');
```

Adding OLAP cube elements to row, column, value and filter axes

Now that pivot table is initialized and assigned with sample OLAP data source, will further move to showcase the component by organizing appropriate [OLAP cube elements](#) in [rows](#), [columns](#), [values](#) and [filters](#) axes.

In [dataSourceSettings](#) property, four major axes [rows](#), [columns](#), [values](#) and [filters](#) plays a vital role in defining and organizing [OLAP cube elements](#) from the bound data source, to render the entire pivot table component in a desired format.

[rows](#) – Collection of [OLAP cube elements](#) (such as Hierarchies, NamedSet, Calculated Members etc.,) that needs to be displayed in row axis of the pivot table.

[columns](#) – Collection of [OLAP cube elements](#) (such as Hierarchies, NamedSet, Calculated Members etc.,) that needs to be displayed in column axis of the pivot table.

values – Collection of [OLAP cube elements](#) (such as Measures, Calculated Measures) that needs to be displayed as aggregated numeric values in the pivot table.

filters - Collection of [OLAP cube elements](#) (such as Hierarchies and Calculated Members) that would act as master filter over the data bound in row, column and value axes of the pivot table.

In-order to define each [OLAP cube element](#) in the respective axis, the following basic properties should be set.

- **name**: It allows to set the unique name of the hierarchies, named set, measures, calculated members etc., from the bound OLAP data source. It's casing should match exactly like in the data source and if not set properly, the pivot table will be rendered as empty.
- **caption**: It allows to set the caption, which is the alias name of the unique name that needs to be displayed in the pivot table. If not provided, unique name will be displayed.

In this sample, "Product Categories" is added in column, "Customer Geography" in row, and "Customer Count" and "Internet Sales Amount" in value axes respectively.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    catalog: 'Adventure Works DW 2008 SE',
    cube: 'Adventure Works',
    providerType: 'SSAS',
    enableSorting: true,
    url: 'https://bi.syncfusion.com/olap/msmdpump.dll',
    localeIdentifier: 1033,
    rows: [
      { name: '[Customer].[Customer Geography]', caption:
'Customer Geography' },
    ],
    columns: [
      { name: '[Product].[Product Categories]', caption: 'Product
Categories' },
      { name: '[Measures]', caption: 'Measures' },
    ],
    values: [
      { name: '[Measures].[Customer Count]', caption: 'Customer
Count' },
      { name: '[Measures].[Internet Sales Amount]', caption:
'Internet Sales Amount' }
    ]
  },
  height: 350
});
pivotTableObj.appendTo('#PivotTable');
```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Applying formatting to measures

Formatting defines a way in which values should be displayed in pivot table. For example, format “C0” denotes the values should be displayed in currency pattern without decimal points. To do so, define the [formatSettings](#) with its [name](#) and [format](#) properties. In this sample, the [name](#) property is set as

"[Measures].[Internet Sales Amount]", a measure from value axis and its format is set as "C0". Likewise, we can set format for other measures as well.

Only measures from value axis, which is in the form of numeric data values are applicable for formatting.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    catalog: 'Adventure Works DW 2008 SE',
    cube: 'Adventure Works',
    providerType: 'SSAS',
    enableSorting: true,
    url: 'https://bi.syncfusion.com/olap/msmdpump.dll',
    localeIdentifier: 1033,
    rows: [
      { name: '[Customer].[Customer Geography]', caption:
'Customer Geography' },
    ],
    columns: [
      { name: '[Product].[Product Categories]', caption: 'Product
Categories' },
      { name: '[Measures]', caption: 'Measures' },
    ],
    values: [
      { name: '[Measures].[Customer Count]', caption: 'Customer
Count' },
      { name: '[Measures].[Internet Sales Amount]', caption:
'Internet Sales Amount' }
    ],
    formatSettings: [{ name: '[Measures].[Internet Sales Amount]',
format: 'C0' }]
  },
  height: 350
});
pivotTableObj.appendTo('#PivotTable');
```

```

Enable grouping bar

The Grouping Bar feature automatically populates [OLAP cube elements](#) from the bound data source and allows end users to drag [OLAP cube elements](#) between different axes such as [rows](#), [columns](#), [values](#) and [filters](#), and change pivot view at runtime. Sorting, filtering and removing of elements is also possible. It can be enabled by setting the [showGroupingBar](#) property to **true** as follows.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        catalog: 'Adventure Works DW 2008 SE',
        cube: 'Adventure Works',
        providerType: 'SSAS',
        enableSorting: true,
        url: 'https://bi.syncfusion.com/olap/msmdpump.dll',
        localeIdentifier: 1033,
    }
});

```

```

        rows: [
            { name: '[Customer].[Customer Geography]', caption:
'Customer Geography' },
        ],
        columns: [
            { name: '[Product].[Product Categories]', caption: 'Product
Categories' },
            { name: '[Measures]', caption: 'Measures' },
        ],
        values: [
            { name: '[Measures].[Customer Count]', caption: 'Customer
Count' },
            { name: '[Measures].[Internet Sales Amount]', caption:
'Internet Sales Amount' }
        ],

```

Enable pivot field list

The component provides a built-in Field List similar to Microsoft Excel. It allows you to add or remove [OLAP cube elements](#) and also rearrange the [OLAP cube elements](#) between different axes, including [rows](#), [columns](#), [values](#) and [filters](#) along with filter and sort options dynamically at runtime. It can be enabled by setting the [showFieldList](#) property to **true** as follows.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        catalog: 'Adventure Works DW 2008 SE',
        cube: 'Adventure Works',
        providerType: 'SSAS',
        enableSorting: true,
        url: 'https://bi.syncfusion.com/olap/msmdpump.dll',
        localeIdentifier: 1033,
        rows: [
            { name: '[Customer].[Customer Geography]', caption:
'Customer Geography' },
        ],
        columns: [

```

```

        { name: '[Product].[Product Categories]', caption: 'Product
Categories' },
        { name: '[Measures]', caption: 'Measures' },
    ],
    values: [
        { name: '[Measures].[Customer Count]', caption: 'Customer
Count' },
        { name: '[Measures].[Internet Sales Amount]', caption:
'Internet Sales Amount' }
    ],
    filters: [
        { name: '[Date].[Fiscal]', caption: 'Date Fiscal' },
    ],
    filterSettings: [
        {
            name: '[Date].[Fiscal]', items:
['[Date].[Fiscal].[Fiscal Quarter].&[2002]&[4]',
'[Date].[Fiscal].[Fiscal Year].&[2005]'],
            levelCount: 3
        }
    ]
},
showFieldList: true,
height: 350
});
pivotTableObj.appendTo('#PivotTable');

```

INDEX.HTML

```

Exploring filter axis

The filter axis contains collection of [OLAP cube elements](#) such as hierarchies and calculated members that would act as master filter over the data bound in [rows](#), [columns](#) and [values](#) axes of the pivot table. The [OLAP cube elements](#) along with filter members could be set to filter axis either through report via code behind or by dragging and dropping [OLAP cube elements](#) from other axes to filter axis via grouping bar or field list at runtime.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        catalog: 'Adventure Works DW 2008 SE',

Calculated field

The calculated field allows user to insert or add a new calculated field based on the available [OLAP cube elements](#) from the bound data source. Calculated fields are nothing but customized dimensions or measures that are newly created based on the user-defined expression.

The two types of calculated fields are as follows:

- **Calculated Measure** – Creates a new measure through user-defined expression.
- **Calculated Dimension** – Creates a new dimension through user-defined expression.

It can be customized using the [calculatedFieldsSettings](#) property through code behind. The setting required for calculate field feature at code behind are:

- [name](#): It allows to set the unique name for new calculated field.
- [formula](#): It allows to set the user-defined expression.
- [hierarchyUniqueName](#): It allows to specify dimension unique name whose hierarchies alone should be used in the expression. This will be applicable only for calculated dimension.
- [formatString](#): It allows to set the format string for the resultant calculated field.

You need to set [isCalculatedField](#) property to true, while adding calculated fields to respective axis through code behind.

Also calculated fields can be added at run time through the built-in dialog. The dialog can be enabled by setting the [allowCalculatedField](#) property to **true** as follows. You will see a button enabled in the Field List UI automatically to invoke the calculated field dialog and perform necessary operation.

Calculated measure can be added only in value axis.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    catalog: 'Adventure Works DW 2008 SE',
    cube: 'Adventure Works',
    providerType: 'SSAS',

    }

```

```
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Users can add a calculated field at runtime through the built-in dialog by using the following steps.

Step 1: Click the "CALCULATED FIELD" button in the field list dialog positioned at the top right corner. The calculated field dialog will be opened now. Enter the name of the calculated field to be created.

Field List

CLOSE

Create Calculated Field

All Fields

- > Calculated Members
- > Measures
- > Account
- > Customer
- > Date
- > Delivery Date
- > Department
- > Destination Currency
- > Employee
- > Geography
- > Internet Sales Order Details
- > Organization

Field Name
BikeAndComponents

Expression
Example: [Measures].[Order Quantity] + ([Measures].[Order Quantity] * 0.10)

Field Type
Measure

Parent Hierarchy
Account Number

Format String
Standard

Enter custom format string

CLEAR OK CANCEL

Step 2: Frame the expression by dragging and dropping the fields from the tree view on the left side of the dialog using simple arithmetic operators. **Example:** "IIF([Measures].[Internet Sales Amount]^0.5 > 100, [Measures].[Internet Sales Amount]*100, [Measures].[Internet Sales Amount]/100)". Please refer here to learn more about the supported [operators](#) and [functions](#) to frame the expression.

Parent Hierarchy
Account Number

Format String
Standard

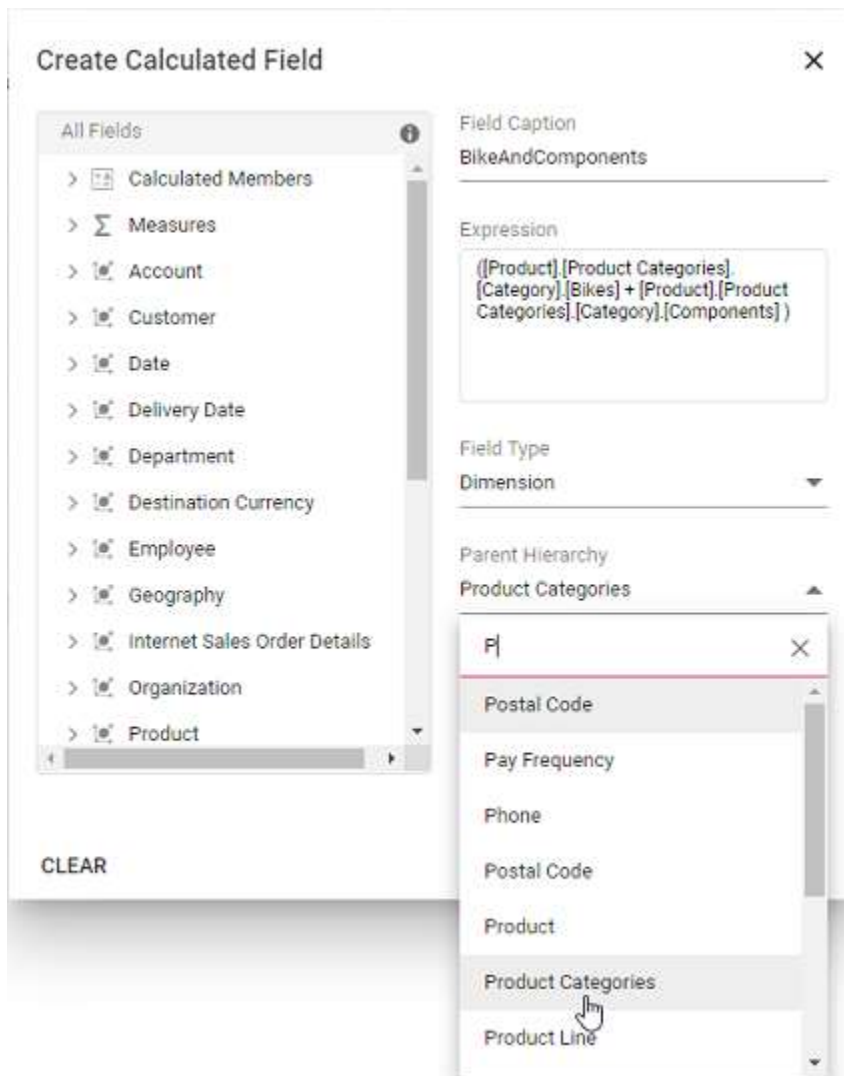

Enter custom format string

CLEAR OK CANCEL

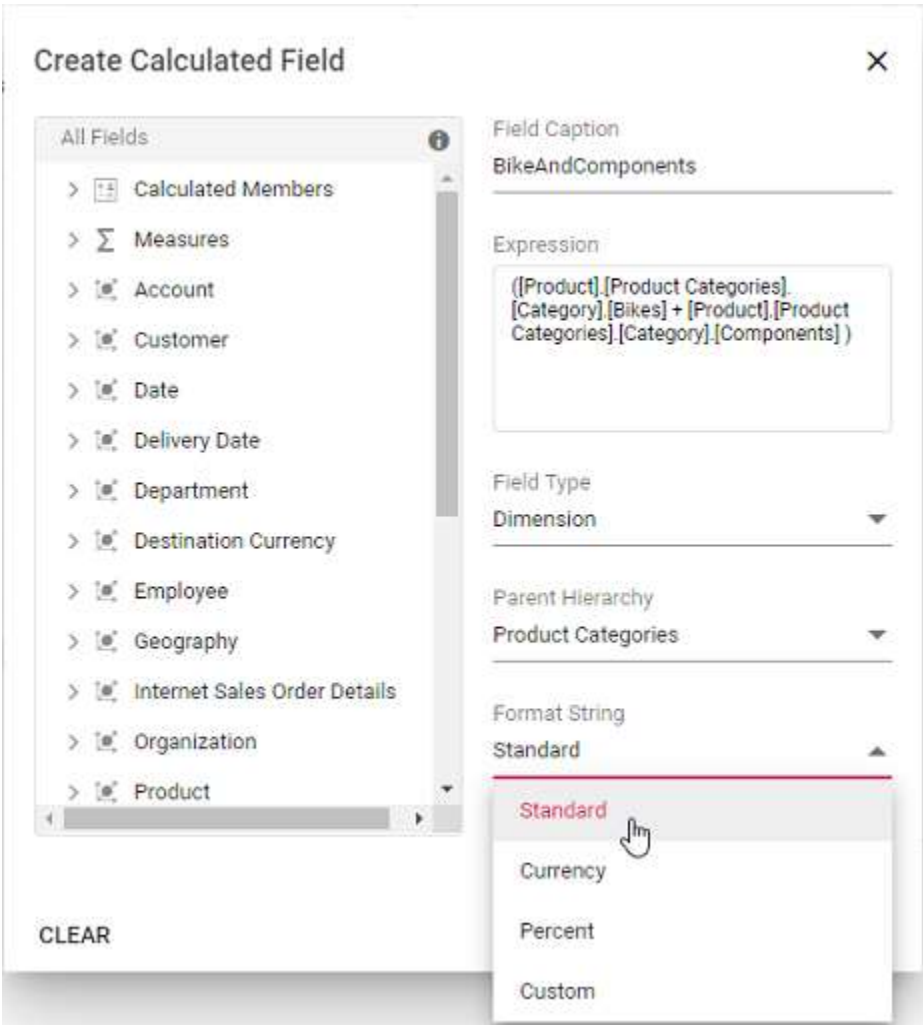

Step 3: Confirm the type of the field to be created - calculated measure or calculated dimension.

Step 4: Choose the parent hierarchy of the calculated field. NOTE: It is only applicable to the calculated dimension.

Step 5: Then select the format string from the drop-down list and finally click "OK".

	Accessories		
	Customer Count	Internet Sales Amount	Order on Discount
▶ Australia	2,905	\$138,690.63	\$68,124.10
▶ Canada	1,230	\$103,377.85	\$68,124.10
▶ France	1,505	\$63,406.78	\$68,124.10
▶ Germany	1,535	\$62,232.59	\$68,124.10

Format String

Allows you to specify the required format string while creating new calculated field. Supported format strings are:

- **Standard** - Denotes the numeric type.
- **Currency** - Denotes the currency type.
- **Percent** - Denotes the percentage type.
- **Custom** - Denotes the custom format. For example: "###0.##0#". This shows the value "9584.3" as "9584.300."

By default, **Standard** will be selected from the drop down list.

Renaming the existing calculated field

Existing calculated field can be renamed only through the UI at runtime. To do so, open the calculated field dialog, click the target field. User can now see the existing name getting displayed in the text box at the top of the dialog. Now, change the name based on user requirement and click "OK".

The screenshot shows the 'Create Calculated Field' dialog box. On the left, under 'All Fields', the 'Calculated Members' section is expanded, showing a list of fields. The field 'Order on Discount' is selected and highlighted in red. The right side of the dialog contains the following fields:

- Field Caption:** Order Quantity on Discount
- Expression:**
$$[\text{Measures}].[Order\ Quantity] + ([\text{Measures}].[Order\ Quantity] * 0.50)$$
- Field Type:** Measure
- Parent Hierarchy:** Account Number
- Format String:** Standard
- Enter custom format string:** (empty text box)

At the bottom of the dialog, there are three buttons: 'CLEAR', 'OK', and 'CANCEL'.

[Reusing the existing formula in a new calculate field](#)

While creating a new calculated field, if user wants to add the formula of an existing calculated field, it can be done easily. To do so, simply drag-and-drop the existing calculated field to the "Expression" section.

[Clearing the changes while editing the calculated field](#)

Previous changes can be cleared by using the "Clear" option while performing operations such as creating and editing the calculated field. To do so, click the "Clear" button in the bottom left corner of the dialog.

Virtual Scrolling

Allows large amounts of data to be loaded without any performance degradation by rendering rows and columns in relation to the current viewport. Rest of the data will be brought into the viewport dynamically based on vertical or horizontal scroll position. This feature can be enabled by setting the [enableVirtualization](#) property to **true**.

To use the virtual scrolling feature, inject the **VirtualScroll** module into the pivot table.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    catalog: 'Adventure Works DW 2008 SE',
    cube: 'Adventure Works',
    providerType: 'SSAS',

        </div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Limitations for virtual scrolling

- The [columnWidth](#) property in [gridSettings](#) should be in pixels. The percentage value is not accepted.
- Resizing columns and setting the width of individual columns will affect scrolling and is therefore not recommended.
- The grand totals option is not supported by virtual scrolling.

Run the application

The quickstart project is configured to compile and run the application in the browser. Use the following command to run the application.

`

npm start

`

Output will be displayed as follows.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        catalog: 'Adventure Works DW 2008 SE',

</body></html>

```

Deploy the Application

The Essential JS 2 pivot table control features are segregated into individual feature-wise modules. The [Essential Studio JavaScript \(Essential JS 2\)](#) build and [CDN](#) scripts contains code for all features used in pivot table and hence we suggest to not to use them in production. We strongly recommend you to generate script files to use in production using our [Custom Resource Generator \(CRG\)](#) for Essential JS 2. CRG will allow you to generate the bundled script for the currently enabled features in pivot table.

Data Binding

To bind OLAP datasource to the pivot table, you need to specify following properties under [dataSourceSettings](#) option.

Properties	Description
cube	Points the respective cube name from OLAP database.
providerType	Points the provider type for pivot table to identify the type of data source.
url	Contains the cube URL for establishing the connection (online).
catalog	Contains the database name (catalog name) to fetch the data.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    catalog: 'Adventure Works DW 2008 SE',
    cube: 'Adventure Works',
    providerType: 'SSAS',
    enableSorting: true,
    url: 'https://bi.syncfusion.com/olap/msmdpump.dll',
    localeIdentifier: 1033,
    rows: [
      { name: '[Customer].[Customer Geography]', caption:
'Customer Geography' },
    ],
    columns: [
      { name: '[Product].[Product Categories]', caption: 'Product
Categories' },
      { name: '[Measures]', caption: 'Measures' },
    ],
    values: [
      { name: '[Measures].[Customer Count]', caption: 'Customer
Count' },
      { name: '[Measures].[Internet Sales Amount]', caption:
'Internet Sales Amount' }
    ],
    filters: [
      { name: '[Date].[Fiscal]', caption: 'Date Fiscal' },
    ],
    filterSettings: [
      {
        name: '[Date].[Fiscal]', items:
['[Date].[Fiscal].[Fiscal Quarter].&[2002]&[4]',
'[Date].[Fiscal].[Fiscal Year].&[2005]'],
        levelCount: 3
      }
    ]
  },
  height: 350
});
pivotTableObj.appendTo('#PivotTable');
```

```

Named set

Named set is a multidimensional expression (MDX) that returns a set of dimension members, which can be created by combining the cube data, arithmetic operators, numbers, and functions.

You can bind the named sets in the pivot table by setting its unique name in the [name](#) property either in row or column axis and [isNamedSet](#) boolean property to **true**. In this sample, we have added "Core Product Group" named set in the column axis.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        catalog: 'Adventure Works DW 2008 SE',
        cube: 'Adventure Works',
        providerType: 'SSAS',
        enableSorting: true,
        url: 'https://bi.syncfusion.com/olap/msmdpump.dll',
        localeIdentifier: 1033,
    }
});

```

```

```

Configuring authentication

Users can configure basic authentication information to access the OLAP cube using the [authentication](#) property. The settings required to configure are as follows:

- [userName](#): It allows the user to set a username that recognizes the basic authentication of the IIS.
- [password](#): It allows to set the appropriate password.

If the user does not configure the authentication, a default popup will appear in the browser to get the authentication information.

`ts

```

var pivotTableObj = new ej.pivotview.PivotView({
dataSourceSettings: {
catalog: 'Adventure Works DW 2008 SE',
cube: 'Adventure Works',
providerType: 'SSAS',

```

```
enableSorting: true,
url: 'https://bi.syncfusion.com/olap/msmdpump.dll',
localeIdentifier: 1033,
rows: [
{ name: '[Customer].[Customer Geography]', caption: 'Customer Geography' },
],
columns: [
{ name: '[Product].[Product Categories]', caption: 'Product Categories' },
{ name: '[Measures]', caption: 'Measures' },
],
values: [
{ name: '[Measures].[Customer Count]', caption: 'Customer Count' },
{ name: '[Measures].[Internet Sales Amount]', caption: 'Internet Sales Amount' }
],

{ name: '[Date].[Fiscal]', caption: 'Date Fiscal' },
],
filterSettings: [
{
name: '[Date].[Fiscal]', items: ['[Date].[Fiscal].[Fiscal Quarter].&[2002]&[4]',
'[Date].[Fiscal].[Fiscal Year].&[2005]'],
levelCount: 3
}
],
authentication: {
userName: 'username',
password: 'password'
}
},
height: 350
});
pivotTableObj.appendTo('#PivotTable');
`
```

Roles

SQL Server Analysis Services uses [roles](#) to limit data access within a cube. Each role defines a set of permissions that can be granted to a single user or groups of users. It is used to manage security by limiting access to sensitive data and determining who has access to and can change the cube. It can be configured using the [roles](#) property in [dataSourceSettings](#).

The [roles](#) property can be used to specify one or more roles to the OLAP cube, separated by commas.

```
`ts
```

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    catalog: 'Adventure Works DW 2008 SE',
    cube: 'Adventure Works',
    roles: 'Role1',
    providerType: 'SSAS',
    url: 'https://bi.syncfusion.com/olap/msmdpump.dll',
    localeIdentifier: 1033,
    rows: [
      { name: '[Customer].[Customer Geography]', caption: 'Customer Geography' },
    ],
    columns: [
      { name: '[Product].[Product Categories]', caption: 'Product Categories' },
      { name: '[Measures]', caption: 'Measures' },
    ],
    values: [
      { name: '[Measures].[Customer Count]', caption: 'Customer Count' },
      { name: '[Measures].[Internet Sales Amount]', caption: 'Internet Sales Amount' }
    ],
  },
  height: 350
});
pivotTableObj.appendTo('#PivotTable');
```

OLAP Cube: Elements

Field list

The field list, aka cube dimension browser, is a tree view like structure that organizes the cube elements such as dimensions, hierarchies, measures, etc., from the selected cube into independent logical groups.

Types of node in field list

- **Display folder:** A folder that contains a set of similar elements.
- **Measure:** Quantity available for analysis.
- **Dimension:** A name given to the parts of the cube that categorizes data.
- **Attribute Hierarchy:** Level of attributes down the hierarchy.
- **User-defined Hierarchy:** Members of a dimension in a hierarchical structure.
- **Level:** Denotes a specific level in the category.
- **Named Set:** A collection of tuples and members, that can be defined and saved as a part of cube definition for later use.

Measure

In a cube, a measure is a set of values that are based on a column in the cube's fact table and are usually numeric. The measures are the central values of a cube that are analyzed. That is, measures are the numeric data of primary interest to users browsing a cube. You can select measures depend on the types of users request. Some common measures are sales, costs, expenditures, and production count.

Dimension

A simple dimension object is composed of basic information such as name, hierarchy, level, and members. You can create a dimension element by specifying its name and providing the hierarchy and level name. The dimension element contains the hierarchical details and information about each included level elements in that hierarchy. A hierarchy can have any number of level elements and the level elements can have any number of members and the member elements can have any number of child members.

Hierarchy

Each element of a dimension can be summarized using a hierarchy. The hierarchy is a series of parent-child relationship, where a parent member represents the consolidation of members which are its children. Parent members can be further aggregated as the children of another parent. For example, May 2005 can be summarized into Second Quarter 2005 which in turn would be summarized in the year 2005.

Level

Level element is the child of hierarchy element which contains a set of members, each of which has the same rank within a hierarchy.

Attribute hierarchy

Attribute hierarchy contains the following levels:

- A leaf level contains distinct attribute member, and each member of the leaf level is known as a leaf member.
- Intermediate levels if the attribute hierarchy is a parent-child hierarchy.
- An optional (all) level contains the aggregated value of the attribute hierarchy's leaf members, with the member of the (all) level also known as the (all) member.

User-defined hierarchy

User-defined hierarchy organizes the members of a dimension into hierarchical structure and provides navigation paths in a cube. For example, take a dimension table that supports three attributes such as year, quarter, and month. The year, quarter, and month attributes are used to construct a user-defined hierarchy, named Calendar, in the time dimension that relates to all levels.

Differentiating user-defined hierarchy and attribute hierarchy

- User-defined hierarchy contains more than one level whereas attribute hierarchy contains only one level.
- User-defined hierarchy provides the navigation path between the levels taken from attribute hierarchies of the same dimension.
- The attribute hierarchy and the user-defined hierarchy are represented in different ways as shown in the following table.

Named set

A named set is a collection of tuples and members, which can be defined and saved as a part of the cube definition. Named set records reside inside the sets folder, which is under a dimension element. These elements can be dragged to [rows](#) or [columns](#) axis via grouping bar or field list at runtime. To work with a lengthy, complex, or commonly used expression easier, Multidimensional Expressions (MDX) allows you to define a named set.

Calculated field

The calculated field allows user to insert or add a new calculated field based on the available OLAP cube elements from the bound data source. Calculated fields are nothing but customized dimensions or measures that are newly created based on the user-defined expression.

The two types of calculated fields are as follows:

- **Calculated Measure** – Creates a new measure through user-defined expression.
- **Calculated Dimension** – Creates a new dimension through user-defined expression.

Symbolic representation of the nodes inside field list

Icon	Name	Node type	Is Draggable	
	Display Folder	Display Folder	False	
	Measure	Measure	False	
	Dimension	Dimension	False	
	User Defined Hierarchy	Hierarchy	True	
	Attribute Hierarchy	Hierarchy	True	
	 	Levels (in order)	Level Element	True
	Named Set	Named Set	True	

In general, the Pivot Table is created using the built-in engine for given data source. This is an optional feature that allows you to create the Pivot Table with a server-side pivot engine and external data binding. And this option is applicable only for relational data source.

Server side pivot engine in EJ2 JavaScript Pivotview control

This section briefs the Syncfusion assembly [Syncfusion.Pivot.Engine](#), which is used in a server-side application to perform all Pivot calculations such as aggregation, filtering, sorting, grouping, and so on, and only the information to be displayed in the Pivot Table's viewport is passed to the client-side (browser) via web service (Web API) rather than the entire data source. It reduces network traffic and improves the rendering performance of the Pivot Table, especially when dealing with large amounts of data. It also works best with virtual scrolling enabled and supports all the Pivot Table's existing features.

Quick steps to render the Pivot Table by using the server-side Pivot Engine

Download and installing Server-side Pivot Engine

1. Download the ASP.NET Core-based stand-alone Pivot Table [application](#) from the GitHub repository.
2. The **PivotController** (Server-side) application that is downloaded includes the following files.
 - **PivotController.cs** file under **Controllers** folder – This helps to do data communication with Pivot Table.
 - **DataSource.cs** file under **DataSource** folder – This file has model classes to define the structure of the data sources.
 - The sample data source files **sales.csv** and **sales-analysis.json** under **DataSource** folder.
3. Open the **PivotController** application in Visual Studio where the Syncfusion library [Syncfusion.Pivot.Engine](#) will be downloaded automatically from the nuget.org site.

Connecting Pivot Table to Server-side Pivot Engine

1. Run the **PivotController** (Server-side) application which will be hosted in IIS shortly.
2. Then in the Pivot Table sample, set the [mode](#) property under [dataSourceSettings](#) as **Server** and map the URL of the hosted Server-side application in [URL](#) property of [dataSourceSettings](#).

```
`javascript
var pivotObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    url: 'https://localhost:44350/api/pivot/post',
    mode: 'Server',
    //Other codes here...
  }
});
pivotObj.appendTo('#PivotTable');
```

3. Frame and set the report based on the data source available in the **PivotController** application.

```
`javascript
var pivotObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
```

```

url: 'https://localhost:44350/api/pivot/post',
mode: 'Server',
rows: [{
name: 'ProductID', caption: 'Product ID'
}],
formatSettings: [{
name: 'Price', format: 'C'
}],
columns: [{
name: 'Year', caption: 'Production Year'
}],
values: [
{ name: 'Sold', caption: 'Units Sold' },
{ name: 'Price', caption: 'Sold Amount' }
],
//Other codes here...
});
pivotObj.appendTo('#PivotTable');

```

4. Run the sample to get the following result.

	FY 2015		FY 2016		FY 2017
	Units Sold	Sold Amount	Units Sold	Sold Amount	Units Sold
PRO-10	7901220	\$1,841,712.00	7561880	\$1,762,804.00	7591
PRO-11	7174625	\$1,673,533.00	7338175	\$1,711,599.80	7164
PRO-12	9168140	\$2,135,848.80	7689400	\$1,792,704.00	7375
PRO-13	6674280	\$1,560,619.20	8585260	\$2,001,738.40	6571
PRO-14	7489240	\$1,745,841.20	7167840	\$1,675,479.20	7396
PRO-15	8149185	\$1,902,397.00	7450585	\$1,734,093.00	7247
PRO-16	7070150	\$1,652,838.40	8037500	\$1,873,597.60	7883

Available configurations in Server-side application

[Supportive Data Sources](#)

The server-side Pivot Engine supports the following data sources,

- Collection
- JSON

- CSV
- DataTable
- Dynamic

Collection

The collection data sources such as List, IEnumerable, and so on are supported. This can be bound using the **GetData** controller method. Also, in the Pivot Table sample, set the [type](#) property under [dataSourceSettings](#) to **JSON**, which is also the default enumeration value.

In the server-side application (**PivotController**), a collection type data source is framed in the **DataSource.cs** file as shown in the following.

```
`c#
public class PivotViewData
{
    public string ProductID { get; set; }
    public string Country { get; set; }
    public string Product { get; set; }
    public double Sold { get; set; }
    public double Price { get; set; }
    public string Year { get; set; }
    public List<PivotViewData> GetVirtualData()
    {
        List<PivotViewData> VirtualData = new List<PivotViewData>();
        for (int i = 1; i <= 10000; i++)
        {
            PivotViewData p = new PivotViewData
            {
                ProductID = "PRO-" + ((100 + i)%20),
                Year = (new string[] { "FY 2015", "FY 2016", "FY 2017", "FY 2018", "FY 2019" })[new Random().Next(5)],
                Country = (new string[] { "Canada", "France", "Australia", "Germany", "France" })[new Random().Next(5)],
                Product = (new string[] { "Car", "Van", "Bike", "Flight", "Bus" })[new Random().Next(5)],
                Price = (3.4 * i) + 500,
                Sold = (i * 15) + 10
            };
            VirtualData.Add(p);
        }
    }
}
```

```

return VirtualData;
}
}
`

```

To bind the data source, set its model type **PivotViewData** to **TValue** of the **PivotEngine** class.

```

`c#
private PivotEngine<DataSource.PivotViewData> PivotEngine = new
PivotEngine<DataSource.PivotViewData>();
`

```

Then call the data source in **GetData** method of **PivotController.cs** file.

```

`c#
public async Task<object> GetData(FetchData param)
{
return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
async (cacheEntry) =>
{
cacheEntry.SetSize(1);
cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
// Here bind the collection type data source.
return new DataSource.PivotViewData().GetVirtualData();
});
}
`

```

Finally set the appropriate report to the Pivot Table sample based on the above data source.

```

`javascript
var pivotObj = new ej.pivotview.PivotView({
dataSourceSettings: {
url: 'https://localhost:44350/api/pivot/post',
mode: 'Server',
type: 'JSON',
rows: [{
name: 'ProductID', caption: 'Product ID'
}],

```

```

formatSettings: [{
  name: 'Price', format: 'C'
}],
columns: [{
  name: 'Year', caption: 'Production Year'
}],
values: [
  { name: 'Sold', caption: 'Units Sold' },
  { name: 'Price', caption: 'Sold Amount' }
],
//Other codes here...
});

```

	FY 2015		FY 2016		FY 2017
	Units Sold	Sold Amount	Units Sold	Sold Amount	Units Sold
PRO-10	7901220	\$1,841,712.00	7561880	\$1,762,804.00	7591
PRO-11	7174625	\$1,673,533.00	7338175	\$1,711,599.80	7164
PRO-12	9168140	\$2,135,848.80	7689400	\$1,792,704.00	7375
PRO-13	6674280	\$1,560,619.20	8585260	\$2,001,738.40	6571
PRO-14	7489240	\$1,745,841.20	7167840	\$1,675,479.20	7396
PRO-15	8149185	\$1,902,397.00	7450585	\$1,734,093.00	7247
PRO-16	7070150	\$1,652,838.40	8037500	\$1,873,597.60	7885

JSON

The JSON data from a local *.json file type can be connected to the Pivot Table. Here, the file can be read by the **StreamReader** option, which will give the result in the string format. The resultant string needs to be converted to collect data that can be bound to the Server-side pivot engine.

In the Server-side application, **sales-analysis.json** file is available under **DataSource** folder and its model type is defined in **DataSource.cs** file.

```

`c#
public class PivotJSONData
{
  public string Date { get; set; }
  public string Sector { get; set; }
  public string EnerType { get; set; }
  public string EneSource { get; set; }
}

```

```

public int PowUnits { get; set; }
public int ProCost { get; set; }
public List<PivotJSONData> ReadJSONData(string url)
{
    WebClient myWebClient = new WebClient();
    Stream myStream = myWebClient.OpenRead(url);
    StreamReader stream = new StreamReader(myStream);
    string result = stream.ReadToEnd();
    stream.Close();
    return Newtonsoft.Json.JsonConvert.DeserializeObject<List<PivotJSONData>>(result);
}
}
`

```

To bind the data source, set its model type **PivotJSONData** to **TValue** of the **PivotEngine** class.

```

`c#
private PivotEngine<DataSource.PivotJSONData> PivotEngine = new PivotEngine<DataSource.
PivotJSONData>();
`

```

Then call the data source in **GetData** method of **PivotController.cs** file.

```

`c#
public async Task<object> GetData(FetchData param)
{
    return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
    async (cacheEntry) =>
    {
        cacheEntry.SetSize(1);
        cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
        // Here bind JSON type data source from the sales-analysis.json file.
        return new DataSource.PivotJSONData().ReadJSONData(_hostingEnvironment.ContentRootPath +
        "/DataSource/sales-analysis.json");
    });
}
`

```

Finally set the appropriate report to the Pivot Table sample based on the above data source.

```

`javascript
var pivotObj = new ej.pivotview.PivotView({
dataSourceSettings: {
url: 'https://localhost:44350/api/pivot/post',
mode: 'Server',
type: 'JSON',
rows: [{
name: 'EneSource', caption: 'Energy Source'
}],
formatSettings: [{
name: 'ProCost', format: 'C'
}],
columns: [{
name: 'EnerType', caption: 'Energy Type'
}],
values: [
{ name: 'PowUnits', caption: 'Units Sold' },
{ name: 'ProCost', caption: 'Sold Amount' }
],
},
//Other codes here...
});
`

```

	Biomass		Free Energy		Grand Total
	Units Sold	Sold Amount	Units Sold	Sold Amount	Units Sold
Bio-diesel	1042	\$1,439.00			1042
Ethanol Fuel	595	\$1,031.00			595
Geo-thermal			1528	\$2,115.00	1528
Hydro-electric			3378	\$3,244.00	3378
Solar			7929	\$6,210.00	7929
Wastage	712	\$1,043.00			712
Wind			15571	\$7,666.00	15571

JSON data from any remote server, like a local JSON file, can also be supported. It accepts both directly downloadable files (*.json*) and web service URLs. To bind this, the URL of the *.json* file of a remote server

has to be mapped under the **GetData** method. The rest of the configurations are the same as described above.

In the server-side application, the CDN link is used to connect the same **sales-analysis.json** file which is already hosted in the Syncfusion server.

```
`c#
public async Task<object> GetData(FetchData param)
{
    return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
    async (cacheEntry) =>
    {
        cacheEntry.SetSize(1);
        cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
        // Here bind JSON type data source from remote server.
        return new DataSource.PivotJSONData().ReadJSONData("http://cdn.syncfusion.com/data/sales-
        analysis.json");
    });
}
```

CSV

The CSV data from a local *.csv file type can be connected to the Pivot Table. Here, the file can be read by the **StreamReader** option, which will give the result in the string format. The resultant string needs to be converted to collect data that can be bound to the server-side pivot engine. Also, in the Pivot Table sample, set the [type](#) property under [dataSourceSettings](#) as **CSV**.

In the server application, the **sales.csv** file is available under the **DataSource** folder, and its model type is defined in the **DataSource.cs** file.

```
`c#
public class PivotCSVData
{
    public string Region { get; set; }
    public string Country { get; set; }
    public string ItemType { get; set; }
    public string SalesChannel { get; set; }
    public string OrderPriority { get; set; }
    public string OrderDate { get; set; }
    public int OrderID { get; set; }
    public string ShipDate { get; set; }
```

```

public int UnitsSold { get; set; }
public double UnitPrice { get; set; }
public double UnitCost { get; set; }
public double TotalRevenue { get; set; }
public double TotalCost { get; set; }
public double TotalProfit { get; set; }
public List<string[]> ReadCSVData(string url)
{
    List<string[]> data = new List<string[]>();
    using (StreamReader reader = new StreamReader(new WebClient().OpenRead(url)))
    {
        string line;
        while ((line = reader.ReadLine()) != null)
        {
            line = line.Trim();
            if (!string.IsNullOrEmpty(line))
            {
                data.Add(line.Split(','));
            }
        }
        return data;
    }
}

```

To bind the data source, set its model type **PivotCSVData** to **TValue** of the **PivotEngine** class.

```

`c#
private PivotEngine<DataSource.PivotCSVData> PivotEngine = new PivotEngine<DataSource.
PivotCSVData>();

```

Then call the data source in **GetData** method of **PivotController.cs** file.

```

`c#
public async Task<object> GetData(FetchData param)

```

```

{
return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
async (cacheEntry) =>
{
cacheEntry.SetSize(1);
cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
// Here bind CSV type data source from sales.csv file.
return new DataSource.PivotCSVData().ReadCSVData(_hostingEnvironment.ContentRootPath +
"//DataSource//sales.csv");
});
}
`

```

Finally set the appropriate report to the Pivot Table sample based on the above data source.

```

`javascript
var pivotObj = new ej.pivotview.PivotView({
dataSourceSettings: {
url: 'https://localhost:44350/api/pivot/post',
mode: 'Server',
type: 'CSV',
rows: [{
name: 'ItemType', caption: 'Item Type'
}],
formatSettings: [{
name: 'UnitPrice', format: 'C'
}],
columns: [{
name: 'Region'
}],
values: [
{ name: 'UnitsSold', caption: 'Units Sold' },
{ name: 'UnitPrice', caption: 'Sold Amount' }
],
},
}

```

```
//Other codes here...
```

```
});
```

```
,
```

	Asia		Australia and Oceania		Central Ar
	Units Sold	Sold Amount	Units Sold	Sold Amount	Units Sold
Baby Food	55810	\$3,318.64	21548	\$765.84	
Beverages	84400	\$806.65	34486	\$332.15	
Cereal	32668	\$1,439.90	43195	\$1,645.60	
Clothes	24290	\$764.96	17020	\$655.68	
Cosmetics	84630	\$7,432.40	35220	\$3,060.40	
Fruits	35679	\$74.64	29951	\$46.65	
Household	28166	\$4,009.62	55444	\$6,014.43	

CSV data from any remote server, like a local CSV file, can also be supported. It accepts both directly downloadable files (.csv) and web service URLs. To bind this, the URL of the .csv file of a remote server has to be mapped under **GetData** method. The rest of the configurations are the same as described above.

In the server application, the CDN link is used to connect the same **sales.csv** file which is already hosted in the Syncfusion server.

```
`c#
```

```
public async Task<object> GetData(FetchData param)
{
    return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
    async (cacheEntry) =>
    {
        cacheEntry.SetSize(1);
        cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
        // Here bind CSV type data source from remote server.
        return new DataSource.PivotCSVData().ReadCSVData("http://cdn.syncfusion.com/data/sales-
analysis.csv");
    });
}
```

DataTable

In the server-side application, there is a manually created DataTable **BusinessObjectsDataView** by mapping the model type **PivotViewData** in **DataSource.cs** file.

```
`c#
```

```

public class BusinessObjectsDataView
{
    public DataTable GetDataTable()
    {
        DataTable dt = new DataTable("BusinessObjectsDataTable");
        PropertyDescriptorCollection pdc = TypeDescriptor.GetProperties(typeof(PivotViewData));
        foreach (PropertyDescriptor pd in pdc)
        {
            dt.Columns.Add(new DataColumn(pd.Name, pd.PropertyType));
        }
        List<PivotViewData> list = new PivotViewData().GetVirtualData();
        foreach (PivotViewData bo in list)
        {
            DataRow dr = dt.NewRow();
            foreach (PropertyDescriptor pd in pdc)
            {
                dr[pd.Name] = pd.GetValue(bo);
            }
            dt.Rows.Add(dr);
        }
        return dt;
    }
}

```

To bind the data source, set its model type **PivotViewData** to **TValue** of the **PivotEngine** class.

```

`c#
private PivotEngine<DataSource.PivotViewData> PivotEngine = new
PivotEngine<DataSource.PivotViewData>();

```

Then call the data source in **GetData** method of **PivotController.cs** file.

```

`c#
public async Task<object> GetData(FetchData param)
{

```

```
return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
async (cacheEntry) =>
{
cacheEntry.SetSize(1);
cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
// Here bind the DataTable.
return new DataSource.BusinessObjectsDataView().GetDataTable();
});
}
```

Finally set the appropriate report to the Pivot Table sample based on the above data source.

```
`javascript
var pivotObj = new ej.pivotview.PivotView({
dataSourceSettings: {
url: 'https://localhost:44350/api/pivot/post',
mode: 'Server',
rows: [{
name: 'ProductID', caption: 'Product ID'
}],
formatSettings: [{
name: 'Price', format: 'C'
}],
columns: [{
name: 'Year', caption: 'Production Year'
}],
values: [
{ name: 'Sold', caption: 'Units Sold' },
{ name: 'Price', caption: 'Sold Amount' }
],
}
//Other codes here...
});
```

	FY 2015		FY 2016		FY 2017
	Units Sold	Sold Amount	Units Sold	Sold Amount	Units Sold
PRO-10	7901220	\$1,841,712.00	7561880	\$1,762,804.00	759
PRO-11	7174625	\$1,673,533.00	7338175	\$1,711,599.80	716

PRO-15	8149185	\$1,902,397.00	7450585	\$1,734,093.00	724
PRO-16	7070150	\$1,652,838.40	8037500	\$1,873,597.60	788

Dynamic

The model type has to be defined in the aforementioned data sources. However, there is no need to define a model type for the following data sources, which are also supported by the server-side pivot engine.

ExpandoObject

In the server-side application, an **ExpandoObject** type data source is available under the class **PivotExpandoData** in **DataSource.cs** file.

```
`c#
public class PivotExpandoData
{
    public List<ExpandoObject> Orders { get; set; } = new List<ExpandoObject>();
    public List<ExpandoObject> GetExpandoData()
    {
        Orders = Enumerable.Range(1, 75).Select((x) =>
        {
            dynamic d = new ExpandoObject();
            d.OrderID = 1000 + (x % 100);
            d.CustomerID = (new string[] { "ALFKI", "ANANTR", "ANTON", "BLONP", "BOLID" })[new Random().Next(5)];
            d.Freight = (new double[] { 2, 1, 4, 5, 3 })[new Random().Next(5)] * x;
            d.OrderDate = (new DateTime[] { new DateTime(2010, 11, 5), new DateTime(2018, 10, 3), new DateTime(1995, 9, 9), new DateTime(2012, 8, 2), new DateTime(2015, 4, 11) })[new Random().Next(5)];
            d.ShipCountry = (new string[] { "USA", "UK" })[new Random().Next(2)];
            d.Verified = (new bool[] { true, false })[new Random().Next(2)];
            return d;
        }).Cast<ExpandoObject>().ToList<ExpandoObject>();
        return Orders;
    }
}
```

```

}
}
`

```

To bind the data source, set its model type as **ExpandoObject** to **TValue** of the **PivotEngine** class.

```

`c#
private PivotEngine<ExpandoObject> PivotEngine = new PivotEngine<ExpandoObject>();
`

```

Then call the data source in **GetData** method of **PivotController.cs** file.

```

`c#
public async Task<object> GetData(FetchData param)
{
    return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
    async (cacheEntry) =>
    {
        cacheEntry.SetSize(1);
        cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
        // Here returns ExpandoObject type data source.
        return new DataSource.PivotExpandoData().GetExpandoData();
    });
}
`

```

Finally set the appropriate report to the Pivot Table sample based on the above data source.

```

`javascript
var pivotObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        url: 'https://localhost:44350/api/pivot/post',
        mode: 'Server',
        rows: [{
            name: 'CustomerID', caption: 'Customer ID'
        }],
        columns: [{
            name: 'ShipCountry', caption: 'Ship Country'
        }],
    },
});

```

```

values: [
{ name: 'Freight', caption: 'Units Sold' }
]
}
//Others codes here...
});
`

```

	UK	USA	Grand Total
	Units Sold	Units Sold	Units Sold
ALFKI	1187	738	1925
ANANTR	1011	814	1825
ANTON	1046	632	1678
BLONP	1080	749	1829
BOLID	492	929	1421
Grand Total	4816	3862	8678

Dynamic Objects

In the server-side application, a data source is framed by dynamic objects which is available under the class **PivotDynamicData** in the **DataSource.cs** file.

```

`c#
public class PivotDynamicData
{
    public List<DynamicDictionary> Orders = new List<DynamicDictionary>() { };
    public List<DynamicDictionary> GetDynamicData()
    {
        Orders = Enumerable.Range(1, 100).Select((x) =>
        {
            dynamic d = new DynamicDictionary();
            d.OrderID = 100 + x;
            d.CustomerID = (new string[] { "ALFKI", "ANANTR", "ANTON", "BLONP", "BOLID" })[new
            Random().Next(5)];
            d.Freight = (new double[] { 2, 1, 4, 5, 3 })[new Random().Next(5)] * x;
            d.OrderDate = (new DateTime[] { new DateTime(2010, 11, 5), new DateTime(2018, 10, 3), new
            DateTime(1995, 9, 9), new DateTime(2012, 8, 2), new DateTime(2015, 4, 11) })[new Random().Next(5)];
            d.ShipCountry = (new string[] { "USA", "UK" })[new Random().Next(2)];
            d.Verified = (new bool[] { true, false })[new Random().Next(2)];
            return d;
        }
    }
}

```

```

}).Cast<DynamicDictionary>().ToList<DynamicDictionary>());
return Orders;
}
public class DynamicDictionary : System.Dynamic.DynamicObject
{
    Dictionary<string, object> dictionary = new Dictionary<string, object>();
    public override bool TryGetMember(GetMemberBinder binder, out object result)
    {
        string name = binder.Name;
        return dictionary.TryGetValue(name, out result);
    }
    public override bool TrySetMember(SetMemberBinder binder, object value)
    {
        dictionary[binder.Name] = value;
        return true;
    }
    //The "GetDynamicMemberNames" method of the "DynamicDictionary" class must be overridden and
    return the property names to perform data operation and editing while using dynamic objects.
    public override System.Collections.Generic.IEnumerable<string> GetDynamicMemberNames()
    {
        return this.dictionary?.Keys;
    }
}
}
}
`

```

To bind the data source, set its class **PivotDynamicData** to **TValue** of the **PivotEngine** class.

```

`c#
private PivotEngine<DataSource.PivotDynamicData> PivotEngine = new
PivotEngine<DataSource.PivotDynamicData>();
`

```

Then call the data source in **GetData** method of **PivotController.cs** file.

```

`c#
public async Task<object> GetData(FetchData param)
{

```

```
return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
async (cacheEntry) =>
{
cacheEntry.SetSize(1);
cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
// Here bind data source with dynamic objects.
return new DataSource.PivotDynamicData().GetDynamicData();
});
}
```

Finally set the appropriate report to the Pivot Table sample based on the above data source.

```
`javascript
var pivotObj = new ej.pivotview.PivotView({
dataSourceSettings: {
url: 'https://localhost:44350/api/pivot/post',
mode: 'Server',
rows: [{
name: 'CustomerID', caption: 'Customer ID'
}],
columns: [{
name: 'ShipCountry', caption: 'Ship Country'
}],
values: [
{ name: 'Freight', caption: 'Units Sold' }
]
}
//Other codes here...
});
```

	UK	USA	Grand Total
	Units Sold	Units Sold	Units Sold
ALFKI	1030	742	1772
ANANTR	1352	1018	2370
ANTON	2525	1782	4307
BLONP	1786	1002	2788
BOLID	1409	2012	3421
Grand Total	8102	6556	14658

Controller Configuration

Memory Cache

In the server-side application, the [Memory Cache](#) option is used to store the data source and engine properties in RAM, which will be used for UI operations. To improve performance, this limits the execution of all initial rendering code to regenerate the aggregated values during each UI operation. The codes below show how we use the memory cache option in the **GetEngine** method to store engine properties.

```
`c#
public async Task<EngineProperties> GetEngine(FetchData param)
{
    isRendered = false;
    // Engine properties are stored in memory cache with GUID "param.Hash".
    return await _cache.GetOrCreateAsync("engine" + param.Hash,
    async (cacheEntry) =>
    {
        isRendered = true;
        cacheEntry.SetSize(1);
        // Memory cache expiration time can be set here.
        cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
        PivotEngine.Data = await GetData(param);
        return await PivotEngine.GetEngine(param);
    });
}
```

The engine properties are stored in RAM as a cache with a unique ID (GUID) that is transferred from the client-side source code. The GUID is generated at random and will be changed if the page containing the Pivot Table is refreshed or opened in a new tab/window. As a result, each GUID's memory cache contains unique information, and the component operates independently.

Meanwhile, the memory cache is set to expire after 60 minutes from RAM to free its memory. If the component is still running, the data will be generated and stored for another 60 minutes.

Methods and its needs

- **Post:** Allows to get the information from the client-side source and calls appropriate controller methods.
- **GetEngine:** Allows to store the engine properties in RAM as a cache which fires on initial rendering or when the memory cache is expired.
- **GetData:** Allows to store data source in RAM as a cache which fires on initial rendering or when the memory cache is expired.
- **GetMembers:** Allows to get the members of a field. This fires when the member editor is opened to do a filtering operation.
- **GetRawData:** Allows to get raw data of an aggregated value cell. This fires when the drill-through or editing dialog is opened.
- **GetPivotValues:** Allows to update the stored engine properties in-memory cache and returns the aggregated values to browser to render the Pivot Table. Here, the return value can be modified. The Pivot Table will be rendered browser-based on this.

Pivot chart in EJ2 JavaScript Pivotview control

In pivot table component, pivot chart would act as an additional visualization component with its basic and important characteristic like drill down and drill up, 15+ chart types, series customization, axis customization, legend customization, export, print and tooltip. Its main purpose is to show the pivot data in graphical format.

If user prefers, the pivot chart component can also be displayed individually with pivot values and can change the report dynamically with the help of field list and grouping bar. Using the `displayOption` property in pivot table, user can set the visibility of grid and chart in pivot table component. It holds below properties,

- **view:** Specifies the pivot table component to display grid alone or chart alone or both.
- **primary:** Specifies the pivot table to display either grid or chart as primary component during initial loading. It is applicable only when setting the property **view** to **Both**.

The below sample displays the pivot chart component based on the pivot report bound on it.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  height: 350,
  displayOption: { view: 'Chart' },
  chartSettings: { chartSeries: { type: 'Column' } }
});
```

```
pivotTableObj.appendTo('#PivotTable');
```

INDEX.HTML

```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Data binding

End user can bind both local and remote data binding options available in the component to feed the data. The [dataSource](#) property can be assigned either with an instance of **DataManager** or JavaScript object array collection.

For more information [refer](#) here.

Chart Types

Supports 21 different types of charts as follows,

- Line
- Column
- Area
- Bar
- StepArea
- StackingLine
- StackingColumn
- StackingArea
- StackingBar
- StepLine
- Pareto
- Bubble
- Scatter
- Spline
- SplineArea
- StackingLine100
- StackingColumn100
- StackingBar100
- StackingArea100
- Polar
- Radar

Line is the default pivot chart type. User can change the pivot chart type by using the property [type](#) in [chartSeries](#).

In the below code sample, the pivot chart type is set as **Bar**.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
```

```

        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 350,
    displayOption: { view: 'Chart' },
    chartSettings: { chartSeries: { type: 'Bar' } }
});
pivotTableObj.appendTo('#PivotTable');

```

INDEX.HTML

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Accumulation Charts

Supports 4 different types of accumulation charts as follows,

- Pie
- Doughnut
- Funnel
- Pyramid

As like other chart types it can be changed using the property [type](#) in [chartSeries](#).

In the below code sample, the **Pie** chart is rendered, and the other accumulation charts can be switched using the drop-down list.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        columns: [{ name: 'Year' }, { name: 'Products' }],
        rows: [{ name: 'Country' }, { name: 'Quarter' }],
        formatSettings: [{ name: 'Amount', format: 'C' }],
        values: [{ name: 'Amount' }, { name: 'Sold' }],
        filters: []
    },
    height: 350,
    displayOption: { view: 'Chart' },
    chartSettings: { chartSeries: { type: 'Pie' } }
});
pivotTableObj.appendTo('#PivotTable');
var chartTypesDropDown = new ej.dropdowns.DropDownList({
    floatLabelType: 'Auto',
    change: function (args) {
        pivotTableObj.chartSettings.chartSeries.type = args.value;
    }
});
chartTypesDropDown.appendTo('#charttypes');

```

```

Drill Down/Up

In the accumulation charts, drill down and drill up operations can be performed using the built-in context menu option. It will be shown while clicking on the chart series. The context menu has the following options:

Expand - It is to drill down the corresponding series until the last level.

Collapse - It is to drill up the corresponding series until the first level.

Exit - It is to close the context menu.

The drill operation in accumulation charts can be performed only for row headers.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    columns: [{ name: 'Products' }],
    rows: [{ name: 'Country' }, { name: 'Year' }, { name: 'Quarter' },],
    formatSettings: [{ name: 'Amount', format: 'C' }],
    values: [{ name: 'Amount' }, { name: 'Sold' }],
    filters: []
  },
  height: 350,
  displayOption: { view: 'Chart' },
  chartSettings: { chartSeries: { type: 'Pie' } }
});
pivotTableObj.appendTo('#PivotTable');
```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Column Headers and Delimiters

Unlike other chart types, the accumulation charts consider the values of a single column from the pivot table to be drawn. Preferably the first column of the pivot table is considered by default. But it can be changed by defining the column headers using the `columnHeader` property in [chartSettings](#).

If the column has more than one header, then need to mention all the headers separated by the delimiter -, for example, **Germany-Road Bikes**. Using the property `columnDelimiter` in [chartSettings](#), one can set the desired delimiter to separate the column headers.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['Germany'] }],
        enableSorting: true,
        columns: [{ name: 'Country' }, { name: 'Products' }],
        rows: [{ name: 'Year' }, { name: 'Quarter' }],
        formatSettings: [{ name: 'Amount', format: 'C' }],
        values: [{ name: 'Amount' }, { name: 'Sold' }],
        filters: []
    },
    height: 350,
    displayOption: { view: 'Chart' },

```

```

    chartSettings: { columnHeader: 'Germany-Road Bikes', columnDelimiter: '-'
    }, chartSeries: { type: 'Doughnut' } }
  });
  pivotTableObj.appendTo('#PivotTable');

```

</body></html>

```

Label Customization

The data labels are visible by default showing header name. Its visibility can be modified using the `visible` boolean property in `dataLabel`. With regard to the label arrangement, the **Smart Labels** options help to arrange labels efficiently without overlapping. It can be disabled by setting the `enableSmartLabels` property in `chartSettings` as `false`.

The `position` property in `dataLabel` allows to specify the position of the data label. The available options are,

- **Outside**: Positions the label outside the point. It is the default option.
- **Inside**: Positions the label inside the point.

In the following code sample, the data labels are placed inside.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    columns: [{ name: 'Year' }, { name: 'Products' }],
    rows: [{ name: 'Country' }, { name: 'Quarter' }],
    formatSettings: [{ name: 'Amount', format: 'C' }],
    values: [{ name: 'Amount' }, { name: 'Sold' }],
    filters: []
  },
  height: 350,
  displayOption: { view: 'Chart' },
  chartSettings: {
    enableSmartLabels: false,
    chartSeries: { dataLabel: { visible: true, position: 'Inside' },
  type: 'Pyramid' }
  }
});
pivotTableObj.appendTo('#PivotTable');
```

INDEX.HTML

```

The **Connector Line** will be visible when the data label is placed outside the chart. It can be customized using the `connectorStyle` property in `dataLabel` for its color, length, width etc. In the following code sample, the connector line is customized.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        columns: [{ name: 'Year' }, { name: 'Products' }],
        rows: [{ name: 'Country' }, { name: 'Quarter' }],
        formatSettings: [{ name: 'Amount', format: 'C' }],
        values: [{ name: 'Amount' }, { name: 'Sold' }],
        filters: []
    },
    height: 350,
    displayOption: { view: 'Chart' },
    chartSettings: {
        chartSeries: {

```

```

        dataLabel: {visible: true, position: 'Outside', connectorStyle:
{ length: '50px', width: 2, dashArray: '5,3', color: '#f4429e' } },
        type: 'Funnel'
    }
}
});
pivotTableObj.appendTo('#PivotTable');

```

```

Pie and Doughnut Customization

User can draw pie and doughnut charts within the specified range using the `startAngle` and `endAngle` properties in `chartSeries`. The default value of the `startAngle` property is **0**, and the `endAngle` property is **360**. By customizing these properties, user can draw semi pie and semi doughnut charts.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    columns: [{ name: 'Year' }, { name: 'Products' }],
    rows: [{ name: 'Country' }, { name: 'Quarter' }],
    formatSettings: [{ name: 'Amount', format: 'C' }],
    values: [{ name: 'Amount' }, { name: 'Sold' }],
    filters: []
  },
  height: 350,
  displayOption: { view: 'Chart' },
  chartSettings: { chartSeries: { startAngle: 270, endAngle: 90, type:
'Doughnut' } }
});
pivotTableObj.appendTo('#PivotTable');
```

```

Users can get doughnut chart from pie chart and vice-versa using the `innerRadius` property in [chartSeries](#). If the property is greater than 0 percent, the doughnut chart will appear from the pie chart.

It takes the value only in percentage.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,

Field List

User can enable the field list by setting the property [showFieldList](#) in pivot table as **true**. By using this, user can customize the report dynamically and view the result in pivot chart. For more information regarding the field list, refer the [field list](#) topic.

In the following sample, the **Popup** mode of field list is enabled in the pivot chart integration.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  height: 350,
  displayOption: { view: 'Chart' },
  chartSettings: { chartSeries: { type: 'Column' }},
  showFieldList: true
});
pivotTableObj.appendTo('#PivotTable');

```

INDEX.HTML

<script src="index.js" type="text/javascript"></script>
</body></html>

```

Grouping Bar

User can enable the grouping bar by setting the property [showGroupingBar](#) in pivot table to **true**. The grouping bar in pivot chart shows a dropdown list in value axis instead of buttons. The dropdown list holds list of value fields bounded in the [dataSourceSettings](#) and it can be switched to draw the pivot chart with the selected value field. This has been defined as the default behavior in the pivot chart component. For more information regarding the grouping bar, refer the [grouping bar](#) topic.

For multiple axis support, buttons will be placed in value axis instead of dropdown list.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],

```

```

        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 240,
    displayOption: { view: 'Chart' },
    chartSettings: { chartSeries: { type: 'Column' }},
    showGroupingBar: true
});
pivotTableObj.appendTo('#PivotTable');

```

</body></html>

```

For accumulation charts alone, a drop-down list will be placed in the column axis instead of the buttons. The drop-down list shows the column headers available in the pivot table. Users can dynamically switch column headers with the help of the drop-down list, and the accumulation chart will be updated accordingly.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        columns: [{ name: 'Year' }, { name: 'Products' }],
        rows: [{ name: 'Country' }, { name: 'Quarter' }],
        formatSettings: [{ name: 'Amount', format: 'C' }],
        values: [{ name: 'Amount' }, { name: 'Sold' }],
        filters: []
    },
    displayOption: { view: 'Chart' },
    chartSettings: { chartSeries: { type: 'Pie' } },
    showGroupingBar: true,
    height: 240
});
pivotTableObj.appendTo('#PivotTable');

```

INDEX.HTML

Single Axis

By default, the pivot chart will be drawn with the value field (measure) which is set first in the report under value axis. But, user can change to specific value field using the property [value](#) in [chartSettings](#).

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 350,
    displayOption: { view: 'Chart' },
    chartSettings: { value: 'Amount', chartSeries: { type: 'Column' } }
});
pivotTableObj.appendTo('#PivotTable');

```

INDEX.HTML

```

```

Multiple Axis

User can draw the pivot chart with multiple value fields by setting the property [enableMultipleAxis](#) in [chartSettings](#) to **true**. In the below code sample, the pivot chart will be drawn with both value fields "Sold" and "Amount" available in the [dataSourceSettings](#).

The multiple axis support is not applicable for the accumulation chart types like pie, doughnut, pyramid, and funnel.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  height: 350,
  displayOption: { view: 'Chart' },
  chartSettings: { enableMultipleAxis: true, chartSeries: { type: 'Column'
} }
});
pivotTableObj.appendTo('#PivotTable');
```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

If the user binds more value fields, the result will be multiple pivot charts, and each chart will shrink within the parent container height. To avoid this, set the [enableScrollOnMultiAxis](#) property in [chartSettings](#) to **true**. By doing so, each pivot chart will only shrink to a minimal “160px” - “180px” height showing a vertical scrollbar for a clear view.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }, { name: 'Products', type: 'Count' }],
        rows: [{ name: 'Country' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],

<script src="index.js" type="text/javascript"></script>
```

```
</body></html>
```

Meanwhile, there is another way to display multiple values in a chart. In this approach, the series drawn from multiple values are grouped and displayed in a single chart. And, based on the values, multiple Y axis scales will be framed with different ranges. This can be achieved by setting the properties [enableMultipleAxis](#) as **true** and [multipleAxisMode](#) as **Single** in [chartSettings](#).

In the following code sample, the pivot chart can be seen as a single chart with multiple value fields such as **Sold** and **Amount** that are drawn as multiple Y axis.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  height: 350,
  displayOption: { view: 'Chart' },
  chartSettings: { enableMultipleAxis: true, multipleAxisMode : 'Single',
chartSeries: { type: 'Column' } }
});
pivotTableObj.appendTo('#PivotTable');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Pivot Grid</title>
  <meta charset="utf-8">

="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div>
            <div id="PivotTable"></div>
        </div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Additionally, to display chart series for multiple values within a single y-axis, set the properties [enableMultipleAxis](#) to **true** and the [multipleAxisMode](#) to **Combined**, in the [chartSettings](#).

The y-axis range values will be formatted using the first value field on the value axis. For example, if the first value field is in currency format and the remaining value fields are in different number formats or no format, the y-axis range values will be displayed in the currency format of the first value field.

The pivot chart in the following code sample can be seen as a single chart with multiple value fields such as **Sold** and **Amount** drawn as a single y-axis.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],

```

```

        filters: []
    },
    height: 350,
    showGroupingBar: true,
    showFieldList: true,
    displayOption: { view: 'Chart' },
    chartSettings: { enableMultipleAxis: true, multipleAxisMode :
'Combined', chartSeries: { type: 'Column' } }
});
pivotTableObj.appendTo('#PivotTable');

```

```

Show point color based on members

When multiple axes are enabled, you can display the same color for each member in the column axis by setting the [showPointColorByMembers](#) property to **true** in the [chartSettings](#). As a result, the end user can easily identify each member across different measures in the entire chart.

Furthermore, end user can see or hide specific members across different measures in the entire chart with a single click on the legend item.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,

Series Customization

User can customize series of the pivot chart using [chartSeries](#) in [chartSettings](#). The changes handled in the property will be reflected commonly in all chart series.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
```

```

    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 350,
    displayOption: { view: 'Chart' },
    chartSettings: { chartSeries: { type: 'Column', enableTooltip: false,
border: { color: '#000', width: 2 } } }
});
pivotTableObj.appendTo('#PivotTable');

```

INDEX.HTML

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

You can also customize the pivot chart series individually using the [chartSeriesCreated](#) event, which occurs after the pivot chart series has been created. You can customize each series individually by iterating them.

In the following sample, the even series are hidden in the pivot chart.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 350,
    displayOption: { view: 'Chart' },
    chartSeriesCreated: (args) => {
        for (var pos = 0; pos < args.series.length; pos++) {
            if (pos % 2 == 0) {
                args.series[pos].visible = false;
            }
        }
    }
});
pivotTableObj.appendTo('#PivotTable');

```

</script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Display chart series points in desired color palettes

By default, the pivot chart displays each data point in the chart series with a pre-defined color combination. And, depending on the number of data points drawn in each chart series, this color

combination will change automatically. You can, however, design your own color scheme by using the [palettes](#) property in the [chartSettings](#).

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  height: 350,
  displayOption: { view: 'Chart' },
  chartSettings: { chartSeries: { type: 'Column' }, palettes: ["#E94649",
"#F6B53F", "#6FAAB0", "#C4C24A" ] },
});
pivotTableObj.appendTo('#PivotTable');
```

```

Axis Customization

User can customize axis of the pivot chart using [primaryXAxis](#) and [primaryYAxis](#) properties in [chartSettings](#).

Axis customization is not applicable for the accumulation chart types like pie, doughnut, pyramid, and funnel.

In the following sample, title of y-axis and x-axis are customized.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 350,
    displayOption: { view: 'Chart' },
    chartSettings: {
        chartSeries: { type: 'Column' },
        primaryXAxis: { title: 'X axis title' },
        primaryYAxis: { title: 'Y axis title' }
    }
});

```

```
pivotTableObj.appendTo('#PivotTable');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Pivot Grid</title>

}
  </script>
```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

One can also customize multi-level labels of primary x-axis by using the [multiLevelLabelRender](#) event in the [chartSettings](#), which fires on rendering each multi-level label in the pivot chart. It has the following parameters:

axis - It holds the information of the current axis.

text - It allows to change the text of the multi-level label.

textStyle - It allows to customize the text font.

alignment - It allows to set the text alignment.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  height: 350,
  displayOption: { view: 'Chart' },
  chartSettings: {
    chartSeries: { type: 'Column' },
    multiLevelLabelRender(args) {
      args.alignment = 'Near';
      args.textStyle = { fontFamily: 'Bold', fontWeight: '400', size:
'16px', color: 'red' };
      if (args.text === ' + United Kingdom') {
        args.text = 'Text Changed';
        args.textStyle = { fontFamily: 'Bold', fontWeight: '800',
size: '16px', color: 'Blue' };
      }
    }
  }
});
pivotTableObj.appendTo('#PivotTable');
```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Legend Customization

User can customize legend using [legendSettings](#) in [chartSettings](#). By default, legend will be visible and it can be hidden by setting the property [visible](#) in [legendSettings](#) to **false**.

The pivot chart support different types of legend shapes as follows,

- Circle

- Rectangle
- VerticalLine
- Pentagon
- InvertedTriangle
- SeriesType
- Triangle
- Diamond
- Cross
- HorizontalLine

Here **SeriesType** would act as the default shape and it can be changed using the property [legendShape](#) in [chartSeries](#).

Also user can set the position of the legend in pivot chart using the property [position](#) in [legendSettings](#). The available options to set the legend position are as follows,

- Auto: Places the legend based on area type. This is the default.
- Top: Displays the legend at the top of the pivot chart.
- Left: Displays the legend at the left of the pivot chart.
- Bottom: Displays the legend at the bottom of the pivot chart.
- Right: Displays the legend at the right of the pivot chart.
- Custom: Displays the legend based on the given x and y values.

By default, the legend is not visible for the accumulation chart types like pie, doughnut, pyramid, and funnel.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  height: 350,
  displayOption: { view: 'Chart' },
  chartSettings: {
    legendSettings: { position: 'Right' },

User Interaction

Marker and CrossHair

User can enable and customize the marker and crosshair using [markerSettings](#) and [crosshairSettings](#) properties in [chartSettings](#) respectively.

Also user can enable and customize the crosshair tooltip for axes using [crosshairTooltip](#) in primary X and Y axes

Marker and crosshair is not applicable for the accumulation chart types like pie, doughnut, pyramid, and funnel.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },

```

Zooming and Panning

User can customize zooming and panning option using the property [zoomSettings](#) in [chartSettings](#).

The pivot chart support four types of zooming which can be set as follows,

- [EnablePinchZooming](#)
- [EnableSelectionZooming](#)
- [EnableDeferredZooming](#)
- [EnableMouseWheelZooming](#)

and three modes of zooming direction that specifies whether to zoom vertically or horizontally or in both ways which are,

- x: Pivot chart can be zoomed horizontally.
- y: Pivot chart can be zoomed vertically.
- x,y: Pivot chart can be zoomed both vertically and horizontally.

This can be set using the property [mode](#) in [zoomSettings](#). By default, if the pivot chart is zoomed, a toolbar would display with the options - Zoom, ZoomIn, ZoomOut, Pan, Reset. User can also customize its option using the property [toolbarItems](#) in [zoomSettings](#).

Zooming and panning is not applicable for the accumulation chart types like pie, doughnut, pyramid, and funnel.

In the following sample, all the four types of zooming are enabled with toolbar options.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  height: 350,
  displayOption: { view: 'Chart' },
  chartSettings: {
    chartSeries: {
      type: 'Column'
    },
    zoomSettings: {
      enableDeferredZooming: true,
      enableMouseWheelZooming: true,
      enablePinchZooming: true,
      enableSelectionZooming: true
    }
  }
});
pivotTableObj.appendTo('#PivotTable');
```

```

Tooltip

By default, tooltip for the pivot chart is enabled. User can customize it by using the property [tooltip](#) in [chartSettings](#).

The tooltip can be disabled by setting the property [enable](#) in [tooltip](#) as **false**.

In the following sample, the default appearance of tooltip can be modified.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  height: 350,
  displayOption: { view: 'Chart' },
  chartSettings: {
    chartSeries: {
      type: 'Column'
    },
    tooltip: {
      enableMarker: true,
      textStyle: { color: '#000' },
      fill: '#FFF',
      opacity: 1,
      border: { color: '#000' }
    }
  }
});
pivotTableObj.appendTo('#PivotTable');

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Export

The pivot chart can be exported using the `chartExport` method which holds parameters like export type, file name, PDF orientation, width, and height in the same order. The mandatory parameters for this method are export type and file name whereas other parameters are optional.

The following are the four export types:

- PNG
- JPEG
- SVG
- PDF

In the following code sample, exporting can be done using an external button named as "Export".

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],

```

```

        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 320,
    displayOption: { view: 'Chart' },
    chartSettings: {
        chartSeries: {
            type: 'Column'
        }
    }
});
pivotTableObj.appendTo('#PivotTable');
var exportBtn = new ej.buttons.Button({ isPrimary: true });
exportBtn.appendTo('#chartexport');
document.getElementById('chartexport').onclick = function () {
    pivotTableObj.chartExport('PNG', 'result');
};

```

Drill down in EJ2 JavaScript Pivotview control

Drill down and drill up

The drill down and drill up action helps to view the bound data in detailed and abstract view respectively. By default, if member(s) has children, then expand and collapse icon will be displayed in

the respective row/column header. On clicking the icon, expand or collapse action will be performed automatically through built-in source code. Meanwhile, leaf member(s) does not contain expand and collapse icon.

	► FY 2015		► FY 2016		► FY 2017
	Units Sold	Sold Amount	Units Sold	Sold Amount	Units Sold
▼ France	450	\$714,955	526	\$1,542,104	
Mountain Bikes	197	\$335,688	238	\$405,552	
Road Bikes	253	\$379,267	288	\$1,136,552	
► Germany	440	\$563,515	496	\$1,772,104	
► United States	546	\$754,515	636	\$2,263,104	
Grand Total	1436	\$2,032,985	1658	\$5,577,312	1

Drill position

Allows to drill only the current position of the selected member and exclude the drilled data of selected member in other positions. For example, if "FY 2015" and "FY 2016" have "Quarter 1" member as child in next level, and when end user attempts to drill "Quarter 1" under "FY 2016", only it will be expanded and not "Quarter 1" under "FY 2015".

This feature is built-in and occurs every time when expand or collapse action is done for better performance.

Expand all

This property is applicable only for the relational data source.

Allows to either expand or collapse all headers that are displayed in row and column axes. To display all headers in expanded state, set the property [expandAll](#) to **true** and to collapse all headers, set the property [expandAll](#) to **false**. By default, [expandAll](#) property is set to **false**.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: true,
```

```

        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        filters: [],
    },
    height: 350
});
pivotTableObj.appendTo('#PivotTable');

```

INDEX.HTML

```

Expand all headers for specific fields

This property is applicable only for the relational data source.

Allows to expand or collapse all headers for specific fields (only) in row and column axes. To expand headers for a specific field in row or column axis, set the property [expandAll](#) in [rows](#) or [columns](#) to **true**. By default, [expandAll](#) property in [rows](#) or [columns](#) is set to **false**.

INDEX.JS

Expand all except specific member(s)

This option is applicable only for the relational data source.

In addition to the previous topic, there is an enhancement to expand all headers except specific header(s) and similarly to collapse all headers except specific header(s). To achieve this, [drilledMembers](#) is used. The required properties of the [drilledMembers](#) are explained below:

- [name](#): It allows to set the field name whose member(s) needs to be specifically drilled.
- [items](#): It allows to set the exact member(s) which needs to be drilled.

The [drilledMembers](#) option always works in vice-versa with respect to the property [expandAll](#) in pivot table. For example, if [expandAll](#) is set to **true**, then the member(s) added in [items](#) collection alone will be in collapsed state.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: true,
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    filters: [],
  },
  height: 350
});
pivotTableObj.appendTo('#PivotTable');

```

INDEX.HTML

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Expand specific member(s)

End user can also manually expand or collapse specific member(s) in each fields under row and column axes using the [drilledMembers](#) from code behind. The required properties of the [drilledMembers](#) are explained below:

- [name](#): It allows to set the field name whose member(s) needs to be specifically drilled.
- [items](#): It allows to set the exact member(s) which needs to be drilled.
- [delimiter](#): It allows to separate next level of member from its parent member.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: true,
        drilledMembers: [{ name: 'Quarter', delimiter: '~', items: ['FY
2015~Q1'] }, { name: 'Year', items: ['FY 2015', 'FY 2016'] }],
        rows: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        columns: [{ name: 'Country' }],
        filters: [],
    },
    height: 350
});
pivotTableObj.appendTo('#PivotTable');

```

```

Event

The event [drill](#) triggers every time when a field is expanded or collapsed. For instance using this event user can alter delimiter and drill action for the respective item. It has the following parameters:

- **drillInfo** - It holds the current drilled item information.
- **pivotview** - It holds pivot table instance.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: true,
    drilledMembers: [{ name: 'Quarter', delimiter: '~', items: ['FY
2015~Q1'] }, { name: 'Year', items: ['FY 2015', 'FY 2016'] }],
    rows: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    columns: [{ name: 'Country' }],
    filters: [],
  },
  height: 350
});
pivotTableObj.appendTo('#PivotTable');

```

```

ActionBegin

The event [actionBegin](#) triggers when the UI actions such as drill down and drill up begin. This allows user to identify the current action being performed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action began. The following are the UI actions and their names:

Action	Action Name
Expand	Drill down
Collapse	Drill up

- **cancel**: It allows user to restrict the current action.

In the below sample, drill down and drill up action can be restricted by setting the **args.cancel** option to **true** in the **actionBegin** event.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        allowLabelFilter: true,
        allowValueFilter: true,
        columns: [{ name: 'Year', caption: 'Production Year' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],

```

```

        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 350,
    showFieldList: true,
    actionBegin: function (args) {
        if (args.actionName == 'Drill down' || args.actionName == 'Drill
up') {
            args.cancel = true;
        }
    }
});
pivotTableObj.appendTo('#PivotTable');

```

</body></html>

```

ActionComplete

The event [actionComplete](#) triggers when a UI action such as drill down or drill up, is completed. This allows user to identify the current UI actions being completed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action completed. The following are the UI actions and their names:

| Action | Action Name |

|-----|-----|

| [Expand](#) | Drill down |

| [Collapse](#) | Drill up |

- **actionInfo**: It holds the unique information about the current UI action. For example, if drill down action is completed, the event argument contains information such as field name and the drill information.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        allowLabelFilter: true,
        allowValueFilter: true,
        columns: [{ name: 'Year', caption: 'Production Year' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],

ActionFailure

The event [actionFailure](#) triggers when the current UI action fails to achieve the desired result. It has the following parameters:

- **actionName**: It holds the name of the current action failed. The following are the UI actions and their names:

Action	Action Name
----- -----	
Expand	Drill down
Collapse	Drill up

- **errorInfo**: It holds the error information of the current UI action.

INDEX.JS

```

```

Data Shaping**Aggregation in EJ2 JavaScript Pivotview control**

This feature is applicable only for the relational data source.

End user can perform calculations over a group of values (exclusively for value fields bound in value axis) using the aggregation option. By default, values are added (summed) together. The other aggregation types are explained below.

The fields with data type such as number support all aggregation types mentioned below except for **“CalculatedField”**. The fields with data type such as string, date, datetime, boolean, etc., support **“Count”** and **“DistinctCount”** aggregation types alone.

Operator	Description
-----	-----
Sum	Displays the pivot table values with sum.
Product	Displays the pivot table values with product.
Count	Displays the pivot table values with count.
DistinctCount	Displays the pivot table values with distinct count.
Min	Displays the pivot table with minimum value.
Max	Displays the pivot table with maximum value.
Avg	Displays the pivot table values with average.
Median	Displays the pivot table values with median.
Index	Displays the pivot table values with index.
PopulationStDev	Displays the pivot table values with standard deviation of population.
SampleStDev	Displays the pivot table values with sample standard deviation.
PopulationVar	Displays the pivot table values with variance of population.
SampleVar	Displays the pivot table values with sample variance.
RunningTotals	Displays the pivot table values with running totals.
DifferenceFrom	Displays the pivot table values with difference from the value of the base item in the base field.
PercentageOfDifferenceFrom	Displays the pivot table values with percentage difference from the value of the base item in the base field.
PercentageOfGrandTotal	Displays the pivot table values with percentage of grand total of all values.
PercentageOfColumnTotal	Displays the pivot table values in each column with percentage of total values for the column.
PercentageOfRowTotal	Displays the pivot table values in each row with percentage of total values for the row.
PercentageOfParentTotal	Displays the pivot table values with percentage of total of all values based on selected field.
PercentageOfParentColumnTotal	Displays the pivot table values with percentage of its parent total in each column.
PercentageOfParentRowTotal	Displays the pivot table values with percentage of its parent total in each row.

| CalculatedField | Displays the pivot table with calculated field values. It allows user to create a new calculated field alone. |

Assigning aggregation type for value fields through API

For each value field, the aggregation type can be set using the property **type** for each value fields through code-behind. Meanwhile, aggregation types like **DifferenceFrom** and **PercentageOfDifferenceFrom** can check for specific field of specific item using **baseField** and **baseItem** properties. Likewise, **PercentageOfParentTotal** type can for specific field using **baseField** property. For instance, the aggregation type **DifferenceFrom** would intake the specified field and its corresponding member as input and its value is compared across other members in the same field and also across different fields to formulate an appropriate output value.

It can be configured using **type** option for each value fields through code-behind. The settings required for summarize the value fields at initial rendering are:

- **type**: It allows to set the aggregate type of the field.
- **baseField**: It allows to set the base field to aggregate the values.
- **baseItem**: It allows to set the base item to aggregate the values.

By default, the aggregation will be considered as **Sum** to the value fields which had number type and for the value fields which had non-number type such as string, date, datetime, boolean, etc., the aggregation type will be considered as **Count**. **DifferenceFrom** and **PercentageOfDifferenceFrom** can check for specific field of the specific item using **baseField** and **baseItem**. We can consider the **PercentageOfParentTotal** for specific field using **baseField**.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount', type: 'Sum' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    filters: []
  },
  height: 350
});
pivotTableObj.appendTo('#PivotTable');
```

</body></html>

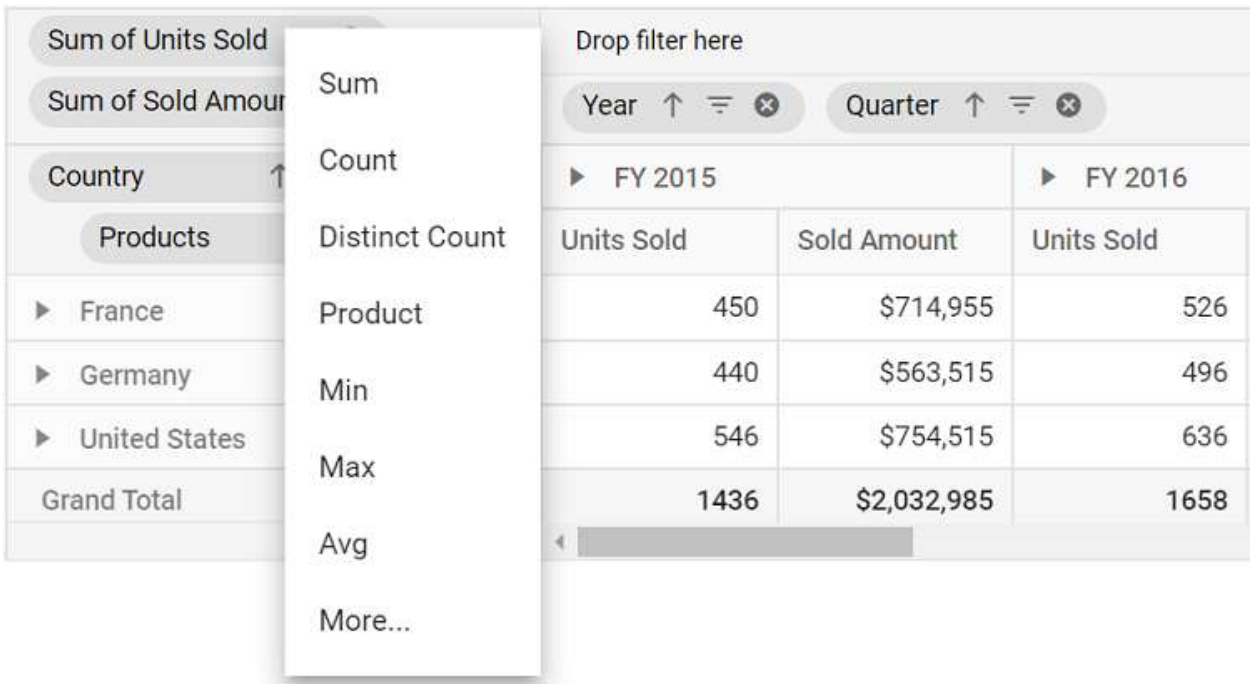

```

Modifying aggregation type for value fields at runtime

Aggregation types can be changed easily through UI at runtime. The value fields bound to grouping bar and field list appears with a dropdown icon which helps to select an appropriate aggregation type for the respective value field. On selection, the values in the pivot table will be changed dynamically.

<!-- markdownlint-disable MD012 -->

Show desired aggregation types in its dropdown menu

By default, all the aggregation types are displayed in the dropdown menu available in buttons. However, based on the request for an application, we may need to show selective aggregation types on our own. This can be achieved using the [aggregateTypes](#) property.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount', type: 'Sum' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    filters: [],
  },
  showFieldList: true,
  showGroupingBar: true,
  height: 350,
  aggregateTypes: ['DistinctCount', 'Avg', 'Product'],
});
pivotTableObj.appendTo('#PivotTable');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Hiding aggregation type from button text

By default, in value axis each field would be displayed by its name and aggregation type together. To hide aggregation type and display field name alone, set the property [showAggregationOnValueField](#) in [dataSourceSettings](#) to **false**.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount', type: 'Sum' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        filters: [],
        showAggregationOnValueField: false
    },
    showFieldList: true,
    showGroupingBar: true,
    height: 350
});
pivotTableObj.appendTo('#PivotTable');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Pivot Grid</title>
    <meta charset="utf-8">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Hiding aggregation type icon from UI

By default, the icon to set aggregation type is enabled in the grouping bar. To disable this icon, set the property [showValueTypeIcon](#) in [groupingBarSettings](#) to **false**.

Icon to change the aggregation type can be hidden only in Grouping Bar but not in Field List at the moment.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount', type: 'Sum' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    filters: [],
    showAggregationOnValueField: false
  },
  showGroupingBar: true,
  height: 350,
  groupingBarSettings: {
    showValueTypeIcon: false
  },
});
pivotTableObj.appendTo('#PivotTable');

```

INDEX.HTML

```

Event

AggregateCellInfo

The event [aggregateCellInfo](#) triggers every time while rendering each value cell. This allows user to change the cell value and skip formatting if applied. It has following parameters:

- **fieldName** - It holds current cell's field name.
- **row** - It holds current cell's row value.
- **column** - It holds current cell's row value.
- **value** - It holds value of current cell.
- **cellSets** - It holds raw data for the aggregated value cell.
- **rowCellType** - It holds row cell type value.
- **columnCellType** - It holds column cell type value.
- **aggregateType** - It holds aggregate type of the cell.
- **skipFormatting** - boolean property, it allows to skip formatting if applied.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,

ActionBegin

The event [actionBegin](#) triggers when clicking and selecting the aggregate type via the dropdown icon in the value field button, which is present in both grouping bar and field list UI. This allows user to identify the current action being performed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action began. For example, while performing aggregation, the action name will be shown as **Aggregate field**.
- **fieldInfo**: It holds the selected value field information.

Note: This option is applicable only when the field based UI actions are performed such as filtering, sorting, removing field from grouping bar, editing and aggregation type change.

- **cancel**: It allows user to restrict the current action.

In the following example, action taken during aggregation type selection via dropdown icon can be restricted by setting the **args.cancel** option to **true** in the **actionBegin** event.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    showGroupingBar: true,
    showFieldList: true,
    actionBegin: function (args) {
        if (args.actionName == 'Aggregate field') {
            args.cancel = true;
        }
    },
    height: 350
});
pivotTableObj.appendTo('#PivotTable');
```

```

ActionComplete

The event [actionComplete](#) triggers when a UI action, such as applying aggregation using the dropdown icon via the value field button, which is present in both the grouping bar and the field list UI, is

completed. This allows user to identify the current UI action being completed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action completed. For example, after completing the aggregation, the action name will be shown as **Field aggregated**.
- **fieldInfo**: It holds the selected value field information.

Note: This option is applicable only when the field based UI actions are performed such as filtering, sorting, removing field from grouping bar, editing and aggregation type change.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  showGroupingBar: true,
  showFieldList: true,
  actionComplete: function (args) {
    if (args.actionName == 'Aggregate field') {
      // Triggers when the aggregation type is applied.
    }
  },
  height: 350
});
pivotTableObj.appendTo('#PivotTable');
```

Calculated field in EJ2 JavaScript Pivotview control

Allows end user to create a new calculated field in the pivot table, based on available fields from the bound data source or using simple formula with basic arithmetic operators. It can be added at runtime through the built-in dialog, invoked from Field List UI. To do so, set the [allowCalculatedField](#) property to **true** in the pivot table. End user can now see a "CALCULATED FIELD" button enabled in Field List UI automatically, which on clicking will invoke the calculated field dialog and perform necessary operation.

Calculated field can also be included in the pivot table through code behind using the [calculatedFieldsSettings](#). The required properties to create a new calculate field are:

- [name](#): It allows to indicate the calculated field with a unique name.
- [formula](#): It allows to set the formula.
- [formatSettings](#): It helps to set the number format for the resultant value.

The calculated field is applicable only for value fields.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }, { name: 'Total', caption: 'Total Amount', type:
'CalculatedField' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }, { name: 'Total',
format: 'C2' }],
        filters: [],
        calculatedFieldSettings: [{ name: 'Total', formula:
'"Sum(Amount) "+"Sum(Sold) "' }],
    },
```

```

        showFieldList: true,
        height: 350,
        allowCalculatedField: true
    });
    pivotTableObj.appendTo('#PivotTable');

```

INDEX.HTML

}

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Meanwhile, user can also view calculated field dialog in UI by invoking [createCalculatedFieldDialog](#) method on an external button click which is shown in the below code sample.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }, { name: 'Total', caption: 'Total Amount', type:
'CalculatedField' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }, { name: 'Total',
format: 'C2' }],
        filters: [],
        calculatedFieldSettings: [{ name: 'Total', formula:
'"Sum(Amount)"+"Sum(Sold)"' }]
    },
    showFieldList: true,
    height: 350,
    allowCalculatedField: true
});
pivotTableObj.appendTo('#PivotTable');
var btn = new ej.buttons.Button({ isPrimary: true });
btn.appendTo('#CalculatedField');
document.getElementById('CalculatedField').addEventListener('click', () => {
    pivotTableObj.calculatedFieldModule.createCalculatedFieldDialog();
});

```

INDEX.HTML

```

Editing through the field list and the grouping bar

User can also modify the existing calculated field using the built-in edit option available directly in the field list (or) grouping bar. To do so, click the "Edit" icon available in the calculated field button. Now the calculated field dialog is opened and the current calculated field name, formula and format can be changed at runtime.

Renaming the existing calculated field

Existing calculated field can be renamed only through the UI at runtime. To do so, open the calculated field dialog, select the target field and click "Edit" icon. User can now see the existing name getting displayed in the text box at the top of the dialog. Now, change the name based on user requirement and click "OK".

<!-- markdownlint-disable MD012 -->

Create Calculated Field [X]

Enter the field name

Drag and drop fields to formula

- Sold Amount (Sum)
- Total Amount (Calculated Field)** [Edit]
- Units Sold (Sum)

Formula

Example: ("Sum(Order_Count)" + "Sum(In_Stock)") * 250

Format

None

Enter custom format string

OK CANCEL

Create Calculated Field [X]

Total Sales Amount

Drag and drop fields to formula

- Sold Amount (Sum) >
- Total Amount (Calculated Field)** [trash] [edit]
- Units Sold (Sum) >

Formula

"Sum(Amount)"+"Sum(Sold)"

Format

Standard

Enter custom format string

OK CANCEL

Editing the existing calculated field formula

Existing calculated field formula can be edited only through the UI at runtime. To do so, open the calculated field dialog, select the target field and click "Edit" icon. User can now see the existing formula getting displayed in a multiline text box at the bottom of the dialog. Now, change the formula based on user requirement and click "OK".

Create Calculated Field

Reusing the existing formula in a new calculate field

While creating a new calculated field, if user wants to add the formula of an existing calculated field, it can be done easily. To do so, simply drag-and-drop the existing calculated field to the "Formula" section.

Apply the format to the calculated field values

Values in a new or existing calculated field can be formatted via the calculated field UI or code behind. The [formatSettings](#) property in code-behind can be used to specify the desired format. For more information about the supported formats refer [here](#).

To apply format to calculated field values at runtime via UI, a built-in dropdown under the "Format" label is available, from which the user can select the pre-defined format options listed below.

- **Standard** - Denotes the numeric type.
- **Currency** - Denotes the currency type.
- **Percent** - Denotes the percentage type.
- **Custom** - Denotes the custom format. For example: "C2". This shows the value "9584.3" as "\$9584.30."
- **None** - Denotes that no format will be applied.

By default, **None** will be selected from the dropdown.

The screenshot shows the 'Create Calculated Field' dialog box. At the top, the title is 'Create Calculated Field' with a close button (X). Below the title, the name of the calculated field is 'Total Amount'. Under the heading 'Drag and drop fields to formula', there is a list of fields: 'Sold Amount (Sum)', 'Total Amount (Calculated Field)' (which is highlighted in red and has a trash icon and a pencil icon), and 'Units Sold (Sum)'. Below this list is a 'Formula' text box containing the formula `"Sum(Amount)*Sum(Sold)"`. At the bottom, there is a 'Format' section with a dropdown menu. The dropdown is open, showing the following options: 'Standard' (which is highlighted in red and has a mouse cursor pointing at it), 'Currency', 'Percent', 'Custom', and 'None'.

In addition, you can specify the desired custom formats by selecting the **Custom** option from the "Format" dropdown.

Supported operators and functions for the calculated field formula

Below is a list of operators and functions that can be used in the formula to create the calculated fields.

- **+** – addition operator.

`ts

Syntax: X + Y

,

- **-** – subtraction operator.

`ts

Syntax: X - Y

,

- `*` – multiplication operator.

`ts

Syntax: $X * Y$

`

- `/` – division operator.

`ts

Syntax: X / Y

`

- `^` – power operator.

Grouping in EJ2 JavaScript Pivotview control

This feature is applicable only for the relational data source.

Grouping is the most-useful feature in pivot table and the component automatically groups date, time, number and string. For example, the date type can be formatted and displayed based on year, quarter, month, and more. Likewise, the number type can be grouped range-wise, such as 1-5, 6-10, etc. These group fields will act as individual fields and allows users to drag them between different axes such as columns, rows, values, and filters and create pivot table at runtime.

<!-- markdownlint-disable MD012 -->

Filtering in EJ2 JavaScript Pivotview control

Filtering allows to view the pivot table with selective records based on members that can be either included or excluded through UI and code-behind.

The following are the three different types of filtering:

- Member filtering
- Label filtering
- Value filtering

When all the above filtering options are disabled via code-behind, then the filter icon would be disabled in the field list or grouping bar UI.

Member filtering

Sorting in EJ2 JavaScript Pivotview control

Member Sorting

Allows to order field members in rows and columns either in ascending or descending order. By default, field members in rows and columns are in ascending order.

Drill through in EJ2 JavaScript Pivotview control

Editing in EJ2 JavaScript Pivotview control

This feature is applicable only for the relational data source.

Data Formatting

Number formatting in EJ2 JavaScript Pivotview control

Allows you to specify the required display format that should be used in values of the pivot table.

Supported display formats are:

- Number
- Currency
- Percentage
- Custom

Conditional formatting in EJ2 JavaScript Pivotview control

Allows end user to change the appearance of the pivot table value cells with its background color, font color, font family, and font size based on specific conditions.

Report Manipulation

Grouping bar in EJ2 JavaScript Pivotview control

Field list in EJ2 JavaScript Pivotview control

The pivot table provides a built-in Field List similar to Microsoft Excel. It allows to add or remove fields and also rearrange them between different axes, including column, row, value, and filter along with sort and filter options dynamically at runtime.

The field list can be displayed in two different formats to interact with pivot table. They are:

- **In-built Field List (Popup):** To display the field list icon in pivot table UI to invoke the built-in dialog.
- **Stand-alone Field List (Fixed):** To display the field list in a static position within a web page.

In-built Field List (Popup)

To enable the field list in pivot table UI, set the [showFieldList](#) property in pivot table to **true**. A small icon will appear on the top left corner of the pivot table and clicking on this icon, field list dialog will appear.

The field list icon will be displayed at the top right corner of the pivot table, when grouping bar is enabled.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    allowLabelFilter: true,
    allowValueFilter: true,
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
},
```

```

        height: 350,
        showFieldList: true
    });
    pivotTableObj.appendTo('#PivotTable');

```

```

Stand-alone Field List (Fixed)

The field list can be rendered in a static position, anywhere in web page layout, like a separate component. To do so, you need to set [renderMode](#) property to **Fixed** in [pivotFieldList](#).

To make field list interact with pivot table, you need to use the [updateView](#) and [update](#) methods for data source update in both field list and pivot table simultaneously.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    height: 300,
    enginePopulated: function () {
        if (fieldlistObj) {
            fieldlistObj.update(pivotTableObj);
        }
    }
});
pivotTableObj.appendTo('#PivotTable');
var fieldlistObj = new ej.pivotview.PivotFieldList({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    renderMode: 'Fixed',
    enginePopulated: function () {
        fieldlistObj.updateView(pivotTableObj);
    }
});
fieldlistObj.appendTo('#Static_FieldList');

```

```

Search desired field

End user can search for desired field in the field list UI by typing the field name into the search box at runtime. It can be enabled by setting the [enableFieldSearching](#) property to **true** via code-behind.

By default, field search option is disabled in the field list UI.

To enable search box in the static field list UI, set the [enableFieldSearching](#) property to **true** in [PivotFieldList](#).

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    enginePopulated: function () {
        if (fieldlistObj) {

```

```

        fieldlistObj.update(pivotTableObj);
    }
}
});
pivotTableObj.appendTo('#PivotTable');
var fieldlistObj = new ej.pivotview.PivotFieldList({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:

```

if(ele) {
    ele.style.visibility = "visible";
}

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Group fields under desired folder name

In the field list UI, you can display fields by grouping them under the desired folder name. It can only be configured via code-behind by setting the [groupName](#) property in [fieldMapping](#).

You can only group fields to one level using the [groupName](#) property.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        allowLabelFilter: true,
        allowValueFilter: true,
        columns: [{ name: 'Year', caption: 'Production Year' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }],
        rows: [{ name: 'Country' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: [],
        fieldMapping: [
            { name: 'Quarter', groupName: 'Product category' },
            { name: 'Products', groupName: 'Product category' },
            { name: 'Amount', groupName: 'Product category', caption: 'Sold
Amount' },
        ]
    },
    height: 350,
    showFieldList: true,
    showGroupingBar: true
});
pivotTableObj.appendTo('#PivotTable');

```

INDEX.HTML

```

Add or remove fields

Using check box besides each field, end user can select or unselect to add or remove fields respectively from the report at runtime.

Field List

Remove specific field(s) from displaying

When a data source is bound to the component, fields will be automatically populated inside the Field List. In such case, user can also restrict specific field(s) from displaying. To do so, set the appropriate field name(s) in [excludeFields](#) property belonging to [dataSourceSettings](#).

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    allowLabelFilter: true,
    allowValueFilter: true,
    columns: [{ name: 'Year', caption: 'Production Year' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: [],
    excludeFields: ['Quarter']
  },
  height: 350,
  showFieldList: true
});
pivotTableObj.appendTo('#PivotTable');

```

Re-arranging fields

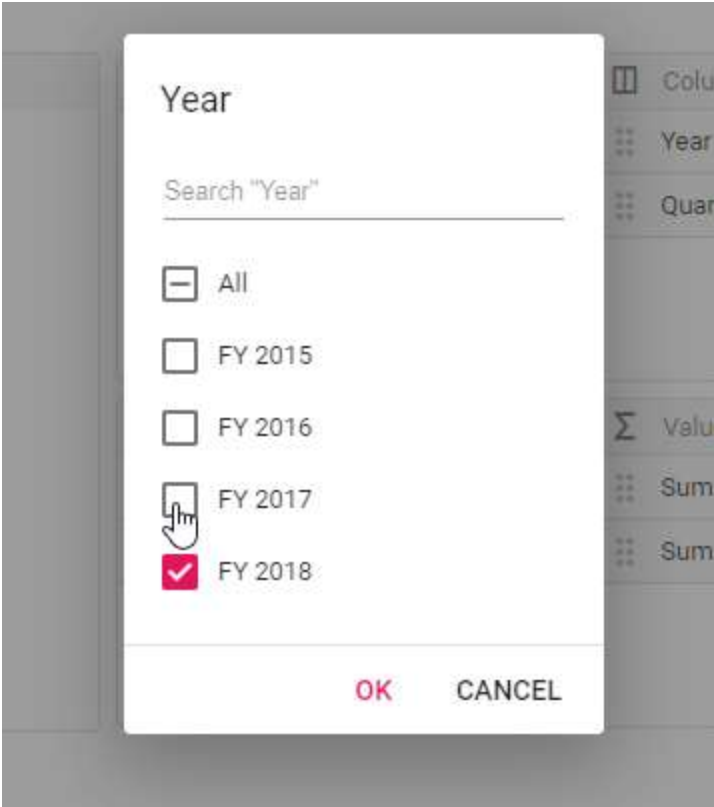

In-order to re-arrange, drag any field from the field list and drop it into the column, row, value, or filter axis using the drag-and-drop holder. It helps end user to alter the report at runtime.

<div>Filters</div> <div>Products (All)</div>	<div>Columns</div> <div>Year</div> <div>Quarter</div>
<div>Rows</div> <div>Country</div>	<div>Values</div> <div>Sum of Unit Sold</div> <div>Sum of Sold Amount</div>

Filtering members

Using the filter icon besides each field in row, column and filter axes, members can be either included or excluded at runtime. To know more about member filtering, [refer](#) here.

<div>Filters</div> <div>Drop filter here</div>	<div>Columns</div> <div>Year</div> <div>Quarter</div>
<div>Rows</div> <div>Country</div> <div>Products</div>	<div>Values</div> <div>Sum of Unit Sold</div> <div>Sum of Sold Amount</div>

	FY 2018		Grand Total	
	Units Sold	Sold Amount	Units Sold	Sold Amount
▶ France	16	\$27,264	16	\$27,264
▶ Germany	96	\$77,264	96	\$77,264
▶ United States	76	\$97,264	76	\$97,264
Grand Total	188	\$201,792	188	\$201,792

Sorting members

Using the sort icon besides each field in row and column axes, members can be arranged either in ascending or descending order at runtime. To know more about member sorting, [refer](#) here.

Calculated fields

The calculated field support allows end user to add a new calculated field based on the available fields from the bound data source using basic arithmetic operators. To enable this support in Field List UI, set the `allowCalculatedField` property to `true` in pivot table. Now a button will be seen automatically inside the field list UI which will invoke the calculated field dialog on click. To know more about calculated field, [refer](#) here.

Changing aggregation type of value fields at runtime

End user can perform calculations over a group of values using the aggregation option. The value fields bound to the field list, appears with a dropdown icon, helps to select an appropriate aggregation type at runtime. On selection, the values in the Pivot Table will be changed dynamically. To know more about aggregation, [refer](#) here.

Defer layout update

Defer layout update support to update the pivot table only on demand and not during every user action. To enable this support in Field List UI, set the [allowDeferLayoutUpdate](#) property to **true** in pivot table. Now a check box inside Field List UI will be seen in checked state, allowing pivot table to update only on demand. To know more about defer layout, [refer](#) here.

Show built-in Field List (Popup) over specific target

By passing the target element to the built-in field list dialog module in the [dataBound](#) event, the field list dialog will be displayed over the appropriate target element on a web page. By default, the Pivot Table's parent element is used as the target element to display the built-in field list dialog.

The sample code below shows the built-in field list dialog using `document.body` as the target element.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    allowLabelFilter: true,
    allowValueFilter: true,
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
```

```

        filters: []
    },
    height: 350,
    dataBound: function (args) {
        // Here the target can be set to the built-in field list dialog

pivotTableObj.pivotFieldListModule.dialogRenderer.fieldListDialog.target =
document.body;
    },
    showFieldList: true
});
pivotTableObj.appendTo('#PivotTable');

```

INDEX.HTML

```

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Show field list using toolbar

It can also be viewed in toolbar by setting [showFieldList](#) and [showToolbar](#) properties in pivot table to **true**. Also, include the item **FieldList** within the [toolbar](#) property in pivot table. When toolbar is enabled, field list icon will be automatically added into the toolbar and the icon won't appear on top left corner in the pivot table component.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:

```

Invoking dynamic Field List (Customized)

Also, you can display the field list dialog independently through other means. For example, you can invoke the field list dialog on an external button click. To do so, set **renderMode** property to **Popup** and since on button click, field list dialog will be invoked.

* Meanwhile, you can display the field list dialog over specific target element within a webpage using **target** property. By default, the **target** value is "null", which by default refers the **document.body** element.

* To make field list interact with pivot table, you need to use the **updateView** and **update** methods for data source update in both field list and pivot table simultaneously.

The below sample code illustrates the field list dialog invoked on an external button click.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
    height: 350,
    enginePopulated: function () {
        if (fieldlistObj) {
            fieldlistObj.update(pivotTableObj);
        }
    }
});
pivotTableObj.appendTo('#PivotTable');
var fieldlistObj = new ej.pivotview.PivotFieldList({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    renderMode: 'Popup',
    target: '#PivotFieldList',
    enginePopulated: function () {
        fieldlistObj.updateView(pivotTableObj);
    }
});
fieldlistObj.appendTo('#PivotFieldList');
var fieldListBtn = new ej.buttons.Button({ isPrimary: true });
fieldListBtn.appendTo('#fieldlistbtn');
document.getElementById('fieldlistbtn').onclick = function () {
    fieldlistObj.dialogRenderer.fieldListDialog.show();
};
```

Set caption to fields which isn't bound to the report

<!-- markdownlint-disable MD009 -->

One can set the caption to all fields from the data source even if it is not bound to the actual report. It can be achieved using the [enginePopulated](#) event. On doing so, caption of the respective field will be displayed in both grouping bar and field list.

In the sample, we have set caption to the fields **Year** and **Quarter** dynamically.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }],
    },

```

```

        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 350,
    showFieldList: true,
    enginePopulated: function (args) {
        Object.keys(pivotTableObj.engineModule.fieldList).forEach((key,
index) => {
            if (key === 'Quarter') {
                pivotTableObj.engineModule.fieldList[key].caption =
'Production Quarter Year';
            }
            else if (key === 'Year') {
                pivotTableObj.engineModule.fieldList[key].caption =
'Production Year';
            }
        });
    }
});
pivotTableObj.appendTo('#PivotTable');

```

INDEX.HTML

```

Show values button

During runtime, the **Values** button in the field list can be moved to a different position (i.e., different index) among other fields in the column or row axis. To enable the **Values** button, set the [showValuesButton](#) property to **true**.

This support is only available for relational data sources.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    height: 300,
    enginePopulated: function () {
        if (fieldlistObj) {
            fieldlistObj.update(pivotTableObj);
        }
    }
});
pivotTableObj.appendTo('#PivotTable');
var fieldlistObj = new ej.pivotview.PivotFieldList({
    dataSourceSettings: {
        dataSource: pivotData,

Events

EnginePopulated

The [enginePopulated](#) event is available in both Pivot Table and Field List.

- The event [enginePopulated](#) is triggered in field list whenever the report gets modified. The updated report is passed to the pivot table via [updateView](#) method written within this event to refresh the same.
- Likewise, [enginePopulated](#) event is triggered in pivot table whenever the report gets modified. The updated report is passed to the field list via [update](#) method written within this event to refresh the same.

The event [enginePopulated](#) is triggered after engine is populated. It has following parameters - [dataSourceSettings](#), [pivotFieldList](#) and [pivotValues](#).

Note: This event is not required for Popup field list since it is a in built one.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  height: 300,
  enginePopulated: function () {
    if (fieldlistObj) {
      fieldlistObj.update(pivotTableObj);
    }
  }
});
pivotTableObj.appendTo('#PivotTable');
var fieldlistObj = new ej.pivotview.PivotFieldList({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  renderMode: 'Fixed',
  enginePopulated: function () {
    fieldlistObj.updateView(pivotTableObj);
  }
});
fieldlistObj.appendTo('#Static_FieldList');
```

```

FieldListRefreshed

The event [FieldListRefreshed](#) is triggered whenever there is any change done in the field list UI. It has following parameter - **dataSourceSettings** and **pivotValues**. It allows user to identify each field list update. This event is applicable only for static field list.

For example, if we perform a sort operation within the field list, the field list will be refreshed. The [fieldListRefreshed](#) event will be triggered at that time and the user can perform custom operation inside that event.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    allowLabelFilter: true,
    allowValueFilter: true,
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  fieldListRefreshed: function (args) {
    //Triggers, whenever field list get refreshed.
  },
  height: 350,
  showFieldList: true
});
pivotTableObj.appendTo('#PivotTable');
```

FieldDropped

The event [onFieldDropped](#) fires whenever a field is dropped in an axis. It has following parameters - **droppedAxis**, **DroppedField** and **DataSourceSettings**. In this illustration, we have modified the **DroppedField** caption through this event at runtime.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        allowLabelFilter: true,
        allowValueFilter: true,
        columns: [{ name: 'Year', caption: 'Production Year' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 350,
    showFieldList: true,
    onFieldDropped: function (args) {

```

```

        args.droppedField.caption = args.droppedField.name + " --> " +
args.droppedAxis;
    },
});
pivotTableObj.appendTo('#PivotTable');

```

```

ActionBegin

The event [actionBegin](#) triggers when the UI actions such as sorting, filtering, aggregation or edit calculated field, that are present in the field list UI begin. This allows user to identify the current action being performed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action began. The following are the UI actions and their names:

Action	Action Name
-----	-----
Sort icon	Sort field
Filter icon	Filter field
Aggregation (Value type drop down and menu)	Aggregate field
Edit icon	Edit calculated field
Calculated field button	Open calculated field dialog
Field list	Open field list
Field list tree – Sort icon	Sort field tree

- **fieldInfo**: It holds the selected field information.

Note: This option is applicable only when the field based UI actions are performed such as filtering, sorting, removing field from grouping bar, editing and aggregation type change.

- **cancel**: It allows user to restrict the current action.

In the below sample, opening pop-up field list can be restricted by setting the **args.cancel** option to **true** in the **actionBegin** event.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        allowLabelFilter: true,
        allowValueFilter: true,

```

```

        columns: [{ name: 'Year', caption: 'Production Year' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 350,
    showGroupingBar: true,
    showFieldList: true,
    actionBegin: function (args) {
        if (args.actionName == 'Open field list') {
            args.cancel = true;
        }
    },
});
pivotTableObj.appendTo('#PivotTable');

ActionComplete

The event [actionComplete](#) triggers when the UI actions such as sorting, filtering, aggregation or edit calculated field, that are present in the field list UI, is completed. This allows user to identify the current UI actions being completed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action completed. The following are the UI actions and their names:

Action	Action Name
-----	-----
Sort icon	Field sorted
Filter icon	Field filtered
Aggregation (Value type drop down and menu)	Field aggregated
Edit icon	Calculated field edited
Calculated field button	Calculated field applied
Field list	Field list closed
Field list tree – Sort icon	Field tree sorted

- **fieldInfo**: It holds the selected field information.

Note: This option is applicable only when the field based UI actions are performed such as filtering, sorting, removing field from grouping bar, editing and aggregation type change.

- **actionInfo**: It holds the unique information about the current UI action. For example, if sorting is completed, the event argument contains information such as sort order and the field name.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,

```

```

        expandAll: false,
        enableSorting: true,
        allowLabelFilter: true,
        allowValueFilter: true,
        columns: [{ name: 'Year', caption: 'Production Year' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 350,
    showGroupingBar: true,
    showFieldList: true,
    actionComplete: function (args) {
        if (args.actionName == 'Field list closed') {
            // Triggers when the field list dialog is closed.
        }
    }
});
pivotTableObj.appendTo('#PivotTable');

```

```

ActionFailure

The event [actionFailure](#) triggers when the current UI action fails to achieve the desired result. It has the following parameters:

- **actionName**: It holds the name of the current action failed. The following are the UI actions and their names:

Action	Action Name
-----	-----
Sort icon	Sort field
Filter icon	Filter field
Aggregation (Value type drop down and menu)	Aggregate field
Edit icon	Edit calculated field
Calculated field button	Open calculated field dialog
Field list	Open field list
Field list tree – Sort icon	Sort field tree

- **errorInfo**: It holds the error information of the current UI action.

INDEX.JS

```

Defer update in EJ2 JavaScript Pivotview control

Defer layout update support allows to update the pivot table component only on demand. On enabling this feature, end user can drag-and-drop fields between row, column, value and filter axes, apply sorting and filtering inside the Field List, resulting in change of pivot report alone but not the pivot table values. Once all operations are performed and on clicking the "Apply" button in the Field List, pivot table will start to update with the last modified report. This also helps in bringing better performance in pivot table component rendering.

The field list can be displayed in two different formats to interact with pivot table. They are:

- **In-built Field List (Popup):** To display the field list icon in pivot table UI to invoke the built-in dialog.
- **Stand-alone Field List (Fixed):** To display the field list in a static position within a web page.

In-built Field List (Popup)

To enable deferred updates in the pivot table, set the property [allowDeferLayoutUpdate](#) in pivot table as **true**. To make a note, the defer update option can be controlled only via Field List during runtime.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        allowLabelFilter: true,
        allowValueFilter: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],

```

```

        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    allowDeferLayoutUpdate: true,
    showFieldList: true,
    height: 350
});
pivotTableObj.appendTo('#PivotTable');

```

var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Stand-alone Field List (Fixed)

The field list can be rendered in a static position, anywhere in web page layout, like a separate component. To do so, you need to set [renderMode](#) property to **Fixed** in [pivotFieldList](#).

To enable deferred updates in the static fieldlist, set the property [allowDeferLayoutUpdate](#) in [pivotFieldlist](#) as **true**. To make a note, the defer update option can be controlled only via Field List during runtime.

To make field list interact with pivot table, you need to use the **updateView** and **update** methods for data source update in both field list and pivot table simultaneously.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    allowDeferLayoutUpdate: true,
    enginePopulated: function () {
        if (fieldlistObj) {
            fieldlistObj.update(pivotTableObj);
        }
    },
    height: 350,
});
pivotTableObj.appendTo('#PivotTable');
var fieldlistObj = new ej.pivotview.PivotFieldList({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    allowDeferLayoutUpdate: true,
    renderMode: 'Fixed',
    enginePopulated: function () {
        if (fieldlistObj.isRequiredUpdate) {
            fieldlistObj.updateView(pivotTableObj);
        }
        pivotTableObj.notify('ui-update', pivotTableObj);
    }
});

```

```

        fieldlistObj.notify('tree-view-update', fieldlistObj);
    }
});
fieldlistObj.appendTo('#Static_FieldList');

```

Virtual scrolling in EJ2 JavaScript Pivotview control

Virtual scrolling

Allows to load the large amounts of data without any performance degradation by rendering rows and columns only in the current content viewport. Rest of the aggregated data will be brought into viewport dynamically based on vertical or horizontal scroll position. This feature can be enabled by setting the [enableVirtualization](#) property in pivot table to **true**..

To use the virtual scrolling feature, inject the **VirtualScroll** module in to the pivot table.

INDEX.JS

```
var customername = ['TOM', 'Hawk', 'Jon', 'Chandler', 'Monica',
  'Rachel', 'Phoebe', 'Gunther',
    'Ross', 'Geller', 'Joey', 'Bing', 'Tribbiani', 'Janice', 'Bong',
  'Perk', 'Green', 'Ken', 'Adams'];
var city = ['New York', 'Los Angeles', 'Chicago', 'Houston',
  'Philadelphia', 'Phoenix', 'San Antonio', 'Austin',
    'San Francisco', 'Columbus', 'Washington', 'Portland', 'Oklahoma',
  'Las Vegas', 'Virginia', 'St. Louis', 'Birmingham'];
var data = function (count) {
  var result = [];
  var dt = 0;
  for (var i = 1; i < (count + 1); i++) {
    dt++;
    var round = void 0;
    var toString_1 = i.toString();
    if (toString_1.length === 1) {
      round = '0000' + (i);
    }
    else if (toString_1.length === 2) {
      round = '000' + i;
    }
    else if (toString_1.length === 3) {
      round = '00' + i;
    }
    else if (toString_1.length === 4) {
      round = '0' + i;
    }
    else {
      round = toString_1;
    }
    result.push({
      ProductID: 'PRO-' + round,
      City: city[Math.round(Math.random() * city.length)] ||

```

Limitations for virtual scrolling

- In virtual scrolling, the `columnWidth` property in `gridSettings` should be in pixel and percentage values are not accepted.
- Resizing columns, setting width to individual columns which affects the calculation used to pick the correct page on scrolling.
- Grouping, which takes additional time to splitting the raw items into the provided format.
- Date Formatting, which takes additional time to convert date format.
- Date Formatting with sorting, here additionally full date time format should be framed to perform sorting along with the provided date format which lags the performance.
- When using OLAP data, subtotals and grandtotals are only displayed when measures are bound at the last position in the [rows](#) or [columns](#) axis. Otherwise, the data from the pivot table will be shown without summary totals.
- Even if virtual scrolling is enabled, not only is the current view port data retrieved, but also the data for the immediate previous page and the immediate next page. As a result, when the end user scrolls slightly ahead or behind, the next or previous page data is displayed immediately without requiring a refresh. **Note:** If the pivot table's width and height are large, the loading data count in the current, previous, and next view ports (pages) will also increase, affecting performance.

Data Compression

This property is applicable only for relational data source.

When we bind one million raw data, the pivot table will process all raw data to generate aggregated data during initial rendering and report manipulation. But in data compression, the data will be compressed based on the uniqueness of the raw data, and unique records will be provided as input for

the Pivot Table. The compressed data will be used for further operations at all times, reducing the looping complexity and improving the performance of the pivot table. For example, if the pivot table is connected to one million raw data aggregated to 1,000 unique data means, it will be rendered within 3 seconds rather than 10 seconds. You can enable this option by using the [allowDataCompression](#) property along with [enableVirtualization](#) property.

This options will only function when the virtual scrolling is enabled.

INDEX.JS

```

var customername = ['TOM', 'Hawk', 'Jon', 'Chandler', 'Monica',
'Rachel', 'Phoebe', 'Gunther',
    'Ross', 'Geller', 'Joey', 'Bing', 'Tribbiani', 'Janice', 'Bong',
'Perk', 'Green', 'Ken', 'Adams'];

```

Limitations during data compression

- The following aggregation types will not be supported.
- Average
- Populationstdev
- Samplestdev
- Populationvar
- Samplevar
- If you use any of the aggregations above, it will result in an aggregation type **"Sum"**.
- Distinctcount will act as **"Count"** aggregation type.
- In the calculated field, an existing field can be inserted without altering its default aggregation type. Even if we change it, it would use the default aggregation type back for calculation.

Virtual scrolling for static field list

Virtual scrolling automatically works with "Popup" field list on setting the [enableVirtualization](#) property in the Pivot Table to **true**. In case of static field list, which act as a separate component, user need to enable [enableVirtualization](#) property in the Pivot Table and also pass the report information to pivot table instance via the [load](#) event of the field list.

INDEX.JS

You can also explore our [Virtual Scrolling in JavaScript PivotTable](#) that showing a large number of records.

Paging in EJ2 JavaScript Pivotview control

Paging allows you to load large amounts of data that can be divided and displayed page by page in the pivot table. It can be enabled by setting the [enablePaging](#) property to **true**. It can be configured at code-behind by using the [pageSettings](#) property, during initial rendering of the component. The properties required are:

- [currentRowPage](#): Allows user to set the current row page number to be displayed in the pivot table.
- [currentColumnPage](#): Allows user to set the current column page number to be displayed in the pivot table.
- [rowPageSize](#): Allows user to set the total number of records to be displayed on each page of the pivot table's row axis.
- [columnPageSize](#): Allows user to set the total number of records to be displayed on each page of the pivot table's column axis.

Pager UI

When paging is enabled, a built-in pager UI appears at the bottom of the pivot table, allowing you to change the current page in the row and column axes by navigating to a desired page using the navigation buttons or an input text box, as well as change the page size via dropdown at runtime.

You can also change the position, visibility, compact view, and template of the row and column pagers by using the [pagerSettings](#).

In order to see and use the pager UI, insert the **Pager** module into the pivot table.

[Show or hide page size](#)

By using the [showRowPageSize](#) and [showColumnPageSize](#) properties in [pagerSettings](#), you can show or hide "Rows per page" and "Columns per page" dropdown menu. The dropdown menu contains a list of

pre-defined or user-defined page sizes, which will be displayed in the "Rows per page" and "Columns per page" dropdowns, allowing you to change the page size for the row and column axes at runtime.

INDEX.JS

Customize page size

By using the [rowPageSizes](#) and [columnPageSizes](#) properties in [pagerSettings](#), you can specify a set of desired page sizes, which will be displayed in the "Rows per page" and "Columns per page" dropdowns, allowing you to change the page size for the row and column axes at runtime.

By default, the "Rows per page" dropdown have pre-defined page sizes of **10, 50, 100, and 200**, while the "Columns per page" dropdown have pre-defined page sizes of **5, 10, 20, 50, and 100**.

In the following example, the "Rows per page" dropdown is set with user-defined page sizes of **10, 20, 30, 40, and 50** and the "Columns per page" dropdown is set with user-defined page sizes of **5, 10, 15, 20, and 30**.

State persistence in EJ2 JavaScript Pivotview control

State persistence allows user to maintain the current state of the component along with its report bounded in the browser local storage (cookie). Even if the browser is refreshed or if you move to the next page within the browser, components state will be persisted. State persistence stores the Pivot Table object in the local storage when [enablePersistence](#) property in pivot table is set to **true**.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    filters: [],
  },
  height: 350,
  enablePersistence: true
});
pivotTableObj.appendTo('#PivotTable');
```

Save and Load Pivot Layout

You can save the current layout of the pivot table by using `getPersistData` in string format. The saved layout can be loaded to pivot table any time by passing the saved data as a parameter to `loadPersistData` method in the pivot table.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        filters: [],
    },
    height: 350,
});
pivotTableObj.appendTo('#PivotTable');
var pivotLayout;
var btn = new ej.buttons.Button({ isPrimary: true });
btn.appendTo('#Save');
document.getElementById('Save').addEventListener('click', () => {
    pivotLayout = pivotTableObj.getPersistData();
});
var btn = new ej.buttons.Button({ isPrimary: true });
btn.appendTo('#Load');
document.getElementById('Load').addEventListener('click', () => {
    pivotTableObj.loadPersistData(pivotLayout);
});

```

<!-- markdownlint-disable MD012 -->

Row and column in EJ2 JavaScript Pivotview control

Width and Height

Allows end user to set the pivot table's height and width by using [height](#) and [width](#) properties in pivot table respectively. The supported formats to set [Height](#) and [Width](#) properties are,

- Pixel: For example - 100, 200, "100px", "200px".
- Percentage: For example - "100%", "200%".
- Auto: It is applicable for [Height](#) property alone in-order to render the pivot table beyond its parent container height without vertical scrollbar. The parent container here would show its vertical scrollbar as soon as the component reaches beyond its dimension.

The pivot table will not be displayed less than **400px**, since it's the minimum width of the component.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: true,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  height: 350,
  width: 550,
});
pivotTableObj.appendTo('#PivotTable');
```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Row Height

Allows end user to set the height of each pivot table rows commonly using the [rowHeight](#) property in [gridSettings](#).

By default, the [rowHeight](#) property is set as **36** pixels for desktop layout and **48** pixels for mobile layout.

The height of the column headers alone may vary when grouping bar feature is enabled.

In the below code sample, the [rowHeight](#) property is set as **60** pixels.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 350,
    gridSettings: {

```

```

        rowHeight: 60
    }
});
pivotTableObj.appendTo('#PivotTable');

```

<script src="index.js" type="text/javascript"></script>
</body></html>

```

Column Width

Allows end user to set the width of each pivot table columns commonly using the [ColumnWidth](#) property in [gridSettings](#).

By default, the [columnWidth](#) property is set as **110** pixels to each columns except the first column. For first column, **250** pixels and **200** pixels are set respectively with and without grouping bar.

In the below example, the [columnWidth](#) property is set as **120** pixels.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  height: 350,
  gridSettings: {
    columnWidth: 120
  }
});
pivotTableObj.appendTo('#PivotTable');

```

</body></html>

```

Adjust width based on columns

By default, if the component width set in code-behind is more than the width of the total columns, then the columns will be stretched to make it fit. To avoid the stretching, set the [allowAutoResizing](#) property in the [gridSettings](#) to **false**. By doing so, the component will be adjusted (shrunk) based on the width of total columns.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],

```

```

        values: [{ name: 'Sold', caption: 'Units Sold' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],

```

Reorder

Allows end user to reorder a particular column header from one index to another index within the pivot table through drag-and-drop option. It can be enabled by setting the [allowReordering](#) property in [gridSettings](#) to **true**.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    gridSettings: {
        allowReordering: true
    },
    height: 350
});
pivotTableObj.appendTo('#PivotTable');

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Column Resizing

Allows end user to resize the columns by clicking and dragging the right edge of the column header. While dragging, the width of the respective column will be resized immediately. To enable column resizing option, set the [allowResizing](#) property in [gridSettings](#) to **true**.

By default, the column resizing option is enabled.

In RTL mode, user can click and drag the left edge of the header cell to resize the column.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    drilledMembers: [{ name: 'Country', items: ['France'] }],

```

Text Align

Allows end user to align the content of the pivot table's row and column headers and value cells by using the [textAlign](#) and [headerTextAlign](#) properties in the [columnRender](#) event under [gridSettings](#). The following alignments are:

- **Left** - It allows the content to be positioned on the left.
- **Right** - It allows the content to be positioned on the right.
- **Center** - It allows the content to be positioned in the middle.
- **Justify** - It allows the content to be as flexible as possible, when the cell does not occupy the entire available area.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: true,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:

```

The minimum width of 250 pixels is set by default with the grouping bar UI for the first column and cannot be reduced further. So, when the grouping bar is enabled, one can auto fit the Pivot Table columns by calling the [autoFitColumns](#) method from the grid instance with the parameter contained pivot table columns field name excluding first column.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: true,
        enableSorting: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },

```

```

height: 350,
width: 800,
showGroupingBar: true,
dataBound: function (args) {
    var columns = [];
    for (var i = 1; i < pivotTableObj.grid.columnModel.length; i++) {
        columns.push(pivotTableObj.grid.columnModel[i].field);
    }
    pivotTableObj.grid.autoFitColumns(columns);
},
});
pivotTableObj.appendTo('#PivotTable');

```

Autofit specific columns

During initial rendering, the parameter `autoFit` in the [columnRender](#) event under [gridSettings](#) can be set to `true` to auto fit specific columns.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: true,
    enableSorting: true,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  height: 350,
  width: 800,
  gridSettings: {
    columnRender: function (args) {
      for (var i = 0; i < args.columns.length; i++) {
        args.columns[i].autoFit = true;
      }
    }
  }
});
pivotTableObj.appendTo('#PivotTable');

```

```

Grid Lines

Allows end user to display cell border for each cells using [gridLines](#) property in [gridSettings](#).

Available mode of grid lines are:

| Modes | Actions |

|-----|-----|

| Both | Displays both the horizontal and vertical grid lines.|

| None | No grid lines are displayed.|

| Horizontal | Displays the horizontal grid lines only.|

| Vertical | Displays the vertical grid lines only.|

| Default | Displays grid lines based on the theme.|

By default, pivot table renders grid lines in **Both** mode.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:

Selection

Selection provides an option to highlight a row or a column or a cell. It can be done through simple mouse down or arrow keys. To enable selection in the pivot table, set the [allowSelection](#) property in [gridSettings](#) to **true**.

The pivot table supports two types of selection that can be set using [type](#) property in [selectionSettings](#). The selection types are:

- **Single:** It is set by default, and it only allows selection of a single row or a column or a cell.
- **Multiple:** Allows you to select multiple rows or columns or cells.

To perform multi-selection, press and hold "CTRL" key and click the desired rows or cells. To select range of rows or cells, press and hold the "SHIFT" key and click the rows or columns or cells.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,

```

```

        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Selection Mode

The pivot table supports four types of selection mode that can be set using [mode](#) in [selectionSettings](#). The selection modes are:

- **Row:** It is set by default, and allows user to select only rows.
- **Column:** Allows you to select only columns.
- **Cell:** Allows you to select only cells.
- **Both:** Allows you to select rows and columns at the same time.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,

<script src="index.js" type="text/javascript"></script>
</body></html>

```

Cell selection requires `selectionSettings.mode` property to be `Cell` or `Both`, and `selectionSettings.type` property should be `Multiple`.

Changing background color of the selected cell

The background-color of the selected cell can be changed using built-in CSS names. To do so, please refer to the code sample below, which shows that the selected cells are changed to a **green yellow** color.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
    }
});

```

```

        filters: []
    },
    height: 350,
    gridSettings: {
        allowSelection: true,
        selectionSettings: { cellSelectionMode: 'Box', type: 'Multiple',
mode: 'Cell' }
    }
});
pivotTableObj.appendTo('#PivotTable');

Event

CellSelected

The event **cellSelected** is triggered when cell selection gets completed. It provides selected cells information with its corresponding column and row headers. It has following parameters - **selectedCellsInfo**, **currentCell** and **target**. This event allows user to view selected cells information and user can pass those selected cells information to any external component for data binding.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],

<script src="index.js" type="text/javascript"></script>
</body></html>

```

Clip Mode

The clip mode provides options to display its overflow cell content in the pivot table. It can be configured using the [clipMode](#) property in [gridSettings](#). The pivot table supports three types of clip modes which are:

- **Clip:** Truncates the cell content when it overflows its area.
- **Ellipsis:** Displays ellipsis when the cell content overflows its area.
- **EllipsisWithTooltip:** Displays ellipsis when the cell content overflows its area, also it will display the tooltip while hover on ellipsis is applied.

By default, `clipMode` value is set to `Ellipsis`.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Cell Template

User can customize the pivot table cell element by using the `cellTemplate` property in pivot table. The `cellTemplate` property accepts either an HTML string or the element's ID, which can be used to append additional HTML elements to showcase each cell with custom format.

In this demo, the revenue cost for each year is represented with trend icons.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: renewableEnergy,
        expandAll: true,
        enableSorting: true,

Events

QueryCellInfo

The event `queryCellInfo` triggers while rendering each row and value cells in the pivot table. It allows the user to customize the current cell like adding or removing styles, editing value, etc. It has the following parameters:

- `cell` - It holds the current cell information.
- `data` - It holds the entire row data across the current cell.
- `column` - It holds the entire column data across the current cell.
- `pivotview` - It holds pivot table instance.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 350,
    gridSettings: {
        columnWidth: 120,
        queryCellInfo: function (args) {
            // triggers every time for value cell while rendering
        },
    }
});
pivotTableObj.appendTo('#PivotTable');

```

HeaderCellInfo

The event `headerCellInfo` triggers while rendering each column header cell in the pivot table. It allows the user to customize the element of the current header cell like adding or removing styles, editing value, etc. It has the following parameters:

- **node** - It holds the current header cell information

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  height: 350,
  gridSettings: {
    columnWidth: 120,
    headerCellInfo: function (args) {
      // triggers every time for header cell while rendering
    },
  }
});
pivotTableObj.appendTo('#PivotTable');
```

```

ColumnRender

The event [columnRender](#) triggers while framing each columns for rendering in the pivot table. It allows the user to customize the text alignment, column visibility, autofit, re-ordering, minimum and maximum width for a specific column. It has the following parameters:

- **columns** - It holds the leaf level columns (i.e., value headers) information.
- **dataSourceSettings** - It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **stackedColumns** - It holds the drilled columns (i.e., including column and value headers) information.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
    }
});

```

```

        filters: []
    },
    gridSettings: {
        columnRender: function (args) {
            // Here you can customize the specific columns.
            for (var i = 0; i < args.columns.length; i++) {
                args.columns[i].autoFit = true;
                args.columns[i].textAlign = "Right";
            }
        },
        height: 350
    });
pivotTableObj.appendTo('#PivotTable');

```

```

CellClick

The event [cellClick](#) triggers while clicking a cell in the pivot table. For instance, using this event end-user can either add or remove styles, edit value and also perform any other DOM manipulations. It has the following parameters:

- **currentCell** - It holds the current cell information.
- **data** - It holds the clicked cell's data like axis, formatted text, actual text, row header, column header and value informations.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    drilledMembers: [{ name: 'Country', items: ['France'] }],

Summary customization in EJ2 JavaScript Pivotview control

Show or hide grand totals

Allows to show or hide grand totals in rows and columns using the [showGrandTotals](#) property. To hide the grand totals in rows and columns, set the property [showGrandTotals](#) in [dataSourceSettings](#) to **false**.

End user can also hide grand totals for row or columns separately by setting the property [showRowGrandTotals](#) or [showColumnGrandTotals](#) in [dataSourceSettings](#) to **false** respectively.

By default, [showGrandTotals](#), [showRowGrandTotals](#) and [showColumnGrandTotals](#) properties in [dataSourceSettings](#) are set as **true**.

INDEX.JS

```
var pivotGridObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: [],
    showGrandTotals: false
  },
  height: 350,
  showFieldList: true
});
pivotGridObj.appendTo('#PivotTable');
```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Show grand totals at top or bottom

Allows to show grand totals either at top or bottom in rows and columns using the [grandTotalsPosition](#) property. To show the grand totals at top in rows and columns, set the [grandTotalsPosition](#) property in [dataSourceSettings](#) to **Top**.

INDEX.JS

```

var pivotGridObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        grandTotalsPosition: 'Top',
    },
    height: 350,
});
pivotGridObj.appendTo('#PivotTable');

```

INDEX.HTML

```

Show or hide sub-totals for specific fields

Allows to show or hide sub-totals for specific fields in rows and columns using the [showSubTotals](#) property. To hide sub-totals for a specific field in row or column axis, set the property [showSubTotals](#) in [rows](#) or [columns](#) to **false** respectively.

By default, [showSubTotals](#) property in [rows](#) or [columns](#) is set as **true**.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year', showSubTotals:
false }, { name: 'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country', showSubTotals: false }, { name: 'Products'
}],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },

```

```

        height: 350,
        showFieldList: true
    });
    pivotTableObj.appendTo('#PivotTable');

```

INDEX.HTML

Show sub-totals at top or bottom

Allows to show sub-totals either at top or bottom of the header group in rows and columns by using the [subTotalsPosition](#) property. By default, [subTotalsPosition](#) property is set to **Auto**, which means that column sub-totals are displayed at the bottom and row sub-totals are displayed at the top of the header group in the pivot table.

To show sub-totals at top of the header group in rows and columns, set the [subTotalsPosition](#) property in [dataSourceSettings](#) to **Top**.

INDEX.JS

```

var pivotGridObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    drilledMembers: [{ name: 'Country', items: ['France'] }, { name:
'Year', items: ['FY 2015'] }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:

<script src="index.js" type="text/javascript"></script>
</body></html>

```

Show or hide totals using toolbar

It can also be achieved using built-in toolbar options by setting the [showToolbar](#) property in pivot table to **true**. Also, include the items **GrandTotal** and **SubTotal** within the [toolbar](#) property in pivot table. End user can now see "Show/Hide Grand totals" and "Show/Hide Sub totals" icons in toolbar UI automatically.

The grand totals and sub-totals can be dynamically displayed at the top or bottom of the pivot table's row and column axes by using the built-in options "Grand totals position" and "Subtotals position" available in the grand totals and sub-totals drop down menus, respectively.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    drilledMembers: [{ name: 'Country', items: ['France', 'Germany']
  }],
  columns: [{ name: 'Year' }],
  rows: [{ name: 'Country' }, { name: 'Products' }],
  values: [{ name: 'Amount', caption: 'Sold Amount' },
    { name: 'Sold', caption: 'Units Sold' }],
  filters: []
},
  showToolbar: true,
  toolbar: ['GrandTotal', 'SubTotal'],
  height: 350
});
pivotTableObj.appendTo('#PivotTable');

```

Hyper link in EJ2 JavaScript Pivotview control

The pivot table supports to show hyperlink option to link data for individual cells that are displayed in the component. Also, the hyperlink can be enabled separately for row headers, column headers, value cells, and summary cells using the [hyperlinkSettings](#). It can be configured through code behind, during initial rendering and the settings available to show hyperlink are:

- [showHyperlink](#): It allows to set the visibility of hyperlink in all cells.
- [showRowHeaderHyperlink](#): It allows to set the visibility of hyperlink in row headers.
- [showColumnHeaderHyperlink](#): It allows to set the visibility of hyperlink in column headers.
- [showValueCellHyperlink](#): It allows to set the visibility of hyperlink in value cells.
- [showSummaryCellHyperlink](#): It allows to set the visibility of hyperlink in summary cells.
- [headerText](#): It allows to set the visibility of hyperlink based on header text.
- [conditionalSettings](#): It allows to set the visibility of hyperlink based on specific condition.

<!-- markdownlint-disable MD028 -->

By default, the hyperlink options are disabled for all cells in the pivot table.

User defined style can be applied to hyperlink using [cssClass](#) property in [hyperlinkSettings](#).

Hyperlink for all cells

The pivot table has an option to show hyperlink option to all the cells that are currently displaying. To do so, user need to set [showHyperlink](#) to **true**.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  height: 350,
  hyperlinkSettings: {
    showHyperlink: true,
    cssClass: 'e-custom-class'
  }
});
pivotTableObj.appendTo('#PivotTable');
```

Condition based hyperlink

The pivot table has an option to show hyperlink option to the cells based on specific conditions. It can be configured using the [conditionalSettings](#) option through code behind, during initial rendering. The required settings are:

- [measure](#): Specifies the value field caption to get visibility of hyperlink option for specific measure.
- [condition](#): Specifies the operator type such as equals, greater than, less than, etc.
- [value1](#): Specifies the start value.
- [value2](#): Specifies the end value.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    drilledMembers: [{ name: 'Year', items: ['FY 2015'] }, { name:

Event

The event [hyperlinkCellClicked](#) fires on every hyperlink cell click.

It has following parameters - `cancel` and `currentCell`. The parameter `currentCell` is used to customize the host cell element by any means. Meanwhile, when the parameter `cancel` is set to `true`, applied customization will not be updated to the host cell element.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,

See Also

- [Apply condition based hyperlink for specific row or column](#)

Tool bar in EJ2 JavaScript Pivotview control

Toolbar option allows to access the frequently used features like switching between pivot table and pivot chart, changing chart types, conditional formatting, exporting, etc... with ease at runtime. This

option can be enabled by setting the [showToolbar](#) property in pivot table to **true**. The [toolbar](#) property in pivot table accepts the collection of built-in toolbar options.

Built-in Toolbar Options

The following table shows built-in toolbar options and its actions.

Built-in Toolbar Options	Actions
----- -----	
New	Creates a new report
Save	Saves the current report
Save As	Save as current report
Rename	Renames the current report
Delete	Deletes the current report
Load	Loads any report from the report list
Grid	Shows pivot table
Chart	Shows a chart in any type from the built-in list and option to enable/disable multiple axes
Exporting	Exports the pivot table as PDF/Excel/CSV and the pivot chart as PDF and image
Sub-total	Shows or hides sub totals
Grand Total	Shows or hides grand totals
Conditional Formatting	Shows the conditional formatting pop-up to apply formatting
Number Formatting	Shows the number formatting pop-up to apply number formatting
Field List	Shows the fieldlist pop-up
MDX	Shows the MDX query that was run to retrieve data from the OLAP data source. NOTE: This applies only to the OLAP data source.

The order of toolbar options can be changed by simply moving the position of items in the toolbar collection. Also if end user wants to remove any toolbar option from getting displayed, it can be simply ignored from adding into the toolbar collection.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({

Show desired chart types in the dropdown menu

By default, all chart types are displayed in the dropdown menu included in the toolbar. However, based on the request for an application, we may need to show selective chart types on our own. This can be achieved using the [chartTypes](#) property. To know more about supporting chart types, [click here](#).

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    enableSorting: true,
    sortSettings: [{ name: 'Country', order: 'Descending' }],

Switch the chart to multiple axes

In the chart, the user can switch from single axis to multiple axes with the help of the built-in checkbox available inside the chart type dropdown menu in the toolbar. For more information [refer here](#).

<!-- markdownlint-disable MD009 -->

There are three modes available in **Multiple Axis** option: **Stacked**, **Single** and **Combined**. The modes can be changed using “Multiple Axis Mode” drop-down list which appears while clicking the **More...** option.

Show or hide legend

In the chart, legend can be shown or hidden dynamically with the help of the built-in option available in the chart type drop-down menu.

By default, the legend is not visible for the accumulation chart types like pie, doughnut, pyramid, and funnel. Users can enable or disable using the built-in checkbox option.

Adding custom option to the toolbar

In addition to the existing built-in toolbar items, new toolbar item(s) may also be included. This can be achieved by using the [toolbarRender](#) event. The action of the new toolbar item(s) can also be defined within this event.

The new toolbar item(s) can be added to the desired position in the toolbar using the `splice` option.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    enableSorting: true,
    drilledMembers: [{ name: 'Country', items: ['France'] }],

</body></html>

```

In the above topic, we have seen how to add an icon as one of the toolbar item in toolbar panel. In the next topic, we are going to see how to frame the entire toolbar panel and how to add a custom control in it.

Toolbar Template

It allows to customize the toolbar panel by using template option. It allows any custom control to be used as one of the toolbar item inside the toolbar panel. It can be achieved by two ways,

Here, the entire toolbar panel can be framed in HTML elements that are appended at the top of the pivot table. The **id** of the HTML element needs to be set in the [toolbarTemplate](#) property in-order to map it to the pivot table.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        filters: [],
    },
    toolbarTemplate: '#template',
    showToolbar: true,
    height: 350,
});
pivotTableObj.appendTo('#PivotTable');
var btnExpand = new ej.buttons.Button({ content: 'Expand All', cssClass: "e-
primary" });
btnExpand.appendTo('#btnexpand');

```

```

var btnCollapse = new ej.buttons.Button({ content: 'Collapse All', cssClass:
'e-primary' });
    btnCollapse.appendTo('#btncollapse');
document.getElementById('btnexpand').onclick = function () {
    pivotTableObj.dataSourceSettings.expandAll = true;
};
document.getElementById('btncollapse').onclick = function () {
    pivotTableObj.dataSourceSettings.expandAll = false;
};

```

INDEX.HTML

```

</head>
<body>

    <div id="container">
        <div>
            <div id="PivotTable"></div>

```

```

        <div id="template">
            <div>
                <div> <button id="btnexpand" class="e-flat"></button></div>
                <div> <button id="btncollapse" class="e-
flat"></button></div>
            </div>
        </div>
    </div>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Another option allows to frame a custom toolbar item using HTML elements and include in the toolbar panel at the desired position. The custom toolbar items can be declared as control **instance** or element **id** in the [toolbar](#) property in pivot table.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        filters: [],
    },
    toolbar: [{template: '#enablertl'}, {template: '#disablertl'}],
    showToolbar: true,
    height: 350,
});
pivotTableObj.appendTo('#PivotTable');
var btnEnableRtl = new ej.buttons.Button({ content: 'Enable Rtl', cssClass:
"e-primary" });
    btnEnableRtl.appendTo('#btnenablertl');
var btnDisableRtl = new ej.buttons.Button({ content: 'Disable Rtl',
cssClass: "e-primary" });
    btnDisableRtl.appendTo('#btndisablertl');
document.getElementById('btnenablertl').onclick = function () {
    pivotTableObj.enableRtl = true;
};
document.getElementById('btndisablertl').onclick = function () {
    pivotTableObj.enableRtl = false;
};

```

<!-- markdownlint-disable MD009 -->
```

Save and load report as a JSON file

The current pivot report can be saved as a JSON file in the desired path and loaded back to the pivot table at any time.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: [],
  },
  height: 350,
  dataBound: function (args) {
    var dataSource =
JSON.parse(pivotTableObj.getPersistData()).dataSourceSettings.dataSource;
    var a = document.getElementById('save');
    var mime_type = 'application/octet-stream'; // text/html,
image/png, et c
    a.setAttribute('download', 'pivot.JSON');
    a.href = 'data:' + mime_type + ';base64,' +
btoa(JSON.stringify(dataSource) || '');
    document.getElementById('files').addEventListener('change',
this.readBlob, false);
  },
  readBlob: function (args) {
    var files = document.getElementById('load').files;
    var file = files[0];
    var start = 0;
    var stop = file.size - 1;
    var reader = new FileReader();
    reader.onloadend = function (evt) {
      if (evt.target.readyState == FileReader.DONE) {
        pivotTableObj.dataSource = JSON.parse(evt.target.result);
      }
    };
    var blob = file.slice(start, stop + 1);
    reader.readAsBinaryString(blob);
  }
});
pivotTableObj.appendTo('#PivotTable');
```

Save and load reports to a SQL database

SQL Server is a relational database management system (RDBMS) that can be used to store and manage large amounts of data. In this topic, we will see how to save, save as, rename, load, delete, and add reports between a SQL Server database and a JavaScript Pivot Table at runtime.

Create a Web API service to connect to a SQL Server database

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document [link](#).

Configure your new project

ASP.NET Core Web App C# Linux macOS Windows Cloud Service Web

Project name
MyWebService

Location
C:\Users\username\sources\repos

Solution name ⓘ
MyWebService

☐ Place solution and project in the same directory

Back Next

2. To connect a SQL Server database using the Microsoft SqlClient in our application, we need to install the [Microsoft.Data.SqlClient](#) NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **Microsoft.Data.SqlClient** and install it.

3. Under the **Controllers** folder, create a Web API controller (aka, PivotController.cs) file that aids in data communication with the Pivot Table.

4. In the Web API Controller (aka, PivotController), the **OpenConnection** method is used to connect to the SQL database. The **GetDataTable** method then processes the specified SQL query string, retrieves data from the database, and converts it into a **DataTable** using **SqlCommand** and **SqlDataAdapter**. This **DataTable** can be used to retrieve saved reports and modify them further as shown in the code block below.

[PivotController.cs]

```
`c#
```

```
using Microsoft.AspNetCore.Mvc;
```

```
using Microsoft.Data.SqlClient;
```

```
using System.Data;
```

```
namespace MyWebService.Controllers
```

```
{
```

```
[ApiController]
```

```
[Route("[controller]")]
```

```
public class PivotController : ControllerBase
```

```
{
```

```
[HttpPost]
```

```
[Route("Pivot/SaveReport")]
public void SaveReport([FromBody] Dictionary<string, string> args)
{
    SaveReportToDB(args["ReportName"], args["Report"]);
}

[HttpPost]
[Route("Pivot/FetchReport")]
public string[] FetchReport(Dictionary<string, string> args)
{
    return FetchReportListFromDB().ToArray();
}

[HttpPost]
[Route("Pivot/LoadReport")]
public string LoadReport(Dictionary<string, string> args)
{
    return LoadReportFromDB(args["ReportName"]);
}

[HttpPost]
[Route("Pivot/RemoveReport")]
public void RemoveReport(Dictionary<string, string> args)
{
    RemoveReportFromDB(args["ReportName"]);
}

[HttpPost]
[Route("Pivot/RenameReport")]
public void RenameReport(Dictionary<string, string, bool> args)
{
    RenameReportInDB(args["ReportName"], args["Rename"], args["isReportExists"]);
}

public void SaveReportToDB(string reportName, string report)
{
    SqlConnection sqlConn = OpenConnection();
    bool isDuplicate = true;
```

```
SqlCommand cmd1 = null;
foreach (DataRow row in GetDataTable(sqlConn).Rows)
{
    if ((row["ReportName"] as string).Equals(reportName))
    {
        isDuplicate = false;
        cmd1 = new SqlCommand("UPDATE ReportTable set Report=@Report where ReportName like
        @ReportName", sqlConn);
    }
}
if (isDuplicate)
{
    cmd1 = new SqlCommand("INSERT into ReportTable (ReportName,Report)
    Values(@ReportName,@Report)", sqlConn);
}
cmd1.Parameters.AddWithValue("@ReportName", reportName);
cmd1.Parameters.AddWithValue("@Report", report.ToString());
cmd1.ExecuteNonQuery();
sqlConn.Close();
}

public string LoadReportFromDB(string reportName)
{
    SqlConnection sqlConn = OpenConnection();
    string report = string.Empty;
    foreach (DataRow row in GetDataTable(sqlConn).Rows)
    {
        if ((row["ReportName"] as string).Equals(reportName))
        {
            report = (string)row["Report"];
            break;
        }
    }
    sqlConn.Close();
    return report;
}
```

```
}  
public List<string> FetchReportListFromDB()  
{  
    SqlConnection sqlConn = OpenConnection();  
    List<string> reportNames = new List<string>();  
    foreach (DataRow row in GetDataTable(sqlConn).Rows)  
    {  
        if (!string.IsNullOrEmpty(row["ReportName"] as string))  
        {  
            reportNames.Add(row["ReportName"].ToString());  
        }  
    }  
    sqlConn.Close();  
    return reportNames;  
}  
  
public void RenameReportInDB(string reportName, string renameReport, bool isReportExists)  
{  
    SqlConnection sqlConn = OpenConnection();  
    SqlCommand cmd1 = null;  
    if (isReportExists)  
    {  
        RemoveReportFromDB(renameReport);  
    }  
    foreach (DataRow row in GetDataTable(sqlConn).Rows)  
    {  
        if ((row["ReportName"] as string).Equals(reportName))  
        {  
            cmd1 = new SqlCommand("UPDATE ReportTable set ReportName=@RenameReport where ReportName  
like '%" + reportName + "%'", sqlConn);  
            break;  
        }  
    }  
    cmd1.Parameters.AddWithValue("@RenameReport", renameReport);
```

```
cmd1.ExecuteNonQuery();
sqlConn.Close();
}
public void RemoveReportFromDB(string reportName)
{
    SqlConnection sqlConn = OpenConnection();
    SqlCommand cmd1 = null;
    foreach (DataRow row in GetDataTable(sqlConn).Rows)
    {
        if ((row["ReportName"] as string).Equals(reportName))
        {
            cmd1 = new SqlCommand("DELETE FROM ReportTable WHERE ReportName LIKE '%" + reportName +
            "%'", sqlConn);
            break;
        }
    }
    cmd1.ExecuteNonQuery();
    sqlConn.Close();
}
private SqlConnection OpenConnection()
{
    // Replace with your own connection string.
    string connectionString = @"<Enter your valid connection string here>";
    SqlConnection sqlConn = new SqlConnection(connectionString);
    sqlConn.Open();
    return sqlConn;
}
private DataTable GetDataTable(SqlConnection sqlConn)
{
    string xquery = "SELECT * FROM ReportTable";
    SqlCommand cmd = new SqlCommand(xquery, sqlConn);
    SqlDataAdapter da = new SqlDataAdapter(cmd);
    DataTable dt = new DataTable();
```

```

da.Fill(dt);
return dt;
}
}
}
`

```

5. When you run the app, it will be hosted at <https://localhost:44313>. You can use the hosted URL to save and load reports in the SQL database from the Pivot Table.

Further, let us explore more on how to save, load, rename, delete, and add reports using the built-in toolbar options via Web API controller (aka, PivotController) one-by-one.

Saving a report

When you select the **“Save a report”** option from the toolbar, the [saveReport](#) event is triggered. In this event, an AJAX request is made to the Web API controller's **SaveReport** method, passing the name of the current report and the current report, which you can use to check and save in the SQL database.

For example, the report shown in the following code snippet will be passed to the **SaveReport** method along with the report name **“Sample Report”** and saved in the SQL database.

[index.js]

```

`ts
var pivotTableObj = new ej.pivotview.PivotView({
dataSourceSettings: {
columns: [
{ name: "Year", caption: "Production Year" },
{ name: "Quarter" },
],
dataSource: getPivotData(),
expandAll: false,
filters: [],
formatSettings: [{ name: "Amount", format: "C0" }],
rows: [{ name: "Country" }, { name: "Products" }],
values: [
{ name: "Sold", caption: "Units Sold" },
{ name: "Amount", caption: "Sold Amount" },
],
},
height: 350,

```

```
saveReport: function (args) {
var report = JSON.parse(args.report);
report.dataSourceSettings.dataSource = [];
fetch("https://localhost:44313/Pivot/SaveReport", {
method: "POST",
headers: {
Accept: "application/json",
"Content-Type": "application/json",
},
body: JSON.stringify({
reportName: args.reportName,
report: JSON.stringify(report),
}),
})
.then(function (response) {
pivotTableObj.fetchReport();
});
},
toolbar: ['New', 'Save', 'SaveAs', 'Rename', 'Remove', 'Load',
'Grid', 'Chart', 'Export', 'SubTotal', 'GrandTotal', 'ConditionalFormatting', 'FieldList'],
allowExcelExport: true,
allowConditionalFormatting: true,
allowPdfExport: true,
showToolbar: true,
allowCalculatedField: true,
displayOption: { view: "Both" },
showFieldList: true,
height: "700",
});
pivotTableObj.appendTo("#PivotView");
、

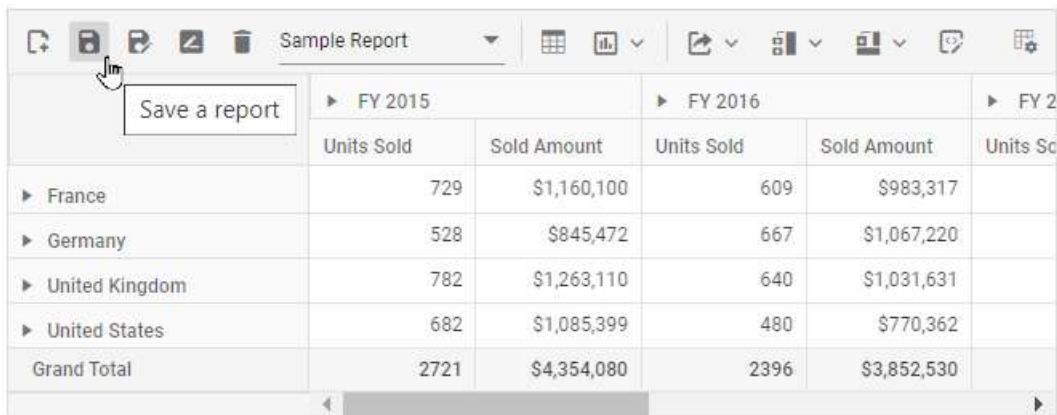

[PivotController.cs]
`c#
```

```
namespace MyWebApp.Controllers
{
    [ApiController]
    [Route("[controller]")]
    public class PivotController : ControllerBase
    {
        [HttpPost]
        [Route("Pivot/SaveReport")]
        public void SaveReport(Dictionary<string,string> args)
        {
            SaveReportToDB(args["ReportName"], args["Report"]);
        }
        public void SaveReportToDB(string reportName, string report)
        {
            SqlConnection sqlConn = OpenConnection();
            bool isDuplicate = true;
            SqlCommand cmd1 = null;
            foreach (DataRow row in GetDataTable(sqlConn).Rows)
            {
                if ((row["ReportName"] as string).Equals(reportName))
                {
                    isDuplicate = false;
                    cmd1 = new SqlCommand("UPDATE ReportTable set Report=@Report where ReportName like @ReportName", sqlConn);
                }
            }
            if (isDuplicate)
            {
                cmd1 = new SqlCommand("INSERT into ReportTable (ReportName,Report) Values(@ReportName,@Report)", sqlConn);
            }
            cmd1.Parameters.AddWithValue("@ReportName", reportName);
            cmd1.Parameters.AddWithValue("@Report", report.ToString());
            cmd1.ExecuteNonQuery();
        }
    }
}
```

```

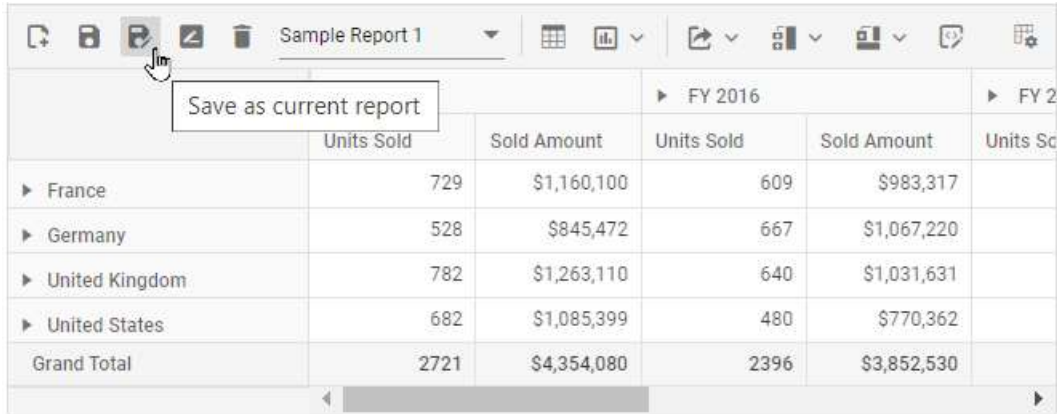

sqlConn.Close();
}
private SqlConnection OpenConnection()
{
// Replace with your own connection string.
string connectionString = @"<Enter your valid connection string here>";
SqlConnection sqlConn = new SqlConnection(connectionString);
sqlConn.Open();
return sqlConn;
}
private DataTable GetDataTable(SqlConnection sqlConn)
{
string xquery = "SELECT * FROM ReportTable";
SqlCommand cmd = new SqlCommand(xquery, sqlConn);
SqlDataAdapter da = new SqlDataAdapter(cmd);
DataTable dt = new DataTable();
da.Fill(dt);
return dt;
}
}
}
,

```

	FY 2015		FY 2016		FY 2017
	Units Sold	Sold Amount	Units Sold	Sold Amount	Units Sold
France	729	\$1,160,100	609	\$983,317	
Germany	528	\$845,472	667	\$1,067,220	
United Kingdom	782	\$1,263,110	640	\$1,031,631	
United States	682	\$1,085,399	480	\$770,362	
Grand Total	2721	\$4,354,080	2396	\$3,852,530	

In the meantime, you can save a duplicate of the current report to the SQL Server database with a different name by selecting **“Save as current report”** from the toolbar. The [saveReport](#) event will then be triggered with the new report name **“Sample Report 1”** and the current report. You can save them to the SQL Server database after passing them to the Web API service, as mentioned above.

	Units Sold	Sold Amount	Units Sold	Sold Amount	Units Sold
France	729	\$1,160,100	609	\$983,317	
Germany	528	\$845,472	667	\$1,067,220	
United Kingdom	782	\$1,263,110	640	\$1,031,631	
United States	682	\$1,085,399	480	\$770,362	
Grand Total	2721	\$4,354,080	2396	\$3,852,530	

Loading a report

When you select the dropdown menu item from the toolbar, the [loadReport](#) event is triggered. In this event, an AJAX request is made to the **LoadReport** method of the Web API controller, passing the name of the selected report. The method uses this information to search for the report in the SQL database, fetch it, and load it into the pivot table.

For example, if the report name **"Sample Report 1"** is selected from a dropdown menu and passed, the **LoadReport** method will use that name to search for the report in the SQL database, retrieve it, and then load it into the pivot table.

[index.js]

`ts

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    columns: [
      { name: "Year", caption: "Production Year" },
      { name: "Quarter" },
    ],
    dataSource: getPivotData(),
    expandAll: false,
    filters: [],
    formatSettings: [{ name: "Amount", format: "C0" }],

Grand Total	2721	\$4,354,080	2396	\$3,852,530	

Renaming a report

When you select the **“Rename a current report”** option from the toolbar, the [renameReport](#) event is triggered. In this event, an AJAX request is made to the **RenameReport** method of the Web API controller, passing the current and new report names, where you can use the current report name to identify the report and resave it with the new report name in the SQL database.

For example, if we rename the current report from “**Sample Report 1**” to “**Sample Report 2**”, both “**Sample Report 1**” and “**Sample Report 2**” will be passed to the **RenameReport** method, which will rename the current report with the new report name “**Sample Report 2**” in the SQL database.

Deleting a report

When you select the **“Delete a current report”** option from the toolbar, the [removeReport](#) event is triggered. In this event, an AJAX request is made to the **RemoveReport** method of the Web API controller, passing the current report name to identify and delete the appropriate report from the SQL database.

* If the current report **n** from the pivot table is deleted, the pivot table will automatically load the last report from the report list.

* When a report is removed from a pivot table with only one report, the SQL database refreshes; however, the pivot table will continue to show the removed report until a new report is added to the pivot table.

For example, if we delete the current report **“Sample Report 2”** from the pivot table, the current report name **“Sample Report 2”** is passed to the **RemoveReport** method, which allows you to identify and delete the report from the SQL database.

Adding a report

When you select the “**Create a new report**” option from the toolbar, the [newReport](#) event is triggered, followed by the [saveReport](#) event. To save this new report to the SQL database, use the [saveReport](#) event triggered later, and then follow the save report briefing in the preceding [topic](#).

	Grand Total
Grand Total	

No records to display

Limitations with respect to report manipulation

Below points need to be considered when saving the report to SQL Server database.

- **Data source:** Both raw data and aggregated data won't be saved and loaded from the database.
- **Conditional formatting:** The appearance of the pivot table, such as background color, font color, font family, and font size based on the specific conditions won't be saved and loaded from the database.
- **Hyperlinks:** Option to link external facts via pivot table cells won't be saved and loaded from the database.
- The pivot table should always load reports from the SQL database based on the data source that is currently bound to it.

In [this](#) GitHub repository, you can find our Javascript Pivot Table sample and ASP.NET Core Web Application to save and load reports from SQL Server database.

Events

FetchReport

The event [fetchReport](#) is triggered when dropdown list is clicked in the toolbar in-order to retrieve and populate saved reports. It has following parameter - **ReportName**. This event allows user to fetch the report names from local storage and populate the dropdown list.

LoadReport

The event [loadReport](#) is triggered when a report is selected from the dropdown list in the toolbar. It has following parameters - **Report** and **ReportName**. This event allows user to load the selected report to the pivot table.

NewReport

The event [newReport](#) is triggered when the new report icon is clicked in the toolbar. It has following parameter - **Report**. This event allows user to create new report and add to the report list.

RenameReport

The event [renameReport](#) is triggered when rename report icon is clicked in the toolbar. It has following parameters - **rename**, **report** and **reportName**. This event allows user to rename the selected report from the report list.

RemoveReport

The event [removeReport](#) is triggered when remove report icon is clicked in the toolbar. It has following parameters - **Report** and **ReportName**. This event allows user to remove the selected report from the report list.

SaveReport

The event [saveReport](#) is triggered when save report icon is clicked in the toolbar. It has following parameters - **Report** and **ReportName**. This event allows user to save the altered report to the report list.

ToolbarRender

The [toolbarRender](#) event is triggered when the toolbar is rendered. It has the **customToolbar** parameter. This event helps to customize the built-in toolbar items and to [include new toolbar item\(s\)](#).

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({

ActionBegin

The event [actionBegin](#) triggers when the UI actions such as switching between pivot table and pivot chart, changing chart types, conditional formatting, exporting, etc. that are present in toolbar UI begin. This allows user to identify the current action being performed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action began. The following are the UI actions and their names:

Action	Action Name
-----	-----
New report	Add new report
Save report	Save current report
Save as report	Save as current report
Rename report	Rename current report
Remove report	Remove current report
Report change	Report change
Conditional Formatting	Open conditional formatting dialog
Number Formatting	Open number formatting dialog
Export menu	PDF export, Excel export, CSV export
Show Fieldlist	Open field list
Show Table	Show table view
Chart menu	Show chart view

| Sub-totals menu | Hide sub-totals, Show row sub-totals, Show column sub-totals, Show sub-totals |

| Grand totals menu | Hide grand totals, Show row grand totals, Show column grand totals, Show grand totals |

- **cancel**: It allows user to restrict the current action.

In the below sample, toolbar UI actions such as add new report and save current report can be restricted by setting the **args.cancel** option to **true** in the **actionBegin** event.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  showFieldList: true,
  displayOption: { view: 'Both' },
  chartSettings: {
    value: 'Amount', enableExport: true, chartSeries: { type: 'Column',
animation: { enable: false } }, enableMultipleAxis: false,
  },
  toolbar: ['New', 'Save', 'SaveAs', 'Rename', 'Remove', 'Load',
'Grid', 'Chart', 'MDX', 'Export', 'SubTotal', 'GrandTotal',
'ConditionalFormatting', 'FieldList'],
  allowExcelExport: true,
  allowConditionalFormatting: true,
  allowPdfExport: true,
  showToolbar: true,
  actionBegin: function (args) {
    if (args.actionName == 'Add new report' || args.actionName == 'Save
current report') {
      args.cancel = true;
    }
  },
  height: 350
});
pivotTableObj.appendTo('#PivotTable');
```

```

ActionComplete

The event [actionComplete](#) triggers when the UI actions such as switching between pivot table and pivot chart, changing chart types, conditional formatting, exporting, etc. that are present in toolbar UI, is completed. This allows user to identify the current UI actions being completed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action completed. The following are the UI actions and their names:

Action	Action Name
-----	-----
New report	New report added
Save report	Report saved
Save as report	Report re-saved
Rename report	Report renamed
Remove report	Report removed
Report change	Report changed
Conditional Formatting	Conditionally formatted
Number Formatting	Number formatted
Export menu	PDF exported, Excel exported, CSV exported
Show Fieldlist	Field list closed
Show Table	Table view shown
Sub-totals menu	Sub-totals hidden, Row sub-totals shown, Column sub-totals shown, Sub-totals shown
Grand totals menu	Grand totals hidden, Row grand totals shown, Column grand totals shown, Grand totals shown

- **actionInfo**: It holds the unique information about the current UI action. For example, while adding new report, the event argument contains information such as report name and the action name.

ActionFailure

The event [actionFailure](#) triggers when the current UI action fails to achieve the desired result. It has the following parameters:

- **actionName**: It holds the name of the current action failed. The following are the UI actions and their names:

Action	Action Name
-----	-----
New report	Add new report
Save report	Save current report
Save as report	Save as current report
Rename report	Rename current report
Remove report	Remove current report
Report change	Report change
Conditional Formatting	Open conditional formatting dialog
Number Formatting	Open number formatting dialog
Export menu	PDF export, Excel export, CSV export
Show Fieldlist	Open field list
Show Table	Show table view
Chart menu	Show chart view
Sub-totals menu	Hide sub-totals, Show row sub-totals, Show column sub-totals, Show sub-totals
Grand totals menu	Hide grand totals, Show row grand totals, Show column grand totals, Show grand totals

- **errorInfo**: It holds the error information of the current UI action.

Tool tip in EJ2 JavaScript Pivotview control

The tooltip can be enabled or disabled by setting the [showTooltip](#) property to **true**. By default, tooltip is enabled in the pivot table.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    showTooltip: false,
    height: 350

```

```
});  
pivotTableObj.appendTo('#PivotTable');
```

```

Tooltip Template

User can design their own tooltip by setting the property [tooltipTemplate](#) with own HTML elements. The property accepts both HTML string and ID attribute. The following place holders are available to display its dynamic values inside the HTML elements.

`\${rowHeaders}` – Row headers of the selected value cell.

`\${columnHeaders}` – Column headers of the selected value cell.

`\${rowFields}` – Row fields of the selected value cell.

`\${columnFields}` – Column fields of the selected value cell.

`\${valueField}` – Field name of the selected value cell.

`\${aggregateType}` – Aggregate type of the selected value cell.

`\${value}` - Formatted value of the selected value cell.

The tooltip customization is common for both pivot table and pivot chart or it can be done individually as well. To customize the pivot table tooltip, the above procedure needs to be followed. To customize the pivot chart tooltip alone use **template** property of tooltip under [chartSettings](#).

In the below sample, the pivot table and pivot chart shows customized tooltip layouts.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    filters: []
  },
  height: 350,
  displayOption: { view: 'Both' },
  chartSettings: {
    value: 'Amount', chartSeries: { type: 'Column', animation: {
enable: false } },
    tooltip: { template: '<span class="wrap">`${aggregateType}` of
`${valueField}`: `${value}</span>' }
  },
  toolbar: ['Grid', 'Chart'],
  showToolbar: true,
  tooltipTemplate: "#Template"
});
pivotTableObj.appendTo("#PivotTable");

```

Css customization in EJ2 JavaScript Pivotview control

Hiding Axis

The visibility of row, column, value and filter axis in Field List and Grouping Bar can be changed using custom CSS setting. To do so, please refer the code sample below:

```
PivotTable .e-group-columns {
```

```
display: none;
```

```
}
```

```
PivotTable .e-group-filters {
```

```
height: 71px !important;
```

```
}
```

```
PivotTable_PivotFieldList_Wrapper .e-field-list-columns{
```

```
display: none;
```

```
}
```

```
PivotTable_PivotFieldList_Wrapper .e-field-list-values{
```

```
margin-top: 0px;
```

```
height: 338px;
```

```

}
,

```

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  height: 320,
  showGroupingBar: true,
  showFieldList: true
});
pivotTableObj.appendTo('#PivotTable');

```

INDEX.HTML

```

Customize header, value and summary cell style

The elements in pivot table like header cell, value cell and summary cell style can be customized using built-in CSS names. To do so, please refer the code sample below:

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  height: 320,
  showGroupingBar: true,
  showFieldList: true
});
pivotTableObj.appendTo('#PivotTable');

```

INDEX.HTML

```

Printing and Exporting

Print

The rendered pivot table can be printed directly from the browser by invoking the [print](#) method from the grid's instance. The below sample code illustrates the print option being invoked by an external button click.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [
            { name: 'Year', caption: 'Production Year' },
            { name: 'Quarter' },
        ],
        values: [
            { name: 'Sold', caption: 'Units Sold' },
            { name: 'Amount', caption: 'Sold Amount' },
        ],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: [],
    },
    height: 350
});
pivotTableObj.appendTo('#PivotTable');
var exportBtn = new ej.buttons.Button({ content: 'Print', cssClass: `e-
primary`, isPrimary: true });
exportBtn.appendTo('#print');
document.getElementById('print').onclick = function () {
    // Method used to print the pivot table.
    pivotTableObj.grid.print();
};

```

```

Similarly, to print the pivot chart, use the [print](#) method from the chart's instance. The below sample code illustrates the print option being invoked by an external button click.

To use pivot chart, you need to inject the `PivotChart` module in the pivot table.

To display the pivot chart, set the [displayOption](#) property to either **Chart** or **Both**.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    columns: [
      { name: 'Year', caption: 'Production Year' },
      { name: 'Quarter' },
    ],
    values: [
      { name: 'Sold', caption: 'Units Sold' },
      { name: 'Amount', caption: 'Sold Amount' },
    ],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: [],
  },
  height: 350,
  displayOption: { view: 'Chart' }
});
pivotTableObj.appendTo('#PivotTable');
var exportBtn = new ej.buttons.Button({ content: 'Print', cssClass: `e-
primary`, isPrimary: true });
exportBtn.appendTo('#print');
document.getElementById('print').onclick = function () {
  // Method used to print the pivot chart.
  pivotTableObj.chart.print();
};
```

Excel export in EJ2 JavaScript Pivotview control

The Excel export allows pivot table data to export as Excel document. To enable Excel export in the pivot table, set the `allowExcelExport` as **true**. You need to use the `excelExport` method for Excel exporting.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],

```

```

        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 320,
    allowExcelExport: true
});
pivotTableObj.appendTo('#PivotTable');
var exportBtn = new ej.buttons.Button({ isPrimary: true });
exportBtn.appendTo('#excel');
document.getElementById('excel').onclick = function () {
    pivotTableObj.excelExport();
};

```

```

Multiple pivot table exporting

The Excel export provides an option to export multiple pivot table data in the same Excel file.

Same WorkSheet

The Excel export provides support to export multiple pivot tables in same sheet. To export in same sheet, define `multipleExport.type` as `AppendToSheet` in `ExcelExportProperties`. It has an option to provide blank rows between pivot tables and these blank row(s) count can be defined using the `multipleExport.blankRows` property.

By default, `multipleExport.blankRows` value is 5 between pivot tables within the same sheet.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 300,
    allowExcelExport: true
});
var pivotTableObj2 = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        rows: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        columns: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 300,
    allowExcelExport: true
});
pivotTableObj.appendTo('#PivotTable');

```

```

pivotTableObj2.appendTo('#PivotTable2');
var exportBtn = new ej.buttons.Button({ isPrimary: true });
exportBtn.appendTo('#excel');
document.getElementById('excel').onclick = function () {
    var excelExportProperties = {
        multipleExport: { type: 'AppendToSheet', blankRows: 2 }
    };
    var firstGridExport =
pivotTableObj.grid.excelExport(excelExportProperties, true);
    firstGridExport.then(function (fData) {
        pivotTableObj2.excelExport(excelExportProperties, false, fData);
    });
};

Changing the pivot table style while exporting

The Excel export provides an option to change colors for headers, caption and records in pivot table before exporting. In-order to apply colors, define **theme** settings in **excelExportProperties** object and pass it as a parameter to the [excelExport](#) method.

By default, material theme is applied to exported Excel document.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 320,
    allowExcelExport: true
});
pivotTableObj.appendTo('#PivotTable');
var exportBtn = new ej.buttons.Button({ isPrimary: true });
exportBtn.appendTo('#excel');
document.getElementById('excel').onclick = function () {
    var excelExportProperties = {
        theme: {
            header: { fontName: 'Segoe UI', fontColor: '#666666' },
            record: { fontName: 'Segoe UI', fontColor: '#666666' },
            caption: { fontName: 'Segoe UI', fontColor: '#666666' }
        }
    };
    pivotTableObj.excelExport(excelExportProperties);
};

Changing the file name while exporting

The Excel export provides an option to change file name of the document before exporting. In-order to change the file name, define **fileName** property in **excelExportProperties** object and pass it as a parameter to the [excelExport](#) method.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,

CSV Export

Also, the Excel export allows pivot table data to be exported in CSV file format. To export pivot table in CSV file format, you need to use the `csvExport` method.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 320,
    allowExcelExport: true
});
pivotTableObj.appendTo('#PivotTable');
var exportBtn = new ej.buttons.Button({ isPrimary: true });
exportBtn.appendTo('#excel');
document.getElementById('excel').onclick = function () {
    pivotTableObj.csvExport();
};

```

```

Virtual Scroll Data

You can export the pivot table virtual scroll data as Excel/CSV document by using PivotEngine export without any performance degradation. To enable PivotEngine export in the pivot table, set the `allowExcelExport` as true. You need to use the `exportToExcel` method for PivotEngine export.

To use PivotEngine export, You need to inject the `ExcelExport` module in pivot table.

PivotEngine export will be performed while enabling virtual scrolling by default.

Virtual Scroll Data Excel Export

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,

```

```

        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 320,
    allowExcelExport: true
});
pivotTableObj.appendTo('#PivotTable');
var exportBtn = new ej.buttons.Button({ isPrimary: true });
exportBtn.appendTo('#excel');
document.getElementById('excel').onclick = function () {
    pivotTableObj.excelExportModule.exportToExcel('Excel');
};

Export all pages

The pivot engine exports the entire virtual data of the pivot table (i.e. the data that contains all of the records used to render the complete pivot table) as an Excel/CSV document. To export just the current viewport of the pivot table, set the [exportAllPages](#) property to **false**. To use the pivot engine export, add the **ExcelExport** module into the pivot table.

By default, the pivot engine export will be performed while virtual scrolling is enabled.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: true,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:

Events

ExcelQueryCellInfo

The event `excelQueryCellInfo` triggers while framing each row and value cell during Excel export. It allows the user to customize the cell value, style etc. of the current cell. It has the following parameters:

- **value** - It holds the cell value.
- **column** - It holds column information for the current cell.
- **data** - It holds the entire row data across the current cell.
- **style** - It holds the style properties for the cell.

INDEX.JS

```

ExcelHeaderQueryCellInfo

The event `excelHeaderQueryCellInfo` triggers on framing each header cell during Excel export. It allows the user to customize the cell value, style etc. of the current cell. It has the following parameters:

- `cell` - It holds the current cell information.
- `style` - It holds the style properties for the cell.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 350,
    gridSettings: {
        columnWidth: 120,
        excelHeaderQueryCellInfo: function (args) {
            // triggers every time for header cell while rendering
        },
    }
});
pivotTableObj.appendTo('#PivotTable');

```

ExportComplete

The event [exportComplete](#) is triggered after the pivot table data has been exported to an Excel/CSV document. You can use this event to acquire blob stream data for further customization and processing at your end by passing the `isBlob` parameter as **true** when using the [excelExport](#) method. It has the following parameters:

- **type** - It holds the current export type such as PDF, Excel, and CSV.
- **promise** - It holds the promise object for blob data.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: true,

Pdf export in EJ2 JavaScript Pivotview control

PDF export allows exporting pivot table data as PDF document. To enable PDF export in the pivot table, set the `allowPdfExport` as true. You need to use the `pdfExport` method for PDF exporting.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 320,

```

```

        allowPdfExport: true
    });
    pivotTableObj.appendTo('#PivotTable');
    var exportBtn = new ej.buttons.Button({ isPrimary: true });
    exportBtn.appendTo('#pdf');
    document.getElementById('pdf').onclick = function () {
        pivotTableObj.pdfExport();
    };

```

Multiple pivot table exporting

PDF export provides an option for exporting multiple pivot tables to same file. In this exported document, each pivot table will be exported to new page of document in same file.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 300,
    allowPdfExport: true
});
var pivotTableObj2 = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        rows: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        columns: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 300,
    allowPdfExport: true
});
pivotTableObj.appendTo('#PivotTable');
pivotTableObj2.appendTo('#PivotTable2');
var exportBtn = new ej.buttons.Button({ isPrimary: true });
exportBtn.appendTo('#pdf');
document.getElementById('pdf').onclick = function () {
    var firstGridPdfExport = pivotTableObj.grid.pdfExport({}, true);
    firstGridPdfExport.then(function (pdfData) {
        pivotTableObj2.pdfExport({}, false, pdfData);
    });
};

```

Export table and chart into the same document

When the [displayOption](#) is set to **Both**, you can export both the table and the chart into the same PDF document. To achieve this, use the [pdfExport](#) method and set the `exportBothTableAndChart` parameter to **true**.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  allowPdfExport: true,
  displayOption: { view: 'Both', primary: 'Table' },
  chartSettings: {
    value: 'Amount', enableExport: true, chartSeries: { type: 'Column' }
  },
  height: 320,
});
pivotTableObj.appendTo('#PivotTable');
var exportBtn = new ej.buttons.Button({ isPrimary: true });
exportBtn.appendTo('#pdf');
document.getElementById('pdf').onclick = function () {
  pivotTableObj.pdfExport(null, false, null, false, true);
};
```

Customization during PDF export

PDF export provides option to customize mapping of pivot table to the exported PDF document.

To add header and footer while exporting

You can customize text, page number, line, page size and changing orientation in header and footer of the exported document.

To add a text in header/footer

You can add text either in header or footer of the exported PDF document like in the below code example.

```

`js
var pdfExportProperties = {
header: {
fromTop: 0,
height: 130,
contents: [
{

```

```

type: 'Text',
value: "Northwind Traders",
position: { x: 0, y: 50 },
style: { textBrushColor: '#000000', fontSize: 13 }
},
]
}
}
,

```

To draw a line in header/footer

You can add line either in header or footer of the exported PDF document like in the below code example.

Supported line styles:

- dash
- dot
- dashdot
- dashdotdot
- solid

```

`js
var pdfExportProperties = {
header: {
fromTop: 0,
height: 130,
contents: [
{
type: 'Line',
style: { penColor: '#000080', penSize: 2, dashStyle: 'Solid' },
points: { x1: 0, y1: 4, x2: 685, y2: 4 }
}
]
}
}
,

```

[Add page number in header/footer](#)

You can add page number either in header or footer of exported PDF document like in the below code example.

Supported page number types:

- LowerLatin - a, b, c,
- UpperLatin - A, B, C,
- LowerRoman - i, ii, iii,
- UpperRoman - I, II, III,
- Number - 1,2,3.

```
`js
var pdfExportProperties = {
  header: {
    fromTop: 0,
    height: 130,
    contents: [
      {
        type: 'PageNumber',
        pageNumberType: 'Arabic',
        format: 'Page {$current} of {$total}', //optional
        position: { x: 0, y: 25 },
        style: { textBrushColor: '#ffff80', fontSize: 15, hAlign: 'Center' }
      }
    ]
  }
},
`
```

The below code illustrates the PDF export customization options.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
```

```

        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 320,
    allowPdfExport: true
});
pivotTableObj.appendTo('#PivotTable');
var exportBtn = new ej.buttons.Button({ isPrimary: true });
exportBtn.appendTo('#pdf');
document.getElementById('pdf').onclick = function () {
    var pdfExportProperties = {
        header: {
            fromTop: 0,
            height: 130,
            contents: [
                {
                    type: 'Text',
                    value: "Pivot Grid",
                    position: { x: 0, y: 50 },
                    style: { textBrushColor: '#000000', fontSize: 13,
dashStyle: 'Solid', hAlign: 'Center' }
                }
            ]
        },
        footer: {
            fromBottom: 160,
            height: 150,
            contents: [
                {
                    type: 'PageNumber',
                    pageNumberType: 'Arabic',
                    format: 'Page { $current } of { $total }',
                    position: { x: 0, y: 25 },
                    style: { textBrushColor: '#02007a', fontSize: 15 }
                }
            ]
        }
    };
    pivotTableObj.pdfExport(pdfExportProperties);
};

```

INDEX.HTML

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Add an image in header/footer

You can add image (Base64 string) either in header or footer of the exported PDF document like in the below code example.

```

`js
var pdfExportProperties = {
header: {
fromTop: 0,
height: 130,
contents: [
{
type: 'Image',

```

```

src: image,
position: { x: 20, y: 10 },
size: { height: 100, width: 100 },
}
]
}
}
,

```

The below code illustrates the PDF export customization options.

INDEX.TS

```

import { PivotView, IDataset } from '@syncfusion/ej2-pivotview';
import { PdfExportProperties } from '@syncfusion/ej2-grids';
import { Button } from '@syncfusion/ej2-buttons';
import { pivotData } from './datasource.ts';
import { image } from './image.ts';
let pivotTableObj: PivotView = new PivotView({
    dataSourceSettings: {
        dataSource: pivotData as IDataset[],
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],

```

Changing page orientation while exporting

The PDF export provides an option to change page orientation of the document before exporting. In order to change the page orientation, define **pageOrientation** property in **pdfExportProperties** object and pass it as a parameter to the [pdfExport](#) method. By default, the page orientation will be in **Portrait** and it can be changed to **Landscape** based on user requirement.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 320,
    allowPdfExport: true
});
pivotTableObj.appendTo('#PivotTable');

```

```

var exportBtn = new ej.buttons.Button({ isPrimary: true });
exportBtn.appendTo('#pdf');
document.getElementById('pdf').onclick = function () {
    var pdfExportProperties = {
        pageOrientation: 'Landscape'
    };
    pivotTableObj.pdfExport(pdfExportProperties);
};

```

Changing document width and height while exporting

Before exporting, you can change the height and width of the PDF document. To achieve this, use the **height** and **width** properties in the [beforeExport](#) event.

This option is only available if [enableVirtualization](#) is set to **true**. In addition, the [VirtualScroll](#) and [PDFExport](#) modules must be injected into the pivot table.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,

```

```

        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    allowPdfExport: true,
    enableVirtualization: true,
    height: 320,
    beforeExport: function (args) {
        args.width = pivotTableObj.element.offsetWidth;
        args.height = pivotTableObj.element.offsetHeight;
    },
});
pivotTableObj.appendTo('#PivotTable');
var exportBtn = new ej.buttons.Button({ isPrimary: true });
exportBtn.appendTo('#pdf');
document.getElementById('pdf').onclick = function () {
    pivotTableObj.pdfExport();
};

```

Customize the table column count while exporting

Before exporting, you can split and export the pivot table columns on each page of the PDF document by using the **columnSize** property in the [beforeExport](#) event.

This option is only available if [enableVirtualization](#) is set to **true**. In addition, the **VirtualScroll** and **PDFExport** modules must be injected into the pivot table.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    allowPdfExport: true,
    enableVirtualization: true,
    height: 320,
    beforeExport: function (args) {
        args.columnSize = 6;
    },
});
pivotTableObj.appendTo('#PivotTable');
var exportBtn = new ej.buttons.Button({ isPrimary: true });
exportBtn.appendTo('#pdf');
document.getElementById('pdf').onclick = function () {

```

```

    pivotTableObj.pdfExport();
};

```

INDEX.HTML

```

</body></html>

```

Changing the table's column width and row height while exporting

You can change the column width and row height in the PDF document during the pivot table export by using the [onPdfCellRender](#) event. Within this event, the `args.column.width` property allows you to change the width of specific columns.

As shown in the code example below, the “Unit Sold” column under “FY 2015” is changed to a width of 60 pixels.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  allowPdfExport: true,
  enableVirtualization: true,
  height: 320,
  onPdfCellRender: function (args) {
    if (args.pivotCell && args.pivotCell.valueSort &&
args.pivotCell.valueSort.levelName === 'FY 2015.Units Sold') {
      args.column.width = 60
    }
  },
});
pivotTableObj.appendTo('#PivotTable');
var exportBtn = new ej.buttons.Button({ isPrimary: true });
exportBtn.appendTo('#pdf');
document.getElementById('pdf').onclick = function () {
  pivotTableObj.pdfExport({}, false, null, false, true);
};
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Pivot Grid</title>
  <meta charset="utf-8">

<body>

    <div id="container">
        <input id="pdf" type="button" value="PDF Export" name="PDF Export">
        <div id="PivotTable"></div>
        <br>
        <div id="PivotTable2"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Similarly, you can change the height of specific rows in the PDF document by using the `args.cell.height` property in the [onPdfCellRender](#) event.

As shown in the code example below, the “**Mountain Bikes**” row under “**France**” is changed to a height of **30** pixels.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],

```

```

        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    allowPdfExport: true,
    enableVirtualization: true,
    height: 320,
    onPdfCellRender: function (args) {
        if (args.pivotCell && args.pivotCell.valueSort &&
args.pivotCell.valueSort.levelName === 'France.Mountain Bikes') {
            args.cell.height = 30
        }
    },
});
pivotTableObj.appendTo('#PivotTable');
var exportBtn = new ej.buttons.Button({ isPrimary: true });
exportBtn.appendTo('#pdf');
document.getElementById('pdf').onclick = function () {
    pivotTableObj.pdfExport({}, false, null, false, true);
};

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Pivot Grid</title>

type="text/javascript"></script>

```

```

<script src="es5-datasource.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type="text/javascript"></script>
</head>
<body>

    <div id="container">
        <input id="pdf" type="button" value="PDF Export" name="PDF Export">
        <div id="PivotTable"></div>
        <br>
        <div id="PivotTable2"></div>
    </div>
</script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

This option is only available if [enableVirtualization](#) is set to **true**. In addition, the **VirtualScroll** and **PDFExport** modules must be injected into the pivot table.

Changing the pivot table style while exporting

The PDF export provides an option to change colors for headers, caption and records in pivot table before exporting. In-order to apply colors, define **theme** settings in **pdfExportProperties** object and pass it as a parameter to the [pdfExport](#) method.

By default, material theme is applied to exported PDF document.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name: 'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount', caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 320,
    allowPdfExport: true
});
pivotTableObj.appendTo('#PivotTable');
var exportBtn = new ej.buttons.Button({ isPrimary: true });
exportBtn.appendTo('#pdf');
document.getElementById('pdf').onclick = function () {
    var pdfExportProperties = {
        theme: {
            header: {

```

```

        fontColor: '#64FA50', fontName: 'Calibri', fontSize: 17,
bold: true, borders: { color: '#64FA50', lineStyle: 'Thin' }
    },
    record: {
        fontColor: '#64FA50', fontName: 'Calibri', fontSize: 17,
bold: true
    },
    caption: {
        fontColor: '#64FA50', fontName: 'Calibri', fontSize: 17,
bold: true
    }
}
};
pivotTableObj.pdfExport(pdfExportProperties);
};

```

        <br>
        <div id="PivotTable2"></div>
    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

<!-- markdownlint-disable MD009 -->

Changing default font while exporting

By default, the pivot table uses "Helvetica" font in the exported document. But it can be changed using the [theme](#) property in [pdfExportProperties](#).

The available built-in fonts are,

- Helvetica
- TimesRoman
- Courier
- Symbol
- ZapfDingbats

```
`js
```

```

var pdfExportProperties = {
  theme: {
    header: { font: new ej.pdfexport.PdfStandardFont(ej.pdfexport.PdfFontFamily.TimesRoman, 11,
    ej.pdfexport.PdfFontStyle.Bold) },
    caption: { font: new ej.pdfexport.PdfStandardFont(ej.pdfexport.PdfFontFamily.TimesRoman, 9) },
    record: { font: new ej.pdfexport.PdfStandardFont(ej.pdfexport.PdfFontFamily.TimesRoman, 10) }
  }
};
`

```

Adding custom font while exporting

In addition to existing built-in fonts, custom fonts can also be used. The custom font should be in **Base64** format and mention it in **PdfTrueTypeFont** class. In the following example, we have used **Advent Pro** font family that supports **Hungarian** language.

INDEX.JS

```

var pivotTableObj = new ej.pivottview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,

```

```

        expandAll: false,
        enableSorting: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 320,
    allowPdfExport: true
});
pivotTableObj.appendTo('#PivotTable');
var exportBtn = new ej.buttons.Button({ isPrimary: true });
exportBtn.appendTo('#pdf');
document.getElementById('pdf').onclick = function () {
    var pdfExportProperties = {
        theme: {
            header: { font: new
ej.pdfexport.PdfTrueTypeFont(window.base64AlgeriaFont, 11) },
            caption: { font: new
ej.pdfexport.PdfTrueTypeFont(window.base64AlgeriaFont, 9) },
            record: { font: new
ej.pdfexport.PdfTrueTypeFont(window.base64AlgeriaFont, 10) }
        }
    };
    pivotTableObj.pdfExport(pdfExportProperties);
};

```

INDEX.HTML

```

        <div id="PivotTable"></div>
        <br>
        <div id="PivotTable2"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The non-English alphabets can also be exported properly by setting its appropriate font.

Virtual Scroll Data

You can export the pivot table virtual scroll data as PDF document by using PivotEngine export without any performance degradation. To enable PivotEngine export in the pivot table, set the `allowPdfExport` as true. You need to use the `exportToPDF` method for PivotEngine export.

To use PivotEngine export, You need to inject the `PDFExport` module in pivot table.

PivotEngine export will be performed while enabling virtual scrolling by default

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 320,
    allowPdfExport: true

```

```
});
pivotTableObj.appendTo('#PivotTable');

Repeat row headers

Repeat row headers on each page can be achieved using PivotEngine export option. To disable repeat row headers, you need to set `allowRepeatHeader` to **false** in `beforeExport` event. You need to use the `exportToPDF` method for PivotEngine export.

To use PivotEngine export, You need to inject the `PDFExport` module in pivot table.

By default, repeat row headers is enabled in the PivotEngine export.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: false,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  beforeExport: function(args) {
    args.allowRepeatHeader = false;
  },
  height: 320,
  allowPdfExport: true
});
pivotTableObj.appendTo('#PivotTable');
var exportBtn = new ej.buttons.Button({ isPrimary: true });
exportBtn.appendTo('#pdf');
document.getElementById('pdf').onclick = function () {
  pivotTableObj.pdfExportModule.exportToPDF();
};

```

```

Export all pages

The pivot engine exports the entire virtual data of the pivot table (i.e. the data that contains all of the records used to render the complete pivot table) as a PDF document. To export just the current viewport of the pivot table, set the [exportAllPages](#) property to **false**. To use the pivot engine export, add the **PDFExport** module into the pivot table.

By default, the pivot engine export will be performed while virtual scrolling is enabled.

INDEX.JS

```

Events

PdfQueryCellInfo

The event `pdfQueryCellInfo` triggers on framing each row and value cell during PDF export. It allows the user to customize the cell value, style etc. of the current cell. It has the following parameters:

- **value** - It holds the cell value.
- **column** - It holds column information for the current cell.
- **data** - It holds the entire row data across the current cell.
- **style** - It holds the style properties for the cell.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 350,
    gridSettings: {
        columnWidth: 120,
        pdfQueryCellInfo: function (args) {
            // triggers every time for header cell while rendering
        },
    }
});
pivotTableObj.appendTo('#PivotTable');

```

ExportComplete

The event [exportComplete](#) is triggered after the pivot table data has been exported to an PDF document. You can use this event to acquire blob stream data for further customization and processing at your end by passing the `isBlob` parameter as `true` when using the [pdfExport](#) method. It has the following parameters:

- `type` - It holds the current export type such as PDF, Excel, and CSV.
- `promise` - It holds the promise object for blob data.

INDEX.JS

```

var pivotTableObj = new ej.pivotview.PivotView({
    dataSourceSettings: {
        dataSource: pivotData,
        expandAll: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],

```

```

        columns: [{ name: 'Year', caption: 'Production Year' }, { name:

Globalization and localization in EJ2 JavaScript Pivotview control

Globalization is the combination of Internationalization and localization. You can adapt the component to various languages by parsing and formatting the date or number [Internationalization](#) & adding culture specific customization and translation to the text [Localization](#).

Internationalization

Internationalization library provides support for formatting and parsing the number, date, and time by using the official [Unicode CLDR](#) JSON data and also provides the `loadCldr` method to load the culture specific CLDR JSON data.

By default, all the Essential JS 2 component are specific to English culture ('en-US'). If you want to go with the different culture other than English, follow the below steps.

- Install the `CLDR-Data` package by using the below command (it installs the CLDR JSON data). For more information about CLDR-Data, refer to this [link](#).

```
npm install cldr-data --save
```

Once the package installed, you can find the culture specific JSON data under the location `/node_modules/cldr-data`.

- Now import the installed CLDR JSON data into the `app.ts` file. To import JSON data we need to install the JSON plugin loader. Here we have used the SystemJS JSON plugin loader.

```
npm install systemjs-plugin-json --save-dev
```

- Once installed, configure the `system.config.js` configuration settings as like below to map the `systemjs-plugin-json` loader.

```
`ts
System.config({
  paths: {
    'syncfusion:': './node_modules/@syncfusion/'
  },
  map: {
    app: 'app',
    //Syncfusion packages mapping
    '@syncfusion/ej2-base': 'syncfusion:ej2-base/dist/ej2-base.umd.min.js',
    '@syncfusion/ej2-data': 'syncfusion:ej2-data/dist/ej2-data.umd.min.js',
    '@syncfusion/ej2-inputs': 'syncfusion:ej2-inputs/dist/ej2-inputs.umd.min.js',
    '@syncfusion/ej2-buttons': 'syncfusion:ej2-buttons/dist/ej2-buttons.umd.min.js',

```

```
"@syncfusion/ej2-pivotview": "syncfusion:ej2-pivotview/dist/ej2-pivotview.umd.min.js"
},
meta: {
  '*.json': { loader: 'plugin-json' }
},
packages: {
  'app': { main: 'app', defaultExtension: 'js' },
  'cldr-data': { main: 'index.js', defaultExtension: 'js' }
}
});
System.import('app');
`
```

- Now import the required culture from the installed location to `app.ts` file, like the below code snippets.

```
`ts
//import the loadCldr from ej2-base
import { loadCldr } from '@syncfusion/ej2-base';
loadCldr(
  require('cldr-data/supplemental/numberingSystems.json'),
  require('cldr-data/main/fr-CH/ca-gregorian.json'),
  require('cldr-data/main/fr-CH/numbers.json'));
require('cldr-data/main/fr-CH/timeZoneNames.json'));
`
```

The Internationalization library is used to globalize number, date, and time values in pivot table component using the `dataSourceSettings.formatSettings` option.

- Set the culture by using the `locale` property.

INDEX.TS

```
import { loadCldr, L10n, setCulture, setCurrencyCode } from
 '@syncfusion/ej2-base';
import * as currencies from './currencies.json';
import * as caGregorian from './ca-gregorian.json';
import * as numbers from './numbers.json';

</body></html>

```

* In the above sample, Amount field is formatted by [NumberFormatOptions](#). For date formats, the value strings are formatted by [DateFormatOptions](#).

* By default, locale value is en-US. If you want to change the en-US culture to a different culture, you have to change the locale accordingly.

* Also, you will find more details about support format string for number formats and data formats [here](#).

Decimal separators

<!-- markdownlint-disable MD009 -->

The decimal separators of pivot table values varies based on the culture applied to the component. The culture can be set by calling the method [setCulture](#) with appropriate culture string as its parameter.

The following example demonstrates the decimal separators in Deutsch culture.

INDEX.TS

```

Localization

The [Localization](#) library allows you to localize default text content of the pivot table. The pivot table component has static text on some features (like drop area text, pivot field list title, etc...) that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the

locale value and translation object.

The following list of properties and its values are used in the pivot table.

Locale keywords | Text

staticFieldList | Pivot Field List

fieldList | Field List

dropFilterPrompt | Drop filter here

dropColPrompt | Drop column here

dropRowPrompt | Drop row here

dropValPrompt | Drop value here

addPrompt | Add field here

adaptiveFieldHeader | Choose field

centerHeader | Drag fields between axes below:

add | add

drag | Drag

filter | Filter

filtered | Filtered

sort | Sort

remove | Remove

filters | Filters

rows | Rows

columns | Columns

values | Values

calculatedField | Calculated Field

createCalculatedField | Create Calculated Field

fieldName | Enter the field name

error | Error

invalidFormula | Invalid formula.

dropText | Example: ("Sum(OrderCount)" + "Sum(InStock)") * 250

dropTextMobile | Add fields and edit formula here.

dropAction | Calculated field cannot be place in any other region except value axis.

search | Search

close | Close

cancel | Cancel

delete | Delete

alert | Alert

warning | Warning

ok | OK

sum | Sum

average | Average

count | Count

min | Min

max | Max

allFields | All Fields

formula | Formula

fieldExist | A field already exists in this name. Please enter a different name.

confirmText | A calculation field already exists in this name. Do you want to replace it?

noMatches | No matches

format | Summaries values by

edit | Edit

clear | Clear

formulaField | Drag and drop fields to formula

dragField | Drag field to formula

Loading Translations

To load translation object in an application, use [load](#) function of the [L10n](#) class.

The following example demonstrates the pivot table in **Deutsch** culture.

INDEX.TS

```
import { L10n } from '@syncfusion/ej2-base';
import { PivotView, IDataset, FieldList } from '@syncfusion/ej2-pivotview';
```

```

import { pivotData } from './datasource.ts';
L10n.load({
  'de-DE': {
    'pivotview': {
      'grandTotal': 'Gesamtsumme',
      'total': 'Insgesamt',
      'value': 'Wert',
      'noValue': 'Kein Wert',
      'row': 'Zeile',
      'column': 'Spalte',
      'collapse': 'Zusammenbruch',
      'expand': 'Erweitern'
    },
    'pivotfieldlist': {
      'fieldList': 'Feld Liste',
      'dropRowPrompt': 'Drop Reihe hier',
      'dropColPrompt': 'Drop column Hier',
      'dropValPrompt': 'Drop wert hier',
      'dropFilterPrompt': 'Drop Filter Hier',
      'addPrompt': 'Feld hinzufügen',
      'centerHeader': 'Ziehen Sie die Felder zwischen den Bereichen
unten:',
      'add': 'Hinzufügen',
      'drag': 'Ziehen',
      'filters': 'Filter',
      'rows': 'Zeilen',
      'columns': 'Spalten',
      'values': 'Werte',
      'error': 'Fehler',
      'dropAction': 'Berechnetes Feld nicht in jeder anderen Region
außer Wert Achse sein.',
      'search': 'Suche',
      'close': 'Schließen',
      'cancel': 'Abbrechen',
      'delete': 'Löschen',
      'alert': 'Warnung',
      'warning': 'Warnung',
      'ok': 'OK',
      'allFields': 'Alle Felder',
      'noMatches': 'Keine Treffer'
    }
  }
});
PivotView.Inject(FieldList);
let pivotTableObj: PivotView = new PivotView({
  dataSourceSettings: {
    dataSource: pivotData as IDataSet[],
    expandAll: false,
    enableSorting: true,
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  }
});

```

```

    },
    locale: 'de-DE',
    showFieldList: true,
    height: 350
  });
  pivotTableObj.appendTo('#PivotTable');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

  </div>
</body>
</html>

```

```

var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Right-to-left (RTL)

RTL provides an option to switch the text direction and layout of the pivot table component from right to left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Farsi, Urdu, etc...). To enable RTL pivot table, set the `enableRtl` property to **true**.

INDEX.TS

```

import { L10n } from '@syncfusion/ej2-base';
import { PivotView, IDataset, FieldList } from '@syncfusion/ej2-pivotview';
import { pivotData } from './datasource.ts';
L10n.load({
    'ar-AE': {
        'pivotview': {
            'grandTotal': 'المجموع الكلي',
            'total': 'المجموع',
            'value': 'القيمة',
            'noValue': 'لا قيمة لها',

Accessibility in Javascript Pivotview component

The pivot table component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the pivot table component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

```

| Mobile Device Support |  |
| Keyboard Navigation Support |  |
| Accessibility Checker Validation |  |
| Axe-core Accessibility Validation |  |
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>
<div> - All
features of the component meet the requirement.</div>
<div> - Some features of the component do not meet the requirement.</div>
<div> - The component does not meet the requirement.</div>

```

WAI-ARIA attributes

[WAI-ARIA](#) (Accessibility Initiative – Accessible Rich Internet Applications) defines a way to increase the accessibility of web pages, dynamic content, and user interface components developed with Ajax, HTML, JavaScript, and related technologies. ARIA provides additional semantics to describe the role, state, and functionality of web components. The following ARIA attributes are used in the pivot table component:

Attributes	Purpose
---	---
role=grid	Attribute added to identify the grid component element within the pivot table element.
role=region	Attribute added to identify the chart component element within the pivot table element.
role=button	This attribute is added to the pager navigation buttons as well as the buttons in the dialog popup such as field list, calculated field, member editor, conditional formatting of pivot table component to indicate that it is a clickable element.
role=table	This attribute is added to each conditional formatting style container element to denote it as a table.
role=tableItems	This attribute is added to the container element that appears inside the number formatting popup to indicate it as a table.

| **aria-disabled** | The buttons within the dialog popups, such as field list, calculated field and member editor, will be disabled based on their usability. To indicate its disabled state, we will add this attribute with the values **true**. By default, the attribute value is set to **false**. |

| **aria-label** | This attribute is added to label elements that are placed inside the pager, member editor popup, and calculated field popup to identify them as label elements. |

| **aria-selected** | This attribute is added to the selected treeview item in the calculated field popup with the value as **true** to denote that it is a selected element. |

| **aria-colspan** | This attribute is added to the **th** elements in the **e-table**, which represent the column span value. |

| **aria-rowspan** | This attribute is added to the **th** elements in the **e-table**, which represent the row span value. |

| **data-type** | This attribute is added to the treeview item in the calculated field popup, as well as the buttons in the grouping bar and field list. It represents the aggregate type for the specified field. |

| **data-caption** | This attribute is added to the treeview item in the calculated field popup, as well as the buttons in the grouping bar and field list. It represents the caption for the specified field. |

| **data-basefield** | This attribute is added to the treeview item in the calculated field popup, as well as the buttons in the grouping bar and field list. It denotes the base field for the specified field, which is used to display the values for aggregation types such as **DifferenceFrom**, **PercentageOfDifferenceFrom**, and **PercentageOfParentTotal**. |

| **data-baseitem** | This attribute is added to the treeview item in the calculated field popup, as well as the buttons in the grouping bar and field list. It denotes the base item for the specified field, which is used to display the values for aggregation types such as **DifferenceFrom**, **PercentageOfDifferenceFrom**, and **PercentageOfParentTotal**. |

| **data-field** | This attribute is added to the treeview item in the calculated field popup. It denotes the name of the specified field. |

| **data-membertype** | This attribute is added to the treeview item in the calculated field popup. It denotes the member type of the selected OLAP calculated field. |

| **data-hierarchy** | This attribute is added to the treeview item in the calculated field popup. It denotes the parent hierarchy unique name of the selected OLAP calculated field. |

| **data-formula** | This attribute is added to the treeview item in the calculated field popup. It denotes the formula used for the specified calculated field. |

| **data-formatString** | This attribute is added to the treeview item in the calculated field popup. It denotes the format string used for the specified calculated field. |

| **data-customformatstring** | This attribute is added to the treeview item in the calculated field popup. It denotes the custom format string used for the specified calculated field. |

Keyboard interaction

The pivot table component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Message component.

| **Press** | **To do this** |

| --- | --- |

| **Tab / Shift + Tab** | **To focus the close icon in the message.** |

| **Enter / Space** | **Closes the focused close icon's message.** |

Pivot Table

| **Press** | **To do this** |

| --- | --- |

| **Tab** | **Moves the cell focus right side. If no cells are focused, it moves to the next active element in the browser page.** |

| **Shift + Tab** | **Moves the cell focus left side. If no cells are focused, it moves to the previous active element in the browser page.** |

| **DownArrow** | **Moves the cell focus downwards. If the selection is enabled in the pivot table, then it will move downwards to select next row or column or individual cell.** |

| **UpArrow** | **Moves the cell focus upwards. If the selection is enabled in the pivot table, then it will move upwards to select previous row or column or individual cell.** |

| **LeftArrow** | **Moves the cell focus left side. If the selection is enabled in the pivot table, then it will move left side to select previous row or column or individual cell.** |

| **RightArrow** | **Moves the cell focus right side. If the selection is enabled in the pivot table, then it will move right side to select next row or column or individual cell.** |

| **Shift + DownArrow** | **Extends the cell selection downwards.** |

| **Shift + UpArrow** | **Extends the cell selection selection upwards.** |

| **Shift + LeftArrow** | **Extends the cell selection to the left side.** |

| **Shift + RightArrow** | **Extends the cell selection to the right side.** |

| **Ctrl + A** | **Selects all cells.** |

| **Esc** | **Deselects all cells. If the current active element is a context menu, then the context menu popup will be closed.** |

| **Home** | **Goes to the first cell in the current row.** |

| **End** | **Goes to the last cell in the current row.** |

| **Ctrl + Home** | **Goes to the first cell in the table.** |

| **Ctrl + End** | **Goes to the last cell in the table.** |

| **Enter** | **If the current cell is an expand/collapse cell, it performs expand/collapse operation (drill operation). If the current row/column header is in value sort state, it performs value sorting. If the current cell is in selection state, it moves to the next row, column or individual cell. If drill-through or editing is enabled in the pivot table, the drill-through dialog will be**

opened based on the selected value cell. If the current active element is a context menu popup, menu selection will be performed. |

| Shift + Enter | If value sorting is enabled in the pivot table and the current cell is a header with respect to its value axis, it performs value sorting to either ascending or descending order. If the current cell is in selection state, it moves to the previous row, column or individual cell. |

| Ctrl + Enter | If hyperlink is enabled in the current cell, it performs hyperlink selection. |

| Shift + F10 or Menu | If context menu is enabled in the pivot table, the context menu popup will be opened in the current cell. |

Field List

| Press | To do this |

| --- | --- |

| Shift + Ctrl + F | If the popup field list is enabled in either the pivot table or the pivot chart, the field list dialog will be opened. |

| Tab | Moves to the next active element in the field list. If no active elements present, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element in the field list. If no active elements present, it moves to the previous active element in the browser page. |

| Shift + F | If the current active element is a field's button and if it has a filter icon, the filter dialog will open to perform filtering. |

| Shift + S | If the current active element is a field's button and if it has a sort icon, the sorting will be performed to the selected field. |

| Shift + E | If the current active element is a calculated field's button and if it has an edit icon, the calculated field dialog will be opened to perform editing the selected calculated field. |

| Enter | Performs the selection operation of the current active element. If the current active element is a field's button and it has a dropdown icon, the aggregation menu will open to perform calculations using aggregation options to the selected value field. |

| Delete | If the current active element is a field's button, the selected field will be removed from the current report. |

| DownArrow | If the current active element is a tree node, it moves to the next node. |

| UpArrow | If the current active element is a tree node, it moves to the previous node. |

| LeftArrow | If the current active element is a tree node, it collapses the current node. |

| RightArrow | If the current active element is a tree node, it expands the current node. |

| Home | If the current active element is a tree node, it goes to the first node. |

| End | If the current active element is a tree node, it goes to the last node. |

| Space | If the current active element is a tree node or a checkbox element, it will be either checked or unchecked. |

| Esc or Escape | Closes the popup field list dialog. |

Grouping Bar

| Press | To do this |

| --- | --- |

| Tab | Moves to the next active element (field's button) in the grouping bar. If no active elements present, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element (field's button) in the grouping bar. If no active elements present, it moves to the previous active element in the browser page. |

| Shift + F | If the current active element is a field's button and if it has a filter icon, the filter dialog will be opened to perform filtering. |

| Shift + S | If the current active element is a field's button and if it has a sort icon, the sorting will be performed to the selected field. |

| Shift + E | If the current active element is a calculated field's button and if it has an edit icon, the calculated field dialog will be opened to perform editing the selected calculated field. |

| Enter | Performs the selection operation of the current active element. If the current active element is a field's button and if it has a dropdown icon, the aggregation menu will be opened to perform calculations using aggregation options to the selected value field. |

| Delete | If the current active element is a field's button, the selected field will be removed from the current report. |

| DownArrow | If the current active element is a dropdown list, the next item will be selected. |

| UpArrow | If the current active element is a dropdown list, the previous item will be selected. |

| Home | If the current active element is a dropdown list, the first item will be selected. |

| End | If the current active element is a dropdown list, the last item will be selected. |

| Alt + Down | If the current active element is a dropdown list, the popup will be opened. |

| Alt + Down | If the current active element is a dropdown list, the popup will be closed. |

| Esc or Escape | Closes the dropdown list.

Filter Dialog

| Press | To do this |

| --- | --- |

| Shift + F | If the current active element is a field's button and if it has a filter icon in either the field list or grouping bar UI, the filter dialog will be opened to perform filtering. |

| Tab | Moves to the next active element in the filter dialog. If no active elements present, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element in the filter dialog. If no active elements present, it moves to the previous active element in the browser page. |

| DownArrow | If the current active element is a tree node, it moves to the next node. |

| UpArrow | If the current active element is a tree node, it moves to the previous node. |

| LeftArrow | If the current active element is a tree node, it collapses the current node. If the current active element is a tab, it moves focus to the previous tab element. |

| RightArrow | If the current active element is a tree node, it expands the current node. If the current active element is a tab, it moves focus to the next tab element. |

| Home | If the current active element is a tree node, it goes to the first node. |

| End | If the current active element is a tree node, it goes to the last node. |

| Space | If the current active element is a tree node or a checkbox element, it will be either checked or unchecked. |

| Alt + Down | If the current active element is a DropDownList or DatePicker or DateTimePicker, the popup will be opened. |

| Alt + Up | If the current active element is a DropDownList or DatePicker or DateTimePicker, the popup will be closed. |

| Enter | Performs the selection operation of the current active element. If the current active element is a tab, the current tab element will be selected. If the current active element is a tree node, the current node will be either checked or unchecked. If the current active element is DropDownList, the focus item will be selected, and the popup list will close when it is open. Otherwise, toggles the popup list. |

| Esc or Escape | Closes the filter dialog. |

Calculated Field Dialog

| Press | To do this |

| --- | --- |

| Shift + E | If the current active element is a field's button and if it has an edit icon in either the field list or grouping bar UI, the calculated field dialog will be opened to perform editing the selected calculated field. |

| Tab | Moves to the next active element in the calculated field dialog. If no active elements present, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element in the calculated field dialog. If no active elements present, it moves to the previous active element in the browser page. |

| DownArrow | If the current active element is a tree node, it moves to the next node. |

| UpArrow | If the current active element is a tree node, it moves to the previous node. |

| LeftArrow | If the current active element is a tree node, it collapses the current node. |

| RightArrow | If the current active element is a tree node, it expands the current node. If the current active element is a tree node and has a menu icon, the aggregation menu will be opened to select appropriate aggregation type to the selected field. |

| Home | If the current active element is a tree node, it goes to the first node. |

| End | If the current active element is a tree node, it goes to the last node. |

| Enter | Performs the selection operation of the current active element. If the current active element is a tree node, it copies the selected field name/formula to the formula text area to perform calculations. |

| Esc or Escape | Closes the calculated field dialog. |

Formatting Dialog

| Press | To do this |

| --- | --- |

| Tab | Moves to the next active element in the formatting dialog. If no active elements present, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element in the formatting dialog. If no active elements present, it moves to the previous active element in the browser page. |

| DownArrow | If the current active element is a DropDownList, the next item will be selected. |

| UpArrow | If the current active element is a DropDownList, the previous item will be selected. |

| Home | If the current active element is a DropDownList, the first item will be selected. |

| End | If the current active element is a DropDownList, the last item will be selected. |

| Alt + Down | If the current active element is a DropDownList or ColorPicker, the popup will be opened. |

| Alt + Down | If the current active element is a DropDownList or ColorPicker, the popup will be closed. |

| Enter | Performs the selection operation of the current active element. |

| Esc or Escape | Closes the formatting dialog. |

Toolbar

| Press | To do this |

| --- | --- |

| Tab | Moves to the next active option in the toolbar. If no active elements present, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active option in the toolbar. If no active elements present, it moves to the previous active element in the browser page. |

| Enter | Performs the selection operation of the current active element. |

Drill-Through Dialog

| Press | To do this |

| --- | --- |

| Tab | Moves to the next active element in the drill-through dialog. If the current active element is a Grid cell, it moves the cell focus to right side. If no active elements present, then it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element in the drill-through dialog. If the current active element is a Grid cell, it moves the cell focus to left side, If no active elements present, then it moves to the previous active element in the browser page. |

| DownArrow | Moves the row/cell focus downwards. |

| UpArrow | Moves the row/cell focus upwards. |

| LeftArrow | Moves the cell focus left side. |

| RightArrow | Moves the cell focus right side. |

| Home | Goes to the first cell in the current row. |

| End | Goes to the last cell in the current row. |

| Ctrl + Home | Goes to the first cell in the table. |

| Ctrl + End | Goes to the last cell in the table. |

| Enter | Performs the selection operation of the current active element. |

| Esc or Escape | If the cell is in selected state, the it deselects all rows/cells. If the row/cell is in edit state, it cancels the current entries in the row/cell. If the current active element is not a row/cell, it closes the drill-through dialog. |

| F2 | Initiate editing a row/cell in the data grid. |

| Insert | Adds a new row/cell in the data grid. |

| Delete | Removes the selected row in the data grid. |

Some commonly used applicable key combinations and their relative functionalities in all dialogs are listed below.

| Press | To do this |

| --- | --- |

| Tab | Moves to the next active element in the dialog. If either no active elements present in the dialog or an overlay is not present in the dialog, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element in the dialog. If either no active elements present in the dialog or an overlay is not present in the dialog, it moves to the previous active element in the browser page. |

| Space | If the current active element is a tree node or a checkbox element, it will be either checked or unchecked. |

| Enter | When the Dialog button or any input (except text area) is in focus state, when pressing the Enter key, the click event associated with the primary button or button will be triggered. The Enter key will not be worked, when the dialog content contains any text area with initial focus. |

| Esc or Escape | Closes the dialog. |

Ensuring accessibility

The pivot table component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the pivot table component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the pivot table component with accessibility tools.

INDEX.JS

```
var pivotTableObj = new ej.pivotview.PivotView({
  dataSourceSettings: {
    dataSource: pivotData,
    expandAll: true,
    enableSorting: true,
    allowLabelFilter: true,
    allowValueFilter: true,

Ej1 api migration in EJ2 JavaScript Pivotview control

This article describes the API migration process of pivot table component from Essential JS 1 to Essential JS 2.

Data Binding

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Data source | **property:** dataSource

\$("#PivotGrid").ejPivotGrid({
dataSource:
data: []
}); | **property:** dataSourceSettings

var pivotGridObj = new

```
ej.pivotview.PivotView({<br/>dataSourceSettings: {<br/>dataSource:
[<br/>}}];<br/>pivotGridObj.appendTo('#PivotGrid');|
```

```
| Rows | property: rows<br/><br/>$("#PivotGrid").ejPivotGrid({<br/>dataSource: {<br/>rows:
[{fieldName: "Country",fieldCaption: "Country"}] }<br/>}); | property: rows<br/><br/>var pivotGridObj =
new ej.pivotview.PivotView({<br/> dataSourceSettings: {<br/>rows: [{ name: 'company', caption:
'Industry' }]}<br/>});<br/>pivotGridObj.appendTo('#PivotGrid');|
```

```
| Columns | property: columns<br/><br/>$("#PivotGrid").ejPivotGrid({<br/> dataSource: {<br/>columns:
[ { fieldName: "Country",fieldCaption: "Country" } ] }<br/>}); | property: columns<br/><br/>var
pivotGridObj = new ej.pivotview.PivotView({<br/> dataSourceSettings: {<br/> columns: [{ name:
'company', caption: 'Industry' }]}<br/>});<br/>pivotGridObj.appendTo('#PivotGrid');|
```

```
| Values | property: values<br/><br/>$("#PivotGrid").ejPivotGrid({<br/> dataSource: {<br/> values: [ {
fieldName: "balance", fieldCaption: "Balance($)" } ] }<br/> }); | property: values<br/><br/>var
pivotGridObj = new ej.pivotview.PivotView({<br/>dataSourceSettings: {<br/>values: [{ name: 'balance',
caption: 'Balance($)' }]}<br/>});<br/>pivotGridObj.appendTo('#PivotGrid');|
```

```
| Filters | property: filters<br/><br/>$("#PivotGrid").ejPivotGrid({<br/> dataSource: {<br/>filters: [ {
fieldName: "Country", fieldCaption: "Country" } ] }<br/> }); | property: filters<br/><br/>var pivotGridObj
= new ej.pivotview.PivotView({<br/> dataSourceSettings: {<br/>filters: [{ name: 'company', caption:
'Industry' }]}<br/>});<br/>pivotGridObj.appendTo('#PivotGrid');|
```

```
| Value axis position | Not Applicable | property: valueAxis<br/><br/>var pivotGridObj = new
ej.pivotview.PivotView({<br/>dataSourceSettings: { valueAxis:
'row'}<br/>});<br/>pivotGridObj.appendTo('#PivotGrid');|
```

Aggregation

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

```
| Summary Type | property: summaryType<br/><br/>$("#PivotGrid").ejPivotGrid({<br/> dataSource:
{<br/>values: [ {<br/> fieldName: "balance",<br/>fieldCaption: "Balance($)",<br/>summaryType:
ej.PivotAnalysis.SummaryType.Count<br/> } ] }<br/> }); | property: type<br/><br/>var pivotGridObj =
new ej.pivotview.PivotView({<br/> dataSourceSettings: {<br/> values: [{ name: 'balance', caption:
'Balance($)', type: 'Count' }]}<br/>});<br/>pivotGridObj.appendTo('#PivotGrid');|
```

Number Format

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

```
| Format settings | property: format<br/><br/>$("#PivotGrid").ejPivotGrid({<br/> dataSource: {<br/>
values: [ { fieldName: "balance", fieldCaption: "Balance($)", format: "currency" } ] }<br/> }); | property:
formatSettings<br/><br/>var pivotGridObj = new ej.pivotview.PivotView({<br/> dataSourceSettings:
{<br/>formatSettings: [{ name: 'balance', format: 'C' },<br/> { name: 'date', format: 'dd/MM/yyyy-
hh:mm', type: 'date' }]}<br/>});<br/>pivotGridObj.appendTo('#PivotGrid');|
```

Summary Customization

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Show/hide grand totals | **property:** enableGrandTotal

\$("#PivotGrid").ejPivotGrid({
enableGrandTotal: false
 }); | **property:** showGrandTotals

var pivotGridObj = new ej.pivotview.PivotView({
dataSourceSettings: {
showGrandTotals: false
}
});
pivotGridObj.appendTo('#PivotGrid');|

| Show/hide row grand totals | **property:** enableRowGrandTotal

\$("#PivotGrid").ejPivotGrid({
enableRowGrandTotal: false
}); | **property:** showRowGrandTotals

var pivotGridObj = new ej.pivotview.PivotView({
dataSourceSettings: {
showRowGrandTotals: false
}
});
pivotGridObj.appendTo('#PivotGrid');|

| Show/hide column grand totals | **property:** enableColumnGrandTotal

\$("#PivotGrid").ejPivotGrid({
enableColumnGrandTotal: false
 }); | **property:** showColumnGrandTotals

var pivotGridObj = new ej.pivotview.PivotView({
dataSourceSettings: {
showColumnGrandTotals: false
}
});
pivotGridObj.appendTo('#PivotGrid');|

| Show/hide sub-totals | Not Applicable | **property:** showSubTotals

var pivotGridObj = new ej.pivotview.PivotView({
dataSourceSettings: {
showSubTotals: false
}
});
pivotGridObj.appendTo('#PivotGrid');|

| Show/hide row sub-totals | Not Applicable | **property:** showRowSubTotals

var pivotGridObj = new ej.pivotview.PivotView({
dataSourceSettings: {
showRowSubTotals: false
}
});
pivotGridObj.appendTo('#PivotGrid');|

| Show/hide column sub-totals | Not Applicable | **property:** showColumnSubTotals

var pivotGridObj = new ej.pivotview.PivotView({
dataSourceSettings: {
showColumnSubTotals: false
}
});
pivotGridObj.appendTo('#PivotGrid');|

| Show/hide sub-totals for specific field | **property:** showSubTotal

new ej.PivotGrid(\$("#PivotGrid"){
dataSource: {
rows: [{ fieldName: "Country", showSubTotal : false}] }
}); | **property:** showSubTotals

var pivotGridObj = new ej.pivotview.PivotView({
dataSourceSettings: {
rows: [{ name: 'company', showSubTotals: false }] }
});
pivotGridObj.appendTo('#PivotGrid');|

Drill operation

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Expand All | **property:** enableCollapseByDefault

\$("#PivotGrid").ejPivotGrid({
enableCollapseByDefault:true
 }); | **property:** expandAll

var pivotGridObj = new ej.pivotview.PivotView({
dataSourceSettings: {
expandAll: false
}
});
pivotGridObj.appendTo('#PivotGrid');|

| Drill Up/Down | **property:** collapsedMembers

\$("#PivotGrid").ejPivotGrid({
collapsedMembers: { Country: ["Canada", "France"] }
}); | **property:** drilledMembers

var pivotGridObj = new ej.pivotview.PivotView({
dataSourceSettings: {
drilledMembers: [{ name: 'Country', items: ['France'] }] }
}
});
pivotGridObj.appendTo('#PivotGrid');|

Field List

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Show/hide field list pop-up button on pivot table | Not Applicable | **property:**

```
showFieldList<br><br>var pivotGridObj = new ej.pivotview.PivotView({<br> showFieldList:
true<br>});<br>pivotGridObj.appendTo('#PivotGrid');|
```

| Defer update | **property:** enableDeferUpdate

\$("#PivotGrid").ejPivotGrid({

enableDeferUpdate: true
}); | Not Applicable |

| Control initialization | **component:**

```
PivotSchemaDesigner<br><br>$("#PivotSchemaDesigner").ejPivotSchemaDesigner({});<br>| compone
nt: PivotFieldList<br><br>var fieldlistObj = new
ej.pivotview.PivotFieldList({});<br>fieldlistObj.appendTo('#FieldList');|
```

| Render mode | Not Applicable | **property:** renderMode

var fieldlistObj = new
ej.pivotview.PivotFieldList({
renderMode: 'Fixed'});
fieldlistObj.appendTo('#FieldList');|

| Show/hide calculated field button | Not Applicable | **property:** allowCalculatedField

var
fieldlistObj = new ej.pivotview.PivotFieldList({
 allowCalculatedField:
true
});
fieldlistObj.appendTo('#FieldList');|

| Show/hide value group button | Not Applicable | **property:** showValuesButton

var fieldlistObj
= new ej.pivotview.PivotFieldList({
showValuesButton:
true
});
fieldlistObj.appendTo('#FieldList');|

Grouping Bar

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Show/hide Grouping bar | **property:** enableGroupingBar

\$("#PivotGrid").ejPivotGrid({

enableGroupingBar: true
}); | **property:** showGroupingBar

var pivotGridObj = new
ej.pivotview.PivotView({
 showGroupingBar:
true
});
pivotGridObj.appendTo('#PivotGrid');|

| Grouping Bar Settings | Not Applicable | **property:** groupingBarSettings

var pivotGridObj = new
ej.pivotview.PivotView({
 groupingBarSettings: {

showFilterIcon: false,
showSortIcon:
true,
showRemoveIcon: false}
});
pivotGridObj.appendTo('#PivotGrid');|

| Show/hide value group button | Not Applicable | **property:** showValuesButton

var
pivotGridObj = new ej.pivotview.PivotView({
showValuesButton:
true
});
pivotGridObj.appendTo('#PivotGrid');|

Filtering

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Filter settings | **property:** filterItems

\$("#PivotGrid").ejPivotGrid({
 dataSource: {

rows: [{fieldName: "country",

filterItems : {
 filterType:
ej.PivotAnalysis.FilterType.Exclude,
 values: ["Canada", "France"] }
 }] }
}); | **property:**
filterSettings

var pivotGridObj = new ej.pivotview.PivotView({
 dataSourceSettings:
{
 filterSettings: [{
 name: 'eyeColor',
 type: 'Exclude', items: ['blue']
}]
});
pivotGridObj.appendTo('#PivotGrid');|

Maximum node limit in member editor

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Max node limit in member editor | **property:**

```
maxNodeLimitInMemberEditor<br/><br/>$("#PivotGrid").ejPivotGrid({<br/>
maxNodeLimitInMemberEditor: 100<br/>}); | property: maxNodeLimitInMemberEditor<br/><br/>var
pivotGridObj = new ej.pivotview.PivotView({<br/> maxNodeLimitInMemberEditor:
100<br/>});<br/>pivotGridObj.appendTo('#PivotGrid');|
```

No Data Items

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Show/hide "no data" items | Not Applicable | **property:** showNoDataItems

var pivotGridObj =
new ej.pivotview.PivotView({
 dataSourceSettings: {
 rows: [{
 name: 'eyeColor',
showNoDataItems: true }]
});
pivotGridObj.appendTo('#PivotGrid');|

Excel-like filtering

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Label filtering | **property:** enableAdvancedFilter

\$("#PivotGrid").ejPivotGrid({

enableAdvancedFilter: true,
 dataSource: {
 rows: [{ fieldName: "country",

advancedFilter : [{
 labelFilterOperator: ej.olap.LabelFilterOptions.EndsWith,
 values: ["es"]
}]
 }] }
}); | **property:** allowLabelFilter

var pivotGridObj = new
ej.pivotview.PivotView({
dataSourceSettings: {
 allowLabelFilter: true,
 filterSettings: [{

 name: 'product',
 type: 'Label',
 condition: 'Between',
 value1: 'e',
value2: 'v'
}]
});
pivotGridObj.appendTo('#PivotGrid');|

| Value filtering | **property:** enableAdvancedFilter

\$("#PivotGrid").ejPivotGrid({

enableAdvancedFilter: true,
 dataSource: {
 rows: [{ fieldName: "country",
 advancedFilter
: [{
 measure: "balance",
valueFilterOperator: ej.olap.ValueFilterOptions.GreaterThan,

values: ["200"] }]
 }]
}); | **property:** allowValueFilter

var pivotGridObj = new
ej.pivotview.PivotView({
dataSourceSettings: {
allowValueFilter: true,
filterSettings: [{

 name: 'product',
 measure: 'quantity',
 type: 'Value',
condition: 'Between',

value1: '3250',
value2: '5000' }]
});
pivotGridObj.appendTo('#PivotGrid');|

Sorting

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Enable/disable sorting | Not Applicable | **property:** enableSorting

var pivotGridObj = new
ej.pivotview.PivotView({
 dataSourceSettings: {
 enableSorting:
false
});
pivotGridObj.appendTo('#PivotGrid');|

| Sort settings | **property:** sortOrder

\$("#PivotGrid").ejPivotGrid({
dataSource: {

rows: [{
 fieldName: "Country",
 sortOrder : ej.PivotAnalysis.SortOrder.Descending }]
 }
});
 | **property:** sortSettings

var pivotGridObj = new ej.pivotview.PivotView({

dataSourceSettings: {
 sortSettings: [{
 name: 'company',
order: 'Descending' }]

});
pivotGridObj.appendTo('#PivotGrid');|

Value Sorting

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Enable/disable value sorting | Not Applicable | **property:** enableValueSorting

var pivotGridObj = new ej.pivotview.PivotView({
 enableValueSorting: true
});
pivotGridObj.appendTo('#PivotGrid');|

| Value sort settings | **property:** valueSortSettings

\$("#PivotGrid").ejPivotGrid({
valueSortSettings: {
 headerText: "Bike##Quantity",
 headerDelimiters: "##",
sortOrder: ej.PivotAnalysis.SortOrder.Descending }
});| **property:** valueSortSettings

var pivotGridObj = new ej.pivotview.PivotView({
 dataSourceSettings: {
valueSortSettings: {
headerText: 'FY 2015##Sold Amount',
headerDelimiter: '##',
 sortOrder: 'Descending' }
});
pivotGridObj.appendTo('#PivotGrid');|

Calculated Field

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Show/hide calculated field | Not Applicable | **property:** allowCalculatedField

var pivotGridObj = new ej.pivotview.PivotView({
 allowCalculatedField: true
});
pivotGridObj.appendTo('#PivotGrid');|

| Calculated field settings | **property:** values

\$("#PivotGrid").ejPivotGrid({
 dataSource: {
values: [{
 fieldName: "Amount", fieldCaption: "Amount"
}, {
 fieldName: "Price",
fieldCaption: "Price",
 isCalculatedField: true,
 formula: "Amount*15" }]
});| **property:** calculatedFieldSettings

var pivotGridObj = new ej.pivotview.PivotView({
dataSourceSettings: {
values: [{
 name: 'Total', type: 'CalculatedField' }],
 calculatedFieldSettings: [{
 name: 'Total',
 formula: "Sum(Amount)"+"Sum(Sold)" }]}
});
pivotGridObj.appendTo('#PivotGrid');|

Paging

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Paging | **property:** enablePaging

\$("#PivotGrid").ejPivotGrid({
 enablePaging : true
});| Not Applicable |

| Virtual scrolling | **property:** enableVirtualScrolling

\$("#PivotGrid").ejPivotGrid({
 enableVirtualScrolling : true
 });| **property:** enableVirtualization

var pivotGridObj = new ej.pivotview.PivotView({
 enableVirtualization: true});
pivotGridObj.appendTo('#PivotGrid');|

Conditional Formatting

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Show/hide conditional formatting | **property:** enableConditionalFormatting

\$("#PivotGrid").ejPivotGrid({
 enableConditionalFormatting: true
 });| **property:** allowConditionalFormatting

var pivotGridObj = new ej.pivotview.PivotView({
 allowConditionalFormatting: true
});
pivotGridObj.appendTo('#PivotGrid');|

| Conditional formatting settings | **property:**
conditionalFormatSettings

\$("#PivotGrid").ejPivotGrid({
conditionalFormatSettings:
[
name: "Format2",
 style: {
"color": "#000000",
 "backgroundColor":
"#0000FF",
 "bordercolor": "#000000",
"borderstyle": "Dashed",
 "borderwidth":
"5",
 "fontSize": "12",
 "fontstyle": "Algerian" },
condition:

 color: 'black',
 fontFamily: 'Tahoma',
fontSize: '12px' }

}]
});
pivotGridObj.appendTo('#PivotGrid');|

Exporting

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Excel Export | Not Applicable | **property:** allowExcelExport

var pivotGridObj = new
ej.pivotview.PivotView({
 allowExcelExport: true
});
pivotGridObj.appendTo('#PivotGrid');|

| Pdf Export | Not Applicable | **property:** allowPdfExport

var pivotGridObj = new
ej.pivotview.PivotView({
allowPdfExport: true
});
pivotGridObj.appendTo('#PivotGrid');|

Grid Customization

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Set width for pivot table | Not Applicable | **property:** width

var pivotGridObj = new
ej.pivotview.PivotView({
width: '800'
});
pivotGridObj.appendTo('#PivotGrid');|

| Set height for pivot table | Not Applicable | **property:** height

var pivotGridObj = new
ej.pivotview.PivotView({
height: '400'
});
pivotGridObj.appendTo('#PivotGrid');|

| Set row height for pivot table | Not Applicable | **property:** rowHeight

var pivotGridObj = new
ej.pivotview.PivotView({
 gridSettings: { rowHeight: 60
}
});
pivotGridObj.appendTo('#PivotGrid');|

| Set column width for pivot table | Not Applicable | **property:** columnWidth

var pivotGridObj =
new ej.pivotview.PivotView({
 gridSettings: { columnWidth: 120
}
});
pivotGridObj.appendTo('#PivotGrid');|

| Drag and drop column headers in pivot table | Not Applicable | **property:** allowReordering

var
pivotGridObj = new ej.pivotview.PivotView({
 gridSettings: { allowReordering:
true}
});
pivotGridObj.appendTo('#PivotGrid');|

| Resizing the column headers in pivot table | **property:**
enableColumnResizing

\$("#PivotGrid").ejPivotGrid({
 enableColumnResizing:
true
}); | **property:** allowResizing

var pivotGridObj = new ej.pivotview.PivotView({

gridSettings: { allowResizing: true }
});
pivotGridObj.appendTo('#PivotGrid');|

| Wrap the cell content in pivot table | Not Applicable | **property:** allowTextWrap

var
pivotGridObj = new ej.pivotview.PivotView({
 gridSettings: { allowTextWrap: true
}
});
pivotGridObj.appendTo('#PivotGrid');|

| Display cell border in pivot table | Not Applicable | **property:** gridLines

var pivotGridObj = new ej.pivotview.PivotView({
 gridSettings: { gridLines:'Vertical'
});
pivotGridObj.appendTo('#PivotGrid');|

| Cell selection | **property:** enableCellSelection

\$("#PivotGrid").ejPivotGrid({
 enableCellSelection: true
 }); | **property:** allowSelection

var pivotGridObj = new ej.pivotview.PivotView({
gridSettings: { allowSelection: true,
 selectionSettings: {
 cellSelectionMode: 'Box',
 type: 'Multiple',
 mode: 'Cell' }
});
pivotGridObj.appendTo('#PivotGrid');|

| Display overflow cell content in pivot table | Not Applicable | **property:** clipMode

var pivotGridObj = new ej.pivotview.PivotView({
gridSettings: { clipMode: 'Clip'
});
pivotGridObj.appendTo('#PivotGrid');|

| Cell Editing | **property:** enableCellEditing

\$("#PivotGrid").ejPivotGrid({
 enableCellEditing:true

});
pivotGridObj.appendTo('#PivotGrid'); |

How To

<!-- markdownlint-disable MD009 -->

Switching older themes style in EJ2 JavaScript Pivotview control

From Volume 1, 2020 onwards Syncfusion has revised the theming and layout of the Pivot Table. So, to inherit the older theme style and layout please do the necessary changes in CSS and pivot table height.

CSS Selectors

In current theme, the cells can be differentiated by their background colors. To avoid it, you need to override its background colors via simple CSS coding within your application. The below CSS selectors allow to achieve the same for material, fabric, bootstrap and bootstrap v4 themes.

```
`html
```

```
<!DOCTYPE html>
```

```
<html xmlns="http://www.w3.org/1999/xhtml">
```

```
<head>
```

```
<!-- Codes here... -->
```

```

<style>
.e-pivotview .e-rowsheader,
.e-pivotview .e-columnsheader,
.e-pivotview .e-gtot,
.e-pivotview .e-content,
.e-pivotview .e-gridheader,
.e-pivotview .e-headercell {
background-color:#fff !important;
}
</style>
</head>
<body>
</body>
</html>
`

```

Meanwhile for high contrast theme, we need to set the following CSS.

```

`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<!-- Codes here... -->
<style>
.e-pivotview .e-rowsheader,
.e-pivotview .e-columnsheader,
.e-pivotview .e-gtot,
.e-pivotview .e-content,
.e-pivotview .e-gridheader,
.e-pivotview .e-headercell {
background-color:#000 !important;
}
</style>
</head>
<body>

```

</body>

</html>

,

Adjusting Row Height

In current theme, to make the component compact we have reduced the height of each pivot table rows. But user can reset the height of the pivot table using the [rowHeight](#) property in [gridSettings](#). In older theme, the property was set to 36 pixels for desktop layout and 48 pixels for mobile layout. So reset the [rowHeight](#) accordingly to visualize the older theme style.

In the below code sample, we replicate the older theme style.

INDEX.TS

```
import { PivotView, IDataset } from '@syncfusion/ej2-pivotview';
import { pivotData } from './datasource.ts';
let pivotTableObj: PivotView = new PivotView({
  dataSourceSettings: {
    dataSource: pivotData as IDataset[],
    expandAll: false,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  height: 350,
  gridSettings: {
    rowHeight: 36
  }
});
pivotTableObj.appendTo('#PivotTable');
```

```

Customize number date and time values in EJ2 JavaScript Pivotview control

You can format the number, date, and time values for each field using `formatSettings` option under `dataSourceSettings`. It can be configured through code behind, during initial rendering.

Number formatting

For numbers, the formatting settings required to apply through code behind are:

- `name`: It allows to set the field name.
- `format`: It allows to set the format of the respective field.

Also, you can customize the applied number format by setting the [NumberFormatOptions](#) options in `formatSettings` itself.

INDEX.TS

```
import { PivotView, IDataset } from '@syncfusion/ej2-pivotview';
import { pivotData } from './datasource.ts';
let pivotTableObj: PivotView = new PivotView({
    dataSourceSettings: {
        dataSource: pivotData as IDataset[],
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        formatSettings: [{ name: 'Amount', format: 'C2', useGrouping: false,
            minimumSignificantDigits: 1, maximumSignificantDigits: 3 }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        filters: []
    },
    height: 350
});
pivotTableObj.appendTo('#PivotTable');
```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Date and time formatting

For date and time, the formatting settings required to apply through code behind are:

- **name:** It allows to set the field name.
- **format:** It allows to set the format of the respective field.
- **type:** It allows to set the type of format to be used for the respective field.

Also, you can customize the applied date format by setting [DateFormatOptions](#) options in `formatSettings` itself.

INDEX.TS

```

import { PivotView, IDataset } from '@syncfusion/ej2-pivotview';
import { pivotData } from './datasource.ts';
let pivotTableObj: PivotView = new PivotView({
    dataSourceSettings: {
        dataSource: pivotData as IDataset[],

<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";

```

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Limitations of date formatting

As per Firefox and Edge browsers standards, most of the date and time formats used in data source aren't supported. For example: Apr-2000, Apr-01-2000, 01-03-2000, 2000-Apr-01 etc... are not supported. Meanwhile [ISO formats](#) will be supported across all browsers.

Customize the icons for pivot table in EJ2 JavaScript Pivotview control

You can customize the pivot button icons in the pivot table by overriding the class **.pivot-button** with a custom property content as mentioned below.

```
`ts
```

```
PivotView_PivotFieldList.e-icons.e-toggle-field-list::before {
content: '\e337';
```

```
}
```

```
`
```

In the below sample, pivot table is rendered with a customized pivot button icons.

INDEX.TS

```

import { PivotView, IDataset, FieldList } from '@syncfusion/ej2-pivotview';
import { pivotData } from './datasource.ts';
PivotView.Inject(FieldList);
let pivotTableObj: PivotView = new PivotView({
  dataSourceSettings: {
    dataSource: pivotData as IDataset[],
    expandAll: false,
    enableSorting: true,
    allowLabelFilter: true,
    allowValueFilter: true,
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  showFieldList: true,
  height: 350
});
pivotTableObj.appendTo('#PivotTable');

```

Configure data grid options on editing mode in EJ2 JavaScript Pivotview control

You can access the data grid options such as sort, group, filter on editing mode using the **beginDrillThrough** event in the pivot table. The event occurs in every value cell on double click and provides the data grid information before display the drill through grid pop-up.

Grid features are segregated into individual feature-wise modules. For example, to use sorting feature, you should inject **Sort** using the **Grid.Inject(Sort)** section.

INDEX.TS

```

import { PivotView, IDataSet, BeginDrillThroughEventArgs } from
 '@syncfusion/ej2-pivotview';
import { Grid, Sort, Filter, Group } from '@syncfusion/ej2-grids';
import { pivotData } from './datasource.ts';
Grid.Inject(Sort, Filter, Group);
let pivotTableObj: PivotView = new PivotView({
  dataSourceSettings: {
    dataSource: pivotData as IDataSet[],
    expandAll: false,
    enableSorting: true,
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  },
  height: 350,
  editSettings: { allowAdding: true, allowDeleting: true, allowEditing:
true, mode: 'Normal' },
  beginDrillThrough: (args: BeginDrillThroughEventArgs) => {
    if (args.gridObj) {
      let gridObj: Grid = args.gridObj;
      gridObj.allowGrouping = true;
      gridObj.allowSorting = true;
      gridObj.allowFiltering = true;
      gridObj.filterSettings = { type: 'CheckBox' };
    }
  }
});
pivotTableObj.appendTo('#PivotTable');

```

Hide empty headers in EJ2 JavaScript Pivotview control

If the raw data for a particular field is not defined, it will be shown as 'Undefined' in the pivot table headers. You can hide those headers by setting the [showHeaderWhenEmpty](#) property to **false** in the pivot table.

For example, if the raw data for the field 'Country' is defined as **"United Kingdom"** and **"State"** is not defined means, it will be shown as **"United Kingdom >> Undefined"** in the header section. Here, you can hide those 'Undefined' header using the [showHeaderWhenEmpty](#) property.

By default, this property is set as **true**.

INDEX.TS

```

import { PivotView, IDataSet } from '@syncfusion/ej2-pivotview';
import { pivotNullData } from './datasource.ts';
let pivotTableObj: PivotView = new PivotView({
    dataSourceSettings: {
        dataSource: pivotNullData as IDataSet[],
        expandAll: false,
        rows: [{ name: 'Country' }, { name: 'State' }],
        columns: [{ name: 'Product', showNoDataItems: true }, { name: 'Date'
    }],
        values: [{ name: 'Amount' }, { name: 'Quantity' }],
        showHeaderWhenEmpty: false
    },
    height: 350
});
pivotTableObj.appendTo('#PivotTable');

```

Chart based on pivot table selection in EJ2 JavaScript Pivotview control

The cell selection support is enabled using the [allowSelection](#) property and its type and mode are configured using the [selectionSettings](#) property. The [cellSelected](#) event gets fired on every selection operation performed in the pivot table. This event returns the selected cell informations, like row header name, column header name, measure name, and value. Based on this information, the [chart](#) control will be plotted.

INDEX.TS

Drill through grid cell edit type in EJ2 JavaScript Pivotview control

Using the [drillThrough](#) event in the pivot table, you can define the edit type of a particular column in the grid present inside the drill-through dialog. To do so, check the column name in the [drillThrough](#) event and then specify the edit type of that column using the [gridColumns.editType](#) event argument.

The [gridColumns.editType](#) property must be set based on the column's data type. For example, the string data type will not be applicable for the numeric text box edit type.

- [NumericTextBox](#) control for integer, double, and decimal data types.
- [TextBox](#) control for string data type.
- [DropDownList](#) control to show all unique values related to that field.
- [CheckBox](#) control for boolean data type.
- [DatePicker](#) control for date data type.
- [DateTimePicker](#) control for date time data type.

In the below example, the data type of the **Country** column is set to **DropDownList**.

INDEX.TS

```

import { PivotView, IDataset } from '@syncfusion/ej2-pivotview';
import { pivotData } from './datasource.ts';
let pivotTableObj: PivotView = new PivotView({
    dataSourceSettings: {
        dataSource: pivotData as IDataset[],
        expandAll: false,
        enableSorting: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    height: 350,
    drillThrough(args) {
        for (var i = 0; i < args.gridColumns.length; i++) {
            if (args.gridColumns[i].field === 'Country') {
                args.gridColumns[i].editType = 'dropdownedit';
                //args.gridColumns[i].editType = 'numericedit';
            }
        }
    }
});

```

```

        //args.gridColumns[i].editType = 'textedit';
        //args.gridColumns[i].editType = 'booleanedit';
        //args.gridColumns[i].editType = 'datepickeredit';
        //args.gridColumns[i].editType = 'datetimepickeredit';
    }
}
},
editSettings: { allowAdding: true, allowDeleting: true, allowEditing:
true, mode: 'Normal' }
});
pivotTableObj.appendTo('#PivotTable');

```

Show field list when pivot table empty in EJ2 JavaScript Pivotview control

When there are no fields in a pivot table's row, column, value, and filter axes, a field list can still be displayed. To do so, use the [dataBound](#) event and call the [onShowFieldList](#) method as shown below.

INDEX.TS

```

import { PivotView, IDataset, FieldList } from '@syncfusion/ej2-pivotview';
import { pivotData } from './datasource.ts';
PivotView.Inject(FieldList);
let pivotTableObj: PivotView = new PivotView({
    dataSourceSettings: {
        dataSource: pivotData as IDataset[],
    },
    showFieldList: true,
    dataBound: (): void => {
        if (pivotTableObj && pivotTableObj.dataSourceSettings.values.length
        === 0) {
            (pivotTableObj.pivotFieldListModule.dialogRenderer as
            any).onShowFieldList();
        }
    },
    height: 350
});
pivotTableObj.appendTo('#PivotTable');

```

Apply custom style to pivot cells

The [queryCellInfo](#) event in [gridSettings](#) can be used to apply custom style to row and value cells, and the [headerCellInfo](#) event in [gridSettings](#) can be used to apply custom styles to column cells.

In the following example, a custom style has been applied to the column header **“Sold Amount”** under **“FY 2015”** via the [headerCellInfo](#) event and to the row header **“Germany”** and its aggregated value via the [queryCellInfo](#) event by adding the **“e-custom”** class to the cell element.

INDEX.TS

```

import { PivotView, IDataset } from '@syncfusion/ej2-pivotview';
import { QueryCellInfoEventArgs, HeaderCellInfoEventArgs } from
 '@syncfusion/ej2-grids';
import { pivotData } from './datasource.ts';
let pivotTableObj: PivotView = new PivotView({
    dataSourceSettings: {

```

```

        dataSource: pivotData as IDataset[],
        expandAll: false,
        enableSorting: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    gridSettings: {
        queryCellInfo: function (args: QueryCellInfoEventArgs) {
            let colIndex: number = Number(args.cell.getAttribute('data-
colindex'));
            let cells: QueryCellInfoEventArgs = args.data[colIndex] ?
args.data[colIndex] : {};
            // Here by using 'actualText' option, a custom class can be
added to the specific row header and its value to apply custom style.
            if (cells.actualText === 'Germany') {
                args.cell.classList.add('e-custom');
            } else if (cells.actualText === 'Amount' &&
cells.columnHeaders === 'FY 2016' && cells.rowHeaders ===
'Germany') {
                args.cell.classList.add('e-custom');
            }
        },
        headerCellInfo: function (args: HeaderCellInfoEventArgs) {
            let customAttributes: HeaderCellInfoEventArgs =
args.cell.column.customAttributes;
            // Here custom class can be added to the specific column header
by using unique level name, to apply custom style.
            if (args.node.classList.contains('e-columnsheader') &&
customAttributes &&
customAttributes.cell.valueSort.levelName === 'FY 2016.Sold
Amount') {
                args.node.classList.add('e-custom');
            }
        }
    },
    height: 350
});
pivotTableObj.appendTo('#PivotTable');

```

Hide specific columns in pivot table

By using the [columnRender](#) event in the [gridSettings](#), you can hide specific column(s) in the pivot table. In the example below, the “Units Sold” column under “FY 2016” is hidden by setting its **visible** property to **false** via the [columnRender](#) event.

Note: The **dot(.)** character in **FY 2016.Units Sold** is used by default to identify the header levels in the pivot table's row and column. It can be changed by setting the [headerDelimiter](#) in the [valueSortSettings](#) property to any other delimiter instead of the default separator.

INDEX.TS

```

import { PivotView, IDataset, ColumnRenderEventArgs } from '@syncfusion/ej2-
pivotview';
import { pivotData } from './datasource.ts';
let pivotTableObj: PivotView = new PivotView({
    dataSourceSettings: {
        dataSource: pivotData as IDataset[],
        expandAll: false,
        enableSorting: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],

```

```

        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    },
    gridSettings: {
        columnRender: function (args: ColumnRenderEventArgs) {
            // Specific column(s) can be hidden by checking their level name
            and setting its visible property accordingly.
            for (let i = 1; i < args.columns.length; i++) {
                if (args.stackedColumns[i].customAttributes &&
args.stackedColumns[i].customAttributes.cell.valueSort.levelName === 'FY
2016.Units Sold') {
                    args.stackedColumns[i].visible = false;
                }
            }
        },
        height: 350
    });
pivotTableObj.appendTo('#PivotTable');

```

Export table and chart into the same document using toolbar

Even if the [displayOption.view](#) property is set to **Both** in the pivot table, you can only export either the table or the chart to the PDF document based on the current value set in the [displayOption.primary](#) property. But, to export both the table and the chart to the same PDF document, use the [pdfExport](#) method during the [actionBegin](#) event invoke.

In the following example, the built-in export action can be restricted by setting the [args.cancel](#) option to **true** in the [actionBegin](#) event, and both the table and the chart can be exported by calling the [pdfExport](#) method and setting the `exportBothTableAndChart` argument to **true**.

INDEX.TS

```

import {
    PivotView, FieldList, CalculatedField, Toolbar, IDataset, PDFExport,
    PivotActionBeginEventArgs
} from '@syncfusion/ej2-pivotview';
import { pivotData } from './datasource.ts';
PivotView.Inject(FieldList, CalculatedField, Toolbar, PDFExport);
let pivotTableObj: PivotView = new PivotView({
    dataSourceSettings: {
        dataSource: pivotData as IDataset[],
        expandAll: false,
        enableSorting: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        sortSettings: [{ name: 'Country', order: 'Descending' }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],

```

```

        filters: []
    },
    height: 350,

Add custom aggregation type to the menu in EJ2 JavaScript Pivotview control

By using the [dataBound](#) event, you can add your own custom aggregate type(s) to the pivot table's aggregate menu.

In the following example, we have added the aggregation types **CustomAggregateType 1** and **CustomAggregateType 2** to the aggregate menu. The calculation for those aggregated types can be done using the [aggregateCellInfo](#) event.

INDEX.TS

```

import { PivotView, FieldList, IDataset, AggregateTypes } from
 '@syncfusion/ej2-pivotview';
import { L10n } from '@syncfusion/ej2-base';
import { pivotData } from './datasource.ts';
PivotView.Inject(FieldList);
L10n.load({
    'en-US': {
        pivotview: {
            CustomAggregateType1: 'Custom Aggregate Type 1',
            CustomAggregateType2: 'Custom Aggregate Type 2',
        },
        pivotfieldlist: {
            CustomAggregateType1: 'Custom Aggregate Type 1',
            CustomAggregateType2: 'Custom Aggregate Type 2',
        }
    }
});
const SummaryType: string[] = [
    'Sum',
    'Count',
    'DistinctCount',
    'Avg',
    'CustomAggregateType1',
    'CustomAggregateType2'
]

```

```

];
let pivotObj: PivotView = new PivotView({
  dataSourceSettings: {
    expandAll: false,
    dataSource: pivotData as IDataset[],
    columns: [{ name: 'Year' }, { name: 'Quarter' }],
    values: [{ name: 'Sold' }, { name: 'Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    subTotalsPosition: 'Bottom'
  },

Convert complex JSON to flat JSON and assign it to the pivot table in EJ2 JavaScript Pivotview control

By default, flat JSON can only bind to the pivot table. However, you can connect complex JSON to the pivot table by converting it to flat JSON via code-behind and binding it to the pivot table using the [dataSource](#) property in the [load](#) event.

In the following example, the **complexToFlatJson()** method is used to convert complex JSON to flat JSON and bind it to the pivot table using the [dataSource](#) property, then modifying the field names in the [rows](#) and [columns](#) based on the converted flat JSON under [dataSourceSettings](#) in the [load](#) event.

INDEX.TS

```

import { PivotView, FieldList, LoadEventArgs } from '@syncfusion/ej2-
pivotview';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(false);
PivotView.Inject(FieldList);
let parentProp: any = {};

```

```

let dataSource: Object[][];
let pivotGridObj: PivotView = new PivotView({
    dataSourceSettings: {
        expandAll: true,
        enableSorting: true,
        dataSource: data() as any,
        columns: [{ name: 'OrderDetails' }],
        values: [{ name: 'Freight', caption: 'Units Sold' }],
        rows: [{ name: 'ShipDetails' }],
        valueSortSettings: { headerDelimiter: ' - ' },
        formatSettings: [{ name: 'Amount', format: 'C0' }]
    },
    load: function (args: LoadEventArgs) {
        dataSource =
JSON.parse(JSON.stringify(args.dataSourceSettings.dataSource));
        args.dataSourceSettings.dataSource =
complexToFlatJson(dataSource);
        let rows: any = [];
        for (let i: number = 0; i < args.dataSourceSettings.rows.length;
i++) {
            if (args.dataSourceSettings.rows[i].name in parentProp) {
                rows =
rows.concat(parentProp[args.dataSourceSettings.rows[i].name]);
            } else {
                rows.push(args.dataSourceSettings.rows[i]);
            }
        }

Load desired report from the report list as default in EJ2 JavaScript Pivotview control

By default, the pivot table is displayed with the report bound at the code-behind. To load a desired report from the previously saved report collection during initial rendering, set the desired report name in the [dataBound](#) event, along with the additional report-based customization code shown below.

INDEX.TS

Display string value to pivot table values in EJ2 JavaScript Pivotview control

End user can display string value to the pivot table's value cell by using the [aggregateCellInfo](#) event.

In the following example, each cell value of the **Sold** field's actual value has been assigned from its combination data sets obtained from the [args.cellSets](#) in the [aggregateCellInfo](#) event.

INDEX.TS

```

import { PivotView, FieldList, IDataset, AggregateEventArgs } from
'@syncfusion/ej2-pivotview';
import { pivotData } from './datasource.ts';
PivotView.Inject(FieldList);
let pivotGridObj: PivotView = new PivotView({
    dataSourceSettings: {
        expandAll: false,
        dataSource: pivotData as IDataset[],
        columns: [{ name: 'Year' }, { name: 'Quarter' }],
        values: [{ name: 'Sold' }, { name: 'Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }]
    },
    showFieldList: true,
    width: '100%',
    height: 500,
    aggregateCellInfo: (args: AggregateEventArgs) => {
        if (args.fieldName === 'Sold') {
            args.value = secondsToHms(args.value);
        }
    }
}

```

```

});
pivotGridObj.appendTo('#PivotView');
function secondsToHms(d: number) {
    d = Number(d);
    var h = Math.floor(d / 3600);
    var m = Math.floor((d % 3600) / 60);
    var s = Math.floor((d % 3600) % 60);
    return (
        ('0' + h).slice(-2) + ':' + ('0' + m).slice(-2) + ':' + ('0' +
s).slice(-2)
    );
}

```

Predefined Dialogs

Draggable in EJ2 JavaScript Predefined dialogs control

The predefined dialogs supports dragging within its target container by grabbing the dialog header, which allows the user to reposition the dialog dynamically by using `isDraggable` property.

Alert drag

INDEX.TS

```

import { DialogUtility } from '@syncfusion/ej2-popups';
import { Button } from '@syncfusion/ej2-buttons';
let alertBtn: Button = new Button({cssClass: 'e-danger'});
alertBtn.appendTo('#alertBtn');
document.getElementById('alertBtn').onclick = (): void => {
  // Initialize and render alert dialog
  DialogUtility.alert({
    title: 'Low Battery',
    width: '250px',
    isDraggable: true,
    content: '10% of battery remaining',
  })
};

Animation in EJ2 JavaScript Predefined dialogs control

The predefined dialogs can be animated during the open and close actions. Also, user can customize animation's **delay**, **duration** and **effect** of animation by using the **animationSettings** property.

In the below sample, **Zoom** effect is enabled. So, The Dialog will open with **ZoomIn** and close with **ZoomOut** effects.

Alert animation

INDEX.TS

```

import { DialogUtility } from '@syncfusion/ej2-popups';
import { Button } from '@syncfusion/ej2-buttons';
let alertBtn: Button = new Button({cssClass: 'e-danger'});
alertBtn.appendTo('#alertBtn');
document.getElementById('alertBtn').onclick = (): void => {
  // Initialize and render alert dialog
  DialogUtility.alert({
    title: 'Low Battery',
    width: '250px',
    animationSettings: { effect: 'Zoom' },
    content: '10% of battery remaining'
  })
};

```

Position in EJ2 JavaScript Predefined dialogs control

Customize the dialog position by using the `position` property. The position can be represented with specific `X` and `Y` values.

- The `PositionDataModel.X` can be configured with a left, center, right, or offset value. By default, the value is set as center.

- The `PositionDataModel.Y` can be configured with a top, center, bottom, or offset value. By default, the value is set as `center`.

Alert position

```

Max-width and max-height

To have a restricted max-width and max-height dialog dimension, you need to specify the max-width, max-height CSS properties for the component's container element by using the `cssClass` property. The max-height value is calculated in source level and set to the dialog. so, need to override the max-height property.

Use the following code to customize the max-width and max-height for alert dialog:

INDEX.TS

```

import { DialogUtility } from '@syncfusion/ej2-popups';
import { Button } from '@syncfusion/ej2-buttons';
let alertBtn: Button = new Button({cssClass: 'e-danger'});
alertBtn.appendTo('#alertBtn');
document.getElementById('alertBtn').onclick = (): void => {
    // Initialize and render alert dialog
    DialogUtility.alert({
        title: 'About SYNCFUSION Succinctly Series',
        content: 'In the Succinctly series, Syncfusion created a robust,
        free library of more than 130 technical e-books formatted for PDF, Kindle,
        and EPUB.Each title in the Succinctly series is written by a carefully
        chosen expert and provides essential content in about 100 pages. The
        Succinctly series was born in 2012 out of a desire to provide concise
        technical e-books for software developers.',
        cssClass : 'customClass'
    });
};

```

Customization in EJ2 JavaScript Predefined dialogs control

You can customize the predefined dialogs buttons by using below properties.

- **okButton** - Use this property to customize **OK** button text.
- **cancelButton** - Use this property to customize **Cancel** button text.

Use the following code snippet for **alert**, **confirm** and **prompt** to customize the predefined dialogs action buttons.

For alert dialog , customized the default dialog button content as **Dismiss** by using the **text** property.

For confirm dialog, customized the default dialog buttons content as **Yes** and **No** by using the **text** property and also customized the dialog button icons by using **icon** property.

For prompt dialog , customized the default dialog buttons content as **Connect** and **Close** by using **text** property.

Alert action button

INDEX.TS

```

import { DialogUtility } from '@syncfusion/ej2-popups';
import { Button } from '@syncfusion/ej2-buttons';
let alertBtn: Button = new Button({cssClass: 'e-danger'});
alertBtn.appendTo('#alertBtn');
document.getElementById('alertBtn').onclick = (): void => {
    // Initialize and render alert dialog
    DialogUtility.alert({
        title: 'Good job!',
        content: 'You clicked the alert button!',
        width: '250px',
        okButton: { text: 'Dismiss' }
    })
};

</body></html>

```

Show or hide dialog close button

When rendering the predefined dialogs through utility methods, You can close the dialog using the following ways. The default values of `closeOnEscape` and `showCloseIcon` is `false`.

- By pressing the escape key if the [closeOnEscape](#) property is enabled.
- By clicking the close button if the [showCloseIcon](#) property is enabled.

You can also manually close the Dialogs by creating an instance to the dialog and call the [hide](#) method.

Use the following code for **alert**, **confirm** and **prompt** to demonstrates the different ways of hiding the utility dialog.

Alert dialog close button

INDEX.TS

```

import { DialogUtility } from '@syncfusion/ej2-popups';
import { Button } from '@syncfusion/ej2-buttons';
let alertBtn: Button = new Button({cssClass: 'e-danger'});
alertBtn.appendTo('#alertBtn');
document.getElementById('alertBtn').onclick = (): void => {
    // Initialize and render alert dialog
    DialogUtility.alert({

```

```

        title: 'Low Battery',
        content: '10% of battery remaining',
        width: '250px',
        showCloseIcon : true,
        closeOnEscape : true
    })
};

```

Customize dialog content

You can load custom content in predefined dialogs using the `content` property.

Use the following code to customize the dialog content to render the custom TextBox component inside the prompt dialog to get the username from the user.

INDEX.TS

```
import { DialogUtility } from '@syncfusion/ej2-popups';
import { TextBox } from '@syncfusion/ej2-inputs';
import { Button } from '@syncfusion/ej2-buttons';
let promptBtn: Button = new Button({isPrimary: true});
promptBtn.appendTo('#promptBtn');
document.getElementById('promptBtn').onclick = (): void => {
    dialogObj = DialogUtility.confirm({
        title: 'Join Chat Group',
        content: '<p>Enter your name: </p><input id="name" />',
        width: '350px'
    });
    let inputobj1: TextBox = new TextBox({
        placeholder: 'Type here..'
    });
    inputobj1.appendTo('#name');
};
```

Progressbar

Types in EJ2 JavaScript Progressbar control

Visualize progress in different shapes (rectangle, circle, and semi-circle) to give a unique appearance to your app design.

Linear

Set **type** to Linear to get the linear progress bar. It also support secondary progress and different mode of progress.

INDEX.TS

```

import { ProgressBar } from '@syncfusion/ej2-progressbar';
let uploadProgress: ProgressBar = new ProgressBar({
    type: 'Linear',
    height: '60',
    value: 100,
    animation: {
        enable: true,
        duration: 2000,
        delay: 0,
    }
});
uploadProgress.appendTo('#lineardeterminate');
let successProgress: ProgressBar = new ProgressBar({
    type: 'Linear',
    height: '60',
    isIndeterminate: true,
    value: 20,
    animation: {
        enable: true,
        duration: 2000,
        delay: 0,
    },
});
successProgress.appendTo('#linearindeterminate');
let warningsProgress: ProgressBar = new ProgressBar({
    type: 'Linear',
    height: '60',
    value: 40,
    secondaryProgress: 60,
    animation: {
        enable: true,
        duration: 2000,
        delay: 0,
    }
});

```

```

    },
  });
  warningsProgress.appendTo('#linearbuffer');
  let errorProgress: ProgressBar = new ProgressBar({
    type: 'Linear',
    height: '60',
    segmentCount: 8,
    value: 100,
    animation: {
      enable: true,
      duration: 2000,
      delay: 0,
    },
  });
  errorProgress.appendTo('#linearsegment');

```

Tool tip in EJ2 JavaScript Progressbar control

The tooltip for the progress bar is used to represent the progress value. During the initial load, it can be enabled by using the [enable](#) property. The [showTooltipOnHover](#) property can show the tooltip on mouseover.

INDEX.TS

```

import { ProgressBar } from '@syncfusion/ej2-progressbar';
let uploadProgress: ProgressBar = new ProgressBar({
  type: 'Linear',
  height: '60',
  value: 100,
  animation: {
    enable: true,
    duration: 2000,
    delay: 0,
  },
  tooltip: {
    enable: true,
    showTooltipOnHover: true
  }
});

```

```
});
uploadProgress.appendTo('#lineardeterminate');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 Toast</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Format

By default, the tooltip shows information about progress. In addition to that, show more information in the tooltip using the [format](#) property.

INDEX.TS

```
import { ProgressBar } from '@syncfusion/ej2-progressbar';
let uploadProgress: ProgressBar = new ProgressBar({
  type: 'Linear',
  height: '60',
  value: 100,
  animation: {
    enable: true,
    duration: 2000,
    delay: 0,
```

```

    },
    tooltip:{
        enable: true,
        format: "Progress: ${value}"
    }
});
uploadProgress.appendTo('#lineardeterminate');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 Toast</title>

```

States in EJ2 JavaScript Progressbar control

Visualize progress in different states.

Determinate

<!-- markdownlint-disable MD033 -->

This is the default state. You can use it when the progress estimation is known.

INDEX.TS

```
import { ProgressBar } from '@syncfusion/ej2-progressbar';
let percentageProgress: ProgressBar = new ProgressBar({
    type: 'Linear',
    height: '60',
    value: 100,
});
percentageProgress.appendTo('#percentage');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 Toast</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Toolbar Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/material.css"
rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div class="row linear-parent">
      <div id="percentage"></div>
    </div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Indeterminate

By enabling the **IsIndeterminate** property, the state of the progress bar can be changed to indeterminate when the progress cannot be estimated or is not being calculated. It can be combined with determinate mode to know that the application is estimating progress before the actual progress starts.

INDEX.TS

```
import { ProgressBar } from '@syncfusion/ej2-progressbar';
let percentageProgress: ProgressBar = new ProgressBar({
  type: 'Linear',
  height: '60',
  isIndeterminate: true,
  value: 20,
  animation: {
    enable: true,
    duration: 2000,
    delay: 0,
  },
});
percentageProgress.appendTo('#percentage');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 Toast</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Toolbar Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/material.css"
rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div class="row linear-parent">
      <div id="percentage"></div>
    </div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Buffer

<!-- markdownlint-disable MD033 -->

You can use a secondary progress indicator when the primary progress depends on the secondary progress. This will allow users to visualize both primary and secondary progress simultaneously.

INDEX.TS

```
import { Progressbar } from '@syncfusion/ej2-progressbar';
let percentageProgress: Progressbar = new Progressbar({
  type: 'Linear',
  height: '60',
  value: 40,
  secondaryProgress: 60,
  animation: {
    enable: true,
    duration: 2000,
    delay: 0,
  },
});
percentageProgress.appendTo('#percentage');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 Toast</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Customization in EJ2 JavaScript Progressbar control

Segments

<!-- markdownlint-disable MD033 -->

We can divide a progress bar into multiple segments using a `segmentCount` to visualize the progress of multiple sequential tasks.

INDEX.TS

```
import { ProgressBar } from '@syncfusion/ej2-progressbar';
let errorProgress: ProgressBar = new ProgressBar({
  type: 'Circular',
  height: '60',
  segmentCount: 8,
  value: 100,
  animation: {
    enable: true,
    duration: 2000,
    delay: 0,
  },
});
errorProgress.appendTo('#percentage');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 Toast</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Toolbar Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/material.css"
rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div class="row linear-parent">
      <div id="percentage"></div>
    </div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Thickness

Customize the thickness of the track using [trackThickness](#), progress using [progressThickness](#) and secondary progress using [secondaryProgressThickness](#) to render the progress bar with different appearances.

INDEX.TS

```
import { ProgressBar } from '@syncfusion/ej2-progressbar';
let percentageProgress: ProgressBar = new ProgressBar({
  type: 'Linear',
  height: '60',
  width: '90%',
  trackThickness: 24,
  progressThickness: 24,
  secondaryProgressThickness: 20,
  value: 100,
  showProgressValue: true,
  labelStyle: {
    color: '#FFFFFF'
  },
  animation: {
    enable: true,
    duration: 2000,
    delay: 0,
  }
});
percentageProgress.appendTo('#percentage');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 Toast</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Toolbar Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/material.css"
rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div class="row linear-parent">
      <div id="percentage"></div>
    </div>

```

```

var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Radius

<!-- markdownlint-disable MD033 -->

The radius of the progress bar can be customized using **radius** property and corner can be customized by **cornerRadius** property.

INDEX.TS

```

import { ProgressBar } from '@syncfusion/ej2-progressbar';
let percentageProgress: ProgressBar = new ProgressBar({
    type: "Circular",
    value: 60,
    width: "160px",
    height: "160px",
    enableRtl: false,
    trackColor: "#FFD939",
    radius: "100%",
    progressColor: "white",
    trackThickness: 80,
    cornerRadius: "Round",
    progressThickness: 10,
    animation: {
        enable: true,
        duration: 2000,
        delay: 0
    }
});
percentageProgress.appendTo("#percentage");

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 Toast</title>
    <meta charset="utf-8">

Progress color and track color

<!-- markdownlint-disable MD033 -->

Customize the color of progress, secondary progress, and track by using the [progressColor](#), [secondaryProgressColor](#), and [trackColor](#) properties.

INDEX.TS

```

import { Progressbar } from '@syncfusion/ej2-progressbar';
let percentageProgress: Progressbar = new Progressbar({
    type: 'Linear',
    height: '60',
    width: '90%',
    trackThickness: 24,
    progressThickness: 24,
    cornerRadius: 'Round',
    progressColor: '#E3165B',
    trackColor: '#F8C7D8',
    secondaryProgressColor: 'green',
    secondaryProgress: 70,
    value: 50,
    showProgressValue: true,
    labelStyle: {
        color: 'FFFFFF'
    },
    animation: {
        enable: true,
        duration: 2000,
        delay: 0,
    },
    textRender: (args: ITextRenderEventArgs) => {
        args.text = '50';
    }
});

```

```
percentageProgress.appendTo('#percentage');
```

INDEX.HTML

```

Annotation in EJ2 JavaScript Progressbar control

Annotation

In the circular progress bar, you can add any view to the center using the **Content** property in annotation.

For example, you can include add, start, or pause button to control the progress. You can also add an image that indicates the actual task in progress or add custom text that conveys how far the task is completed.

INDEX.TS

```
import { ProgressBar, ProgressAnnotation } from "@syncfusion/ej2-
progressbar";
ProgressBar.Inject(ProgressAnnotation);
let percentageProgress: ProgressBar = new ProgressBar({
  type: "Circular",
  innerRadius: "190%",
  trackThickness: 80,
  cornerRadius: "Round",
```

```

trackColor: "#FFD939",
annotations: [
  {
    content:
      '<div id="point1" style="font-size:20px;font-weight:bold;color:#ffffff;fill:#ffffff"><span>60%</span></div>'
  }
]
});
percentageProgress.appendTo("#percentage");

```

INDEX.HTML

```

Animation in EJ2 JavaScript Progressbar control

<!-- markdownlint-disable MD033 -->

Progress Bar support to animate the progress by using **animation** property. Enable the animation by setting **enable** property and also you can control the speed by using **duration** property.

INDEX.TS

```
import { ProgressBar } from '@syncfusion/ej2-progressbar';
let percentageProgress: ProgressBar = new ProgressBar({
  type: 'Linear',
  trackThickness: 24,
  progressThickness: 24,
  value: 100,
  showProgressValue: true,
  animation: {
    enable: true,
    duration: 2000,
    delay: 0
  }
});
percentageProgress.appendTo('#percentage');
```

```

Theme in EJ2 JavaScript Progressbar control

To enhance the visualization of the Progress Bar, use different themes that are mapped to the [theme](#) property. The following themes are available in the Progress Bar.

- Material
- Fabric
- Bootstrap
- Bootstrap 4
- High Contrast
- Tailwind

INDEX.TS

```
import { ProgressBar } from '@syncfusion/ej2-progressbar';  
let linearThemeProgress: ProgressBar = new ProgressBar({  
    type: 'Linear',  
    height: '60',  
    width: '100%',  
    value: 40,  
    secondaryProgress: 60,  
    trackThickness: 20,  
    progressThickness: 20,  
    theme: 'HighContrast',  
    animation: {  
        enable: true,  
        duration: 2000,  
        delay: 0  
    }  
});  
linearThemeProgress.appendTo('#linearTheme');  
let circularThemeProgress: ProgressBar = new ProgressBar({  
    type: 'Circular',  
    height: '150',  
    width: '100%',  
    value: 40,

Events in EJ2 JavaScript Progressbar control

This section describes the Progress Bar events that will be triggered when appropriate actions are performed. Following events are available in the Progress Bar.

- [valueChanged](#) - When the progress value changes, this event is triggered.
- [progressCompleted](#) - When the progress reaches the maximum value, this event is triggered.
- [animationComplete](#) - When animation is enabled and the progress to the value is reached, this event is triggered.
- [annotationRender](#) - Before each annotation is rendered, this event is triggered.
- [textRender](#) - Before the progress text is rendered, this event is triggered
- [load](#) - When the control begins to render, this event is triggered.
- [loaded](#) - After the control has been rendered, this event is triggered.
- [resized](#) - When the window is resized, this event is triggered.

INDEX.TS

```

import {ProgressBar, ProgressAnnotation, IProgressValueEventArgs,
ITextRenderEventArgs, IAnnotationRenderEventArgs,

```

```

ILoadedEventArgs, IProgressResizeEventArgs } from '@syncfusion/ej2-
progressbar';
ProgressBar.Inject(ProgressAnnotation);
let progress: ProgressBar = new ProgressBar({
  type: 'Linear',
  trackThickness: 24,
  progressThickness: 24,
  value: 50,
  labelStyle: {
    color: '#FFFFFF'
  },
  animation: {
    enable: true,
    duration: 2000,
    delay: 0
  },
  valueChanged: (args: IProgressValueEventArgs) => {
    // Here you can customize the code.

Accessibility in EJ2 JavaScript Progress bar control

The Progress bar control followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Progress bar control is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

```

<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the control meet the requirement.</div>

<div> - Some features of the control do not meet the requirement.</div>

<div> - The control does not meet the requirement.</div>

```

WAI-ARIA attributes

The Progress bar control followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Progress bar control:

- progressbar (role)
- aria-valuemin (attribute)
- aria-valuemax (attribute)
- aria-valuenow (attribute)
- aria-label (attribute)

Keyboard interaction

The Progress bar control followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Progress bar control.

| **Press** | **To do this** |

| --- | --- |

| **Tab** | Moves the focus to the Progress bar element. |

| **Ctrl + P** | Prints the Progress bar. |

Ensuring accessibility

The Progress bar control's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Progress bar control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Progress bar control with accessibility tools.

ProgressBar

<!-- markdownlint-disable MD002 MD022 -->

Spinner and progress in EJ2 JavaScript Progress button control

Change spinner position

Spinner position can be changed by modifying the [position](#) property of [spinSettingsModel](#). By default, the spinner is positioned at the left of the ProgressBar. You can position it at the **left**, **right**, **top**, **bottom**, or **center** of the text content.

Change spinner size

Spinner size can be changed by modifying the [width](#) property of [spinSettingsModel](#). In this demo, the **width** is set to **20** to change the spinner size.

Spinner template

You can use custom spinner by specifying the [template](#) property of [spinSettingsModel](#) with custom styles.

The following sample demonstrates the above functionalities of the spinner.

INDEX.TS

```
import { ProgressBar } from '@syncfusion/ej2-splitbuttons';
let progressBtn: ProgressBar = new ProgressBar({ content: 'Submit',
spinSettings: { position: 'Right', width: 20, template: '<div
class="template"></div>' } });
progressBtn.appendTo('#progressbtn');
```

INDEX.HTML

Change step of the ProgressButton

The progress can be visualized at the specified interval by changing the [step](#) property in the [begin](#) event of the ProgressButton. In this demo, the [step](#) property is set to [20](#) to show progress at every 20% increment.

INDEX.TS

```

import { ProgressButton, ProgressEventArgs } from '@syncfusion/ej2-splitbuttons';
let progressBtn: ProgressButton = new ProgressButton({
  content: 'Progress Step', enableProgress: true,
  begin: (args: ProgressEventArgs) => {
    args.step = 20;
  }, cssClass: 'e-hide-spinner'
});
progressBtn.appendTo('#progressbtn');

```

}

```

The class `e-hide-spinner` hides the spinner in the ProgressButton, For more information, see [hide spinner](#) section.

Change progress dynamically

The progress can be changed dynamically by modifying the `percent` property in the ProgressButton events. In this demo, on 40% completion of progress, the `percent` property is set to 90 to show dynamic change of the progress.

INDEX.TS

```
import { ProgressButton, ProgressEventArgs } from '@syncfusion/ej2-splitbuttons';
let progressBtn: ProgressButton = new ProgressButton({
  content: 'Progress', enableProgress: true, duration: 15000,
  begin: (args: ProgressEventArgs) => {
    progressBtn.content = 'Progress ' + args.percent + '%';
    progressBtn.dataBind();
  },
  progress: (args: ProgressEventArgs) => {
    progressBtn.content = 'Progress ' + args.percent + '%';
    progressBtn.dataBind();
    if (args.percent === 40) {
      args.percent = 90
    }
  },
  end: (args: ProgressEventArgs) => {
    progressBtn.content = 'Progress ' + args.percent + '%';
    progressBtn.dataBind();
  },
  cssClass: 'e-hide-spinner'
});
progressBtn.appendTo('#progressbtn');
```

    }

```

The method [dataBind](#) applies the property changes immediately to the component.

Start and stop methods

You can pause and resume the progress using the [stop](#) and [start](#) methods, respectively. In this demo, clicking the ProgressButton will pause and resume the progress.

INDEX.TS

```

import { ProgressButton } from '@syncfusion/ej2-splitbuttons';
let progressBtn: ProgressButton = new ProgressButton({
    content: 'Download', enableProgress: true, duration: 4000, iconCss: 'e-

Accessibility in EJ2 JavaScript Progress button control

The Progress button component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Progress button component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  alt="Yes" > |

| [Section 508](#) Support |  alt="Yes" > |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

```
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The
component does not meet the requirement.</div>
```

WAI-ARIA attributes

The Progress button component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Progress button component:

Attributes	Purpose
aria-label	Provides an accessible name for the icon only Progress button.
aria-disabled	Indicates that the element is perceivable but disabled, so it is not editable or otherwise operable.

Keyboard interaction

The Progress button component followed the [keyboard interaction] guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Progress button component.

| Press | To do this |

| --- | --- |

| Enter / Space | Starts the progress. |

Ensuring accessibility

The Progress button component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Progress button component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Progress button component with accessibility tools.

How To

Change the text content and styles of the progressbutton during progress in EJ2 JavaScript Progress button control

You can change the text content and styles of the ProgressButton during progress by changing the text content and the [cssClass](#) property at the [begin](#) and [end](#) events.

INDEX.TS

```
import { ProgressButton } from '@syncfusion/ej2-splitbuttons';
let uploadBtn: ProgressButton = new ProgressButton({
  content: 'Upload',
  cssClass: 'e-hide-spinner',
  enableProgress: true,
  duration: 4000,
  begin: () => {
    uploadBtn.content = 'Uploading...';
    uploadBtn.cssClass = 'e-hide-spinner e-info';
    uploadBtn.dataBind();
  },
  end: () => {
    uploadBtn.content = 'Success';
    uploadBtn.cssClass = 'e-hide-spinner e-success';
    uploadBtn.dataBind();
    setTimeout(() => {
      uploadBtn.content = 'Upload';
      uploadBtn.cssClass = 'e-hide-spinner';
      uploadBtn.dataBind();
    }, 500)
  }
}, '#progressbtn');
```

Customize progress using cssclass in EJ2 JavaScript Progress button control

You can customize the background filler UI using the [cssClass](#) property.

- Adding `e-vertical` to `cssClass` shows vertical progress.
- Adding `e-progress-top` to `cssClass` shows progress at the top.

You can also show reverse progress by adding custom class to the [cssClass](#) property.

INDEX.TS

```
import { ProgressButton } from '@syncfusion/ej2-splitbuttons';
let verticalProgress: ProgressButton = new ProgressButton({ content:
'Vertical Progress', enableProgress: true, cssClass: 'e-hide-spinner e-
vertical', duration: 4000 });
verticalProgress.appendTo('#vertical');
let topProgress: ProgressButton = new ProgressButton({ content: 'Progress
Top', enableProgress: true, cssClass: 'e-hide-spinner e-progress-top',
duration: 4000 });
topProgress.appendTo('#top');
let reverseProgress: ProgressButton = new ProgressButton({ content: 'Reverse
Progress', enableProgress: true, cssClass: 'e-hide-spinner e-reverse-
progress', duration: 4000 });
reverseProgress.appendTo('#reverse');
```

Trace events of progress button in EJ2 JavaScript Progress button control

The ProgressButton component triggers events based on its actions. The events can be used as extension points to perform custom operations.

The events available in ProgressButton are [fail](#), [begin](#), [progress](#), and [end](#).

INDEX.TS

```
import { Button } from '@syncfusion/ej2-buttons';
import { ProgressButton, ProgressEventArgs } from '@syncfusion/ej2-splitbuttons';
let progressBtn: ProgressButton = new ProgressButton({
    content: 'Progress',
    enableProgress: true,
    begin: (args: ProgressEventArgs) => {
        updateEventLog(args);
    },
    end: (args: ProgressEventArgs) => {
        updateEventLog(args);
    },
    progress: (args: ProgressEventArgs) => {
        updateEventLog(args);
    },
    fail: (args: Event) => {
        updateEventLog(args);
    }
}, '#progressbtn');
let clear: Button = new Button({ cssClass: 'e-small' });
clear.appendTo('#clear');
clear.element.onclick = () => {
    let propertyElem: HTMLElement =
document.getElementById('propertyTable');
    propertyElem.getElementsByTagName('td')[0].innerHTML = '';
}
function updateEventLog(args: any): void {
    let propertyElem: HTMLElement =
document.getElementById('propertyTable');

propertyElem.getElementsByTagName('td')[0].insertAdjacentHTML('beforeend',
args.name + ' Event triggered. <br />');
}
```

Query Builder

Columns in EJ2 JavaScript Query builder control

The column definitions are used as the [dataSource](#) schema in the Query Builder. This plays a vital role in rendering column values. The query builder operations such as create or delete conditions, and create or delete groups, are performed based on the column definitions. The [field](#) property of the [columns](#) is necessary to map the data source values in the query builder columns.

If the column field is not specified in the dataSource, the column values will be empty.

Auto generation

The [columns](#) are automatically generated when the [columns](#) declaration is empty or undefined while initializing the query builder. All the columns in the [dataSource](#) are bound as the query builder columns.

INDEX.TS

```

import { QueryBuilder } from '@syncfusion/ej2-querybuilder';
let data: Object[] = [
    { OrderID: 10248, CustomerID: 'VINET', EmployeeID: 5, Freight: 32.3800,
      OrderDate: "07/09/1991" },
    { OrderID: 10249, CustomerID: 'TOMSP', EmployeeID: 6, Freight: 32.3800,
      OrderDate: "07/09/1991" },
    { OrderID: 10250, CustomerID: 'HANAR', EmployeeID: 4, Freight: 32.3800,
      OrderDate: "07/09/1991" }];
let qryBldrObj: QueryBuilder = new QueryBuilder({
    width: '70%',
    dataSource: data,
});
qryBldrObj.appendTo('#querybuilder');

```

    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

When columns are auto-generated, the column type will be determined from the first record of the dataSource.

Labels

By default, the column label is displayed from the column [field](#) value. To override the default label, you have to define the [label](#) value.

Operators

The operator for a column can be defined in the [operators](#) property.

The available operators and its supported data types are:

Operators	Description	Supported Types
-----	-----	-----
startswith	Checks whether the value begins with the specified value.	String
endswith	Checks whether the value ends with the specified value.	String
contains	Checks whether the value contains the specified value.	String

| equal | Checks whether the value is equal to the specified value. | String Number Date Boolean |

| notequal | Checks whether the value is not equal to the specified value. | String Number Date Boolean |

| greaterthan | Checks whether the value is greater than the specified value. | Date Number |

| greaterthanorequal | Checks whether a value is greater than or equal to the specified value. | Date Number |

| lessthan | Checks whether the value is less than the specified value. | Date Number |

| lessthanorequal | Checks whether the value is less than or equal to the specified value. | Date Number |

| between | Checks whether the value is between the two-specific values. | Date Number |

| notbetween | Checks whether the value is not between the two-specific values. | Date Number |

| in | Checks whether the value is one of the specific values. | String Number |

| notin | Checks whether the value is not in the specific values. | String Number |

Step

The Query Builder allows you to set the step values to the number fields. So that, you can easily access the numeric textbox. Use the [step](#) property, to set the step value for number values.

Format

The Query Builder formats date and number values. Use the [format](#) property to format date and number values.

INDEX.TS

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Validation

Validation allows you to validate the conditions and it display errors for invalid fields while using the `validateFields` method. To enable validation in the query builder , set the `allowValidation` to true. Column fields are validated after setting [allowValidation](#) to true. So, you should manually configure the validation for Operator and Value fields through [validation](#).

Set [isRequired](#) validation for Operator and Value fields.

Set [min](#), [max](#) values for number values.

Data binding in EJ2 JavaScript Query builder control

The Query Builder uses **DataManager** to bind the datasource, which supports both RESTful JSON data services binding and local JavaScript object array binding. The [dataSource](#) property can be assigned either with the instance of **DataManager** or JavaScript object array collection. It supports two kind of databinding method:

- Local data
- Remote data

Local data

To bind local data to the query builder, you can assign the [dataSource](#) property with a JavaScript object array. The local data source can also be provided as an instance of the [DataManager](#).

INDEX.TS

```
import { QueryBuilder, ColumnsModel, RuleModel } from '@syncfusion/ej2-querybuilder';
let employeeData: Object[] = [{
    'EmployeeID': 1,
    'FirstName': 'Nancy',
    'Title': 'Sales Representative',
    'TitleOfCourtesy': 'Ms.',
    'HireDate': '22/07/2001',
    'City': 'Seattle',
    'Country': 'USA'
},
{
    'EmployeeID': 2,
    'FirstName': 'Andrew',
    'Title': 'Vice President',
    'TitleOfCourtesy': 'Dr.',
    'HireDate': '21/04/2003',
    'City': 'Tacoma',
    'Country': 'USA'
},
{
    'EmployeeID': 3,
    'FirstName': 'Janet',
    'Title': 'Sales Representative',
    'TitleOfCourtesy': 'Ms.',
    'HireDate': '22/07/2001',
    'City': 'Kirkland',
    'Country': 'USA'
}
];
let columnData: ColumnsModel[] = [
    {
        field: 'EmployeeID', label: 'EmployeeID', type: 'number'
    },
    { field: 'FirstName', label: 'FirstName', type: 'string' },
    { field: 'TitleOfCourtesy', label: 'Title Of Courtesy', type: 'boolean', values: ['Mr.', 'Mrs.'] },
    { field: 'Title', label: 'Title', type: 'string' },
    { field: 'HireDate', label: 'HireDate', type: 'date', format: 'dd/MM/yyyy' },
    { field: 'Country', label: 'Country', type: 'string' },
    { field: 'City', label: 'City', type: 'string' }
];
let importRules: RuleModel = {
    'condition': 'and',
    'rules': [{
        'label': 'EmployeeID',
        'field': 'EmployeeID',
        'type': 'number',
        'operator': 'equal',
        'value': 1001
    }
],
}
```

```

        {
            'label': 'Title',
            'field': 'Title',
            'type': 'string',
            'operator': 'equal',
            'value': 'Sales Manager'
        }
    ];
    let qryBldrObj: QueryBuilder = new QueryBuilder({
        width: '70%',
        dataSource: employeeData,
        columns: columnData,
        rule: importRules,
    });
    qryBldrObj.appendTo('#querybuilder');

```

INDEX.HTML

var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

By default, **DataManager** uses **JsonAdaptor** for local data-binding.

Remote data

To bind remote data to the query builder, assign service data as an instance of **DataManager** to the [dataSource](#) property. To interact with remote data source, provide the endpoint **url**.

INDEX.TS

```

import { QueryBuilder, ColumnsModel, RuleModel } from '@syncfusion/ej2-querybuilder';
import { DataManager, ODataAdaptor } from '@syncfusion/ej2-data';
let data: DataManager = new DataManager({
  url: 'https://services.syncfusion.com/js/production/api/employees',
  adaptor: new ODataAdaptor()
});

let columnData: ColumnsModel[] = [
  { field: 'EmployeeID', label: 'EmployeeID', type: 'number' },
  { field: 'FirstName', label: 'FirstName', type: 'string' },
  { field: 'Designation', label: 'Designation', type: 'string' },
  { field: 'Country', label: 'Country', type: 'string' }
];

let importRules: RuleModel = {
  'condition': 'and',
  'rules': [{
    'label': 'EmployeeID',
    'field': 'EmployeeID',
    'type': 'number',
    'operator': 'equal',
    'value': 1001
  },
  {
    'label': 'Country',
    'field': 'Country',
    'type': 'string',
    'operator': 'equal',
    'value': 'USA'
  }
]
};

let qryBldrObj: QueryBuilder = new QueryBuilder({
  width: '70%',
  dataSource: data,
  columns: columnData,
  rule: importRules,
});
qryBldrObj.appendTo('#querybuilder');

```

```

By default, **DataManager** uses **ODataAdaptor** for remote data-binding.

Binding with OData services

OData is a standardized protocol for creating and consuming data. You can retrieve data from OData service using the DataManager. Refer to the following code example for remote Data binding using OData service.

INDEX.TS

```

import { QueryBuilder, ColumnsModel, RuleModel } from '@syncfusion/ej2-querybuilder';
import { DataManager, ODataAdaptor } from '@syncfusion/ej2-data';
let data: DataManager = new DataManager({
    url: 'https://services.syncfusion.com/js/production/api/Employees/',
    adaptor: new ODataAdaptor(),
    crossDomain: true
});

let columnData: ColumnsModel[] = [
    {
        field: 'EmployeeID', label: 'EmployeeID', type: 'number'
    },
    { field: 'FirstName', label: 'FirstName', type: 'string' },
    { field: 'TitleOfCourtesy', label: 'Title Of Courtesy', type: 'boolean', values: ['Mr.', 'Mrs.'] },
    { field: 'Title', label: 'Title', type: 'string' },
    { field: 'HireDate', label: 'HireDate', type: 'date', format: 'dd/MM/yyyy' },
    { field: 'Country', label: 'Country', type: 'string' },
    { field: 'City', label: 'City', type: 'string' }
];

let importRules: RuleModel = {
    'condition': 'and',
    'rules': [{
        'label': 'EmployeeID',
        'field': 'EmployeeID',
        'type': 'number',
        'operator': 'equal',
        'value': 1001
    },
    {
        'label': 'Title',
        'field': 'Title',
        'type': 'string',
        'operator': 'equal',
        'value': 'Sales Manager'
    }
    ]
};

let qryBldrObj: QueryBuilder = new QueryBuilder({
    width: '70%',
    dataSource: data,
    columns: columnData,
    rule: importRules,
});

qryBldrObj.appendTo('#querybuilder');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Query Builder</title>

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Binding with OData v4 services

The ODataV4 is an improved version of OData protocols, and the **DataManager** can also retrieve and consume OData v4 services. For more details on OData v4 services, refer to the [odata documentation](#). To bind OData v4 service, use the **ODataV4Adaptor**.

INDEX.TS

```

import { QueryBuilder, ColumnsModel, RuleModel } from '@syncfusion/ej2-
querybuilder';
import { DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
let data: DataManager = new DataManager({
    url: 'https://services.odata.org/V4/Northwind/Northwind.svc/Employees/',
    adaptor: new ODataV4Adaptor()
});
let columnData: ColumnsModel[] = [

```

```

        {
            field: 'EmployeeID', label: 'EmployeeID', type: 'number'
        },
        { field: 'FirstName', label: 'FirstName', type: 'string' },
        { field: 'TitleOfCourtesy', label: 'Title Of Courtesy', type:
'boolean', values: ['Mr.', 'Mrs.'] },
        { field: 'Title', label: 'Title', type: 'string' },
        { field: 'HireDate', label: 'HireDate', type: 'date', format:
'dd/MM/yyyy' },
        { field: 'Country', label: 'Country', type: 'string' },
        { field: 'City', label: 'City', type: 'string' }
    ];
    let importRules: RuleModel = {
        'condition': 'and',
        'rules': [{
            'label': 'EmployeeID',
            'field': 'EmployeeID',
            'type': 'number',
            'operator': 'equal',
            'value': 1001
        },
        {
            'label': 'Title',
            'field': 'Title',
            'type': 'string',
            'operator': 'equal',
            'value': 'Sales Manager'
        }
    ]
    };
    let qryBldrObj: QueryBuilder = new QueryBuilder({
        width: '70%',
        dataSource: data,
        columns: columnData,
        rule: importRules,

```

Web API

You can use **WebApiAdaptor** to bind query builder with Web API created using OData endpoint.

`ts

```

import { QueryBuilder, ColumnsModel, RuleModel } from '@syncfusion/ej2-querybuilder';
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';

let data: DataManager = new DataManager({
    url: '/api/OrderAPI',
    adaptor: new WebApiAdaptor
});

let columnData: ColumnsModel[] = [
    {
        field: 'EmployeeID', label: 'EmployeeID', type: 'number'
    },
    { field: 'FirstName', label: 'FirstName', type: 'string' },
    { field: 'TitleOfCourtesy', label: 'Title Of Courtesy', type: 'boolean', values: ['Mr.', 'Mrs.'] },

```

```
{ field: 'Title', label: 'Title', type: 'string' },
{ field: 'HireDate', label: 'HireDate', type: 'date', format: 'dd/MM/yyyy' },
{ field: 'Country', label: 'Country', type: 'string' },
{ field: 'City', label: 'City', type: 'string' }
];
let importRules: RuleModel = {
  'condition': 'and',
  'rules': [{
    'label': 'EmployeeID',
    'field': 'EmployeeID',
    'type': 'number',
    'operator': 'equal',
    'value': 1001
  },
  {
    'label': 'Title',
    'field': 'Title',
    'type': 'string',
    'operator': 'equal',
    'value': 'Sales Manager'
  }
  ]
};
let qryBldrObj: QueryBuilder = new QueryBuilder({
  width: '70%',
  dataSource: data,
  columns: columnData,
  rule: importRules,
});
qryBldrObj.appendTo('#querybuilder');
```

Support with Data Manager

You can use the created conditions in DataManager through the [getPredicate](#) method, which results the filtered records.

INDEX.TS

```

import { QueryBuilder, ColumnsModel, RuleModel } from '@syncfusion/ej2-
querybuilder';
import { Button } from '@syncfusion/ej2-buttons';
import { DataManager, Query } from '@syncfusion/ej2-data';
import { compile } from '@syncfusion/ej2-base';

Complex Data Binding

Complex Data Binding allows you to create subfield for columns. To implement complex data binding, either bind the complex data in nested columns or specify complex data source and separator must be given in querybuilder.

In the following sample, complex data was bound in nested columns.

INDEX.TS

```

import { QueryBuilder, RuleModel, RuleChangeEventArgs, ColumnsModel } from '@syncfusion/ej2-querybuilder';

Filtering in EJ2 JavaScript Query builder control

Query Builder allows you to create or delete conditions and groups. You can use [showButtons](#) to enable/disable these buttons.

You can create or delete conditions by interacting through the user interface and methods.

- Use the [addRules](#), and [deleteRules](#) methods to create/delete conditions.
- Use [addGroups](#), and [deleteGroups](#) methods to create/delete groups.

Templates in EJ2 JavaScript Query builder control

Templates allows users to define customized header and own user interface for columns.

Header Template

Header Template allows to define your own user interface for Header, which includes creating or deleting rules and groups and to customize the AND/OR condition and NOT condition options. To implement header template in querybuilder, you can create the user interface using x-template and assign the values when requestType is header-template-create in actionBegin event.

In the following sample dropdown, splitbutton and button are used as the custom components in the header.

INDEX.TS

```

import { QueryBuilder, RuleModel, ColumnsModel, ActionEventArgs } from

Column Template

Column Template allows you to define your own input widgets for columns. To implement [template](#), you can define the following functions

- **create**: Creates the custom component.
- **write**: Wire events for the custom component.
- **Destroy**: Destroy the custom component.

In the following sample, dropdown is used as the custom component in the PaymentMode column.

INDEX.TS

```

import { QueryBuilder, ColumnsModel, RuleModel } from '@syncfusion/ej2-querybuilder';
import { getComponent } from '@syncfusion/ej2-base';
import { TextBox } from '@syncfusion/ej2-inputs';
import { DropDownList, MultiSelect, CheckBoxSelection } from '@syncfusion/ej2-dropdowns';
let expenseData: Object[] = [{
    'Category': 'Food',
    'PaymentMode': 'Credit Card',
    'TransactionType': 'Expense',
    'Description': 'Boiled peanuts',
    'Amount': '7',
    'Date': '06/01/2017'
}, {
    'Category': 'Food',
    'PaymentMode': 'Cash',
    'TransactionType': 'Expense',
    'Description': 'Peanuts in Coke',
    'Amount': '8',
    'Date': '06/04/2017'
}, {
    'Category': 'Food',
    'PaymentMode': 'Cash',
    'TransactionType': 'Expense',

Import export in EJ2 JavaScript Query builder control

Importing allows you to view or edit the predefined conditions which is available in JSON or SQL. You can import the conditions either initial rendering or post rendering.

Initial rendering

To apply conditions initially, you can define the [rule](#). Here, you can import structured JSON object by defining the [rule](#) property.

INDEX.TS

```
import { QueryBuilder, ColumnsModel, RuleModel } from '@syncfusion/ej2-querybuilder';
let hardwareData: Object[] = [{
  'TaskID': 1,
  'Name': 'Lenovo Yoga',
  'Category': 'Laptop',
  'SerialNo': 'CB27932009',
  'InvoiceNo': 'INV-2878',
  'Status': 'Assigned'
},
{
  'TaskID': 2,
  'Name': 'Acer Aspire',
  'Category': 'Others',
  'SerialNo': 'CB35728290',
  'InvoiceNo': 'INV-3456',
  'Status': 'In-repair'
},
{
  'TaskID': 3,
  'Name': 'Apple MacBook',
  'Category': 'Laptop',
  'SerialNo': 'CB35628728',
  'InvoiceNo': 'INV-2763',
  'Status': 'In-repair'
}
];
let columnData: ColumnsModel[] = [
  { field: 'TaskID', label: 'Task ID', type: 'number' },
  { field: 'Name', label: 'Name', type: 'string' },
  { field: 'Category', label: 'Category', type: 'string' },
  { field: 'SerialNo', label: 'Serial No', type: 'string' },
  { field: 'InvoiceNo', label: 'Invoice No', type: 'string' },
  { field: 'Status', label: 'Status', type: 'string' }
];

Exporting

Exporting allows you to save or maintain the created conditions through the Query Builder. You can export the defined conditions by the following ways.

Exporting to JSON

You can export the defined conditions to structured JSON object through the [getRules](#) method.

Exporting to SQL

You can export the defined conditions to SQL query through the [getSqlFromRules](#) method.

Global local in EJ2 JavaScript Query builder control

The **Localization** library allows you to localize default text content of the Query Builder. The Query Builder has static text that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the **locale** value and translation object.

The following list of properties and its values are used in the Query Builder.

Locale key words	Text
-----	-----
AddGroup	Add Group
AddCondition	Add Condition
DeleteRule	Remove this condition
DeleteGroup	Delete group
Edit	EDIT
SelectField	Select a field
SelectOperator	Select operator
StartsWith	Starts With
EndsWith	Ends With
Contains	Contains
Equal	Equal
NotEqual	Not Equal
LessThan	Less Than
LessThanOrEqual	Less Than Or Equal
GreaterThan	Greater Than
GreaterThanOrEqual	Greater Than Or Equal
Between	Between
NotBetween	Not Between
In	In
NotIn	Not In
Remove	REMOVE
ValidationMessage	This field is required
SummaryViewTitle	Summary View
OtherFields	Other Fields
AND	AND
OR	OR
SelectValue	Enter Value

| IsEmpty | Is Empty |

| IsNotEmpty | Is Not Empty |

| IsNull | Is Null |

| IsNotNull | Is Not Null |

| True | True |

| False | False |

Style and appearance in EJ2 JavaScript Query builder control

To modify the QueryBuilder appearance, you need to override the default CSS of QueryBuilder component. Please find the list of CSS classes and its corresponding section in QueryBuilder component. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

CSS Class | Purpose of Class

|.e-group-header .e-btn|To customize the condition button in querybuilder

|.e-group-body .e-rule-container|To customize the querybuilder rule container

|.e-group-container .e-group-header .e-dropdown-btn|To customize the querybuilder Add group/condition button

|.e-query-builder .e-group-header .e-deletegroup|To customize the querybuilder Delete group button

|.e-query-builder .e-rule-field .e-rule-value-delete .e-rule-delete|To customize the querybuilder Delete condition button

|.e-query-builder .e-rule-list > ::after, .e-query-builder .e-rule-list > ::before|To customize the querybuilder group joining line

|.e-query-builder .e-rule-container.e-joined-rule|To customize the querybuilder condition joining line

Accessibility in EJ2 JavaScript Query builder control

The Query Builder component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Query Builder component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

WAI-ARIA attributes

WAI-ARIA (Accessibility Initiative – Accessible Rich Internet Applications) defines a way to increase the accessibility of web pages, dynamic content, and user interface components developed with Ajax, HTML, JavaScript, and related technologies. ARIA provides additional semantics to describe the role, state, and functionality of web components.

The following list of ARIA attributes is used in Query Builder.

Attributes	Purpose
---	---
role	Indicates the query builder component.

Keyboard interaction

The Query Builder component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Query Builder component.

Press	To do this
---	---
Tab / Shift + Tab	To focus the next item in the rule.

Ensuring accessibility

The Query Builder component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Query Builder component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Query Builder component with accessibility tools.

How To

Display mode in EJ2 JavaScript Query builder control

Display options allows you to view the Query Builder in Vertically or Horizontally. For this, you should use the [displayMode](#) property.

INDEX.TS

```
import { QueryBuilder, ColumnsModel, RuleModel } from '@syncfusion/ej2-querybuilder';
let employeeData: Object[] = [{
    'EmployeeID': 1,
    'FirstName': 'Nancy',
    'Title': 'Sales Representative',

Restrict groups in EJ2 JavaScript Query builder control

You can restrict the condition set by defining the [maxGroupCount](#) property. By default, the value is 5. In the below demo, the [maxGroupCount](#) is set to 2 .

INDEX.TS

```

import { QueryBuilder, ColumnsModel, RuleModel } from '@syncfusion/ej2-querybuilder';
let employeeData: Object[] = [{
    'EmployeeID': 1,
    'FirstName': 'Nancy',
    'Title': 'Sales Representative',
    'TitleOfCourtesy': 'Ms.',
    'HireDate': '22/07/2001',
    'City': 'Seattle',
    'Country': 'USA'
},
{
    'EmployeeID': 2,
    'FirstName': 'Andrew',
    'Title': 'Vice President',
    'TitleOfCourtesy': 'Dr.',
    'HireDate': '21/04/2003',
    'City': 'Tacoma',
    'Country': 'USA'
},
{
    'EmployeeID': 3,
    'FirstName': 'Janet',
    'Title': 'Sales Representative',
    'TitleOfCourtesy': 'Ms.',
    'HireDate': '22/07/2001',
    'City': 'Kirkland',
    'Country': 'USA'
}
];
let columnData: ColumnsModel[] = [
    {
        field: 'EmployeeID', label: 'Employee ID', type: 'number'
    },
    {
        field: 'FirstName', label: 'FirstName', type: 'string' },
    {
        field: 'TitleOfCourtesy', label: 'Title Of Courtesy', type: 'boolean', values: ['Mr.', 'Mrs.'] },
    {
        field: 'Title', label: 'Title', type: 'string' },

You can use this property in the mobile mode to restrict the nested group creation.

State persistence in EJ2 JavaScript Query builder control

State persistence allows you to maintain the current state in the browser's `localStorage` even if the browser is refreshed or if you move to the next page within the browser. State persistence stores the Query Builder's `rule` object in the local storage when the [enablePersistence](#) is defined to true.

RTL in EJ2 JavaScript Query builder control

RTL provides an option to switch the text direction and layout of the Query Builder component from right-to-left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Farsi, Urdu, etc.). To enable RTL, set the [enableRtl](#) to true.
