```

Font customization

Default fonts

By default, grid uses **Helvetica** font in the exported document. You can change the default font by using **pdfExportProperties.theme** property. The available default fonts are,

- Helvetica
- TimesRoman
- Courier
- Symbol
- ZapfDingbats

The code example for changing default font,

```
`ts
```

```
import { PdfStandardFont, PdfFontFamily, PdfFontStyle } from '@syncfusion/ej2-pdf-export';
```

```
...
```

```
let pdfExportProperties: PdfExportProperties = {
  theme: {
    header: {font: new PdfStandardFont(PdfFontFamily.TimesRoman, 11, PdfFontStyle.Bold),
    caption: { font: new PdfStandardFont(PdfFontFamily.TimesRoman, 9) },
    record: { font: new PdfStandardFont(PdfFontFamily.TimesRoman, 10) }
  }
};
`
```

Add custom font

You can change the default font of Grid header, content and caption cells in the exported document by using `pdfExportProperties.theme` property.

In the following example, we have used Advent Pro font to export the grid with Hungarian fonts.

INDEX.TS

```
import { Grid, Page, Toolbar, PdfExport, Group, PdfExportProperties } from
 '@syncfusion/ej2-grids';
import { data, adventProFont } from './datasource.ts';
import { PdfTrueTypeFont } from '@syncfusion/ej2-pdf-export';
Grid.Inject(Page, Toolbar, PdfExport, Group);
let grid: Grid = new Grid({
  dataSource: data,
  allowPaging: true,
  allowPdfExport: true,
  allowGrouping: true,
  toolbar: ['PdfExport'],
  columns: [
    { field: 'OrderID', headerText: 'Rendelés azonosító', textAlign:
 'Right', width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Ügyfél-azonosító',
 type: 'string' },
    { field: 'Freight', headerText: 'fuvar', textAlign: 'Right', width:
 120, format: 'C' },
    { field: 'OrderDate', headerText: 'Rendelés dátuma', textAlign:
 'Right', width: 140, format: 'yMd' }
  ],
  height: 172
});
grid.appendTo('#Grid');
grid.toolbarClick = (args: Object) => {
  if (args['item'].id === 'Grid_pdfexport') {
    let pdfExportProperties: PdfExportProperties = {
      theme: {
        header: {font: new PdfTrueTypeFont(adventProFont, 12) },
        caption: { font: new PdfTrueTypeFont(adventProFont, 10) },
        record: { font: new PdfTrueTypeFont(adventProFont, 9) }
      }
    };
    grid.pdfExport(pdfExportProperties);
  }
}
```

```
}
```

</head>
<body>

  <div id="container">
    <div id="Grid"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
```

```
</body></html>
```

PdfTrueTypeFont accepts base 64 format of the Custom Font.

Export grid as blob

The Grid offers an option to export the data as a **Blob** instead of downloading it as a file in the browser. To export the grid as a Blob, set the **isBlob** parameter to **true** in the [pdfExport](#) method. The grid returns the promise of a blob in the [pdfExportComplete](#) event.

The following example demonstrates how to obtain the blob data of the exported grid by executing the promise in the **pdfExportComplete** event.

INDEX.TS

```
import { Grid, Page, Toolbar, PdfExport, PdfExportCompleteArgs } from
 '@syncfusion/ej2-grids';
import { ClickEventArgs } from '@syncfusion/ej2-navigations';
import { data } from './datasource.ts';
Grid.Inject(Page, Toolbar, PdfExport);
let grid: Grid = new Grid({
  dataSource: data,
  allowPaging: true,
  allowPdfExport: true,
  toolbar: ['PdfExport'],
  toolbarClick: toolbarClick,
  pdfExportComplete: pdfExportComplete,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
    { field: 'OrderDate', headerText: 'Order Date', textAlign: 'Right',
width: 140, format: 'yMd' }
  ],
  height: 230
});
grid.appendTo('#Grid');
function toolbarClick(args: ClickEventArgs) {
  if (args.item.id === 'Grid_pdfexport') {
    // pass fourth parameter as true to get the blob data of exported
grid
    grid.pdfExport(null, null, null, true);
  }
}
function pdfExportComplete(args: PdfExportCompleteArgs) {
  // execute the promise to get the blob data
  args.promise.then((e: { blobData: Blob }) => {
    console.log(e.blobData);
  });
};
```

```

Pdf cell style customization in EJ2 JavaScript Grid control

Conditional cell formatting

Grid cells in the exported PDF can be customized or formatted using [pdfQueryCellInfo](#) event. In this event, we can format the grid cells of exported PDF document based on the column cell value.

In the below sample, we have set the background color for **Freight** column in the exported document by **args.cell** and **backgroundColor** property.

INDEX.TS

```
import { Grid, Page, Toolbar, PdfExport } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Page, Toolbar, PdfExport);
let grid: Grid = new Grid({
  dataSource: data,
  allowPaging: true,
  allowPdfExport: true,
  toolbar: ['PdfExport'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120 },
    { field: 'OrderDate', headerText: 'Order Date', textAlign: 'Right',
width: 140, format: 'yMd' }
  ],
  height: 230
});
grid.appendTo('#Grid');
grid.toolbarClick = (args: Object) => {
  if (args['item'].id === 'Grid_pdfexport') {
    grid.pdfExport();
  }
}
grid.pdfQueryCellInfo = (args: Object) => {
  if (args.column.field === 'Freight') {
    if (args.value < 30) {
      args.style = { backgroundColor: '#99ffcc' };
    }
    else if (args.value < 60) {
      args.style = { backgroundColor: '#ffffb3' };
    }
    else {
      args.style = { backgroundColor: '#ff704d' };
    }
  }
}
grid.queryCellInfo = (args: Object) => {
  if (args.column.field === 'Freight') {
    if (args.data['Freight'] < 30) {
      args.cell.bgColor = '#99ffcc';
    }
    else if (args.data['Freight'] < 60) {
      args.cell.bgColor = '#ffffb3';
    }
    else {
      args.cell.bgColor = '#ff704d';
    }
  }
}
```

Theme

PDF export provides an option to include theme for exported PDF document.

To apply theme in exported PDF, define the `theme` in `exportProperties`.

INDEX.TS

```

import { Grid, Toolbar, Page, PdfExport, PdfExportProperties } from
'@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Page, Toolbar, PdfExport);
let grid: Grid = new Grid({
    dataSource: data,
    allowPaging: true,
    allowPdfExport: true,
    toolbar: ['PdfExport'],
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
        { field: 'OrderDate', headerText: 'Order Date', textAlign: 'Right',
width: 140, format: 'yMd' }
    ],
    height: 230
});
grid.appendTo('#Grid');
grid.toolbarClick = (args: Object) => {
    if (args['item'].id === 'Grid_pdfexport') {
        let exportProperties: PdfExportProperties = {
            theme: {
                header: {
                    fontColor: '#64FA50', fontName: 'Calibri', fontSize: 17,

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

By default, material theme is applied to exported PDF document.

Adding header and footer in EJ2 JavaScript Grid control

You can customize text, page number, line, page size and changing orientation in header and footer.

Write a text in header and footer

You can add text either in Header or Footer of exported PDF document.

```
`ts
```

```

let exportProperties: PdfExportProperties = {
header: {
fromTop: 0,
height: 130,
contents: [
{
type: 'Text',
value: "Northwind Traders",
position: { x: 0, y: 50 },
style: { textBrushColor: '#000000', fontSize: 13 }
}
]
}
}

```

```
},
]
}
`ts
```

Draw a line in header and footer

you can add line either in Header or Footer of the exported PDF document.

Supported line styles:

- dash
- dot
- dashdot
- dashdotdot
- solid

```
`ts
let exportProperties: PdfExportProperties = {
header: {
fromTop: 0,
height: 130,
contents: [
{
type: 'Line',
style: { penColor: '#000080', penSize: 2, dashStyle: 'Solid' },
points: { x1: 0, y1: 4, x2: 685, y2: 4 }
}
]
}
}
`ts
```

Add page number in header and footer

you can add page number either in Header or Footer of exported PDF document.

Supported page number types:

- LowerLatin - a, b, c,
- UpperLatin - A, B, C,
- LowerRoman - i, ii, iii,
- UpperRoman - I, II, III,
- Number - 1,2,3.

```
`ts
let exportProperties: PdfExportProperties = {
  header: {
    fromTop: 0,
    height: 130,
    contents: [
      {
        type: 'PageNumber',
        pageNumberType: 'Arabic',
        format: 'Page {$current} of {$total}', //optional
        position: { x: 0, y: 25 },
        style: { textBrushColor: '#ffff80', fontSize: 15, hAlign: 'Center' }
      }
    ]
  }
}
```

Insert an image in header and footer

Image (Base64 string) can be added in the exported document in header/footer using the `exportProperties`.

```
`ts
let exportProperties: PdfExportProperties = {
  header: {
    fromTop: 0,
    height: 130,
    contents: [
      {
        type: 'Image',
        src: image,
        position: { x: 40, y: 10 },
        size: { height: 100, width: 250 },
      }
    ]
  }
}
```

```

}
,

```

The below code illustrates the pdf export customization.

INDEX.TS

```

import { Grid, Page, Toolbar, PdfExport, PdfExportProperties } from
 '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
import { image } from './image.ts';
Grid.Inject(Page, Toolbar, PdfExport);
let grid: Grid = new Grid({
    dataSource: data,
    allowPaging: true,
    allowPdfExport: true,
    toolbar: ['PdfExport'],
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
        { field: 'OrderDate', headerText: 'Order Date', textAlign: 'Right',
width: 140, format: 'yMd' }
    ],
    height: 230
});
grid.appendTo('#Grid');
grid.toolbarClick = (args: Object) => {
    if (args['item'].id === 'Grid_pdfexport') {
        let pdfExportProperties: PdfExportProperties = {
            header: {
                fromTop: 0,
                height: 130,
                contents: [
                    {
                        type: 'Image',
                        src: image,
                        position: { x: 40, y: 10 },
                        size: { height: 100, width: 250 },
                    }
                ]
            },
            footer: {
                fromBottom: 160,
                height: 150,
                contents: [
                    {
                        type: 'PageNumber',
                        pageNumberType: 'Arabic',
                        format: 'Page { $current } of { $total }',
                        position: { x: 0, y: 25 },
                        style: { textBrushColor: '#ffff80', fontSize: 15 }
                    }
                ]
            }
        }
    }
}

```

```

    }
    };
    grid.pdfExport(pdfExportProperties);
}
}

```

```

Repeat column header on every page

By default, column header will be placed on the first page of the pdf document but you can display column header on every page using `repeatHeader` property of `pdfGrid`.

In the below sample, we have enabled `repeatHeader` property in `pdfHeaderQueryCellInfo` event to show the header on every page.

INDEX.TS

```

import { Grid, Toolbar, Page, PdfExport, PdfExportProperties } from
 '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Page, Toolbar, PdfExport);
let grid: Grid = new Grid({
  dataSource: data,
  allowPaging: true,
  allowPdfExport: true,
  toolbar: ['PdfExport'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120},
    { field: 'CustomerID', width: 140, headerText: 'Customer ID'},
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
    { field: 'ShipName', headerText: 'ShipName', textAlign: 'Right',
width: 140}
  ],
  height: 230,
});
grid.appendTo('#Grid');
grid.toolbarClick = (args: Object) => {
  if (args['item'].id === 'Grid_pdfexport') {
    grid.pdfExport();
  }
}

```

```

}
grid.pdfHeaderQueryCellInfo = (args: Object) => {
    args.cell.row.pdfGrid.repeatHeader = true;
}

```

Exporting hierarchy grid in EJ2 JavaScript Grid control

The grid have an option to export the hierarchy grid to pdf document. By default, grid will exports the master grid with expanded child grids alone. you can change the exporting option by using the PdfExportProperties.hierarchyExportMode property. The available options are,

Mode	Behavior
-----	-----
Expanded	Exports the master grid with expanded child grids.
All	Exports the master grid with all the child grids.
None	Exports the master grid alone.

INDEX.TS

```

import { Grid, DetailRow, Toolbar, PdfExport, PdfExportProperties } from
'@syncfusion/ej2-grids';
import { data, employeeData } from './datasource.ts';
Grid.Inject(DetailRow, Toolbar, PdfExport);
let grid: Grid = new Grid({
    dataSource: employeeData,
    toolbar: ['PdfExport'],
    allowPdfExport: true,
    columns: [
        { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 120 },
        { field: 'FirstName', headerText: 'First Name', width: 150 },
        { field: 'City', headerText: 'City', width: 150 },
        { field: 'Country', headerText: 'Country', width: 150 }
    ],
    childGrid: {
        dataSource: data,
        queryString: 'EmployeeID',
        columns: [

```

```

        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ]
    },
    toolbarClick: toolbarClick
});
grid.appendTo('#Grid');

Exporting grid with templates in EJ2 JavaScript Grid control

The grid offers the option to export the column, detail, and caption templates to a PDF document. The template contains images, hyperlinks, and customized text.

Exporting with column template

The PDF export functionality allows you to export Grid columns that include images, hyperlinks, and custom text to an PDF document.

In the following sample, the hyperlinks and images are exported to PDF using [hyperlink](#) and [image](#) properties in the [pdfQueryCellInfo](#) event.

PDF Export supports base64 string to export the images.

INDEX.TS

```

import { Grid, Toolbar, PdfExport, PdfQueryCellInfoEventArgs } from
'@syncfusion/ej2-grids';
import { ClickEventArgs } from '@syncfusion/ej2-navigations';
import { employeeData } from './datasource.ts';
Grid.Inject(Toolbar, PdfExport);
let grid: Grid = new Grid({
    dataSource: employeeData,
    allowPdfExport: true,
    toolbar: ['PdfExport'],
    columns: [
        {
            headerText: 'Employee Image', textAlign: 'Center',
            template: '#imageTemplate', width: 150
        },
        { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 125 },
        { field: 'FirstName', headerText: 'Name', width: 120 },
        { field: 'EmailID', headerText: 'Email ID', template:
'#mailTemplate', width: 170 }
    ],
    toolbarClick: toolbarClick,

```

```

        pdfQueryCellInfo: pdfQueryCellInfo,
        height: 273
    });
    grid.appendTo('#Grid');
    function toolbarClick(args: ClickEventArgs) {
        if (args.item.id === 'Grid_pdfexport') {
            grid.pdfExport();
        }
    }
    function pdfQueryCellInfo(args: PdfQueryCellInfoEventArgs): any {
        if (args.column.headerText === 'Employee Image') {
            args.image = ({
                base64: args.data['EmployeeImage'],
                height: 50,
                width: 50,
            } as any);
        }
        if (args.column.headerText === 'Email ID') {
            args.hyperLink = {
                target: 'mailto:' + args.data['EmailID'],
                displayText: args.data['EmailID'],
            };
        }
    }
}

```

PDF Export		
Employee Image	Name	Email ID
	Nancy	nancy@domain.com
	Andrew	andrew@domain.com
	Janet	janet@domain.com
	Margaret	margaret@domain.com

Exporting with detail template

By default, the grid will export the parent grid with expanded detail rows alone. Change the exporting option by using the `PdfExportProperties.hierarchyExportMode` property. The available options are:

| Mode | Behavior |

|-----|-----|

| Expanded | Exports the parent grid with expanded detail rows. |

| All | Exports the parent grid with all the detail rows. |

| None | Exports the parent grid alone. |

The detail rows in the exported PDF can be customized or formatted using the [exportDetailTemplate](#) event. In this event, the detail rows of the PDF document are formatted in accordance with their parent row details.

In the following sample, the detail row content is formatted by specifying the [columnCount](#), [columnHeader](#), and [rows](#) properties using its [parentRow](#) details. This allows for the creation of detail rows in the PDF document. Additionally, custom styles can be applied to specific cells using the [style](#) property.

If `columnCount` is not provided, the columns in the detail row of the PDF grid will be generated based on the count of the `columnHeader/rows` first row's [cells](#).

When using [rowSpan](#), it is essential to provide the cell's [index](#) for proper functionality.

INDEX.TS

```
import { Grid, DetailRow, Toolbar, PdfExport, PdfExportProperties,
ExportDetailTemplateEventArgs } from '@syncfusion/ej2-grids';
import { employeeData } from './datasource.ts';
Grid.Inject(DetailRow, Toolbar, PdfExport);

Exporting with caption template

The PDF export feature enables exporting of Grid with a caption template to an PDF document.

In the following sample, the customized caption text is exported to PDF using [captionText](#) property in the [exportGroupCaption](#) event.

INDEX.TS

```
import { Grid, Group, Toolbar, PdfExport, ExportGroupCaptionEventArgs } from '@syncfusion/ej2-grids';
import { ClickEventArgs } from '@syncfusion/ej2-navigations';
import { employeeData } from './datasource.ts';
Grid.Inject(Group, Toolbar, PdfExport);
let grid: Grid = new Grid({
  dataSource: employeeData,
  allowGrouping: true,
  groupSettings: { captionTemplate: '#captiontemplate', columns:
  ['EmployeeID'] },
  allowPdfExport: true,
  toolbar: ['PdfExport'],
  columns: [
    { field: 'EmployeeID', headerText: 'Employee ID', width: 120 },
    { field: 'FirstName', headerText: 'Name', width: 120 },
    { field: 'City', headerText: 'City' },
    { field: 'Title', headerText: 'Title', width: 170 }
  ],
  toolbarClick: toolbarClick,
  exportGroupCaption: exportGroupCaption,
  height: 273
});
grid.appendTo('#Grid');
function toolbarClick(args: ClickEventArgs) {
  if (args.item.id === 'Grid_pdfexport') {
    grid.pdfExport();
  }
}

function exportGroupCaption(args: ExportGroupCaptionEventArgs) {
  args.captionText = args.data['field'] + ' - ' + args.data['key'];
}

Exporting grid in server in EJ2 JavaScript Grid control

The Grid have an option to export the data to PDF in server side using Grid server export library.

Server dependencies

The Server side export functionality is shipped in the Syncfusion.EJ2.GridExport package, which is available in Essential Studio and [nuget.org](https://www.nuget.org/packages/Syncfusion.EJ2.GridExport). The following list of dependencies is required for Grid server side PDF exporting action.

- Syncfusion.EJ2
- Syncfusion.EJ2.GridExport
- Syncfusion.Compression.Base
- Syncfusion.Pdf.Base

Server configuration

The following code snippets shows server configuration using ASP.NET MVC Controller Action.

To Export the Grid in server side, You need to call the

[serverPdfExport](#) method for passing the Grid properties to server exporting action.

```
`ts
public ActionResult PdfExport(string gridModel)
{
```

```

GridPdfExport exp = new GridPdfExport();
Grid gridProperty = ConvertGridObject(gridModel);
return exp.PdfExport<OrdersDetails>(gridProperty, OrdersDetails.GetAllRecords());
}

private Grid ConvertGridObject(string gridProperty)
{
    Grid GridModel = (Grid)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty, typeof(Grid));
    GridColumnModel cols =
    (GridColumnModel)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty,
    typeof(GridColumnModel));
    GridModel.Columns = cols.columns;
    return GridModel;
}

public class GridColumnModel
{
    public List<GridColumn> columns { get; set; }
}

public ActionResult DataSource(DataManager dm)
{
    var DataSource = OrderRepository.GetAllRecords();
    DataResult result = new DataResult();
    result.result = DataSource.Skip(dm.Skip).Take(dm.Take).ToList();
    result.count = result.result.Count;
    return Json(result, JsonRequestBehavior.AllowGet);
}
`ts

import { Grid, Toolbar } from '@syncfusion/ej2-grids';
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
Grid.Inject(Toolbar);
let data: DataManager = new DataManager({
    url: "Home/DataSource",
    adaptor: new UrlAdaptor
});

```

```

let grid: Grid = new Grid({
  dataSource: data,
  toolbar: ['PdfExport'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width: 100 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right', width: 120, format: 'C2' },
    { field: 'ShipCountry', headerText: 'Ship Country', width: 150 }
  ],
  height: 265
});
grid.appendTo('#Grid');
grid.toolbarClick = (args: Object) => {
  if (args['item'].id === 'Grid_pdfexport') {
    grid.serverPdfExport("Home/PdfExport");
  }
}

```

Note: Refer to the GitHub sample for quick implementation and testing from [here](#).

Export grid as memory stream

The Grid offers an option to export the data as a memory stream instead of downloading it as a file in the browser. To obtain the memory stream of the exported grid, set the **AsMemoryStream** parameter to **true** in the [PdfExport](#) method.

The following code demonstrates how to get the memory stream of exported grid.

```

`ts
public object PdfExport(string gridModel)
{
  GridPdfExport exp = new GridPdfExport();
  Grid gridProperty = ConvertGridObject(gridModel);
  // pass third parameter as true to get the Memory Stream of exported grid data
  return (MemoryStream)exp.PdfExport<OrdersDetails>(gridProperty, OrdersDetails.GetAllRecords(),
  true);
}

```

Merge grid's memory stream

The [Essential PDF](#) library is used to merge multiple memory streams into a single stream. To learn more about the merge option, please refer to this [documentation](#).

You can merge a memory stream, a file stream, and a local file with the Grid's memory stream in the following ways:

Merging with an existing memory stream

If you already have a memory stream, you can directly use it to merge with the Grid's memory stream.

In the following code, the [Merge](#) method of the [PdfDocumentBase](#) class is used to merge the grid's memory stream with an existing memory stream.

```
`ts
using Syncfusion.Pdf;

public MemoryStream ms1; // defines existing memory stream
public object PdfExport(string gridModel)
{
    GridPdfExport exp = new GridPdfExport();
    Grid gridProperty = ConvertGridObject(gridModel);
    // get the memory stream of exported grid data
    MemoryStream ms2 = (MemoryStream)exp.PdfExport<OrdersDetails>(gridProperty,
    OrdersDetails.GetAllRecords(), true);
    //Creates a PDF document.
    PdfDocument finalDoc = new PdfDocument();
    //Creates a PDF stream for merging. ms1 and ms2 represents the existing stream and grid's stream.
    Stream[] streams = { ms1, ms2 };
    //Merges PDFDocument.
    PdfDocumentBase.Merge(finalDoc, streams);
    //Save the document into stream.
    MemoryStream ms3 = new MemoryStream();
    finalDoc.Save(ms3);
    ms3.Position = 0;
    //Close the document.
    finalDoc.Close(true);
    //Dispose the streams.
    ms1.Dispose();
    ms2.Dispose();
    return ms3;
}
```

```
}
`ts
```

Merging with an existing file stream

If you already have a file stream, you can directly use it to merge with the Grid's memory stream. In the following code, the existing file stream is merged with the Grid's memory stream.

```
`ts
using Syncfusion.Pdf;

public FileStream fs1; // defines existing file stream

public ActionResult PdfExport(string gridModel)
{
    GridPdfExport exp = new GridPdfExport();
    Grid gridProperty = ConvertGridObject(gridModel);
    MemoryStream ms1 = (MemoryStream)exp.PdfExport<OrdersDetails>(gridProperty,
    OrdersDetails.GetAllRecords(), true);
    PdfDocument finalDoc = new PdfDocument();
    //fs1 and ms1 represents the existing stream and grid's stream.
    Stream[] streams = { fs1, ms1 };
    PdfDocumentBase.Merge(finalDoc, streams);
    MemoryStream ms3 = new MemoryStream();
    finalDoc.Save(ms3);
    ms3.Position = 0;
    return ms3;
}
`ts
```

Merging with a local file

To merge a local file with the Grid's memory stream, you need to convert it into a file stream before merging. In the following code, the existing local file is merged with the Grid's memory stream.

```
`ts
using Syncfusion.Pdf;

// get the file stream of local file

public FileStream fs1 = new FileStream("D:/PdfDoc.pdf", FileMode.Open, FileAccess.Read); //
PdfDoc.pdf is a local file which is located in local disk D.

public ActionResult PdfExport(string gridModel)
{
    GridPdfExport exp = new GridPdfExport();
```

```

Grid gridProperty = ConvertGridObject(gridModel);
MemoryStream ms1 = (MemoryStream)exp.PdfExport<OrdersDetails>(gridProperty,
OrdersDetails.GetAllRecords(), true);
PdfDocument finalDoc = new PdfDocument();
//fs1 and ms1 represents the local file's stream and grid's stream.
Stream[] streams = { fs1, ms1 };
PdfDocumentBase.Merge(finalDoc, streams);
MemoryStream ms3 = new MemoryStream();
finalDoc.Save(ms3);
ms3.Position = 0;
return ms3;
}
`

```

Downloading the merged memory stream

You can download the merged memory stream by converting it into a `FileStreamResult`. In the following code, the merged memory stream is downloaded to the browser.

```

`ts
using Syncfusion.Pdf;
public ActionResult PdfExport(string gridModel)
{
    PdfDocument finalDoc = new PdfDocument();
    //ms1 and ms2 represents the streams needs to merge.
    Stream[] streams = { ms1, ms2 };
    PdfDocumentBase.Merge(finalDoc, streams);
    MemoryStream ms3 = new MemoryStream();
    finalDoc.Save(ms3);
    ms3.Position = 0;
    // Save the MemoryStream into FileStreamResult
    FileStreamResult fileStreamResult = new FileStreamResult(ms3, "application/pdf");
    fileStreamResult.FileName = "Export.pdf";
    //Close the document.
    finalDoc.Close(true);
    //Dispose the streams.
    ms1.Dispose();
}
`

```

```

ms2.Dispose();
// return the file
return fileStreamResult;
}
`

```

Rotate a header text to a certain degree in the exported grid on the server side

The Grid has support to customize the column header styles such as changing text orientation, the font color, and so on in the exported PDF file. To achieve this requirement, define the `BeginCellLayout` event of the `PdfExportProperties` with an event handler to perform the required action.

The `PdfHeaderQueryCellInfoEvent` will be triggered when creating a column header for the pdf document to be exported. Collect the column header details in this event and handle the custom in the `BeginCellLayout` event handler.

In the following demo, the `DrawString` method from the `Graphics` is used to rotate the header text of the column header inside the `BeginCellLayout` event handler.

A PDF exporting is not supported to rotate the column header on the client side.

```

`ts
public ActionResult PdfExport(string gridModel)
{
    GridPdfExport exp = new GridPdfExport();
    Grid gridProperty = ConvertGridObject(gridModel);
    gridProperty.ServerPdfHeaderQueryCellInfo = PdfHeaderQueryCellInfo;
    PdfGrid grid = new PdfGrid();
    PdfExportProperties pdfExportProperties = new PdfExportProperties();
    pdfExportProperties.IsRepeatHeader = true;
    pdfExportProperties.BeginCellLayout = new PdfGridBeginCellLayoutEventHandler(BeginCellEvent);
    gridProperty.ServerPdfQueryCellInfo = PdfQueryCellInfo;
    IEnumerable data = Utils.DataTableToJson(dt);
    var result = exp.PdfExport<dynamic>(gridProperty, data, pdfExportProperties);
    return result;
}

public void BeginCellEvent(object sender, PdfGridBeginCellLayoutEventArgs args)
{
    PdfGrid grid = (PdfGrid)sender;
    var brush = new PdfSolidBrush(new PdfColor(Color.DimGray));
    args.Graphics.Save();
}

```

```

args.Graphics.TranslateTransform(args.Bounds.X + 50, args.Bounds.Height + 40); // give the value for
bounds x and Y by the user

args.Graphics.RotateTransform(-60); // give the rotate degree value by the user

// Draw the text at particular bounds.

args.Graphics.DrawString(headerValues[args.CellIndex], new PdfStandardFont(PdfFontFamily.Helvetica,
10), brush, new PointF(0, 0));

if (args.IsHeaderRow)
{
grid.Headers[0].Cells[args.CellIndex].Value = string.Empty;
}

args.Graphics.Restore();
}

private void PdfHeaderQueryCellInfo(object pdf)
{
ServerPdfHeaderQueryCellInfoEventArgs name = (ServerPdfHeaderQueryCellInfoEventArgs)pdf;
PdfGrid grid = new PdfGrid();
headerValues.Add(name.Column.HeaderText);
var longestString = headerValues.Where(s => s.Length == headerValues.Max(m => m.Length)).First();
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 6);
SizeF size = font.MeasureString(longestString);
name.Headers[0].Height = size.Width * 2;
}

```

Limitations

- The export feature for detail templates is not supported in server-side exporting.
- Multiple grids exporting feature is not supported with server side exporting.

Excel Export

Excel exporting in EJ2 JavaScript Grid control

The excel export allows exporting Grid data to Excel document. You need to use the [excelExport](#) method for exporting. To enable Excel export in the grid, set the [allowExcelExport](#) as true.

To use excel export, You need to inject the **ExcelExport** module in grid.

INDEX.TS

```

import { Grid, Toolbar, ExcelExport, Page } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Toolbar, ExcelExport, Page);

```

```

let grid: Grid = new Grid({
    dataSource: data,
    allowPaging: true,
    allowExcelExport: true,
    toolbar: ['ExcelExport'],
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
        { field: 'OrderDate', headerText: 'Order Date', width: 140, format:
'yMd', textAlign: 'Right' }
    ],
    height: 230
});
grid.toolbarClick = (args: Object) => {
    if (args['item'].id === 'Grid_excelexport') {
        grid.excelExport();
    }
}
grid.appendTo('#Grid');

```

INDEX.HTML

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Show spinner while exporting

You can show/ hide spinner component while exporting the grid using `showSpinner/ hideSpinner` methods. You can use `toolbarClick` event to show spinner before exporting and hide a spinner in the `pdfExportComplete` or `excelExportComplete` event after the exporting.

In the `toolbarClick` event, based on the parameter `args.item.id` as `Gridpdfexport` or `Gridexcelexport` we can call the `showSpinner` method from grid instance.

In the `pdfExportComplete` or `excelExportComplete` event, We can call the `hideSpinner` method.

In the below demo, we have rendered the default spinner component when exporting the grid.

INDEX.TS

```

import { Grid, Page, Toolbar, PdfExport, ExcelExport } from
 '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Page, Toolbar, PdfExport, ExcelExport);
let grid: Grid = new Grid({
  dataSource: data,
  allowPaging: true,
  allowPdfExport: true,
  allowExcelExport: true,
  toolbar: ['PdfExport', 'ExcelExport'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID',
visible: false },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
    { field: 'ShipCity', headerText: 'ShipCity', textAlign: 'Right',
width: 140 }
  ],
  height: 230
});
grid.appendTo('#Grid');
grid.toolbarClick = (args: Object) => {
  if (args['item'].id === 'Grid_pdfexport') {
    grid.showSpinner();
    grid.pdfExport();
  }
  if (args['item'].id === 'Grid_excelexport') {
    grid.showSpinner();
    grid.excelExport();
  }
}
grid.pdfExportComplete = () => {
  grid.hideSpinner();
}
grid.excelExportComplete = () => {
  grid.hideSpinner();
}

```

```

Custom data source

The excel export provides an option to define datasource dynamically before exporting. To export data dynamically, define the `dataSource` in `exportProperties`.

INDEX.TS

```
import { Grid, Toolbar, ExcelExport, ExcelExportProperties, Page } from
 '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Toolbar, ExcelExport, Page);
let grid: Grid = new Grid({
  dataSource: data,
  allowPaging: true,
  allowExcelExport: true,
  toolbar: ['ExcelExport'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
    { field: 'OrderDate', headerText: 'Order Date', width: 140, format:
'yMd', textAlign: 'Right' }
  ],
  height: 230
});
grid.toolbarClick = (args: Object) => {
  if (args['item'].id === 'Grid_excelexport') {
    let excelExportProperties: ExcelExportProperties = {
      dataSource: data
    };
    grid.excelExport(excelExportProperties);
  }
}
grid.appendTo('#Grid');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

```

Passing additional parameters to the server when exporting

You can pass the additional parameter in the `query` property by invoking `addParams` method. In the `toolbarClick` event, you can define params as key and value pair so it will receive at the server side when exporting.

In the below example, we have passed `recordcount` as `12` using `addParams` method.

INDEX.TS

```
import { Grid, Page, Toolbar, PdfExport, ExcelExport } from
 '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
import { Query } from '@syncfusion/ej2-data';
Grid.Inject(Page, Toolbar, PdfExport, ExcelExport);
let queryClone: Object;
let grid: Grid = new Grid({
  dataSource: data,
  allowPaging: true,
  allowPdfExport: true,
  allowExcelExport: true,
  toolbar: ['PdfExport', 'ExcelExport'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID',
visible: false },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
    { field: 'ShipCity', headerText: 'ShipCity', textAlign: 'Right',
width: 140 }
  ],
  height: 230
});
grid.appendTo('#Grid');
grid.toolbarClick = (args: Object) => {
  if (args['item'].id === 'Grid_pdfexport') {
    queryClone = grid.query;
    grid.query = new Query().addParams("recordcount", "12");
    grid.pdfExport();
  }
  if (args['item'].id === 'Grid_excelexport') {
    queryClone = grid.query;
    grid.query = new Query().addParams("recordcount", "12");
    grid.excelExport();
  }
}
grid.pdfExportComplete = () => {
  grid.query = queryClone;
}
grid.excelExportComplete = () => {
  grid.query = queryClone;
}
```

Passing the selected records to the server using ajax request via custom toolbar button click

You can pass the selected records to the server with the help of an ajax request. In the `toolbarClick` event, you can get the selected records using the [getSelectedRecords](#) method and pass the selected records to the server using the **data** property of the ajax.

`ts

```

import { Grid, Page, Toolbar } from '@syncfusion/ej2-grids';
import { Ajax } from '@syncfusion/ej2-base';

Grid.Inject(Page, Toolbar);

let grid: Grid = new Grid({
    dataSource: data,
    allowSelection: true,
    toolbar: ['Selected'],
    columns: [
        { type: 'checkbox', width: 50, },
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width: 120},
        { field: 'CustomerID', width: 140, headerText: 'CustomerID'},
        { field: 'ShipCity', headerText: 'Ship Country', width: 140 }
    ],
    toolbarClick: function (args) {
        if (args.item.text === 'Selected') {
            var selectedRecord = this.getSelectedRecords();
            var ajax = new Ajax({
                url: "/Home/SelectRecord",
                type: "POST",
                contentType: "application/json",
                data: JSON.stringify(selectedRecord),
                successHandler: function (response) {

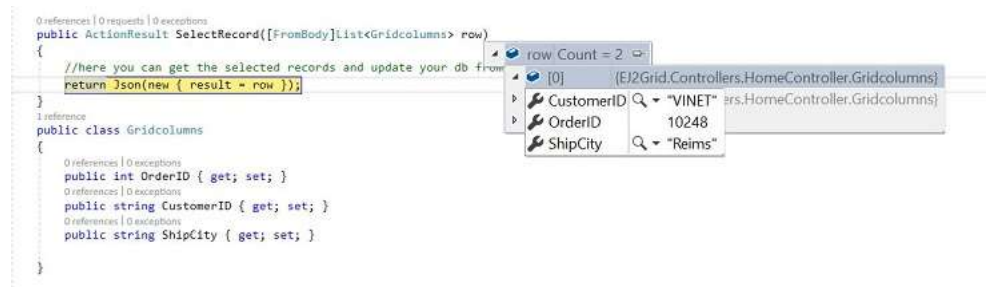

```

```

console.log(JSON.parse(response));
},
failure: function (response) {
alert(response);
}
});
ajax.send();
}
},
});
grid.appendTo('#Grid');
`

```

The selected record details are bound to the `row` parameter. Please refer to the following screenshot.

Export multiple grids in EJ2 JavaScript Grid control

The Excel export provides an option to export multiple grid data in the same or different sheets of an Excel file. Each grid is identified by its unique ID. You can specify which grids to export by listing their IDs in the `exportGrids` property.

Same sheet

Excel exporting provides support for exporting multiple grids on the same sheet. To export the grids in the same sheet, define `multipleExport.type` as **AppendToSheet** in `exportProperties`. It also has an option to provide blank rows between the grids. These blank rows count can be defined by using `multipleExport.blankRows` property.

INDEX.TS

```

import { Grid, Toolbar, ExcelExport, ExcelExportProperties, Page } from
 '@syncfusion/ej2-grids';
import { data, employeeData } from './datasource.ts';
Grid.Inject(Toolbar, ExcelExport, Page);
let firstGrid: Grid = new Grid({

```

```

dataSource: data.slice(0, 5),
allowPaging: true,
exportGrids: ['FirstGrid', 'SecondGrid'],
allowExcelExport: true,
toolbar: ['ExcelExport'],
columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 },
    { field: 'ShipCountry', headerText: 'Ship Country', width: 150 },
]
});
let secondGrid: Grid = new Grid({
    dataSource: employeeData.slice(0, 5),
    allowPaging: true,
    allowExcelExport: true,
    columns: [
        { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Reight', width: 120, type: 'number' },
        { field: 'FirstName', width: 140, headerText: 'First Name', type:
'string' },
        { field: 'LastName', width: 140, headerText: 'Last Name', type:
'string' },
        { field: 'City', headerText: 'City', width: 120 },
    ]
});
firstGrid.toolbarClick = (args: Object) => {
    if (args['item'].id === 'FirstGrid_excelelexport') {
        let appendExcelExportProperties: ExcelExportProperties = {
            multipleExport: { type: 'AppendToSheet', blankRows: 2 }
        };
        firstGrid.excelExport(appendExcelExportProperties, true);
    }
}
firstGrid.appendTo('#FirstGrid');
secondGrid.appendTo('#SecondGrid');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

By default, `multipleExport.blankRows` value is 5.

New sheet

Excel export functionality enables the exporting of multiple grids onto separate sheets (each grid in new sheet of excel) within the Excel file. To achieve this, you can specify `multipleExport.type` as `NewSheet` in `exportProperties`.

INDEX.TS

```

import { Grid, Toolbar, ExcelExport, ExcelExportProperties, Page } from
 '@syncfusion/ej2-grids';
import { data, employeeData } from './datasource.ts';
Grid.Inject(Toolbar, ExcelExport, Page);
let firstGrid: Grid = new Grid({

```

```

dataSource: data.slice(0, 5),
allowPaging: true,
allowExcelExport: true,
exportGrids: ['FirstGrid', 'SecondGrid'],
toolbar: ['ExcelExport'],
columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 },
    { field: 'ShipCountry', headerText: 'Ship Country', width: 150 },
]
});
let secondGrid: Grid = new Grid({
dataSource: employeeData.slice(0, 5),
allowPaging: true,
allowExcelExport: true,
columns: [
    { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 120, type: 'number' },
    { field: 'FirstName', width: 140, headerText: 'First Name', type:
'string' },
    { field: 'LastName', width: 140, headerText: 'Last Name', type:
'string' },
    { field: 'City', headerText: 'City', width: 120 },
]
});
firstGrid.toolbarClick = (args: Object) => {
    if (args['item'].id === 'FirstGrid_excelexport') {
        let appendExcelExportProperties: ExcelExportProperties = {
            multipleExport: { type: 'NewSheet' }
        };
        firstGrid.excelExport(appendExcelExportProperties, true);
    }
}
firstGrid.appendTo('#FirstGrid');
secondGrid.appendTo('#SecondGrid');

```

Excel export options in EJ2 JavaScript Grid control

The excel export provides an option to customize mapping of the grid to excel document.

Export current page

The excel export provides an option to export the current page into excel. To export current page, define `exportType` to `CurrentPage`.

INDEX.TS

```

import { Grid, Toolbar, ExcelExport, ExcelExportProperties, Page } from
 '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Toolbar, ExcelExport, Page);
let grid: Grid = new Grid({

```

```

    dataSource: data,
    allowPaging: true,
    allowExcelExport: true,
    toolbar: ['ExcelExport'],
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
        { field: 'OrderDate', headerText: 'Order Date', width: 140, format:
'yMd', textAlign: 'Right' }
    ],
    height: 230
});
grid.toolbarClick = (args: Object) => {
    if (args['item'].id === 'Grid_excelexport') {
        let excelExportProperties: ExcelExportProperties = {
            exportType: 'CurrentPage'
        };
        grid.excelExport(excelExportProperties);
    }
}
grid.appendTo('#Grid');

```

```

Export the selected records only

You can export the selected records data by passing it to `exportProperties.dataSource` Property in the `toolbarClick` event.

In the below exporting demo, We can get the selected records using `getSelectedRecords` method and pass the selected data to `PdfExport` or `excelExport` property.

INDEX.TS

```

import { Grid, Page, Toolbar, PdfExport, Filter, ExcelExport } from
 '@syncfusion/ej2-grids';

Show or hide columns

You can show a hidden column or hide a visible column while printing the grid using [toolbarClick](#) and [excelExportComplete](#) events.

In the `toolbarClick` event, based on `args.item.id` as `Grid_excelexport`. We can show or hide columns by setting `column.visible` property to `true` or `false` respectively.

In the `excelExportComplete` event, We have reversed the state back to the previous state.

In the below example, we have `CustomerID` as a hidden column in the grid. While exporting, we have changed `CustomerID` to visible column and `ShipCity` as hidden column.

INDEX.TS

```
import { Grid, Toolbar, ExcelExport, Page } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Toolbar, ExcelExport, Page);
let grid: Grid = new Grid({
  dataSource: data,
  allowPaging: true,
  allowExcelExport: true,
  toolbar: ['ExcelExport'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID',
visible: false },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
    { field: 'ShipCity', headerText: 'ShipCity', width: 140, textAlign:
'Right' }
  ],
  height: 230
});
grid.toolbarClick = (args: Object) => {
  if (args['item'].id === 'Grid_excelexport') {
    grid.columns[1].visible = false;
    grid.columns[3].visible = true;
    grid.excelExport();
  }
}
grid.pdfExportComplete = () => {
  grid.columns[1].visible = false;
  grid.columns[3].visible = true;
}
grid.appendTo('#Grid');
```

Export with filter options

The excel export provides an option to export with filter option in excel by defining `enableFilter` as `true`.

It requires the [allowFiltering](#) to be true.

INDEX.TS

```

import { Grid, Toolbar, ExcelExport, ExcelExportProperties, Page, Filter }
from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Toolbar, ExcelExport, Page, Filter);
let grid: Grid = new Grid({
    dataSource: data,
    allowPaging: true,
    allowExcelExport: true,
    allowFiltering: true,
    toolbar: ['ExcelExport'],
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
        { field: 'OrderDate', headerText: 'Order Date', width: 140, format:
'yMd', textAlign: 'Right' }
    ],
    height: 230
});
grid.toolbarClick = (args: Object) => {
    if (args['item'].id === 'Grid_excelexport') {
        let excelExportProperties: ExcelExportProperties = {
            enableFilter: true
        };
        grid.excelExport(excelExportProperties);
    }
}
grid.appendTo('#Grid');

Exporting grouped records

The excel export provides outline option for grouped records which hides the detailed data for better viewing. In grid, we have provided the outline option for the exported document when the data's are grouped.

INDEX.TS

```

import { Grid, Toolbar, ExcelExport, Group } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Toolbar, ExcelExport, Group);
let grid: Grid = new Grid({
    dataSource: data,
    allowExcelExport: true,
    toolbar: ['ExcelExport'],
    allowGrouping: true,
    groupSettings: { columns: ['OrderID', 'CustomerID'] };
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
        { field: 'OrderDate', headerText: 'Order Date', width: 140, format:
'yMd', textAlign: 'Right' }
    ],
    height: 230
});
grid.toolbarClick = (args: Object) => {
    if (args['item'].id === 'Grid_excelexport') {
        grid.excelExport();
    }
}
grid.appendTo('#Grid');

Define file name

You can assign the file name for the exported document by defining `fileName` property in [ExcelExportProperties](#).

INDEX.TS

```
import { Grid, Toolbar, ExcelExport, ExcelExportProperties, Page } from
 '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Toolbar, ExcelExport, Page);
let grid: Grid = new Grid({
  dataSource: data,
  allowPaging: true,
  allowExcelExport: true,
  toolbar: ['ExcelExport'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
    { field: 'OrderDate', headerText: 'Order Date', width: 140, format:
'yMd', textAlign: 'Right' }
  ],
  height: 230
});
grid.toolbarClick = (args: Object) => {
  if (args['item'].id === 'Grid_excelexport') {
    let excelExportProperties: ExcelExportProperties = {
      fileName: "new.xlsx"
    };
    grid.excelExport(excelExportProperties);
  }
}
grid.appendTo('#Grid');
```

Export the master detail grid

It is possible to export the master-detail grid on the same Excel sheet using the `ExcelExportProperties` class in the grid.

To export the master-detail grid on the same sheet in the following sample, you need to set the `multipleExport.type` to `AppendToSheet` in the exportProperties. A promise object is created by exporting the master grid first, and then the detail grid is exported after the master grid has been successfully exported.

INDEX.TS

```
import { Grid, RowSelectEventArgs, Selection, Toolbar, ExcelExport } from
 '@syncfusion/ej2-grids';
import { data, customerData } from './datasource.ts';
Grid.Inject(Selection, Toolbar, ExcelExport);
type carType = { CustomerID: string; CustomerName: string; ContactName:
 string; };
let names: string[] = ['AROUT', 'BERGS', 'BLONP', 'CHOPS', 'ERNSH'];
let masterdata: Object = customerData.filter((e: carType) =>
 names.indexOf(e.CustomerID) !== -1);
let mastergrid: Grid = new Grid({
  dataSource: masterdata,
  toolbar: ['ExcelExport'],
  selectedRowIndex: 1,
  allowExcelExport: true,
  toolbarClick: toolbarClick,
  columns: [
    { field: 'ContactName', headerText: 'Customer Name', width: 150 },
    { field: 'CompanyName', headerText: 'Company Name', width: 150 },
    { field: 'Address', headerText: 'Address', width: 150 },
    { field: 'Country', headerText: 'Country', width: 130 },
  ],
  rowSelected: rowSelected,
});
mastergrid.appendTo('#MasterGrid');
function rowSelected(args: RowSelectEventArgs): void {
  let selectedRecord: carType = args.data as carType;
  grid.dataSource = data.filter((record: carType) => record.CustomerName
  === selectedRecord.ContactName).slice(0, 5);
  document.getElementById('key').innerHTML = selectedRecord.ContactName;
}

Export grid as blob

The Grid offers an option to export the data as a **Blob** instead of downloading it as a file in the browser. To export the grid as a Blob, set the **isBlob** parameter to **true** in the [excelExport](#) method. The grid returns the promise of a blob in the [excelExportComplete](#) event.

The following example demonstrates how to obtain the blob data of the exported grid by executing the promise in the **excelExportComplete** event.

INDEX.TS

```

import { Grid, Page, Toolbar, ExcelExport, ExcelExportCompleteArgs } from
 '@syncfusion/ej2-grids';
import { ClickEventArgs } from '@syncfusion/ej2-navigations';
import { data } from './datasource.ts';
Grid.Inject(Page, Toolbar, ExcelExport);
let grid: Grid = new Grid({
  dataSource: data,
  allowPaging: true,
  allowExcelExport: true,
  toolbar: ['ExcelExport', 'CsvExport'],
  toolbarClick: toolbarClick,
  excelExportComplete: excelExportComplete,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
    { field: 'OrderDate', headerText: 'Order Date', textAlign: 'Right',
width: 140, format: 'yMd' }
  ],
  height: 230
});
grid.appendTo('#Grid');
function toolbarClick(args: ClickEventArgs) {
  if (args.item.id === 'Grid_excelexport') {

```

```

        // pass fourth parameter as true to get the blob data of exported
grid
        grid.excelExport(null, null, null, true);
    }
    if (args.item.id === 'Grid_csvexport') {
        // pass fourth parameter as true to get the blob data of exported
grid
        grid.csvExport(null, null, null, true);
    }
}
function excelExportComplete(args: ExcelExportCompleteArgs) {
    // execute the promise to get the blob data
    args.promise.then((e: { blobData: Blob }) => {
        console.log(e.blobData);
    });
};
};

```

Excel cell style customization in EJ2 JavaScript Grid control

Conditional cell formatting

Grid cells in the exported Excel can be customized or formatted using [excelQueryCellInfo](#) event. In this event, we can format the grid cells of exported PDF document based on the column cell value.

In the below sample, we have set the background color for **Freight** column in the exported excel by **args.cell** and **backColor** property.

INDEX.TS

```
import { Grid, Toolbar, ExcelExport, Page } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Toolbar, ExcelExport, Page);
let grid: Grid = new Grid({
  dataSource: data,
  allowPaging: true,
  allowExcelExport: true,
  toolbar: ['ExcelExport'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120 },
    { field: 'OrderDate', headerText: 'Order Date', width: 140, format:
'yMd', textAlign: 'Right' }
  ],
  height: 230
});
grid.toolbarClick = (args: Object) => {
  if (args['item'].id === 'Grid_excelexport') {
    grid.excelExport();
  }
}
grid.excelQueryCellInfo = (args: Object) => {
  if (args.column.field === 'Freight') {
    if (args.value < 30) {
      args.style = { backColor: '#99ffcc' };
    }
    else if (args.value < 60) {
```

```

        args.style = {backColor: '#ffffb3'};
    }
    else {
        args.style = {backColor: '#ff704d'};
    }
}
}
grid.queryCellInfo = (args: Object) => {
    if(args.column.field == 'Freight'){
        if(args.data['Freight'] < 30) {
            args.cell.bgColor = '#99ffcc';
        }
        else if(args.data['Freight'] < 60) {
            args.cell.bgColor = '#ffffb3';
        }
        else {
            args.cell.bgColor = '#ff704d';
        }
    }
}
grid.appendTo('#Grid');

```

```

By default, material theme is applied to exported excel document.

Rotate a header text to a certain degree in the exported grid

The DataGrid has support to customize the column header styles such as changing text orientation, the font color, and so on in the exported Excel file. To achieve this requirement, use the [excelHeaderQueryCellInfo](#) event of the Grid.

The `excelHeaderQueryCellInfo` will be triggered when creating a column header for the excel document to be exported. Customize the column header in this event.

In the following demo, using the `rotation` property of the style argument in the `excelHeaderQueryCellInfo` event, you can rotate the header text of the column header in the excel exported document.

INDEX.TS

```
import { Grid, Toolbar, ExcelExport, ExcelExportProperties, Page,
  ActionEventArgs } from '@syncfusion/ej2-grids';
import { DropDownList } from '@syncfusion/ej2-dropdowns';
import { data } from './datasource.ts';
Grid.Inject(Toolbar, ExcelExport, Page);
let grid: Grid = new Grid({
  dataSource: data,
  allowPaging: true,
  allowExcelExport: true,
  toolbar: ['ExcelExport'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string', customAttributes:{ class: 'orientationcss' }, textAlign: 'Center'
},
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120 },
    { field: 'OrderDate', headerText: 'Order Date', textAlign: 'Right',

Exporting hierarchy grid in EJ2 JavaScript Grid control

The grid has an option to export the hierarchy grid to excel document. By default, it will use **Expanded** as hierarchyExportMode. you can change the exporting option by using the **ExcelExportProperties.hierarchyExportMode** property. The available options are,

| Mode | Behavior |

|-----|-----|

| Expanded | Exports the visible child grids in expanded state and remaining child grid in collapsed state when args.isChild property is set to true in [beforeExcelExport](#) event. |

| All | Exports the all the child grids in expanded state. |

| None | Exports all child grids in collapsed state when args.isChild property is set to true in [beforeExcelExport](#) event. |

INDEX.TS

```
import { Grid, DetailRow, Toolbar, ExcelExport, ExcelExportProperties } from

Limitations

- Microsoft Excel permits up to seven nested levels in outlines. So that in the grid we can able to provide only up to seven nested level

and if it exceeds more than seven levels then the document will be exported without outline option. Please refer the [Microsoft Limitation](#)

Exporting grid with templates in EJ2 JavaScript Grid control

The grid offers the option to export the column, detail, and caption templates to an Excel document. The template contains images, hyperlinks, and customized text.

Exporting with column template

The Excel export functionality allows you to export Grid columns that include images, hyperlinks, and custom text to an Excel document.

In the following sample, the hyperlinks and images are exported to Excel using [hyperlink](#) and [image](#) properties in the [excelQueryCellInfo](#) event.

Excel Export supports base64 string to export the images.

INDEX.TS

Exporting with detail template

By default, the grid will export the parent grid with expanded detail rows alone. Change the exporting option by using the `ExcelExportProperties.hierarchyExportMode` property. The available options are:

- | Mode | Behavior |
- |-----|-----|
- | Expanded | Exports the parent grid with expanded detail rows. |
- | All | Exports the parent grid with all the detail rows. |
- | None | Exports the parent grid alone. |

The detail rows in the exported Excel can be customized or formatted using the [exportDetailTemplate](#) event. In this event, the detail rows of the Excel document are formatted in accordance with their parent row details.

In the following sample, the detail row content is formatted by specifying the [columnHeader](#) and [rows](#) properties using its [parentRow](#) details. This allows for the creation of detail rows in the Excel document. Additionally, custom styles can be applied to specific cells using the [style](#) property.

When using [rowSpan](#), it is essential to provide the cell's [index](#) for proper functionality.

INDEX.TS

```

import { Grid, DetailRow, Toolbar, ExcelExport, ExcelExportProperties,
ExportDetailTemplateEventArgs } from '@syncfusion/ej2-grids';
import { employeeData } from './datasource.ts';
Grid.Inject(DetailRow, Toolbar, ExcelExport);
let grid: Grid = new Grid({
    dataSource: employeeData,
    detailTemplate: '#detailtemplate',
    toolbar: ['ExcelExport'],
    allowExcelExport: true,
    toolbarClick: toolbarClick,
    exportDetailTemplate: exportDetailTemplate,
    columns: [
        { field: 'Category', headerText: 'Category', width: 120 },
        { field: 'ProductID', headerText: 'Product ID', width: 140 },
        { field: 'Status', headerText: 'Status', width: 200 }
    ],
    height: 273
});
grid.appendTo('#Grid');
function toolbarClick(args) {
    if (args['item'].id === 'Grid_excelexport') {
        let exportProperties: ExcelExportProperties = {
            hierarchyExportMode: "Expanded"
        };
        grid.excelExport(exportProperties);
    }
}
function exportDetailTemplate(args: ExportDetailTemplateEventArgs) {
    args.value = {
        columnHeader: [
            {
                cells: [{
                    index: 0, colSpan: 2, value: 'Product Details',
                    style: { backgroundColor: '#ADD8E6', excelHAlign: 'Center',
bold: true }
                }]
            }
        ],
        rows: [
            {

Exporting with caption template

The Excel export feature enables exporting of Grid with a caption template to an Excel document.

In the following sample, the customized caption text is exported to Excel using [captionText](#) property in the [exportGroupCaption](#) event.

INDEX.TS

```

import { Grid, Group, Toolbar, ExcelExport, ExportGroupCaptionEventArgs }
  from '@syncfusion/ej2-grids';
import { ClickEventArgs } from '@syncfusion/ej2-navigations';
import { employeeData } from '../datasource.ts';
Grid.Inject(Group, Toolbar, ExcelExport);
let grid: Grid = new Grid({
  dataSource: employeeData,
  allowGrouping: true,
  groupSettings: { captionTemplate: '#captiontemplate', columns:
    ['EmployeeID'] },
  allowExcelExport: true,
  toolbar: ['ExcelExport'],
  columns: [
    { field: 'EmployeeID', headerText: 'Employee ID', width: 120 },
    { field: 'FirstName', headerText: 'Name', width: 120 },
    { field: 'City', headerText: 'City' },
    { field: 'Title', headerText: 'Title', width: 170 }
  ],
  toolbarClick: toolbarClick,
  exportGroupCaption: exportGroupCaption,
  height: 273
});
grid.appendTo('#Grid');
function toolbarClick(args: ClickEventArgs) {
  if (args.item.id === 'Grid_excelexport') {
    grid.excelExport();
  }
}

function exportGroupCaption(args: ExportGroupCaptionEventArgs) {
  args.captionText = args.data['field'] + ' - ' + args.data['key'];
}

```

Exporting grid in server in EJ2 JavaScript Grid control

The Grid have an option to export the data to Excel in server side using Grid server export library.

Server dependencies

The Server side export functionality is shipped in the Syncfusion.EJ2.GridExport package, which is available in Essential Studio and [nuget.org](https://www.nuget.org). The following list of dependencies is required for Grid server side Excel exporting action.

- Syncfusion.EJ2
- Syncfusion.EJ2.GridExport
- Syncfusion.Compression.Base
- Syncfusion.XlsIO.Base

Server configuration

The following code snippets shows server configuration using ASP.NET MVC Controller Action.

To Export the Grid in server side, You need to call the [serverExcelExport](#) method for passing the Grid properties to server exporting action.

```
`ts
public ActionResult ExcelExport(string gridModel)
{
```

```

GridExcelExport exp = new GridExcelExport();
Grid gridProperty = ConvertGridObject(gridModel);
return exp.ExcelExport<OrdersDetails>(gridProperty, OrderRepository.GetAllRecords());
}

private Grid ConvertGridObject(string gridProperty)
{
    Grid GridModel = (Grid)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty, typeof(Grid));
    GridColumnModel cols =
    (GridColumnModel)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty,
    typeof(GridColumnModel));
    GridModel.Columns = cols.columns;
    return GridModel;
}

public class GridColumnModel
{
    public List<GridColumn> columns { get; set; }
}

public ActionResult DataSource(DataManager dm)
{
    var DataSource = OrderRepository.GetAllRecords();
    DataResult result = new DataResult();
    result.result = DataSource.Skip(dm.Skip).Take(dm.Take).ToList();
    result.count = result.result.Count;
    return Json(result, JsonRequestBehavior.AllowGet);
}
`ts
import { Grid, Toolbar } from '@syncfusion/ej2-grids';
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
Grid.Inject(Toolbar);
let data: DataManager = new DataManager({
    url: "Home/DataSource",
    adaptor: new UrlAdaptor
});

```

```

let grid: Grid = new Grid({
  dataSource: data,
  toolbar: ['ExcelExport'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width: 100 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right', width: 120, format: 'C2' },
    { field: 'ShipCountry', headerText: 'Ship Country', width: 150 }
  ],
  height: 265
});
grid.appendTo('#Grid');
grid.toolbarClick = (args: Object) => {
  if (args['item'].id === 'Grid_excelexport') {
    grid.serverExcelExport("Home/ExcelExport");
  }
}
`

```

Note: Refer to the GitHub sample for quick implementation and testing from [here](#).

CSV export in server side

You can export the Grid to CSV format by using the [serverCsvExport](#) method which will pass the Grid properties to server.

In the below demo, we have invoked the above method inside the [toolbarClick](#) event. In server side, we have deserialized the Grid properties and passed to the `CsvExport` method which will export the properties to CSV format.

```

`ts
public ActionResult CsvGridExport(string gridModel)
{
  GridExcelExport exp = new GridExcelExport();
  Grid gridProperty = ConvertGridObject(gridModel);
  return exp.CsvExport<OrdersDetails>(gridProperty, OrderRepository.GetAllRecords());
}

private Grid ConvertGridObject(string gridProperty)
{

```

```

Grid GridModel = (Grid)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty, typeof(Grid));
GridColumnModel cols =
(GridColumnModel)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty,
typeof(GridColumnModel));
GridModel.Columns = cols.columns;
return GridModel;
}

public ActionResult DataSource(DataManager dm)
{
var DataSource = OrderRepository.GetAllRecords();
DataResult result = new DataResult();
result.result = DataSource.Skip(dm.Skip).Take(dm.Take).ToList();
result.count = result.result.Count;
return Json(result, JsonRequestBehavior.AllowGet);
}
、

`ts
import { Grid, Toolbar } from '@syncfusion/ej2-grids';
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
Grid.Inject(Toolbar);
let data: DataManager = new DataManager({
url: "Home/DataSource",
adaptor: new UrlAdaptor
});
let grid: Grid = new Grid({
dataSource: data,
toolbar: ['CsvExport'],
columns: [
{ field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width: 100 },
{ field: 'CustomerID', headerText: 'Customer ID', width: 120 },
{ field: 'Freight', headerText: 'Freight', textAlign: 'Right', width: 120, format: 'C2' },
{ field: 'ShipCountry', headerText: 'Ship Country', width: 150 }
],
height: 265

```

```
});
grid.appendTo('#Grid');
grid.toolbarClick = (args: Object) => {
  if (args['item'].id === 'Grid_csvexport') {
    grid.serverCsvExport("Home/CsvGridExport");
  }
}
`
```

Export grid as memory stream

The Grid offers an option to export the data as a memory stream instead of downloading it as a file in the browser. To obtain the memory stream of the exported grid, set the `AsMemoryStream` parameter to **true** in the [ExcelExport](#) and [CsvExport](#) methods.

The following code demonstrates how to get the memory stream of exported grid.

```
`ts
public object ExcelExport(string gridModel)
{
  GridExcelExport exp = new GridExcelExport();
  Grid gridProperty = ConvertGridObject(gridModel);
  // pass third parameter as true to get the Memory Stream of exported grid data
  return (MemoryStream)exp.ExcelExport<OrdersDetails>(gridProperty, OrderRepository.GetAllRecords(),
  true);
}

public object CsvExport(string gridModel)
{
  GridExcelExport exp = new GridExcelExport();
  Grid gridProperty = ConvertGridObject(gridModel);
  return (MemoryStream)exp.CsvExport<OrdersDetails>(gridProperty, OrderRepository.GetAllRecords(),
  true);
}
`
```

Merge grid's memory stream

The [Essential XlsIO](#) library is used to merge multiple memory streams into a single stream. To learn more about the merge option, please refer to this [documentation](#).

You can merge a memory stream, a file stream, and a local file with the Grid's memory stream in the following ways:

Merging with an existing memory stream

If you already have a memory stream, you can directly use it to merge with the Grid's memory stream.

In the following code, `ExcelEngine` and `AddCopy` method of `Worksheets` are used to merge the grid's memory stream with an existing memory stream.

```
`ts
using Syncfusion.XlsIO;

public MemoryStream ms1; // defines existing memory stream
public object ExcelExport(string gridModel)
{
    GridExcelExport exp = new GridExcelExport();
    Grid gridProperty = ConvertGridObject(gridModel);
    // get the memory stream of exported grid data
    MemoryStream ms2 = (MemoryStream)exp.ExcelExport<OrdersDetails>(gridProperty,
    OrderRepository.GetAllRecords(), true);

    //New instance of ExcelEngine is created equivalent to launching Microsoft Excel with no workbooks
    open
    ExcelEngine excelEngine = new ExcelEngine();
    //Instantiate the Excel application object
    IApplication application = excelEngine.Excel;
    //Assigns default application version
    application.DefaultVersion = ExcelVersion.Xlsx;

    //open an workbook of existing memory stream and grid's memory stream through Open method of
    IWorkbooks
    IWorkbook sourceWorkbook = application.Workbooks.Open(ms1);
    IWorkbook destinationWorkbook = application.Workbooks.Open(ms2);
    //Copy all the worksheet from the Source workbook to the destination workbook
    for (int i = 0; i < sourceWorkbook.Worksheets.Count; i++)
    {
        destinationWorkbook.Worksheets.AddCopy(sourceWorkbook.Worksheets[i]);
    }
    destinationWorkbook.ActiveSheetIndex = 1;
    //Saving the workbook as stream
    MemoryStream ms3 = new MemoryStream();
    destinationWorkbook.SaveAs(ms3);
    ms3.Position = 0;
```

```
//Dispose the instance of ExcelEngine
excelEngine.Dispose();
//Dispose the streams.
ms1.Dispose();
ms2.Dispose();
return ms3;
}
`ts
```

Merging with an existing file stream

If you already have a file stream, you can directly use it to merge with the Grid's memory stream. In the following code, the existing file stream is merged with the Grid's memory stream.

```
`ts
using Syncfusion.XlsIO;
public FileStream fs1; // defines existing file stream
public object ExcelExport(string gridModel)
{
    GridExcelExport exp = new GridExcelExport();
    Grid gridProperty = ConvertGridObject(gridModel);
    MemoryStream ms1 = (MemoryStream)exp.ExcelExport<OrdersDetails>(gridProperty,
    OrderRepository.GetAllRecords(), true);
    ExcelEngine excelEngine = new ExcelEngine();
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Xlsx;
    //fs1 and ms1 represents the existing stream and grid's stream.
    IWorkbook sourceWorkbook = application.Workbooks.Open(fs1);
    IWorkbook destinationWorkbook = application.Workbooks.Open(ms1);
    for (int i = 0; i < sourceWorkbook.Worksheets.Count; i++)
    {
        destinationWorkbook.Worksheets.AddCopy(sourceWorkbook.Worksheets[i]);
    }
    destinationWorkbook.ActiveSheetIndex = 1;
    //Saving the workbook as stream
    MemoryStream ms3 = new MemoryStream();
    destinationWorkbook.SaveAs(ms3);
}
```

```

ms3.Position = 0;
return ms3;
}
`

```

Merging with a local file

To merge a local file with the Grid's memory stream, you need to convert it into a file stream before merging. In the following code, the existing local file is merged with the Grid's memory stream.

```

`ts
using Syncfusion.XlsIO;

// get the file stream of local file
public FileStream fs1 = new FileStream("D:/ExcelDoc.xlsx", FileMode.Open, FileAccess.Read); //
ExcelDoc.xlsx is a local file which is located in local disk D.

public object ExcelExport(string gridModel)
{
    GridExcelExport exp = new GridExcelExport();
    Grid gridProperty = ConvertGridObject(gridModel);
    MemoryStream ms1 = (MemoryStream)exp.ExcelExport<OrdersDetails>(gridProperty,
    OrderRepository.GetAllRecords(), true);
    ExcelEngine excelEngine = new ExcelEngine();
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Xlsx;
    //fs1 and ms1 represents the local file's stream and grid's stream.
    IWorkbook sourceWorkbook = application.Workbooks.Open(fs1);
    IWorkbook destinationWorkbook = application.Workbooks.Open(ms1);
    for (int i = 0; i < sourceWorkbook.Worksheets.Count; i++)
    {
        destinationWorkbook.Worksheets.AddCopy(sourceWorkbook.Worksheets[i]);
    }
    destinationWorkbook.ActiveSheetIndex = 1;
    MemoryStream ms3 = new MemoryStream();
    destinationWorkbook.SaveAs(ms3);
    ms3.Position = 0;
    return ms3;
}

```

Downloading the merged memory stream

You can download the merged memory stream by converting it into a `FileStreamResult`. In the following code, the merged memory stream is downloaded to the browser.

```
`ts
using Syncfusion.XlsIO;

public ActionResult ExcelExport(string gridModel)
{
    ExcelEngine excelEngine = new ExcelEngine();
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Xlsx;
    //open an workbook of streams through Open method of IWorkbooks
    IWorkbook sourceWorkbook = application.Workbooks.Open(ms1);
    IWorkbook destinationWorkbook = application.Workbooks.Open(ms2);
    for (int i = 0; i < sourceWorkbook.Worksheets.Count; i++)
    {
        destinationWorkbook.Worksheets.AddCopy(sourceWorkbook.Worksheets[i]);
    }
    destinationWorkbook.ActiveSheetIndex = 1;
    MemoryStream ms3 = new MemoryStream();
    destinationWorkbook.SaveAs(ms3);
    ms3.Position = 0;
    // Save the MemoryStream into FileStreamResult
    FileStreamResult fileStreamResult = new FileStreamResult(ms3, "Application/vnd.openxmlformats-officedocument.spreadsheetml.sheet");
    fileStreamResult.FileNameDownload = "Export.xlsx";
    //Dispose the instance of ExcelEngine
    excelEngine.Dispose();
    //Dispose the streams.
    ms1.Dispose();
    ms2.Dispose();
    // return the file
    return fileStreamResult;
}
```

Rotate a header text to a certain degree in the exported grid on the server side

The DataGrid has support to customize the column header styles such as changing text orientation, the font color, and so on in the exported Excel file. To achieve this requirement, use the `ServerExcelHeaderQueryCellInfo` event of the Grid.

The `ServerExcelHeaderQueryCellInfo` will be triggered when creating a column header for the excel document to be exported in the server side. Customize the column header in this event.

In the following demo, using the `HeaderCellRotate` method of the `GridExcelExport` class in the `ServerExcelHeaderQueryCellInfo` event, you can rotate the header text of the column header in the excel exported document.

`ts

```
public ActionResult ExcelExport(string gridModel)
{
    GridExcelExport exp = new GridExcelExport();
    Grid gridProperty = ConvertGridObject(gridModel);
    gridProperty.ServerExcelHeaderQueryCellInfo = ExcelHeaderQueryCellInfo;
    IEnumerable data = Utils.DataTableToJson(dt);
    var result = exp.ExcelExport<dynamic>(gridProperty, data);
    return result;
}

private void ExcelHeaderQueryCellInfo(object excel)
{
    ServerExcelHeaderQueryCellInfoEventArgs name = (ServerExcelHeaderQueryCellInfoEventArgs)excel;
    headerValues.Add(name.Column.HeaderText);
    var longestString = headerValues.Where(s => s.Length == headerValues.Max(m => m.Length)).First();
    GridExcelExport exp = new GridExcelExport();
    var size = exp.ExcelTextSize(name.Style.Font.FontName, (float)name.Style.Font.Size, longestString);
    name.Cell.RowHeight = size.Width;
    exp.HeaderCellRotate(name, 45); // Give the rotate degree value by the user.
    name.Style.Borders.LineStyle = Syncfusion.XlsIO.ExcelLineStyle.None;
}
```

Limitations

- The export feature for detail templates is not supported in server-side exporting.
- Multiple grids exporting feature is not supported with server side exporting.

Global local in EJ2 JavaScript Grid control

Localization

The [Localization](#) library allows you to localize default text content of the Grid. The grid component has static text on some features (like group drop area text, pager information text, etc.) that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the [locale](#) value and translation object.

The following list of properties and its values are used in the grid.

Locale keywords | Text

EmptyRecord | No records to display

True | true

False | false

InvalidFilterMessage | Invalid Filter Data

GroupDropArea | Drag a column header here to group its column

UnGroup | Click here to ungroup

GroupDisable | Grouping is disabled for this column

FilterbarTitle | \s filter bar cell

EmptyDataSourceError | DataSource must not be empty at initial load since columns are generated from dataSource in AutoGenerate Column Grid

Add | Add

Edit | Edit

Cancel | Cancel

Update | Update

Delete | Delete

Print | Print

Pdfexport | PDF Export

Excelexport | Excel Export

Wordexport | Word Export

Csvexport | CSV Export

pagerDropDown | Items per page

pagerAllDropDown | Items

All | All

Loading translations

To load translation object in an application, use [load](#) function of the [L10n](#) class.

The following example demonstrates the Grid in **Deutsch** culture.

INDEX.TS

```
import { L10n } from '@syncfusion/ej2-base';
import { Grid, Group, Page } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Group, Page);
L10n.load({
    'de-DE': {
        'grid': {
            'EmptyRecord': 'Keine Aufzeichnungen angezeigt',
            'GroupDropArea': 'Ziehen Sie einen Spaltenkopf hier, um die
Gruppe ihre Spalte',
            'UnGroup': 'Klicken Sie hier, um die Gruppierung aufheben',
            'EmptyDataSourceError': 'DataSource darf bei der Erstaustausung
nicht leer sein, da Spalten aus der dataSource im AutoGenerate
Spaltenraster',
            'Item': 'Artikel',
            'Items': 'Artikel'
        },
        'pager': {
            'currentPageInfo': '{0} von {1} Seiten',
            'totalItemsInfo': '({0} Beiträge)',
            'firstPageTooltip': 'Zur ersten Seite',
            'lastPageTooltip': 'Zur letzten Seite',
            'nextPageTooltip': 'Zur nächsten Seite',
            'previousPageTooltip': 'Zurück zur letzten Seit',
            'nextPagerTooltip': 'Gehen Sie zu den nächsten Pager-Elementen',
            'previousPagerTooltip': 'Gehen Sie zu vorherigen Pager-
Elementen'
        }
    }
});
let grid: Grid = new Grid({
    dataSource: data,
    locale: 'de-DE',
    allowGrouping: true,
    allowPaging: true,
    pageSettings: { pageSize: 6 },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ],
    height: 210
});
```

```
grid.appendTo('#Grid');
```

<script src="index.js" type="text/javascript"></script>
</body></html>

```

* In the above sample, **Freight** column is formatted by **NumberFormatOptions**.

* By default, **locale** value is **en-US**. If you want to change the **en-US** culture to a different culture, you have to change the **locale** accordingly.

Right to left (RTL)

RTL provides an option to switch the text direction and layout of the Grid component from right to left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Farsi, Urdu, etc.). To enable RTL Grid, set the [enableRtl](#) to true.

INDEX.TS

```
import { L10n } from '@syncfusion/ej2-base';
import { Grid, Page } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Page);

Accessibility in EJ2 JavaScript Grid control

The Grid component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

WAI-ARIA attributes

The Grid component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Grid component:

Attributes	Purpose
---	---
<code>role=grid</code>	To represent the element containing the grid component.
<code>role=row</code>	To represent the element containing the cells of the row in the grid.
<code>role=rowgroup</code>	To represent the group of rows in the grid.
<code>role=columnheader</code>	To represent the cell in a row contains header information for a column in the grid.
<code>role=gridcell</code>	To represent a cell in the grid component.
<code>role=button</code>	To represent the element that acts as a button in the grid.
<code>role=search</code>	To represent the element that acts as a search region in the grid.
<code>role=presentation</code>	To represent the element to be not available for accessibility concerns.
<code>role=navigation</code>	To represent the element containing pager elements to navigate from one page to another.
<code>aria-colindex</code>	Defines the column index of the column with respect to the total number of columns within the grid.
<code>aria-rowindex</code>	Defines row index of the row with respect to the total number of rows within the grid.
<code>aria-rowspan</code>	Defines the number of rows spanned by a cell within the grid.
<code>aria-colspan</code>	Defines the number of columns spanned by a cell within the grid.
<code>aria-rowcount</code>	Defines the total number of rows in the grid.
<code>aria-colcount</code>	Defines the total number of columns in the grid.

- | **aria-selected** | Indicates the current "selected" state of the rows and cells in the grid. |
- | **aria-expanded** | Indicate if the expand icon in the hierarchy grid or grouped grid or detail grid is expanded or collapsed |
- | **aria-sort** | Indicates whether the data in the grid are sorted in ascending or descending order. |
- | **aria-busy** | Indicates an element is being modified and that assistive technologies may want to wait until the changes are complete before informing the user about the update. |
- | **aria-owns** | Identifies an element in order to define a visual, functional, or contextual relationship between a parent and its child elements. |
- | **aria-hidden** | Hides the element from accessibility concerns. |
- | **aria-labelledby** | Provides an accessible name for the checkbox labels in excel filter, checkbox filter and column chooser dialog. |
- | **aria-describedby** | Provides an description about the features enabled in the header when the grid header cell is focused. |

Keyboard interaction

The Grid component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Grid component.

Pager

Windows | MAC | To do this

Home | Fn + Left Arrow | Moves the focus to the first cell of the focused row.

End | Fn + Right Arrow | Moves the focus to the last cell of the focused row.

Ctrl + Home | Command + Fn + Left Arrow | Moves the focus to the first Cell of the first row in the grid.

Ctrl + End | Command + Fn + Right Arrow | Moves the focus to the last Cell of the last row in the grid.

Up Arrow | Up Arrow | Moves the cell focus upward from the focused cell.

Down Arrow | Down Arrow | Moves the cell focus downward from the focused cell.

Right Arrow | Right Arrow | Moves the cell focus right side from the focused cell.

Left Arrow | Left Arrow | Moves the cell focus left side from the focused cell.

Alt + J | Alt + J | Moves the focus to the entire grid.

Alt + W | Alt + W | Move the focus to the grid content element.

Selection

Windows | MAC | To do this

Ctrl + Up Arrow | Command + Up Arrow | Collapses all the visible groups.

Ctrl + Down Arrow | Command + Down Arrow | Expands all the visible groups.

Ctrl + Space | Ctrl + Space | Performs grouping when focused on a header element.

Enter | Enter | If the current cell is an expand/collapse cell then expands/collapses the current group/detailrow/childgrid.

Print

Windows | MAC | To do this

Ctrl + C | Command + C | Copies selected rows or cells data into the clipboard.

Ctrl + Shift + H | Ctrl + Shift + H | Copies selected rows or cells data with header into clipboard

Editing

Windows | MAC | To do this

Alt + Down arrow | Alt + Down arrow | Opens the filter menu(excel, menu and checkbox filter) when its header element is in focused state.

Column Menu

Windows | MAC | To do this

Ctrl + left arrow or right arrow | Command + left arrow or right arrow | Reorders the focused header column to the left or right side.

Sorting

Windows | MAC | To do this

Enter | Enter | Performs sorting(ascending/descending) on a column when its header element is in focused state.

Ctrl + Enter | Command + Enter | Performs multi-sorting on a column when its header element is in focused state.

Shift + Enter | Shift + Enter | Clears sorting for the focused header column.

* The Command and Control keys on Mac devices can be interchanged. When this switch occurs, use the Command key in place of the Control key and the Control key in place of the Command key for the above listed key interactions with Mac devices.

* For example, after switching the keys to group the columns when the header element is focused use Command + Space and for expanding the visible groups use Ctrl + Down Arrow.

Ensuring accessibility

The Grid component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Grid component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Grid component with accessibility tools.

Clipboard in EJ2 JavaScript Grid control

The clipboard provides an option to copy selected rows or cells data into the clipboard.

The following list of keyboard shortcuts is supported in the Grid to copy selected rows or cells data into the clipboard.

Interaction keys | Description

Ctrl + C | Copy selected rows or cells data into clipboard.

Ctrl + Shift + H | Copy selected rows or cells data with header into clipboard.

INDEX.TS

```
import { Grid } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
let grid: Grid = new Grid({
  dataSource: data,
  allowSelection: true,
  selectionSettings: { type: 'Multiple' },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    { field: 'ShipCity', headerText: 'Ship City', width: 150 },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 }
  ],
  height: 272
});
grid.appendTo('#Grid');
```

Copy to clipboard by external buttons

To copy selected rows or cells data into the clipboard with help of external buttons, you need to invoke the [copy](#) method.

INDEX.TS

```

import { Grid } from '@syncfusion/ej2-grids';
import { Button } from '@syncfusion/ej2-buttons';
import { data } from './datasource.ts';

```

```

let grid: Grid = new Grid({
  dataSource: data,
  allowSelection: true,
  selectionSettings: { type: 'Multiple' },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    { field: 'ShipCity', headerText: 'Ship City', width: 150 },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 }
  ],
  height: 280
});
grid.appendTo('#Grid');
let copyBtn: Button = new Button();
copyBtn.appendTo('#copy');
document.getElementById('copy').addEventListener('click', () => {
  grid.copy();
});
let copyHeaderBtn: Button = new Button();
copyHeaderBtn.appendTo('#copyHeader');
document.getElementById('copyHeader').addEventListener('click', () => {
  grid.copy(true);
});

```

```

AutoFill

AutoFill Feature allows you to copy the data of selected cells and paste it to another cells by just dragging the autofill icon of the selected cells up to required cells. This feature is enabled by defining `enableAutoFill` property as true.

INDEX.TS

```

import { Grid, Selection, Edit, Toolbar } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Selection, Edit, Toolbar);
let grid: Grid = new Grid({
    dataSource: data,
    enableAutoFill: true,
    enableHover: false,
    allowSelection: true,
    toolbar: ['Add', 'Update', 'Cancel'],
    selectionSettings: { type: 'Multiple', mode: 'Cell', cellSelectionMode:
'Box' },
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Batch' },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
isPrimaryKey: true, visible: false, width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'ShipCity', headerText: 'ShipCity', width: 150 },
        { field: 'ShipCountry', headerText: 'Ship Country', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ]
});

```

```
grid.appendTo('#Grid');
```

    <div id="container">
        <div id="Grid"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

* If `enableAutoFill` is set to true, then the autofill icon will be displayed on cell selection to copy cells.

* It requires the selection `mode` to be `Cell`, `cellSelectionMode` to be `Box` and also Batch Editing should be enabled.

Limitations of AutoFill

- Since the string values are not parsed to number and date type, so when the selected string type cells are dragged to number type cells then it will display as **NaN**. For date type cells, when the selected string type cells are dragged to date type cells then it will display as an **empty cell**.
- Linear series and the sequential data generations are not supported in this autofill feature.

Paste

You can able to copy the content of a cell or a group of cells by selecting the cells and pressing Ctrl + C shortcut key and paste it to another set of cells by selecting the cells and pressing Ctrl + V shortcut key.

INDEX.TS

```

import { Grid, Selection, Edit, Toolbar } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Selection, Edit, Toolbar);
let grid: Grid = new Grid({
    dataSource: data,
    enableHover: false,
    allowSelection: true,
    toolbar: ['Add', 'Update', 'Cancel'],
    selectionSettings: { type: 'Multiple', mode: 'Cell', cellSelectionMode: 'Box' },
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting: true, mode: 'Batch' },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', isPrimaryKey: true, visible: false, width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'ShipCity', headerText: 'ShipCity', width: 150 },
    ]
});

```

```

        { field: 'ShipCountry', headerText: 'Ship Country', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ];
});
grid.appendTo('#Grid');

```

</body></html>

```

To perform paste functionality, it requires the selection **mode** to be **Cell**, **cellSelectionMode** to be **Box** and also Batch Editing should be enabled.

Limitations of Paste Functionality

- Since the string values are not parsed to number and date type, so when the copied string type cells are pasted to number type cells then it will display as **NaN**. For date type cells, when the copied string format cells are pasted to date type cells then it will display as an **empty cell**.

Context menu in EJ2 JavaScript Grid control

The Grid has options to show the context menu when right clicked on it. To enable this feature, you need to define either default or custom item in the [contextMenuItems](#).

To use the context menu, inject the **ContextMenu** module in the grid.

The default items are in the following table.

Items | Description

AutoFit | Auto fit the current column.

AutoFitAll | Auto fit all columns.

Edit | Edit the current record.

Delete | Delete the current record.

Save | Save the edited record.

Cancel | Cancel the edited state.

Copy | Copy the selected records.

PdfExport | Export the grid data as Pdf document.

ExcelExport | Export the grid data as Excel document.

CsvExport | Export the grid data as CSV document.

Group | Group the current column.

Ungroup | Ungroup the current column.

SortAscending | Sort the current column in ascending order.

SortDescending | Sort the current column in descending order.

FirstPage | Go to the first page.

PrevPage | Go to the previous page.

LastPage | Go to the last page.

NextPage | Go to the next page.

INDEX.TS

```
import { Grid, Resize, Sort, Group, ContextMenu, Edit, Page, PdfExport,
ExcelExport } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Resize, Sort, Group, Edit, ContextMenu, Page, PdfExport,
ExcelExport);
let grid: Grid = new Grid({
  dataSource: data,
  allowSorting: true,
  allowPaging: true,
  editSettings: {allowEditing: true, allowDeleting: true},
  allowPdfExport: true,
  allowExcelExport: true,
  contextMenuItems: ['AutoFit', 'AutoFitAll', 'SortAscending',
'SortDescending',

Custom context menu items

The custom context menu items can be added by defining the [contextMenuItems](#) as a collection of [contextMenuItemModel](#). Actions for this customized items can be defined in the [contextMenuClick](#) event.

INDEX.TS

```

import { Grid, ContextMenu, Page } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(ContextMenu, Page);
let grid: Grid = new Grid({
    dataSource: data,
    contextMenuItems: [{text: 'Copy with headers', target: '.e-content' id:
'copywithheader'}],
    allowSelection: true,
    allowPaging: true,
    contextMenuClick: function(args: MenuEventArgs){
        if(args.item.id === 'copywithheader'){
            grid.copy(true);
        }
    },

</body></html>

```

Show context menu on left click

By default, the context menu items will be shown in the Grid using the right mouse click action. Show the context menu items during the left mouse click action using the [created](#) and context menu's `beforeOpen` events of the Grid.

Using the `onclick` eventlistener of Grid , you can get the clicked position values and send them to the `open` method of the context menu in the `onclick` event of the Grid. Also, we have prevented the default right click action to open the context menu items using the [created](#) event of the Grid.

This is demonstrated in the following sample.

INDEX.TS

```
import { Grid, Edit, Page, ContextMenu } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Edit, Page, ContextMenu);
let values: any;
let grid: Grid = new Grid({
  dataSource: data,
  editSettings: { allowAdding: true, allowDeleting: true, allowEditing: true
},
  allowPaging: true,
  contextMenuItems: ['Copy', 'Edit', 'Delete'],
  columns: [
    {
      field: 'OrderID',
      headerText: 'Order ID',
      width: 120,
      textAlign: 'Right',
      isPrimaryKey: true,
    },
    { field: 'CustomerName', headerText: 'Customer Name' },
    {
      field: 'Freight',
      format: 'C2',
      textAlign: 'Right',
      editType: 'numericedit',
    },
    { field: 'ShipName', headerText: 'Ship Name', width: 200 },
    {
      field: 'ShipCountry',
      headerText: 'Ship Country',
      width: 150,
      editType: 'dropdownedit',
    },
    { field: 'ShipCity', headerText: 'Ship City', width: 150 },
  ],
  created: () => {
    grid.contextMenuModule.contextMenu.beforeOpen = (args) => {
      if (args.event && args.event.which === 3) args.cancel = true;
      args.event = values;
      grid.contextMenuModule.contextMenuBeforeOpen(args);
    };
  },
});
grid.appendTo('#Grid');
document.getElementById('Grid').onclick = (event) => {
  values = event;
  grid.contextMenuModule.contextMenu.open(
    values.pageY + pageYOffset,
    values.pageX + pageXOffset
  );
};
```

```

You can hide or show an item in context menu for specific area inside of grid by defining the [target](#) property.

Enable or disable context menu items

It is possible to enable or disable the default and custom context menu items in the Grid component. This is achieved by using the [enableItems](#) method of the ContextMenu. To enable or disable menu items, set the `enable` parameter in the `enableItems` method to true, and vice versa.

In the following sample, the Copy item is enabled or disabled based on some condition (as per the needs of the application) in the [rowSelected](#) event of the Grid.

INDEX.TS

```

import { Grid, Edit, Page, ContextMenu } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Edit, Page, ContextMenu);
let grid: Grid = new Grid({

Loading animation in EJ2 JavaScript Grid control

The grid has an option to show a loading indicator in-between the time of fetching the data and binding it to the grid during initial rendering or refreshing or after performing any grid action like sorting, filtering, grouping, and more. The grid supports two indicator types, which is achieved by setting the `loadingIndicator.indicatorType` property to `Spinner` or `Shimmer`. The default value of the indicator type is `"Spinner"`.

In the following sample, the Shimmer indicator is displayed while the grid is loading and refreshing when using the remote data.

INDEX.TS

```
import { Grid, Page, Sort, Filter } from '@syncfusion/ej2-grids';
import { DataManager, ODataAdaptor } from '@syncfusion/ej2-data';
Grid.Inject(Page, Sort, Filter);
let data: DataManager = new DataManager({
    url: 'https://services.syncfusion.com/js/production/api/Orders',
    adaptor: new ODataAdaptor
});
let grid: Grid = new Grid({
    dataSource: data,
    allowPaging: true,
    allowSorting: true,
    allowFiltering: true,
    pageSettings: { pageCount: 3 },
    loadingIndicator: { indicatorType: 'Shimmer' },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
        { field: 'OrderDate', headerText: 'Order Date', width: 140, format:
'yMd' }
    ]
});
grid.appendTo('#Grid');
```

Style And Appearance

Style and appearance in EJ2 JavaScript Grid control

The Grid control offers various ways to customize its appearance using both default CSS and custom themes. Let's go over some common approaches:

Default CSS overrides:

You can use custom CSS to override the default styles of the Grid control. This allows you to change colors, fonts, paddings, and more. You can inspect the generated HTML of the Grid using browser developer tools to identify the relevant CSS classes and styles.

Here's a basic example of how you can override the header background color of the Grid:

```
`css
```

```
/ In your control's CSS file /
```

```
.e-grid .e-headercell {
```

```
background-color: #333; / Override the header background color /
```

```
color: #fff;
```

```
}
```

```
`
```

ORDER ID ▾	CUSTOMER ID ▾	FREIGHT ▾	ORDER DATE ▾
10248	VINET	\$32.38	7/4/1996
10249	TOMSP	\$11.61	7/5/1996
10250	HANAR	\$65.83	7/8/1996
10251	VICTE	\$41.34	7/8/1996
10252	SUPRD	\$51.30	7/9/1996
10253	HANAR	\$58.17	7/10/1996

Using theme studio:

Syncfusion's Theme Studio tool allows you to create custom themes for all their controls, including the Grid. This is a more advanced approach that lets you define a comprehensive set of styles to achieve a consistent look and feel throughout your application.

1. Visit the [Syncfusion Theme Studio](#).
2. Select the Grid control from the left panel.
3. Customize various aspects of the control's appearance, such as colors, typography, and spacing.
4. Once done, you can download the generated CSS file and include it in your EJ2 JavaScript project.

Customizing the grid root element

To customize the appearance of the root element of the Syncfusion EJ2 JavaScript Grid control, you can use CSS. Here's an example of how to modify the font family and row colors using CSS:

```
`css
.e-grid {
font-family: cursive;
}
`
```

ORDER ID ▾	CUSTOMER ID ▾	FREIGHT ▾	ORDER DATE ▾
10248	VINET	\$32.38	7/4/1996
10249	TOMSP	\$11.61	7/5/1996
10250	HANAR	\$65.83	7/8/1996
10251	VICTE	\$41.34	7/8/1996
10252	SUPRD	\$51.30	7/9/1996
10253	HANAR	\$58.17	7/10/1996

The above code snippet, the **.e-grid** class targets the root element of the Syncfusion EJ2 JavaScript Grid control, and the **font-family** property is set to cursive to change the font family of the grid content.

In the following sample, the font family of grid content is changed to **cursive**, and the background color of rows, selected rows, alternate rows, and row hovering color is modified using the below CSS styles.

INDEX.TS

```
import { Grid, Page, Selection } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Page, Selection);
let grid: Grid = new Grid({
  dataSource: data,
  selectionSettings: { type: 'Multiple' },
  allowPaging: true,
  pageSettings: { pageSize: 8 },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', type: 'number',
      textAlign: 'Right', isPrimaryKey: true, width: 100 },
    { field: 'CustomerID', headerText: 'Customer ID', type: 'string',
      width: 120 },
    { field: 'Freight', headerText: 'Freight', type: 'number', format:
      'C2', textAlign: 'Right', width: 100 },
    { field: 'ShipName', headerText: 'Ship Name', type: 'string', width:
      180 },
  ],
  height: 273
});
```

```
grid.appendTo('#Grid');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en">
<head>

Header in EJ2 JavaScript Grid control

You can customize the appearance of the header elements in the Syncfusion EJ2 JavaScript Grid control using CSS. Here are examples of how to customize the Grid header, header cell, and header cell div element.

Customizing the grid header

To customize the appearance of the Grid header root element, you can use the following CSS code:

```

`css
.e-grid .e-gridheader {
border: 2px solid green;
}
`

```

In this example, the **.e-gridheader** class targets the Grid header root element. You can modify the **border** property to change the style of the header border. This customization allows you to override the thin line between the header and content of the grid.

ORDER ID	CUSTOMER ID	FREIGHT	ORDER DATE
10248	VINET	\$32.38	7/4/1996
10249	TOMSP	\$11.61	7/5/1996
10250	HANAR	\$65.83	7/8/1996
10251	VICTE	\$41.34	7/8/1996

Customizing the grid header cell

To customize the appearance of the grid header cell elements, you can use the following CSS code:

```

`css
.e-grid .e-headercell {

```

```
color: #ffffff;
background-color: #1ea8bd;
}
```

In this example, the **.e-headercell** class targets the header cell elements. You can modify the **color** and **background-color** properties to change the text color and background of the header cells.

ORDER ID	CUSTOMER ID	FREIGHT	ORDER DATE
10248	VINET	\$32.38	7/4/1996
10249	TOMSP	\$11.61	7/5/1996
10250	HANAR	\$65.83	7/8/1996
10251	VICTE	\$41.34	7/8/1996

Customizing the grid header cell div element

To customize the appearance of the grid header cell div element, you can use the following CSS code:

```
`css
.e-grid .e-headercelldiv {
font-size: 15px;
font-weight: bold;
color: darkblue;
}
```

In this example, the **.e-headercelldiv** class targets the div element within the header cell. You can modify the **font-size**, **font-weight**, **color** properties to change the font size, font-weight and color of the header text content.

ORDER ID	CUSTOMER ID	FREIGHT	ORDER DATE
10248	VINET	\$32.38	7/4/1996
10249	TOMSP	\$11.61	7/5/1996
10250	HANAR	\$65.83	7/8/1996
10251	VICTE	\$41.34	7/8/1996

Paging in EJ2 JavaScript Grid control

You can customize the appearance of the paging elements in the Syncfusion EJ2 JavaScript Grid control using CSS. Here are examples of how to customize the pager root element, pager container element, pager navigation elements, pager page numeric link elements, and pager current page numeric element.

Customizing the grid pager root element

To customize the appearance of the grid pager root element, you can use the following CSS code:

```
`css
.e-grid .e-gridpager {
font-family: cursive;
background-color: #deecf9;
}
```

In this example, the **.e-gridpager** class targets the pager root element. You can modify the **font-family** to change the font family and **background-color** property to change the background color of the pager.

ORDER ID	CUSTOMER ID	FREIGHT	ORDER DATE
10248	VINET	\$32.38	7/4/1996
10249	TOMSP	\$11.61	7/5/1996
10250	HANAR	\$65.83	7/8/1996
10251	VICTE	\$41.34	7/8/1996
10252	SUPRD	\$51.30	7/9/1996
10253	HANAR	\$58.17	7/10/1996

Customizing the grid pager container element

To customize the appearance of the grid pager container element, you can use the following CSS code:

```
`css
.e-grid .e-pagercontainer {
border: 2px solid #00b5ff;
font-family: cursive;
}
```

In this example, the **.e-pagercontainer** class targets the pager container element. You can modify the **border** property and **font-family** property to change the border color and font family of the pager container.

ORDER ID	CUSTOMER NAME	ORDER DATE	FREIGHT	SHIPPED DATE
10248	Paul Henriot	7/4/1996	\$32.38	7/16/1996
10249	Karin Josephs	7/5/1996	\$11.61	7/10/1996
10250	Mario Pontes	7/8/1996	\$65.83	7/12/1996
10251	Mary Saveley	7/8/1996	\$41.34	7/15/1996

Customizing the grid pager navigation elements

To customize the appearance of the grid pager navigation elements, you can use the following CSS code:

```
`css
.e-grid .e-gridpager .e-prevpagedisabled,
.e-grid .e-gridpager .e-prevpage,
.e-grid .e-gridpager .e-nextpage,
.e-grid .e-gridpager .e-nextpagedisabled,
.e-grid .e-gridpager .e-lastpagedisabled,
.e-grid .e-gridpager .e-lastpage,
.e-grid .e-gridpager .e-firstpage,
.e-grid .e-gridpager .e-firstpagedisabled {
background-color: #deecf9;
}
```

In this example, the classes **.e-prevpagedisabled**, **.e-prevpage**, **.e-nextpage**, **.e-nextpagedisabled**, **.e-lastpagedisabled**, **.e-lastpage**, **.e-firstpage**, and **.e-firstpagedisabled** target the various pager navigation elements. You can modify the **background-color** property to change the background color of these elements.

ORDER ID	CUSTOMER ID	FREIGHT	ORDER DATE
10248	VINET	\$32.38	7/4/1996
10249	TOMSP	\$11.61	7/5/1996
10250	HANAR	\$65.83	7/8/1996
10251	VICTE	\$41.34	7/8/1996
10252	SUPRD	\$51.30	7/9/1996
10253	HANAR	\$58.17	7/10/1996

<< < 1 2 3 > >>

1 of 3 pages (15 items)

Customizing the grid pager page numeric link elements

To customize the appearance of the grid pager current page numeric link elements, you can use the following CSS code:

```
`css
.e-grid .e-gridpager .e-numericitem {
background-color: #5290cb;
color: #ffffff;
cursor: pointer;
}
.e-grid .e-gridpager .e-numericitem:hover {
background-color: white;
color: #007bff;
}
`
```

In this example, the **.e-numericitem** class targets the page numeric link elements. You can modify the **background-color**, **color** properties to change the background color and text color of these elements.

ORDER ID	CUSTOMER ID	FREIGHT	ORDER DATE
10248	VINET	\$32.38	7/4/1996
10249	TOMSP	\$11.61	7/5/1996

Sorting in EJ2 JavaScript Grid control

You can customize the appearance of the sorting icons and multi sorting icons in the Syncfusion EJ2 JavaScript Grid control using CSS. You can use the available Syncfusion [icons](#) based on your theme. Here's how to do it:

Customizing the grid sorting icon

To customize the sorting icon that appears in the Grid header when sorting is applied, you can use the following CSS code:

```
`css
.e-grid .e-icon-ascending::before {
content: '\e7a3'; / Icon code for ascending order /
}
.e-grid .e-icon-descending::before {
content: '\e7b6'; / Icon code for descending order /
}
`
```

In this example, the **.e-icon-ascending::before** class targets the sorting icon for ascending order, and the **.e-icon-descending::before** class targets the sorting icon for descending order.

ORDER ID	CUSTOMER ID	↓↑	FREIGHT	ORDER DATE
10259	CENTC		\$3.25	7/18/1996
10254	CHOPS		\$22.98	7/11/1996
10258	ERNSH		\$140.51	7/17/1996
10250	HANAR		\$65.83	7/8/1996
10253	HANAR		\$58.17	7/10/1996
10257	HILAA		\$81.91	7/16/1996

« < 1 2 3 > »
1 of 3 pages (15 items)

Customizing the grid multi sorting icon

To customize the multi sorting icon that appears in the grid header when multiple columns are sorted, you can use the following CSS code:

```
`css
.e-grid .e-sortnumber {
background-color: #deecf9;
font-family: cursive;
}
```

```
}
,
```

In this example, the **.e-sortnumber** class targets the background color and font family of the multi sorting icon. You can modify the **background-color** and **font-family** properties to customize the appearance of the multi sorting icon.

Filtering in EJ2 JavaScript Grid control

You can customize the appearance of filtering elements in the Syncfusion EJ2 JavaScript Grid control using CSS. Below are examples of how to customize various filtering elements, including filter bar cell elements, filter bar input elements, focus styles, clear icons, filter icons, filter dialog content, filter dialog footer, filter dialog input elements, filter dialog button elements, and Excel filter dialog number filters.

Customizing the filter bar cell element

To customize the appearance of the filter bar cell element in the grid header, you can use the following CSS code:

```
`css
.e-grid .e-filterbarcell {
background-color: #045fb4;
}
,
```

In this example, the **.e-filterbarcell** class targets the filter bar cell element in the grid header. You can modify the **background-color** property to change the color of the filter bar cell element.

ORDER ID	CUSTOMER ID	FREIGHT	ORDER DATE
10248	VINET	\$32.38	7/4/1996
10249	TOMSP	\$11.61	7/5/1996
10250	HANAR	\$65.83	7/8/1996
10251	VICTE	\$41.34	7/8/1996
10252	SUPRD	\$51.30	7/9/1996
10253	HANAR	\$58.17	7/10/1996

Customizing the filter bar input element

To customize the appearance of the filter bar input element in the grid header, you can use the following CSS code:

```
`css
.e-grid .e-filterbarcell .e-input-group input.e-input{
font-family: cursive;
}
`
```

In this example, the **.e-filterbarcell** class targets the filter bar cell element, and the **.e-input** class targets the input element within the cell. You can modify the **font-family** property to change the font of the filter bar input element.

ORDER ID	CUSTOMER ID	FREIGHT	ORDER DATE
	HANAR ×		
10248	VINET	\$32.38	7/4/1996
10249	TOMSP	\$11.61	7/5/1996
10250	HANAR	\$65.83	7/8/1996

10252	SUPRD	\$51.30	7/9/1996
10253	HANAR	\$58.17	7/10/1996

Customizing the filter bar input focus

To customize the appearance of the filter bar input element's focus highlight, you can use the following CSS code:

```
`css
.e-grid .e-filterbarcell .e-input-group.e-input-focus{
background-color: #deecf9;
}
`
```

In this example, the **.e-filterbarcell** class targets the filter bar cell element, and the **.e-input-group.e-input-focus** class targets the focused input element. You can modify the `background-color` property to change the color of the focus highlight.

10252	SUPRD	\$51.30	7/9/1996
10253	HANAR	\$58.17	7/10/1996

Customizing the filter bar input clear icon

To customize the appearance of the filter bar input element's clear icon, you can use the following CSS code:

```
`css
.e-grid .e-filterbarcell .e-input-group .e-clear-icon::before {
content: '\e72c';
}
`
```

In this example, the **.e-clear-icon** class targets the clear icon element within the input group. You can modify the `content` property to change the icon displayed.

	VIN 		
10248	VINET	\$32.38	7/4/1996
10249	TOMSP	\$11.61	7/5/1996
10250	HANAR	\$65.83	7/8/1996
10251	VICTE	\$41.34	7/8/1996
10252	SUPRD	\$51.30	7/9/1996
10253	HANAR	\$58.17	7/10/1996

Customizing the grid filtering icon

To customize the appearance of the grid's filtering icon in the grid header, you can use the following CSS code:

```
`css
.e-grid .e-icon-filter::before{
content: '\e81e';
}
```

In this example, the **.e-icon-filter** class targets the filtering icon element. You can modify the **content** property to change the icon displayed.

ORDER ID 	CUSTOMER ID 	FREIGHT 	ORDER DATE 
10248	VINET	\$32.38	7/4/1996
10249	TOMSP	\$11.61	7/5/1996
10250	HANAR	\$65.83	7/8/1996
10251	VICTE	\$41.34	7/8/1996
10252	SUPRD	\$51.30	7/9/1996
10253	HANAR	\$58.17	7/10/1996

Customizing the filter dialog content

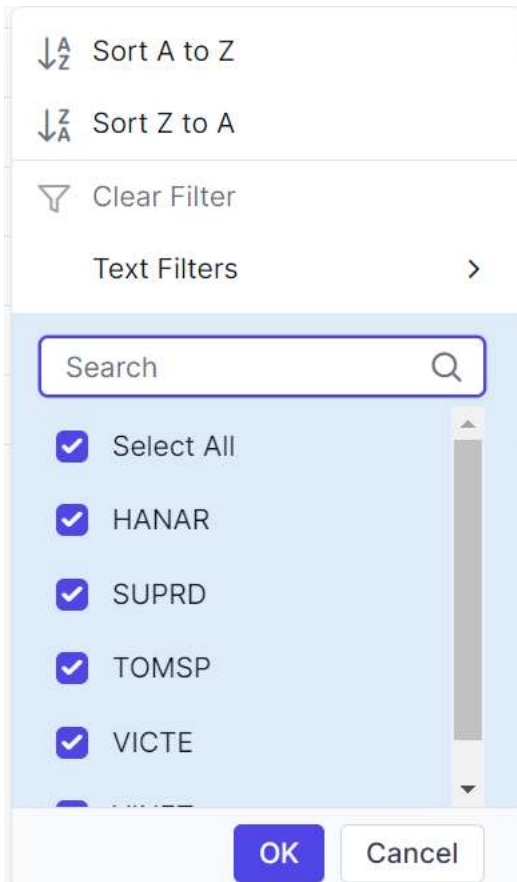

To customize the appearance of the filter dialog's content element, you can use the following CSS code:

```
`css
.e-grid .e-filter-popup .e-dlg-content {
```

```
background-color: #deecf9;
}
`
```

In this example, the **.e-filter-popup .e-dlg-content** classes target the content element within the filter dialog. You can modify the `background-color` property to change the color of the dialog's content.

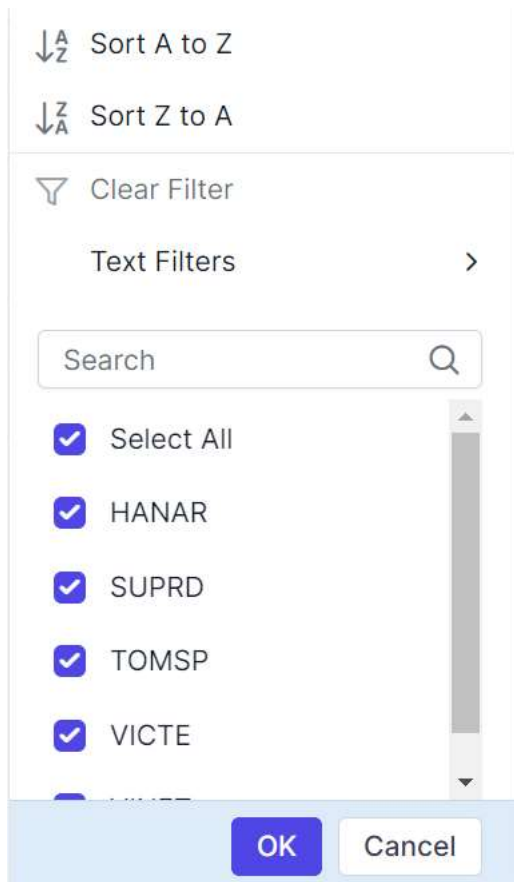

Customizing the filter dialog footer

To customize the appearance of the filter dialog's footer element, you can use the following CSS code:

```
`css
.e-grid .e-filter-popup .e-footer-content {
background-color: #deecf9;
}
`
```

In this example, the **.e-filter-popup .e-footer-content** classes target the footer element within the filter dialog. You can modify the `background-color` property to change the color of the dialog's footer.

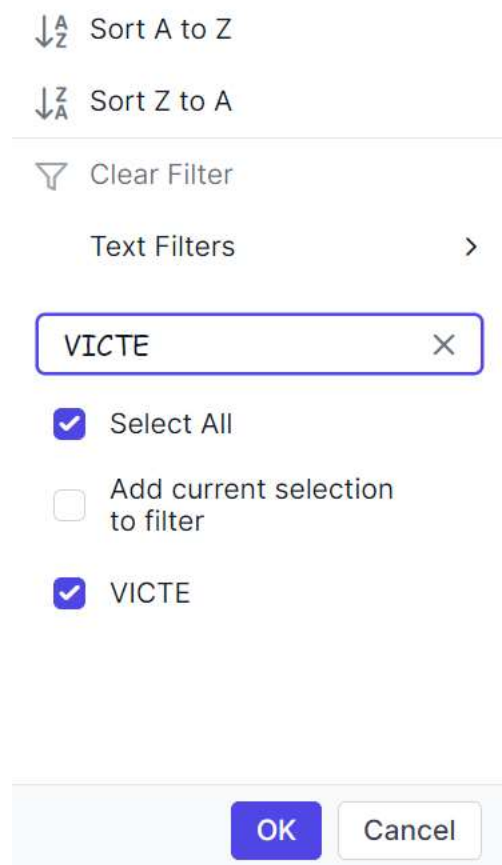

Customizing the filter dialog input element

To customize the appearance of the filter dialog's input elements, you can use the following CSS code:

```
`css
.e-grid .e-filter-popup .e-input-group input.e-input{
font-family: cursive;
}
```

In this example, the **.e-filter-popup** class targets the filter dialog, and the **.e-input** class targets the input elements within the dialog. You can modify the **font-family** property to change the font of the input elements.

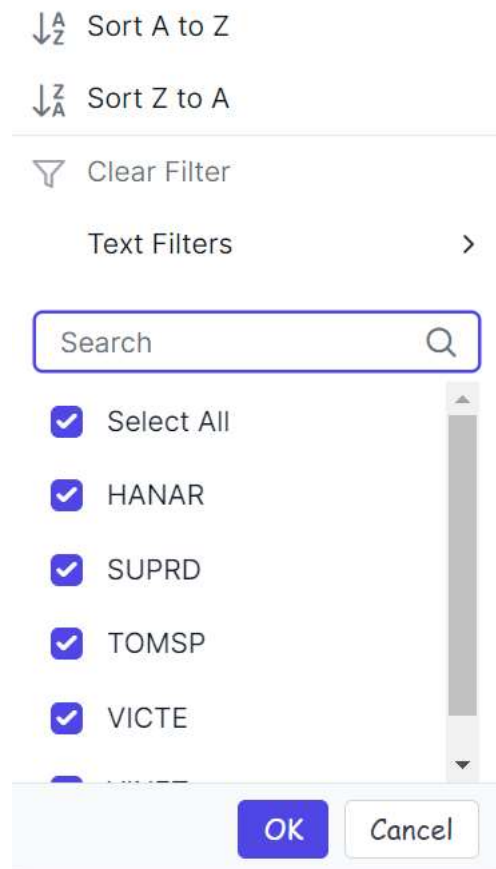

Customizing the filter dialog button element

To customize the appearance of the filter dialog's button elements, you can use the following CSS code:

```
`css
.e-grid .e-filter-popup .e-btn{
font-family: cursive;
}
`
```

In this example, the **.e-filter-popup** class targets the filter dialog, and the **.e-btn** class targets the button elements within the dialog. You can modify the `font-family` property to change the font of the button elements.

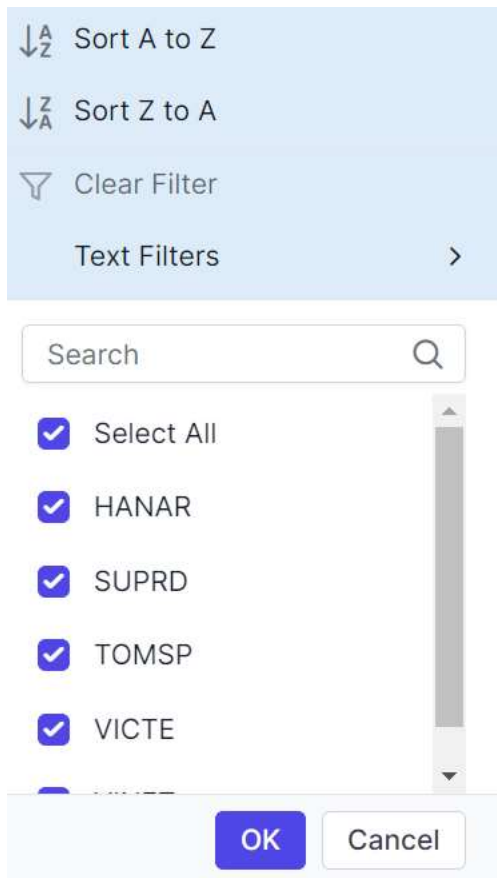

Customizing the excel filter dialog number filters element

To customize the appearance of the excel filter dialog's number filters, you can use the following CSS code:

```
`css
.e-grid .e-filter-popup .e-contextmenu-wrapper ul{
background-color: #deecf9;
}
`
```

In this example, the **.e-filter-popup .e-contextmenu-wrapper** ul classes target the number filter elements within the excel filter dialog. You can modify the `background-color` property to change the color of these elements.

Grouping in EJ2 JavaScript Grid control

You can customize the appearance of grouping elements in the Syncfusion EJ2 JavaScript Grid control using CSS. Here are examples of how to customize the group header, group expand/collapse icons, group caption row, and grouping indent cell.

Customizing the group header

To customize the appearance of the group header element, you can use the following CSS code:

```
`css
.e-grid .e-groupdroparea {
background-color: #132f49;
}
`
```

In this example, the **.e-groupdroparea** class targets the group header element. You can modify the **background-color** property to change the color of the group header.

Drag a column header here to group its column			
ORDER ID	CUSTOMER ID	SHIP CITY	SHIP NAME
10248	VINET	Reims	Vins et alcools Cheva...
10249	TOMSP	Münster	Toms Spezialitäten
10250	HANAR	Rio de Janeiro	Hanari Carnes
10251	VICTE	Lyon	Victuailles en stock

Customizing the group expand or collapse icons

To customize the appearance of the group expand/collapse icons in the grid, you can use the following CSS code:

```
`css
.e-grid .e-icon-gdownarrow::before{
content:'\e7c9'
}
.e-grid .e-icon-grightarrow::before{
content:'\e80f'
}
`
```

In this example, the **.e-icon-gdownarrow** and **.e-icon-grightarrow** classes target the expand and collapse icons, respectively. You can modify the `content` property to change the icon displayed. You can use the available Syncfusion icons based on your theme.

Customer ID ↑ ×		
ORDER ID	SHIP CITY	SHIP NAME
Customer ID: CENTC - 1 item		
Customer ID: CHOPS - 1 item		
Customer ID: ERNSH - 1 item

10253	Rio de Janeiro	Hanari Carnes
Customer ID: HILAA - 1 item		
10257	San Cristóbal	HILARION-Abastos

Customizing the group caption row

To customize the appearance of the group caption row and the icons indicating record expansion or collapse, you can use the following CSS code:

```
`css
.e-grid .e-groupcaption {
background-color: #deecf9;
}
.e-grid .e-recordplusexpend,
.e-grid .e-recordpluscollapse {
background-color: #deecf9;
}
`
```

In this example, the **.e-groupcaption** class targets the group caption row element, and the **.e-recordplusexpend** and **.e-recordpluscollapse** classes target the icons indicating record expansion or collapse. You can modify the **background-color** property to change the color of these elements.

Customer ID ↑ ×

	10253	Rio de Janeiro	Hanari Carnes

Customizing the grouping indent cell

To customize the appearance of the grouping indent cell element, you can use the following CSS code:

```
`css
.e-grid .e-indentcell {
background-color: #deecf9;
}
`
```

In this example, the **.e-indentcell** class targets the grouping indent cell element. You can modify the **background-color** property to change the color of the indent cell.

Toolbar in EJ2 JavaScript Grid control

You can customize the appearance of the toolbar in the Syncfusion EJ2 JavaScript Grid control using CSS. Here are examples of how to customize the toolbar root element and toolbar button element.

Customizing the toolbar root element

To customize the appearance of toolbar root element, you can use the following CSS code:

```
`css
.e-grid .e-toolbar-items {
background-color: #deecf9;
}
```

In this example, the **.e-toolbar-items** class targets the background color of the toolbar root element. You can modify the **background-color** property to change the background color of the toolbar.

<div> <div>+ Add</div> <div> Update</div> <div> Cancel</div> </div>			
ORDER ID	CUSTOMER ID	SHIP CITY	SHIP NAME
10248	VINET	Reims	France
10249	TOMSP	Münster	Germany
10250	HANAR	Rio de Janeiro	Brazil
10251	VICTE	Lyon	France

Customizing the toolbar button element

To customize the appearance of toolbar buttons, you can use the following CSS code:

```
`css
.e-grid .e-toolbar .e-btn {
background-color: #deecf9;
}
```

In this example, the **.e-toolbar .e-btn** selector targets the background color of the toolbar button elements. You can modify the **background-color** property to change the background color of the toolbar buttons.

<div> <div>+ Add</div> <div> Update</div> <div> Cancel</div> </div>			
ORDER ID	CUSTOMER ID	SHIP CITY	SHIP NAME
10248	VINET	Reims	France
10249	TOMSP	Münster	Germany
10250	HANAR	Rio de Janeiro	Brazil
10251	VICTE	Lyon	France

Editing in EJ2 JavaScript Grid control

You can customize the appearance of editing-related elements in the Syncfusion EJ2 JavaScript Grid control using CSS. Below are examples of how to customize various editing-related elements.

Customizing the edited and added row element

To customize the appearance of edited and added row table elements in the grid, you can use the following CSS code:

```
`css
.e-grid .e-editedrow table, .e-grid .e-addedrow table {
```

```
background-color: #62b2eb;
}
```

In this example, the **.e-editedrow** class represents the edited row element, and the **.e-addedrow** class represents the added row element. You can modify the `background-color` property to change the color of these row table elements.

+ Add  Update X Cancel			
ORDER ID	CUSTOMER ID	SHIP CITY	SHIP NAME
<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
10248	VINET	Reims	France
10249	TOMSP	Münster	Germany
10250	HANAR	Rio de Janeiro	Brazil
10251	VICTE	Lyon	France

+ Add  Update X Cancel			
ORDER ID	CUSTOMER ID	SHIP CITY	SHIP NAME
10248	VINET	Reims	France
<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
10250	HANAR	Rio de Janeiro	Brazil
10251	VICTE	Lyon	France

Customizing the edited row input element

To customize the appearance of edited row input elements in the grid, you can use the following CSS code:

```
`css
.e-grid .e-gridform .e-rowcell .e-input-group .e-input.e-field {
font-family: cursive;
color:rgb(214, 33, 123)
}
```

In this example, the **.e-gridform** class represents the editing form, and the **.e-input** class represents the input elements within the form. You can modify the **font-family** property to change the font and **color** property to change text color of the input elements.

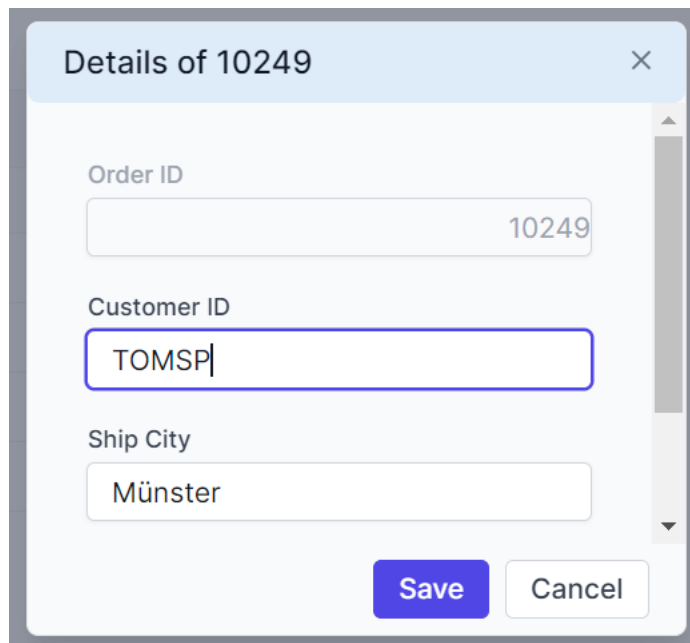

+ Add 📄 Update ✕ Cancel			
ORDER ID	CUSTOMER ID	SHIP CITY	SHIP NAME
10248	VINET	Reims	France
10249	TOMSP	Münster	Germany
10250	HANAR	Rio de Janeiro	Brazil
10251	VICTE	Lyon	France

Customizing the edit dialog header element

To customize the appearance of the edit dialog header element in the grid, you can use the following CSS code:

```
`css
.e-edit-dialog .e-dlg-header-content {
background-color: #deecf9;
}
`
```

In this example, the **.e-edit-dialog** class represents the edit dialog, and the **.e-dlg-header-content** class targets the header content within the dialog. You can modify the **background-color** property to change the color of the header element.

The image shows a dialog box titled "Details of 10249" with a close button (X) in the top right corner. Inside the dialog, there are three input fields: "Order ID" containing "10249", "Customer ID" containing "TOMSP", and "Ship City" containing "Münster". At the bottom of the dialog are two buttons: "Save" (highlighted in blue) and "Cancel".

Customizing the edited row input element in dialog edit mode

To customize the appearance of edited row input elements in dialog edit mode, you can use the following CSS code:

```
`css
.e-gridform .e-rowcell .e-float-input .e-field {
font-family: cursive;
}
`
```

In this example, the **.e-gridform** class represents the editing form, and the **.e-float-input** class targets the floating input elements within the form. You can modify the `font-family` property to change the font of the input elements.

Customizing the command column buttons

To customize the appearance of command column buttons such as edit, delete, update, and cancel, you can use the following CSS code:

```
`css
.e-grid .e-delete::before ,.e-grid .e-cancel-icon::before{
color: #f51717;
}
.e-grid .e-edit::before, .e-grid .e-update::before {
color: #077005;
}
`
```

In this example, the **.e-edit**, **.e-delete**, **.e-update**, and **.e-cancel-icon** classes represent the respective command column buttons. You can modify the `color` property to change the color of these buttons.

ORDER ID	CUSTOMER ID	FREIGHT	SHIP COUNTRY	COMMANDS	
10248	VINET	\$32.38	France		
10249	TOMSP	\$11.61	Germany		
10250	HANAR	\$65.83	Brazil		
10251	VICTE	\$41.34	France		

ORDER ID	CUSTOMER ID	FREIGHT	SHIP COUNTRY	COMMANDS	
10248	VINET	32....	France		
10249	TOMSP	\$11.61	Germany		
10250	HANAR	\$65.83	Brazil		
10251	VICTE	\$41.34	France		

Aggregate in EJ2 JavaScript Grid control

You can customize the appearance of aggregate elements in the Syncfusion EJ2 JavaScript Grid control using CSS. Below are examples of how to customize the aggregate root element and the aggregate cell elements.

Customizing the aggregate root element

To customize the appearance of the Grid's aggregate root elements, you can use the following CSS code:

```
`css
.e-grid .e-gridfooter {
font-family: cursive;
}
```

In this example, the **e-gridfooter** class represents the root element of the aggregate row in the grid footer. You can modify the **font-family** property to change the font of the aggregate root element.

Customer Name	Freight	Order Date	Ship Country
Paul Henriot	\$32.38	7/4/1996	France
Karin Josephs	\$11.61	7/5/1996	Germany
Mario Pontes	\$65.83	7/8/1996	Brazil
Mary Saveley	\$41.34	7/8/1996	France
Sum: \$64,942.69			
Average: \$78.24			

Customizing the aggregate cell elements

To customize the appearance of the Grid's aggregate cell elements (summary row cell elements), you can use the following CSS code:

```
`css
.e-grid .e-summaryrow .e-summarycell {
background-color: #deecf9;
}
```

In this example, the **e-summaryrow** class represents the summary row containing aggregate cells, and the **e-summarycell** class targets individual aggregate cells within the summary row. You can modify the **background-color** property to change the **color** of the aggregate cell elements.

Order ID	Customer ID	Freight	Ship Name
10248	VINET	32.38	Vins et alcools Chev...
10249	TOMSP	11.61	Toms Spezialitäten
10250	HANAR	65.83	Hanari Carnes
10251	VICTE	41.34	Victuailles en stock
		Sum: 151.16	
		Max: 65.83	

Selection in EJ2 JavaScript Grid control

You can customize the appearance of the selection in the Syncfusion EJ2 JavaScript Grid control using CSS. Here are examples of how to customize the row selection background, cell selection background, and column selection background.

Customizing the row selection background

To customize the appearance of row selection, you can use the following CSS code:

```
`css
.e-grid td.e-selectionbackground {
background-color: #00b7ea;
}
```

In this example, the **.e-selectionbackground** class targets the background color of the row selection. You can modify the **background-color** property to change the background color of the selected rows.

ORDER ID	CUSTOMER ID	FREIGHT	ORDER DATE
10248	VINET	\$32.38	7/4/1996
10249	TOMSP	\$11.61	7/5/1996
10250	HANAR	\$65.83	7/8/1996
10251	VICTE	\$41.34	7/8/1996

Customizing the cell selection background

To customize the appearance of cell selection, you can use the following CSS code:

```
`css
```

```
.e-grid td.e-cellselectionbackground {
background-color: #00b7ea;
}
`
```

In this example, the **.e-cellselectionbackground** class targets the background color of the cell selection. You can modify the **background-color** property to change the background color of the selected cells.

ORDER ID	CUSTOMER ID	FREIGHT	ORDER DATE
10248	VINET	\$32.38	7/4/1996
10249	TOMSP	\$11.61	7/5/1996
10250	HANAR	\$65.83	7/8/1996
10251	VICTE	\$41.34	7/8/1996

Customizing the column selection background

To customize the appearance of column selection, you can use the following CSS code:

```
`css
.e-grid .e-columnselection {
background-color: #aec2ec;
}
`
```

In this example, the **.e-columnselection** class targets the background color of the column selection. You can modify the **background-color** property to change the background color of the selected columns.

ORDER ID	CUSTOMER NAME	ORDER DATE	FREIGHT	SHIPPED DATE
10248	Paul Henriot	7/4/1996	\$32.38	7/16/1996
10249	Karin Josepchs	7/5/1996	\$11.61	7/10/1996
10250	Mario Pontes	7/8/1996	\$65.83	7/12/1996
10251	Mary Saveley	7/8/1996	\$41.34	7/15/1996
10252	Pascale Cartrain	7/9/1996	\$51.30	7/11/1996

Migration in EJ2 JavaScript Grid control

[Ej1 api migration in EJ2 JavaScript Grid control](#)

This article describes the API migration process of Grid component from Essential JS 1 to Essential JS 2.

Sorting

|Behavior | API in Essential JS 1 | API in Essential JS 2 |

|----- | ----- | ----- |

|Default | **Property:** *allowSorting*

 `$("#Grid").ejGrid({
 allowSorting: true
});` | **Property:** *allowSorting*

 `var gridObj = new ej.grids.Grid({ allowSorting: true
});
gridObj.appendTo('#Grid');` |

|Clear the Sorted columns | **Method:** *clearSorting()*

 `var gridObj = $("#Grid").data("ejGrid");
gridObj.clearSorting();` | **Method:** *clearSorting()*

 `var gridObj = document.getElementById('Grid')
.ej2_instances[0]
gridObj.clearSorting()`

|Get the Sorted Columns by using the Fieldname | **Method:** *getsortColumnByField(field)*

 `var gridObj = $("#Grid").data("ejGrid");
gridObj.getsortColumnByField("OrderID");` | **Property:** *sortSettings.columns*

 Sorted Column for a particular field can be get by iterating the *sortSettings.columns* with the fieldname

|Remove the Sorted Columns | **Method:** *removeSortedColumns(fieldName)*

 `var gridObj = $("#Grid").data("ejGrid");
gridObj.removeSortedColumns("OrderID");` | **Method:** *removeSortColumn()*

 `var gridObj = document.getElementById('Grid')
.ej2_instances[0]
gridObj.removeSortColumn("OrderID")`

| Sort a Column by using the method | **Method:** *sortColumn(columnName, [sortingDirection])*

 var gridObj = \$("#Grid").data("ejGrid");
 gridObj.sortColumn("OrderID", "ascending"); |
Method: *sortColumn(columnName, Direction)*

 var gridObj =
 document.getElementById('Grid')
.ej2_instances[0]
 gridObj.sortColumn("OrderID",
 "ascending");

Grouping

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Default | **Property:** *allowGrouping*

 \$("#Grid").ejGrid({
 allowGrouping: true

 }); | **Property:** *allowGrouping*

 var gridObj = new
 ej.grids.Grid({
 allowGrouping: true
});
gridObj.appendTo('#Grid'); |

| Group Columns initially | **Property:** *groupSettings.groupedColumns*

 \$("#Grid").ejGrid({
 allowGrouping: true,
 groupSettings: {

 groupedColumns:["OrderID", "CustomerID"]
 }
}); | **Property:**
groupSettings.columns

 var gridObj = new ej.grids.Grid({
 allowGrouping:
 true,
 groupSettings: {
 columns: ["OrderID",
 "CustomerID"]
 }
});
gridObj.appendTo('#Grid');

| Caption Template | **Property:** *groupSettings.captionFormat*

 \$("#Grid").ejGrid({
 allowGrouping: true,
 groupSettings: {

 captionFormat: "#template"
 }
}); | **Property:**
groupSettings.captionTemplate

 var gridObj = new
 ej.grids.Grid({
 allowGrouping: true,
 groupSettings:
 {
 captionTemplate:
 '#template'
 }
});
gridObj.appendTo('#Grid');

| Show Drop Area | **Property:** *groupSettings.showDropArea*

 \$("#Grid").ejGrid({
 allowGrouping: true,
 groupSettings: {

 showDropArea: false
 }
}); | **Property:**
groupSettings.showDropArea

 var gridObj = new ej.grids.Grid({
 allowGrouping:
 true,
 groupSettings: {
 showDropArea:
 false
 }
});
gridObj.appendTo('#Grid');

| Collapse all group caption rows | **Method:** *collapseAll()*

 var gridObj =
 \$("#Grid").data("ejGrid");
 gridObj.collapseAll(); | **Method:** *collapseAll()*

 var gridObj =
 document.getElementById('Grid')
.ej2_instances[0]
 gridObj.groupModule.collapseAll()

| Expand all group caption rows | **Method:** *expandAll()*

 var gridObj =
 \$("#Grid").data("ejGrid");
 gridObj.expandAll(); | **Method:** *expandAll()*

 var gridObj =
 document.getElementById('Grid')
.ej2_instances[0]
 gridObj.groupModule.expandAll()

| Expand or collapse the row based
on the row state in grid | **Method:** *expandCollapse(\$target)*

 var gridObj = \$("#Grid").data("ejGrid");
 gridObj.expandCollapse(\$("#tr
 td.recordplusexpend > div").first()); | **Method:** *expandCollapseRows()*

 var gridObj =
 document.getElementById('Grid')
.ej2_instances[0]
gridObj.groupModule.expandCollap
 seRows(
gridObj.getContent().querySelectorAll('.e-recordplusexpend')[0])

| Collapse the group drop area in grid | **Method:** *collapseGroupDropArea()*

 `var gridObj = $("#Grid").data("ejGrid");`
 `gridObj.collapseGroupDropArea();` | Not Applicable

| Expand the group drop area in grid | **Method:** *expandGroupDropArea()*

 `var gridObj = $("#Grid").data("ejGrid");`
 `gridObj.expandGroupDropArea();` | Not Applicable

| Group a column by using the method | **Method:** *groupByColumn(fieldName)*

 `var gridObj = $("#Grid").data("ejGrid");`
 `gridObj.groupColumn("OrderID");` | **Method:** *groupByColumn(fieldName)*

 `var gridObj = document.getElementById('Grid')`
 `.ej2_instances[0]`
 `gridObj.groupColumn("OrderID")`

| Ungroup a grouped column by using the method | **Method:** *ungroupColumn(fieldName)*

 `var gridObj = $("#Grid").data("ejGrid");`
 `gridObj.ungroupColumn("OrderID");` | **Method:** *ungroupColumn(fieldName)*

 `var gridObj = document.getElementById('Grid')`
 `.ej2_instances[0]`
 `gridObj.ungroupColumn("OrderID")`

Filtering

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| ----- | ----- | ----- |

| Default | **Property:** *allowFiltering*

 `$("#Grid").ejGrid({
 allowFiltering: true
});` | **Property:** *allowFiltering*

 `var gridObj = new ej.grids.Grid({
 allowFiltering: true
});`
 `gridObj.appendTo('#Grid');` |

| Menu Filtering | **Property:** *filterSettings.filterType*

 `$("#Grid").ejGrid({
 allowFiltering: true,
 filterSettings: {
 filterType : "menu"
 }
});` | **Property:** *filterSettings.type*

 `var gridObj = new ej.grids.Grid({
 allowFiltering: true,
 filterSettings: {
 type:'Menu'
 }
});`
 `gridObj.appendTo('#Grid');`

| Excel Filtering | **Property:** *filterSettings.filterType*

 `$("#Grid").ejGrid({
 allowFiltering: true,
 filterSettings: {
 filterType : "excel"
 }
});` | **Property:** *filterSettings.type*

 `var gridObj = new ej.grids.Grid({
 allowFiltering: true,
 filterSettings: {
 type:'Excel'
 }
});`
 `gridObj.appendTo('#Grid');`

| Clear the Filtered values | **Method:** *clearFiltering(field)* - *field is optional*

 `var gridObj = $("#Grid").data("ejGrid");`
 `gridObj.clearFiltering();` | **Method:** *clearFiltering()*

 `var gridObj = document.getElementById('Grid')`
 `.ej2_instances[0]`
 `gridObj.clearFiltering()`

| Filter a column by using the method | **Method:** *filterColumn(fieldName, filterOperator, filterValue,
predicate, [matchcase],[actualFilterValue])*

 `var gridObj = $("#Grid").data("ejGrid");`
 `gridObj.filterColumn("OrderID",
"equal","10248","and", true);` | **Method:** *filterByColumn(fieldName, filterOperator, filterValue, predicate, matchCase, ignoreAccent, actualFilterValue, actualOperator)*

 `var gridObj = document.getElementById('Grid')`
 `.ej2_instances[0]`
 `gridObj.filterByColumn("OrderID","equal",10248)`

| Filter columns by Collection | **Method:** *filterColumn(filterCollection)*

 `var gridObj = $("#Grid").data("ejGrid");`

```
gridObj.filterColumn([{field:"OrderID",<br>&#160;operator:"lessthan",value:"10266",<br>predic
ate:"and",matchcase:true},<br>&#160;{field:"EmployeeID",operator:<br>&#160;"equal",value:2,
predicate:"and", matchcase:true}])| Property: filterSettings.columns <br><br> var gridObj =
document.getElementById('Grid')<br>.ej2_instances[0] <br>gridObj.filterSettings:{columns: [{
field: 'ShipCity', matchCase: false, operator: 'startswith', predicate: 'and', value: 'reims' ]}}
```

| Get the Filtered Records | **Method:** `getFilteredRecords()`

 `var gridObj = $(“#Grid”).data(“ejGrid”);
 gridObj.getFilteredRecords();` | Not Applicable

Searching

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

```
| Default | Property: toolbarSettings.toolbarItems <br><br>
$(“#Grid”).ejGrid({<br>&#160;&#160;showToolBar: true, toolbarItems : [“search”]<br>
&#160;&#160;allowSearching : true<br>}); | Property: toolbar <br><br> var gridObj = new
ej.grids.Grid({<br>&#160;toolbar: [‘Search’]<br>});<br>gridObj.appendTo(‘#Grid’);
```

```
| Clear the Searched values | Method: clearSearching() <br><br> var gridObj =  
$(("#Grid").data("ejGrid")); <br> gridObj.clearSearching(); | Method: searchModule.search() <br><br>  
var gridObj = document.getElementById('Grid')<br>.ej2_instances[0] <br>  
gridObj.searchModule.search("");
```

```
| Search a value | Method: search(searchString) <br><br> var gridObj = $("#Grid").data("ejGrid");  
<br> gridObj.search("France"); | Method: searchModule.search() <br><br> var gridObj =  
document.getElementById('Grid')<br>.ej2_instances[0] <br>  
gridObj.searchModule.search("France");
```

Paging

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

```
| Default | Property: allowPaging <br><br> $(" #Grid").ejGrid({ <br>&#160; allowPaging: true <br>}); | Property: allowPaging <br><br>var gridObj = new ej.grids.Grid({ &#160;allowPaging: true <br>});<br>gridObj.appendTo('#Grid'); |
```

| Customize Paging | **Property:** *pageSettings.pageSize*

```
<br><br>$("#Grid").ejGrid({<br>&#160;&#160;allowPaging: true,<br>&#160;pageSettings: {<br>&#160;&#160;pageSize: 8,pageSizeList: [5, 10],pageCount:3<br>&#160;&#160;}<br>});|Property:  
pageSettings.pageSize <br><br> var gridObj = new ej.grids.Grid({<br>&#160;allowPaging:  
true,<br>&#160;pageSettings: {<br>&#160;pageSize:8, pageSize: [5,  
10],pageCount:3<br>&#160;&#160;}<br>});<br>gridObj.appendTo('#Grid');
```

| Change Page Size | **Method:** `changePageSize(pageSize)`

 `var gridObj = $("#Grid").data("ejGrid");`
 `gridObj.changePageSize(7);` | **Property:** `pageSettings.pageSize`

 Pagesize can be modified dynamically by using the below code
 `pageSettings.pageSize = 7;` |

| Get Current Page Index | **Method:** *getCurrentIndex()*

 var gridObj =
 \$("#Grid").data("ejGrid");
 gridObj.getCurrentIndex(); | **Property:** *pageSettings.currentPage*

 var gridObj = document.getElementById('Grid')
.ej2_instances[0]

 gridObj.pageSettings.currentPage;

| Get Pager Element | **Method:** *getPager()*

 var gridObj = \$("#Grid").data("ejGrid");

 gridObj.getPager(); | **Method:** *getPager()*

 var gridObj =
 document.getElementById('Grid')
.ej2_instances[0]
 gridObj.getPager();

| Send a paging request to specified Page | **Method:** *gotoPage(pageIndex)*

 var gridObj =
 \$("#Grid").data("ejGrid");
 gridObj.gotoPage(3); | **Method:** *gotoPage(pageIndex)*

 var
 gridObj = document.getElementById('Grid')
.ej2_instances[0]
 gridObj.gotoPage(3);

| Calculate Pagesize of grid by using its Parent height(containerHeight) | **Method:**
calculatePageSizeByParentHeight(containerHeight)

 var gridObj =
 \$("#Grid").data("ejGrid");
 gridObj.
calculatePageSizeByParentHeight(400); | Not
 Applicable

Selection

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Default | **Property:** *allowSelection*

 \$("#Grid").ejGrid({
 allowSelection: true

}); | **Property:** *allowSelection*

 var gridObj = new ej.grids.Grid({ allowSelection:
 true
});
gridObj.appendTo('#Grid'); |

| Single Selection | **Property:**
selectionType

\$("#Grid").ejGrid({
 allowSelection:
 true,
 selectionType : "single"
 }); | **Property:**
selectionSettings.type

var gridObj = new ej.grids.Grid({
 allowSelection:
 true,
 selectionSettings: {
 type :
 "Single"
 }
});
gridObj.appendTo('#Grid');

| Multiple Selection | **Property:** *selectionType*

 \$("#Grid").ejGrid({
 allowSelection: true,
 selectionType :
 "multiple"
 }); | **Property:** *selectionSettings.type*

var gridObj = new
 ej.grids.Grid({
 allowSelection: true,
 selectionSettings: {
 type :
 "Multiple"
 }
});
gridObj.appendTo('#Grid');

| Row Selection | **Property:** *selectionSettings.selectionMode*

 \$("#Grid").ejGrid({
 allowSelection: true,
 selectionSettings :
 {selectionMode: ["row"]
 }); | **Property:** *selectionSettings.mode*

var
 gridObj = new ej.grids.Grid({
 allowSelection: true,
 selectionSettings:
 {
 mode: 'Row'
 }
});
gridObj.appendTo('#Grid');

| Cell Selection | **Property:** *selectionSettings.selectionMode*

 \$("#Grid").ejGrid({
 allowSelection: true,
 selectionSettings :
 {selectionMode: ["cell"]
 }); | **Property:** *selectionSettings.mode*

var

```
gridObj = new ej.grids.Grid({  
allowSelection: true,  
selectionSettings:  
mode: 'Cell'  
});  
gridObj.appendTo("#Grid");
```

| Clear the selected Cells | **Method:** *clearCellSelection()*

var gridObj = \$("#Grid").data("ejGrid");
gridObj.clearCellSelection(); | **Method:** *clearCellSelection()*

var gridObj = document.getElementById('Grid').ej2_instances[0]
gridObj.selectionModule.clearCellSelection();

| Clear the selected Columns | **Method:** *clearColumnSelection([index])* - index is optional

var gridObj = \$("#Grid").data("ejGrid");
gridObj.clearColumnSelection(); | Not Applicable

| Get the selected Records | **Method:** *getSelectedRecords()*

var gridObj = \$("#Grid").data("ejGrid");
gridObj.getSelectedRecords(); | **Method:** *getSelectedRecords()*

var gridObj = document.getElementById('Grid').ej2_instances[0]
gridObj.getSelectedRecords();

| Get the selected Rows | **Method:** *getSelectedRows()*

var gridObj = \$("#Grid").data("ejGrid");
gridObj.getSelectedRows(); | **Method:** *getSelectedRows()*

var gridObj = document.getElementById('Grid').ej2_instances[0]
gridObj.getSelectedRows();

| Select Cells | **Method:** *selectCells(rowCellIndexes)*

var gridObj = \$("#Grid").data("ejGrid");
gridObj.selectCells([[1, [4, 3, 2]]]); | **Method:** *selectionModule.selectCells();*

var gridObj = document.getElementById('Grid').ej2_instances[0]
gridObj.selectionModule.selectCells([{ rowIndex: 0, cellIndexes: [0] }, { rowIndex: 1, cellIndexes: [1] }]);

| Select Rows | **Method:** *selectRows(fromIndex, toIndex)*

var gridObj = \$("#Grid").data("ejGrid");
gridObj.selectRows(1, 4); | **Method:** *selectionModule.selectRows()*

var gridObj = document.getElementById('Grid').ej2_instances[0]
gridObj.selectionModule.selectRows([0, 2])

| Triggers when a cell is selected | **Event:** *cellSelected*

\$("#Grid").ejGrid({
cellSelected: function (args) {}
}); | **Event:** *cellSelected*

var gridObj = new ej.grids.Grid({
cellSelected: function (args) {}

Resizing

|Behavior | API in Essential JS 1 | API in Essential JS 2 |

|----- | ----- | ----- |

|Default | **Property:** *allowResizing*

 `$("#Grid").ejGrid({
#160; allowResizing: true

});`| **Property:** *allowResizing*

 `var gridObj = new ej.grids.Grid({ allowResizing: true

});`
`gridObj.appendTo("#Grid");` |

|Resize a column by using the method| **Method:** *resizeColumns(column,width)*

 `var gridObj =
$("#Grid").data("ejGrid");`
 `gridObj.resizeColumns("OrderID",width);`| **Property:**
columns.width

To resize a column, set width to that particular column and then refresh the grid
by using the refresh method.
`var gridObj =
document.getElementById('Grid')`
`.ej2_instances[0]`
 `gridObj.columns[1].width =
100;`
`gridObj.refresh();`

|Triggers when a column resize starts| **Event:** *resizeStart*

 `$("#Grid").ejGrid({
#160;
resizeStart: function (args){}
 });`| **Event:** *resizeStart*

 `var gridObj = new ej.grids.Grid({

#160; resizeStart: function (args){}
 });`;

|Triggers when a column is resized| **Event:** *resized*

 `$("#Grid").ejGrid({
#160; resized:
function (args){}
 });`| **Event:** *resizeStop*

 `var gridObj = new ej.grids.Grid({
#160;
resizeStop: function (args){}
 });`;

| Triggers when a column resize stops | **Event:** *resizeEnd*

 `$("#Grid").ejGrid({

resizeEnd: function (args){}
 });` | Not Applicable

Reordering

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Default | **Property:** *allowReordering*

 `$("#Grid").ejGrid({
 allowReordering:
true
 });` | **Property:** *allowReordering*

 `var gridObj = new ej.grids.Grid({
 allowReordering: true
});
 gridObj.appendTo('#Grid');` |

| Reorder Columns | **Method:** *reorderColumns(fromFieldName, toFieldName)*

 `var gridObj =
$("#Grid").data("ejGrid");
 gridObj.reorderColumns("OrderID", "CustomerID");` | **Method:**
reorderColumns(fromFieldName, toFieldName)

 `var gridObj =
document.getElementById('Grid')
 .ej2_instances[0]
 gridObj.reorderColumns("OrderID",
"CustomerID");`

| Reorder Rows | **Method:** *reorderRows(indexes, toIndex)*

 `var gridObj =
$("#Grid").data("ejGrid");
 gridObj.reorderRows([0,1],3);` | Not Applicable

Context Menu

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Default | **Property:** *contextMenuSettings.enableContextMenu*

 `$("#Grid").ejGrid({
 contextMenuSettings: { enableContextMenu: true }
 });`
| **Property:** *contextMenuItems*

 `var gridObj = new
ej.grids.Grid({
 contextMenuItems: ['AutoFit',
'AutoFitAll']
 });
 gridObj.appendTo('#Grid');`

| Triggers when context menu item is clicked | **Event:** *contextClick*

 `$("#Grid").ejGrid({

 contextClick: function (args){}
 });` | **Event:** *contextMenuClick*

 `var gridObj =
new ej.grids.Grid({
 contextMenuClick: function (args){}
 });`

| Triggers when context menu opens | **Event:** *contextOpen*

 `$("#Grid").ejGrid({

contextOpen: function (args){}
 });` | **Event:** *contextMenuOpen*

 `var gridObj = new
ej.grids.Grid({
 contextMenuOpen: function (args){}
 });`

Toolbar

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Print | **Property:** *toolbarSettings.toolbarItems*

 `$("#Grid").ejGrid({
 showToolbar: true,
 toolbarItems:
[ej.Grid.ToolbarItems.PrintGrid]
 });` | **Property:** *toolbar*

 `var gridObj = new
ej.grids.Grid({
 toolbar: ['Print']
 });
 gridObj.appendTo('#Grid');`

| Add | **Property:** *toolbarSettings.toolbarItems*

 `$("#Grid").ejGrid({
 showToolbar: true,
 toolbarItems:`

[ej.Grid.ToolBarItems.Add]
}); | **Property:** *toolbar*

 var gridObj = new ej.grids.Grid({
 toolbar: ['Add']
});
gridObj.appendTo('#Grid');

| Edit | **Property:** *toolbarSettings.toolbarItems*

 \$("#Grid").ejGrid({
 showToolbar: true,
 toolbarItems: [ej.Grid.ToolBarItems.Edit]
}); | **Property:** *toolbar*

 var gridObj = new ej.grids.Grid({
 toolbar: ['Edit']
});
gridObj.appendTo('#Grid');

| Delete | **Property:** *toolbarSettings.toolbarItems*

 \$("#Grid").ejGrid({
 showToolbar: true,
 toolbarItems: [ej.Grid.ToolBarItems.Delete]
}); | **Property:** *toolbar*

 var gridObj = new ej.grids.Grid({
 toolbar: ['Delete']
});
gridObj.appendTo('#Grid');

| Update | **Property:** *toolbarSettings.toolbarItems*

 \$("#Grid").ejGrid({
 showToolbar: true,
 toolbarItems: [ej.Grid.ToolBarItems.Update]
}); | **Property:** *toolbar*

 var gridObj = new ej.grids.Grid({
 toolbar: ['Update']
});
gridObj.appendTo('#Grid');

| Cancel | **Property:** *toolbarSettings.toolbarItems*

 \$("#Grid").ejGrid({
 showToolbar: true,
 toolbarItems: [ej.Grid.ToolBarItems.Cancel]
}); | **Property:** *toolbar*

 var gridObj = new ej.grids.Grid({
 toolbar: ['Cancel']
});
gridObj.appendTo('#Grid');

| ExcelExport | **Property:** *toolbarSettings.toolbarItems*

 \$("#Grid").ejGrid({
 showToolbar: true,
 toolbarItems: [ej.Grid.ToolBarItems.ExcelExport]
}); | **Property:** *toolbar*

 var gridObj = new ej.grids.Grid({
 toolbar: ['ExcelExport']
});
gridObj.appendTo('#Grid');

| WordExport | **Property:** *toolbarSettings.toolbarItems*

 \$("#Grid").ejGrid({
 showToolbar: true,
 toolbarItems: [ej.Grid.ToolBarItems.WordExport]
}); | Not Applicable

| PdfExport | **Property:** *toolbarSettings.toolbarItems*

 \$("#Grid").ejGrid({
 showToolbar: true,
 toolbarItems: [ej.Grid.ToolBarItems.PdfExport]
}); | **Property:** *toolbar*

 var gridObj = new ej.grids.Grid({
 toolbar: ['PdfExport']
});
gridObj.appendTo('#Grid');

| Refresh Toolbar | **Method:** *refreshToolbar()*

 var gridObj = \$("#Grid").data("ejGrid");
gridObj.refreshToolbar(); | Not Applicable

| Triggers when toolbar item is clicked | **Event:** *toolbarClick*

 \$("#Grid").ejGrid({
 toolbarClick: function (args){}
 }); | **Event:** *toolbarClick*

 var gridObj = new ej.grids.Grid({
 toolbarClick: function (args){}
 });

GridLines

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| ----- | ----- | ----- |

| Default | **Property:** *gridLines*

 \$("#Grid").ejGrid({
 gridLines: ej.Grid.GridLines.Both
 }); | **Property:** *gridLines*

 var gridObj = new ej.grids.Grid({
 gridLines: 'Default'
 });
gridObj.appendTo('#Grid');

Templates

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Detail Template | **Property:** *detailsTemplate*

 `$("#Grid").ejGrid({
#160; detailsTemplate : "#detailsTemplate"
 });` | **Property:** *detailTemplate*

 `var gridObj = new ej.grids.Grid({
#160;detailTemplate: '#detailtemplate',
});
gridObj.appendTo('#Grid');` |

| Row Template | **Property:** *rowTemplate*

 `$("#Grid").ejGrid({
#160; rowTemplate : "#rowTemplate"
 });` | **Property:** *rowTemplate*

 `var gridObj = new ej.grids.Grid({
#160;rowTemplate: '#rowtemplate',
});
gridObj.appendTo('#Grid');` |

| Refresh Template | **Method:** *refreshTemplate()*

 `var gridObj = $("#Grid").data("ejGrid");
gridObj.refreshTemplate();` | Not Applicable

| Triggers when detail template row is clicked to collapse | **Event:** *detailsCollapse*

 `$("#Grid").ejGrid({
#160; detailsCollapse: function (args){}
 });` | Not Applicable

| Triggers when detail template row is initialized | **Event:** *detailsDataBound*

 `$("#Grid").ejGrid({
#160; detailsDataBound: function (args){}
 });` | Not Applicable

| Triggers when detail template
row is clicked to expand | **Event:** *detailsExpand*

 `$("#Grid").ejGrid({
#160; detailsExpand: function (args){}
 });` | **Event:** *detailDataBound*

 `var gridObj = new ej.grids.Grid({
#160; detailDataBound: function (args){}
 });`

| Triggers when refresh the template column elements in the Grid | **Event:** *templateRefresh*

 `$("#Grid").ejGrid({
#160; templateRefresh: function (args){}
 });` | Not Applicable

Row/Column Drag and Drop

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Default | **Property:** *allowRowDragAndDrop*

 `$("#Grid").ejGrid({
#160; allowRowDragAndDrop: true
 });` | **Property:** *allowRowDragAndDrop*

 `var gridObj = new ej.grids.Grid({
#160;allowRowDragAndDrop: true,
#160;rowDropSettings: { targetID: 'DestGrid' }
});
gridObj.appendTo('#Grid');` |

| Triggers when the row is
being dragged | **Event:** *rowDrag*

 `$("#Grid").ejGrid({
#160; rowDrag: function (args){}
 });` | **Event:** *rowDrag*

 `var gridObj = new ej.grids.Grid({
#160; rowDrag: function (args){}
 });`

| Triggers when the row drag begins | **Event:** *rowDragStart*

 `$("#Grid").ejGrid({
#160; rowDragStart: function (args){}
 });` | **Event:** *rowDragStart*

 `var gridObj = new ej.grids.Grid({
#160; rowDragStart: function (args){}
 });`

| Triggers when the row is dropped | **Event:** *rowDrop*

 `$("#Grid").ejGrid({
#160; rowDrop: function (args){}
 });` | **Event:** *rowDrop*

 `var gridObj = new ej.grids.Grid({
#160; rowDrop: function (args){}
 });`

| Triggers before the row is being dropped | **Event:** *beforeRowDrop*

 `$("#Grid").ejGrid({

 beforeRowDrop: function (args){}
 });` | Not Applicable

| Triggers when the
column is being dragged | **Event:** *columnDrag*

 `$("#Grid").ejGrid({

 columnDrag: function (args){}
 });` | Not Applicable

| Triggers when the
column drag begins | **Event:** *columnDragStart*

 `$("#Grid").ejGrid({

 columnDragStart: function (args){}
 });` | Not Applicable

| Triggers when the
column is dropped | **Event:** *columnDrop*

 `$("#Grid").ejGrid({

 columnDrop: function (args){}
 });` | Not Applicable

Frozen Rows and Columns

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Default | **Property:** *scrollSettings.frozenRows*

 `$("#Grid").ejGrid({

allowScrolling: true,
 scrollSettings:{frozenRows:2,
frozenColumns: 2 }
 });` |
Property: *frozenColumns*

`var gridObj = new ej.grids.Grid({
 frozenColumns : 2,

 frozenRows:2
});
gridObj.appendTo('#Grid');` |

| isFrozen | **Property:** *columns.isFrozen*

 `$("#Grid").ejGrid({
 columns : [{ field:
"ShipCity", isFrozen:true}
 });` | **Property:** *columns.isFrozen*

`var gridObj = new
ej.grids.Grid({
 columns : [{ field: "ShipCity", isFrozen: true}

});
gridObj.appendTo('#Grid');` |

ForeignKey

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Default | **Property:** *columns.foreignKeyValue*

 `$("#Grid").ejGrid({
 columns : [{
field: "EmployeeID", foreignKeyField: "EmployeeID", foreignKeyValue: "FirstName",
dataSource: window.employeeView, headerText: "First Name"}
 });` | **Property:**
columns.foreignKeyValue

`var gridObj = new ej.grids.Grid({
 columns : [{ field:
'EmployeeID', headerText: 'Employee Name', width: 150, foreignKeyValue: 'FirstName',
dataSource: employeeData}
});
gridObj.appendTo('#Grid');` |

Auto Wrap

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Default | **Property:** *allowTextWrap*

 `$("#Grid").ejGrid({
 allowTextWrap :
true
 });` | **Property:** *allowTextWrap*

`var gridObj = new ej.grids.Grid({

 allowTextWrap: true,
});
gridObj.appendTo('#Grid');` |

| Both | **Property:** *allowTextWrap*

 `$("#Grid").ejGrid({
 allowTextWrap :
true
 textWrapSettings: {wrapMode: "both"},
 });` | **Property:** *allowTextWrap*

`var gridObj = new ej.grids.Grid({
 allowTextWrap: true,

 textWrapSettings: { wrapMode: 'Both' }
});
gridObj.appendTo('#Grid');` |

| Header | **Property:** *allowTextWrap*

 `$("#Grid").ejGrid({
 allowTextWrap : true
 textWrapSettings: {wrapMode: "header"},
 });` | **Property:** *allowTextWrap*

 `var gridObj = new ej.grids.Grid({
 allowTextWrap: true,
 textWrapSettings: { wrapMode: 'Header' }
});
gridObj.appendTo('#Grid');` |

| Content | **Property:** *allowTextWrap*

 `$("#Grid").ejGrid({
 allowTextWrap : true
 textWrapSettings: {wrapMode: "content"},
 });` | **Property:** *allowTextWrap*

 `var gridObj = new ej.grids.Grid({
 allowTextWrap: true,
 textWrapSettings: { wrapMode: 'Content' }
});
gridObj.appendTo('#Grid');` |

Responsive

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Default | **Property:** *isResponsive*

 `$("#Grid").ejGrid({
 isResponsive: true,enableResponsiveRow: true
});` | Not Applicable

State Persistence

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Default | **Property:** *enablepersistence*

 `$("#Grid").ejGrid({
 enablepersistence: true
 });` | **Property:** *enablepersistence*

 `var gridObj = new ej.grids.Grid({
 enablepersistence: true
});
gridObj.appendTo('#Grid');` |

Right to Left - RTL

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Default | **Property:** *enableRTL*

 `$("#Grid").ejGrid({
 enableRTL: true
 });` | **Property:** *enableRtl*

 `var gridObj = new ej.grids.Grid({
 enableRtl: true
});
gridObj.appendTo('#Grid');` |

ToolTip

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Default | **Property:** *clipMode*

 `$("#Grid").ejGrid({
 columns : [{ field: "ShipCity", clipMode: ej.Grid.ClipMode.EllipsisWithTooltip}
 { field: "ShipCountry", clipMode: ej.Grid.ClipMode.Ellipsis}
 { field: "ShipName", clipMode: ej.Grid.ClipMode.Clip}]
 });` | **Property:** *clipMode*

 `var gridObj = new ej.grids.Grid({
 columns : [{ field: "ShipCity", clipMode: 'EllipsisWithTooltip'},
 { field: "ShipCountry", clipMode: 'Ellipsis'},
 { field: "ShipName", clipMode: 'Clip'}
});
gridObj.appendTo('#Grid');` |

Aggregate/Summary

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Footer Aggregate | **Property:** *showSummary*

 `$("#Grid").ejGrid({
 showSummary: true
 summaryRows: [{
 title: "Sum",
 summaryColumns: [{
 summaryType: ej.Grid.SummaryType.Sum,
 displayColumn: "Freight",
 dataMember: "Freight",
 format: "{0:C2}"}]})`; | **Property:** *aggregates*

 `var gridObj = new ej.grids.Grid({
 aggregates: [{
 columns: [{
 type: 'Sum',
 field: 'Freight',
 footerTemplate: 'Sum: ${Sum}'}]})`;
);
gridObj.appendTo("#Grid"); |

| Caption Aggregate | **Property:** *showSummary*

 `$("#Grid").ejGrid({
 showSummary: true
 summaryRows: [{
 showCaptionSummary: true,
 title: "Sum",
 summaryColumns: [{
 summaryType: ej.Grid.SummaryType.Sum,
 displayColumn: "Freight",
 dataMember: "Freight",
 format: "{0:C2}"}]})`; | **Property:** *aggregates*

 `var gridObj = new ej.grids.Grid({
 aggregates: [{
 columns: [{
 type: 'Sum',
 field: 'Freight',
 groupCaptionTemplate: 'Max: ${Max}'}]})`;
);
gridObj.appendTo("#Grid"); |

| Get Summary values | **Method:** *getSummaryValues(summaryCol, summaryData)*

 `var gridObj = $("#Grid").data("ejGrid");
 gridObj.getSummaryValues(summaryCol, window.gridData);` | Not Applicable

Grid Export

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Adds a grid model property which is
to be ignored on exporting grid | **Method:** *addIgnoreOnExport(propertyNames)*

 `var gridObj = $("#Grid").data("ejGrid");
 gridObj.addIgnoreOnExport("filterSettings");` | Not Applicable |

Columns

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Add or Remove Columns | **Method:** *columns(columnDetails, [action])()*

 `var gridObj = $("#Grid").data("ejGrid");
 gridObj.columns("OrderID", "remove");
 gridObj.columns("CustomerID", "add");` | **Property:** *columns*

 Grid is initially rendered with OrderID and CustomerId columns. Then if you want to add ShipAddress column, you have to reset the value for column property as `gridObj.columns = [{field:"OrderID"}, {field:"CustomerId"}, {field:"ShipAddress"}]`; Then to remove the CustomerId column, reset the column property as, `gridObj.columns = [{field:"OrderID"}, {field:"ShipAddress"}]`;

| Get Column By Field | **Method:** *getColumnByField(fieldName)*

 `var gridObj = $("#Grid").data("ejGrid");
 gridObj.getColumnByField("OrderID");` | **Method:** *getColumnByField(fieldName)*

 `var gridObj =`

```
document.getElementById('Grid')<br>.ej2_instances[0]
<br>gridObj.getColumnByField("OrderID")
```

| Get Column By HeaderText | **Method:** *getColumnByHeaderText(headerText)*

 var gridObj = \$("#Grid").data("ejGrid");
 gridObj.getColumnByHeaderText("Order ID"); | Column object for a corresponding headerText can able to get by iterating the gridObj.columns with the headerText

| Get Column By Index | **Method:** *getColumnByIndex(columnIndex)*

 var gridObj = \$("#Grid").data("ejGrid");
 gridObj.getColumnByIndex(1); | **Method:** *getColumnByIndex(columnIndex)*

 var gridObj = document.getElementById('Grid')
.ej2_instances[0]
gridObj.getColumnByIndex(1)

| Get Column Fieldnames | **Method:** *getColumnFieldNames()*

 var gridObj = \$("#Grid").data("ejGrid");
 gridObj.getColumnFieldNames(); | **Method:** *getColumnFieldNames()*

 var gridObj = document.getElementById('Grid')
.ej2_instances[0]
gridObj.getColumnFieldNames()

| Get Column Index By Field | **Method:** *getColumnIndexByField(fieldName)*

 var gridObj = \$("#Grid").data("ejGrid");
 gridObj.getColumnIndexByField("OrderID"); | **Method:** *getColumnIndexByField(fieldName)*

 var gridObj = document.getElementById('Grid')
.ej2_instances[0]
gridObj.getColumnIndexByField("OrderID");

| Get Column Index By headerText | **Method:** *getColumnIndexByHeaderText(headerText, [field])*

 var gridObj = \$("#Grid").data("ejGrid");
 gridObj.getColumnIndexByHeaderText("Order ID"); | The Column Index for a corresponding headerText can be get by iterating the gridObj.columns with the headerText

| Set Width to columns | **Method:** *setWidthToColumns()*

 var gridObj = \$("#Grid").data("ejGrid");
 gridObj.setWidthToColumns(); | **Method:** *widthService.setWidthToColumns()*

 var gridObj = document.getElementById('Grid')
.ej2_instances[0]
gridObj.widthService.setWidthToColumns()

| Get HeaderText By FieldName | **Method:** *getHeaderTextByFieldName()*

 var gridObj = \$("#Grid").data("ejGrid");
 gridObj.getHeaderTextByFieldName("OrderID"); | Not Applicable

| Get Hidden Columnname | **Method:** *getHiddenColumnNames()*

 var gridObj = \$("#Grid").data("ejGrid");
 gridObj.getHiddenColumnNames(); | Not Applicable

| Get Visible Columns/Names | **Method:** *getVisibleColumnNames()*

 var gridObj = \$("#Grid").data("ejGrid");
 gridObj.getVisibleColumnNames(); | **Method:** *getVisibleColumns()*

 var gridObj = document.getElementById('Grid')
.ej2_instances[0]
gridObj.getVisibleColumns();

| Select Columns | **Method:** *selectColumns(fromIndex)*

 var gridObj = \$("#Grid").data("ejGrid");
 gridObj.selectColumns(1,4); | Not Applicable

| Select Specific Columns based on Index | **Method:** *selectColumns(columnIndex,[toIndex])*

 var gridObj = \$("#Grid").data("ejGrid");
 gridObj.selectColumns(1,4); | Not Applicable

Row

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| EnableHover | **Property:** *enableRowHover*

 `$("#Grid").ejGrid({
 enableRowHover : false
 });`| **Property:** *enableHover*

 `var gridObj = new ej.grids.Grid({
 enableHover: false,
});
gridObj.appendTo('#Grid');` |

| Get Row Height | **Method:** *getRowHeight()*

 `var gridObj = $("#Grid").data("ejGrid");
gridObj.getRowHeight();`| **Method:** *getRowHeight()*

 `var gridObj = document.getElementById('Grid')
.ej2_instances[0]
gridObj.getRowHeight();`

| Refresh Row Height | **Method:** *rowHeightRefresh()*

 `var gridObj = $("#Grid").data("ejGrid");
gridObj.rowHeightRefresh();`| Not Applicable

| Get index by Row Element | **Method:** *getIndexByRow(\$tr)*

 `var gridObj = $("#Grid").data("ejGrid");
gridObj.getIndexByRow($(".gridcontent tr").first());`| Not Applicable

| Get Row by its Index | **Method:** *getRowByIndex(from, to)*

 `var gridObj = $("#Grid").data("ejGrid");
gridObj.getRowByIndex(3, 6);`| **Method:** *getRowByIndex()*

 `var gridObj = document.getElementById('Grid')
.ej2_instances[0]
gridObj.getRowByIndex(1);`

| Get rendered rows | **Method:** *getRows()*

 `var gridObj = $("#Grid").data("ejGrid");
gridObj.getRows();`| **Method:** *getRows()*

 `var gridObj = document.getElementById('Grid')
.ej2_instances[0]
gridObj.getRows();`

| Triggers while hover the grid row | **Event:** *rowHover*

 `$("#Grid").ejGrid({
 rowHover: function (args){}
 });`| Not Applicable

Show/Hide Columns

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Hide Columns by using method | **Method:** *hideColumns(headerText)*

 `var gridObj = $("#Grid").data("ejGrid");
gridObj.hideColumns("Order ID");`| **Method:** *hideColumns(headerText)*

 `var gridObj = document.getElementById('Grid')
.ej2_instances[0]
gridObj.hideColumns("Order ID");`

| Show Columns by using method | **Method:** *showColumns(headerText)*

 `var gridObj = $("#Grid").data("ejGrid");
gridObj.showColumns("Order ID");`| **Method:** *showColumns(headerText)*

 `var gridObj = document.getElementById('Grid')
.ej2_instances[0]
gridObj.showColumns("Order ID");`

Column Chooser

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Default | **Property:** *showColumnChooser*

 `$("#Grid").ejGrid({
 showColumnChooser : true
 columns: [
 { field: 'CustomerID', showInColumnChooser: false },
 { field: 'Name', showInColumnChooser: true },
]});` | **Property:** *showColumnChooser*

 `var gridObj = new ej.grids.Grid({
 showColumnChooser: true,
 toolbar: ['ColumnChooser'],
 columns: [{
 { field: 'CustomerID', showInColumnChooser: false },
 { field: 'Name', showInColumnChooser: true },
 }]);
 gridObj.appendTo('#Grid');` |

Header

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Refresh Header | **Method:** *refreshHeader()*

 `var gridObj = $("#Grid").data("ejGrid");
 gridObj.refreshHeader();` | **Method:** *refreshHeader()*

 `var gridObj = document.getElementById('Grid')
 .ej2_instances[0]
 gridObj.refreshHeader();`

| Triggers every time a request is made to access particular header cell information, element and data. |

Event: *mergeHeaderCellInfo*

 `$("#Grid").ejGrid({
 mergeHeaderCellInfo: function (args){}
 });` | Not Applicable

| Triggers every time a request is made to access particular cell information, element and data | **Event:** *mergeCellInfo*

 `$("#Grid").ejGrid({
 mergeCellInfo: function (args){}
 });` | Not Applicable

DataSource

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| DataSource | **Method:** *dataSource(datasource,[templateRefresh])*

 `var gridObj = $("#Grid").data("ejGrid");
 gridObj.dataSource(newdataSource);` | **Property:** *dataSource*

 `var gridObj = document.getElementById('Grid')
 .ej2_instances[0]
 gridObj.dataSource = newdataSource`

Print

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Print the grid | **Method:** *print()*

 `var gridObj = $("#Grid").data("ejGrid");
 gridObj.print();` | **Method:** *print()*

 `var gridObj = document.getElementById('Grid')
 .ej2_instances[0]
 gridObj.print();`

| Triggers before printing the grid | **Event:** *beforePrint*

 `$("#Grid").ejGrid({
 `

`beforePrint: function (args){}
 });` | **Event:** *beforePrint*

 `var gridObj = new ej.grids.Grid({
 beforePrint: function (args){}
 });`

Scrolling

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Get ScrollObject | **Method:** *getScrollObject()*

 `var gridObj = $("#Grid").data("ejGrid");`

`gridObj.getScrollObject();` | **Property:** *grid.scrollModule*

 `var gridObj =`
`document.getElementById('Grid')`
 `.ej2_instances[0]`
 `var scrollObj =`
`gridObj.scrollModule;`

PrimaryKey

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Set PrimaryKey Column | **Property:** *columns.isPrimaryKey*

 `$("#Grid").ejGrid({`
 `columns:`
`[`
 `{ field: "OrderID", isPrimaryKey: true}]`
 `});` | **Property:** *columns.isPrimaryKey*

 `var`
`gridObj = new ej.grids.Grid({`
 `columns: [`
 `{ field: "OrderID", isPrimaryKey: true}]`
 `});`

| Get the PrimaryKey fieldnames | **Method:** *getPrimaryKeyFieldNames()*

 `var gridObj =`
`$("#Grid").data("ejGrid");`
 `gridObj.getPrimaryKeyFieldNames();` | **Method:**
`getPrimaryKeyFieldNames()`

 `var gridObj =`
`document.getElementById('Grid')`
 `.ej2_instances[0]`

`gridObj.getPrimaryKeyFieldNames();`

Grid

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Get the Browser Details | **Method:** *getBrowserDetails()*

 `var gridObj =`
`$("#Grid").data("ejGrid");`
 `gridObj.getBrowserDetails();` | In Essential JS 2, it can be

 achieved by using `Browser` class of `ej2-base`

| Set dimension for the grid | **Method:** *setDimension(height, width)*

 `var gridObj =`
`$("#Grid").data("ejGrid");`
 `gridObj.setDimension(300,400);` | Not Applicable

| set maximum width for mobile | **Method:** *setPhoneModeMaxWidth(value)*

 `var gridObj =`
`$("#Grid").data("ejGrid");`
 `gridObj.setPhoneModeMaxWidth(500);` | Not Applicable

| Render the grid | **Method:** *render()*

 `var gridObj = $("#Grid").data("ejGrid");`

`gridObj.render();` | **Method:** *render()*

 `var gridObj =`
`document.getElementById('Grid')`
 `.ej2_instances[0]`
 `gridObj.render();`

| Reset the model collections like `pageSettings`, `groupSettings`, `filterSettings`, `sortSettings` and
`summaryRows`. | **Method:** *resetModelCollections()*

 `var gridObj = $("#Grid").data("ejGrid");`

 `gridObj.resetModelCollections();` | Not Applicable

| Destroy the grid | **Method:** *destroy()*

 `var gridObj = $("#Grid").data("ejGrid");`

`gridObj.destroy();` | **Method:** *destroy()*

 `var gridObj =`
`document.getElementById('Grid')`
 `.ej2_instances[0]`
 `gridObj.destroy();`

| Get Content Element | **Method:** *getContent()*

 `var gridObj = $("#Grid").data("ejGrid");`

`gridObj.getContent();` | **Method:** *getContent()*

 `var gridObj =`
`document.getElementById('Grid')`
 `.ej2_instances[0]`
 `gridObj.getContent();`

| Get Content Table | **Method:** *getContentTable()*

 var gridObj = \$("#Grid").data("ejGrid");

 gridObj.getContentTable(); | **Method:** *getContentTable()*

 var gridObj =
document.getElementById('Grid')
.ej2_instances[0]
 gridObj.getContentTable();

| Get Current View Data | **Method:** *getCurrentViewData()*

 var gridObj =
\$("#Grid").data("ejGrid");
 gridObj.getCurrentViewData(); | **Method:** *getCurrentViewRecords()*

 var gridObj = document.getElementById('Grid')
.ej2_instances[0]

gridObj.getCurrentViewRecords();

| Get Data Row | **Method:** *getDataByIndex(rowIndex)*

 var gridObj =
\$("#Grid").data("ejGrid");
 gridObj.getDataByIndex(0); | **Method:** *getDataRows()*

 var
gridObj = document.getElementById('Grid')
.ej2_instances[0]
 gridObj.getDataRows();

| Get Fieldname by using the headertext | **Method:** *getFieldNameByHeaderText(headerText)*

var gridObj = \$("#Grid").data("ejGrid");
 gridObj.getFieldNameByHeaderText("Order ID"); |
Not Applicable

| Get FooterContent | **Method:** *getFooterContent()*

 var gridObj = \$("#Grid").data("ejGrid");

 gridObj.getFooterContent(); | **Method:** *getFooterContent()*

 var gridObj =
document.getElementById('Grid')
.ej2_instances[0]
 gridObj.getFooterContent();

| Get FooterContent Table | **Method:** *getFooterTable()*

 var gridObj =
\$("#Grid").data("ejGrid");
 gridObj.getFooterTable(); | **Method:** *getFooterContentTable()*

 var gridObj = document.getElementById('Grid')
.ej2_instances[0]

gridObj.getFooterContentTable();

| Get HeaderComponent | **Method:** *getHeaderContent()*

 var gridObj =
\$("#Grid").data("ejGrid");
 gridObj.getHeaderContent(); | **Method:** *getHeaderContent()*

 var gridObj = document.getElementById('Grid')
.ej2_instances[0]

gridObj.getHeaderContent();

| Get HeaderComponent Table | **Method:** *getHeaderTable()*

 var gridObj =
\$("#Grid").data("ejGrid");
 gridObj.getHeaderTable(); | **Method:** *getHeaderTable()*

 var
gridObj = document.getElementById('Grid')
.ej2_instances[0]

gridObj.getHeaderTable();

| Refresh Content | **Method:** *refreshContent()*

 var gridObj = \$("#Grid").data("ejGrid");

gridObj.refreshContent(); | **Method:**
 contentModule.refreshContentRows()

 var gridObj
= document.getElementById('Grid')
.ej2_instances[0]

gridObj.
contentModule.refreshContentRows();

| Refresh Data | **Method:** *refreshData()*

 var gridObj = \$("#Grid").data("ejGrid");

gridObj.refreshData(); | Not Applicable

| Triggers every time a request is
made to access particular cell
information, element and data |
Event: *queryCellInfo*

 \$("#Grid").ejGrid({
 queryCellInfo: function (args){}

}); | **Event:** *queryCellInfo*

 var gridObj = new ej.grids.Grid({
 queryCellInfo:
function (args){}
 });

| Triggers every time a request is
made to access row information,
element and data | **Event:**
rowDataBound

 \$("#Grid").ejGrid({
 rowDataBound: function (args){}
 }); |

Event: *rowDataBound*

| Triggers when right clicked on grid element | **Event:** *rightClick*

 `$("#Grid").ejGrid({
 rightClick: function (args){
 }
 });` | Not Applicable

| Triggers when the
record is double clicked | **Event:** *recordDoubleClick*

 `$("#Grid").ejGrid({
 recordDoubleClick: function (args){
 }
 });` | **Event:** *recordDoubleClick*

 `var gridObj = new ej.grids.Grid({
 recordDoubleClick: function (args){
 }
 });`

How To

Enable/disable grid and its actions in EJ2 JavaScript Grid control

You can enable/disable the Grid and its actions by applying/removing corresponding CSS styles.

To enable/disable the grid and its actions, follow the given steps:

Step 1:

Create CSS class with custom style to override the default style of Grid.

,

```
.disablegrid {
pointer-events: none;
opacity: 0.4;
}

.wrapper {
cursor: not-allowed;
}
`
```

Step 2:

Add/Remove the CSS class to the Grid in the click event handler of Button.

```
`ts
document.getElementById('primarybtn').addEventListener('click', () => {
if (grid.element.classList.contains('disablegrid')) {
grid.element.classList.remove('disablegrid');
document.getElementById("GridParent").classList.remove('wrapper');
}
else {
grid.element.classList.add('disablegrid');
document.getElementById("GridParent").classList.add('wrapper');
}
});
`
```

In the below demo, the button click will enable/disable the Grid and its actions.

INDEX.TS

```
import { Grid, Edit, Toolbar, EditEventArgs, EJ2Intance } from
 '@syncfusion/ej2-grids';
import { Button } from '@syncfusion/ej2-buttons';
import { data } from './datasource.ts';
Grid.Inject(Edit, Toolbar);
let button: Button = new Button();
button.appendTo('#primarybtn');
let grid: Grid = new Grid({
  dataSource: data,
  toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
  editSettings: { allowAdding: true, allowEditing: true, allowDeleting: true
},
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true },
```

```

        { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
editType: 'numericedit', width: 120, format: 'C2' },
        { field: 'ShipCountry', headerText: 'Ship Country', editType:
'dropdownedit', width: 150 }
    ],
    height: 265
});
grid.appendTo('#Grid');
document.getElementById('primarybtn').addEventListener('click', () => {
    if (grid.element.classList.contains('disablegrid')) {
        grid.element.classList.remove('disablegrid');
        document.getElementById("GridParent").classList.remove('wrapper');
    }
    else {
        grid.element.classList.add('disablegrid');
        document.getElementById("GridParent").classList.add('wrapper');
    }
});

```

Customize the edit dialog in EJ2 JavaScript Grid control

You can customize the appearance of the edit dialog in the [actionComplete](#) event based on `requestType` as `beginEdit` or `add`.

In the following example, the dialog's properties like header text, `showCloseIcon`, height have been changed while editing and adding the records.

Also the locale text for the `Save` and `Cancel` buttons has been changed by overriding the default locale strings.

You can refer the Grid [Default text](#) list for more localization.

INDEX.TS

```

import { L10n } from '@syncfusion/ej2-base';
import { DialogModel } from '@syncfusion/ej2-popups';
import { Grid, Edit, Toolbar, DialogEditEventArgs } from '@syncfusion/ej2-
grids';
import { data } from './datasource.ts';
Grid.Inject(Edit, Toolbar);
L10n.load({
    'en-US': {
        grid: {
            SaveButton: 'Submit',
            CancelButton: 'Discard'
        }
    }
});
let grid: Grid = new Grid({
    dataSource: data,
    toolbar: ['Add', 'Edit', 'Delete'],
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Dialog' },

```

```

        columns: [
            { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true },
            { field: 'CustomerID', headerText: 'Customer ID', width: 120, },
            { field: 'ShipCountry', headerText: 'Ship Country', width: 150 }
        ],
        height: 265,
        actionComplete: (args: DialogEditEventArgs) => {
            if (args.requestType === 'beginEdit' || args.requestType === 'add')
            {
                let dialog: DialogModel = args.dialog;
                dialog.showCloseIcon = false;
                dialog.height = 400;
                // change the header of the dialog
                dialog.header = args.requestType === 'beginEdit' ? 'Edit Record
of ' + args.rowData['CustomerID'] : 'New Customer';
            }
        }
    });
    grid.appendTo('#Grid');

```

Cascading drop down list with grid editing in EJ2 JavaScript Grid control

You can achieve the Cascading DropDownList with grid Editing by using the Cell Edit Template feature.

In the below demo, Cascading DropDownList is rendered for the **ShipCountry** and **ShipState** column.

INDEX.TS

```

import { Grid, Edit, Toolbar } from '@syncfusion/ej2-grids';
import { DropDownList } from '@syncfusion/ej2-dropdowns';
import { Query } from '@syncfusion/ej2-data';
import { data } from './datasource.ts';
Grid.Inject(Edit, Toolbar);
let countryElem: HTMLElement;
let countryObj: DropDownList;
let stateElem: HTMLElement;
let stateObj: DropDownList;
let country: { [key: string]: Object }[] = [
    { countryName: 'United States', countryId: '1' },
    { countryName: 'Australia', countryId: '2' }
];
let state: { [key: string]: Object }[] = [
    { stateName: 'New York', countryId: '1', stateId: '101' },
    { stateName: 'Virginia ', countryId: '1', stateId: '102' },
    { stateName: 'Washington', countryId: '1', stateId: '103' },
    { stateName: 'Queensland', countryId: '2', stateId: '104' },
    { stateName: 'Tasmania ', countryId: '2', stateId: '105' },
    { stateName: 'Victoria', countryId: '2', stateId: '106' }
];
let grid: Grid = new Grid({
    dataSource: data,
    toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Normal' },
    columns: [

```

```

        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true, validationRules: { required: true } },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120,
validationRules: { required: true, minLength: 3 } },
        {
            field: 'ShipCountry', headerText: 'Ship Country', width: 120,
edit: {
                create: () => {
                    countryElem = document.createElement('input');
                    return countryElem;
                },
                read: () => {

Perform grid actions by keyboard short cut keys in EJ2 JavaScript Grid control

Using keyboard shortcuts, Grid performs navigation and actions.

In addition, You can also perform grid actions with custom keyboard shortcuts. This operation has to be achieved outside of the grid with the help of `keydown` event.

The following example demonstrates on Adding a new row when `Enter` key is pressed in the grid.

INDEX.TS

```

import { Grid, Edit, Toolbar } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Edit, Toolbar);
let grid: Grid = new Grid({
    dataSource: data,
    toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true, validationRules: { required: true } },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
        { field: 'ShipCountry', headerText: 'Ship Country', width: 150 }
    ],
    height: 265
});
grid.appendTo('#Grid');
grid.element.addEventListener("keydown", keyDownHandler);
function keyDownHandler(e: any): void {
    if(e.keyCode === 13) {
        let gridIns: any = document.getElementById("Grid").ej2_instances[0];

```

```

        gridIns.addRecord();
    }
}

```

Exporting grid in cordova application in EJ2 JavaScript Grid control

Cordova application does not support direct file download. So we have to use the Blob stream to export the Grid.

You can use corresponding exporting methods and exportComplete events to get the Blob stream.

INDEX.TS

```

import { EmitType } from '@syncfusion/ej2-base'
import { Grid, Page, Toolbar, ExcelExport, ExcelExportCompleteArgs,
PdfExport, PdfExportCompleteArgs } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Page, Toolbar, ExcelExport, PdfExport);
/**
 * Exporting Blob data
 */
let excelExpComplete: EmitType<ExcelExportCompleteArgs> = (args:
ExcelExportCompleteArgs) => {
    //This event will be triggered when excel exporting.
    args.promise.then((e: { blobData: Blob }) => {
        //In this `then` function, we can get blob data through the
arguments after promise resolved.
        exportBlob(e.blobData);
    });
};
let pdfExpComplete: EmitType<PdfExportCompleteArgs> = (args:
PdfExportCompleteArgs) => {
    //This event will be triggered when pdf exporting.
    args.promise.then((e: { blobData: Blob }) => {
        //In this `then` function, we can get blob data through the
arguments after promise resolved.
        exportBlob(e.blobData);
    });
};
let exportBlob: Function = (blob: Blob) => {
    let a: HTMLAnchorElement = document.createElement('a');

```

```

        document.body.appendChild(a);
        a.style.display = 'none';
        let url: string = window.URL.createObjectURL(blob);
        a.href = url;
        a.download = 'Export';
        a.click();
        window.URL.revokeObjectURL(url);
        document.body.removeChild(a);
    }
    let grid: Grid = new Grid(
    {
        dataSource: data,
        allowExcelExport: true,
        allowPdfExport: true,
        excelExportComplete: excelExpComplete,
        pdfExportComplete: pdfExpComplete,
        toolbar: ['PdfExport', 'ExcelExport'],
        columns: [
            {
                field: 'OrderID', headerText: 'Order ID', textAlign:
'Right', width: 90
            },
            {
                field: 'CustomerID', headerText: 'Customer ID', width: 90
            },
            { field: 'ShipCountry', headerText: 'ShipCountry', width: 90 },
        ]
    });
    grid.appendTo('#Grid');
    grid.toolbarClick = (args: Object) => {
        if (args['item'].id === 'Grid_pdfexport') {
            grid.pdfExport(null, null, null, true);
        }
        if (args['item'].id === 'Grid_excelexport') {
            grid.excelExport(null, null, null, true);
        }
    }
}

Customize pager drop down in EJ2 JavaScript Grid control

To customize the default values of pager drop-down, you need to define the [pageSizes](#) as array of strings.

INDEX.TS

```

import { Grid, Page } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Page);
let grid: Grid = new Grid({
    dataSource: data,
    allowPaging: true,
    pageSettings: { pageSizes: ["5", "10", "All"] },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },

```

```

        { field: 'ShipCity', headerText: 'Ship City', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ],
    });
    grid.appendTo('#Grid');

```

Hide the expand/collapse icon in parent row in EJ2 JavaScript Grid control

By default, the expand/collapse icon will be visible even if the child grid is empty.

You can use [rowDataBound](#) event to hide the icon when there is no record in child grid.

To hide the expand/collapse icon in parent row with no record in child grid, follow the given steps:

Step 1:

Create CSS class with custom style to override the default style of Grid.

```

,

.e-row[aria-selected="true"] .e-customizedExpandcell {
background-color: #e0e0e0;
}
.e-grid.e-gridhover tr[role='row']:hover {
background-color: #eee;
}
,

```

Step 2:

Add the CSS class to the Grid in the [rowDataBound](#) event handler of Grid.

```

`ts
function rowDataBound(args:any):void{
var filter = args.data.EmployeeID;
var data = new DataManager(this.childGrid.dataSource).executeLocal(new
Query().where("EmployeeID", "equal", parseInt(filter), true));
if(data.length == 0) {
//here hide which parent row has no child records
args.row.querySelector('td').innerHTML=" ";
args.row.querySelector('td').className = "e-customizedExpandcell";
}
}
,

```

In the below demo, the expand/collapse icon in the row with **EmployeeID** as **1** is hidden as it does not have record in child Grid.

INDEX.TS

```

import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
import { Grid, Page, Selection, DetailRow } from '@syncfusion/ej2-grids';
import { DataManager, Query } from '@syncfusion/ej2-data';
import { employeeData } from './employeeData.ts';
Grid.Inject(Page, Selection, DetailRow);
let dataManger: Object = [{Order:100, ShipName:'Berlin', EmployeeID:2},
    {Order:101, ShipName:'Capte', EmployeeID:3},
    {Order:102, ShipName:'Marlon', EmployeeID:4},
    {Order:103, ShipName:'Black pearl', EmployeeID:5},
    {Order:104, ShipName:'Pearl', EmployeeID:6},
    {Order:105, ShipName:'Noth bay', EmployeeID:7},
    {Order:106, ShipName:'baratna', EmployeeID:8},
    {Order:107, ShipName:'Charge', EmployeeID:9},
];
let grid: Grid = new Grid({
    dataSource: employeeData,
    allowSorting: true,
    rowDataBound:rowDataBound,
    columns: [
        { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 125 },
        { field: 'FirstName', headerText: 'Name', width: 125 },
        { field: 'Title', headerText: 'Title', width: 180 },

Select rows in grid based on certain condition in EJ2 JavaScript Grid control

You can select the specific row in the grid based on a certain condition by using the [selectRows](#) method in the [dataBound](#) event of Grid.

In the below demo, we have selected the grid rows only when **EmployeeID** column value greater than 3.

INDEX.TS

```

import { Grid, Selection, Page } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Selection, Page);
let selIndex: any = [];
let grid: Grid = new Grid({
    dataSource: data,
    allowPaging: true,
    selectionSettings: {type: "Multiple"},
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ],
    rowDataBound: function(args) {
        if (args.data['EmployeeID'] > 3) {
            selIndex.push(parseInt(args.row.getAttribute('aria-rowindex')));
        }
    },
    dataBound: function(args) {
        if (selIndex.length) {
            this.selectRows(selIndex);
            selIndex = [];
        }
    }
});
grid.appendTo('#Grid');

```

INDEX.HTML

Collapse grouped rows at initial render in EJ2 JavaScript Grid control

You can collapse all the grouped rows at initial rendering by using `dataBound` event with `collapseAll` method of the grid.

In the below demo, all the grouped rows are collapsed at initial rendering.

INDEX.TS

```
import { Grid, Group } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Group);
var initial = true;
let grid: Grid = new Grid({
  dataSource: data,
  allowGrouping: true,
  groupSettings: { columns: ['ShipCity'] },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    { field: 'ShipCity', headerText: 'Ship City', width: 150 },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 }
  ],
  dataBound: bound,
  height: 267
});
grid.appendTo('#Grid');
function bound() {
  if(initial === true) {
    grid.groupModule.collapseAll();
    initial = false;
  }
}
```

INDEX.HTML

Merge duplicate cells in specific column and export in EJ2 JavaScript Grid control

You can merge the duplicate cells (based on the value) for the particular column of Grid by using '[dataBound](#)' event. At the same time, you can also merge the duplicate cells for particular column while exporting by using the [excelQueryCellInfo](#) event for Excel/CSV and [pdfQueryCellInfo](#) event for PDF exporting.

In the below demo, the duplicate cells are merged for the **OrderID** column in Grid view and its exporting.

INDEX.TS

```

import { Grid, ExcelQueryCellInfoEventArgs, ExcelCell,
PdfQueryCellInfoEventArgs, ExcelExport } from '@syncfusion/ej2-grids';
import { PdfExport, PdfGridCell, Toolbar } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(ExcelExport, PdfExport, Toolbar );
// global variable declaration for excel export
let gridcells: ExcelCell;
let ValOfOrderID:Number =null;
let i=1;
// global variable declaration for pdf Export
let pdfGridcell: PdfGridCell;
let ValOfOrderID_PDF :Number = null;
let pdfCellindex:Number =1;
let grid: Grid = new Grid(
    {
        dataSource: data,
        allowExcelExport:true,
        allowPdfExport:true,
        toolbar:["ExcelExport","PdfExport"],
        toolbarClick: toolbarClick,
        dataBound: onDataBound,
        excelQueryCellInfo:excelQueryCellInfo,
        excelExportComplete: excelExportComplete,
        pdfQueryCellInfo: pdfQueryCellInfo,
        pdfExportComplete: pdfExportComplete,
        allowPaging:true,
        pageSettings: { pageSize:5 },
        columns: [
            { field: 'OrderID', headerText: 'Order ID', width: 120,
textAlign: 'Right' },
            { field: 'CustomerID', headerText: 'Customer ID', width: 130 },
            { field: "City", headerText:"ShipCity",width:120}
        ],
        height: 260,
    });
grid.appendTo('#Grid');
function toolbarClick(args){
    if (args.item.text === 'PDF Export') {
        this.pdfExport();
    }
    if (args.item.text === 'Excel Export') {
        this.excelExport();
    }
}
function onDataBound(args: any) {
let previousData: string = null;

Get row cell index in EJ2 JavaScript Grid control

You can get the specific row and cell index of the grid by using `rowSelected` event of the grid. Here, we can get the row and cell index by using `aria-rowindex`(get row Index from `tr` element) and `aria-colindex`(column index from `td` element) attribute.

INDEX.TS

```

import { Grid, Page } from '@syncfusion/ej2-grids';
import { ClickEventArgs } from '@syncfusion/ej2-navigations';
import { data } from './datasource.ts';
import { DataManager } from '@syncfusion/ej2-data';
Grid.Inject(Page);
let grid: Grid = new Grid(
    {
        dataSource: data,
        allowPaging: true,
        pageSettings: { pageCount: 5, pageSize: 5 },
        columns: [
            { field: 'OrderID', headerText: 'Order ID', width: 120,
textAlign: 'Right' },
            { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
            { field: 'OrderDate', headerText: 'Order Date', width: 130,
format: 'yMd', textAlign: 'Right' },
            { field: 'Freight', width: 120, format: 'C2', textAlign: 'Right'
},
            { field: 'ShipCountry', visible: false, headerText: 'Ship
Country', width: 150 }
        ],
        rowSelected: rowSelected
    });
grid.appendTo('#Grid');

```

```
function rowSelected(args: any): void {
    alert("row index: "+args.row.getAttribute('aria-rowindex'));
    alert("column index: "+args.target.getAttribute('aria-colindex'));
}

Display null values at bottom in EJ2 JavaScript Grid control

By default the null values are displayed at bottom of the Grid row while perform sorting in ascending order. As well as this values are displayed at top of the Grid row while perform sorting with descending order. But you can customize this default order to display the null values at always bottom row of the Grid by using [column.sortComparer](#) method.

In the below demo we have displayed the null values at bottom of the Grid row while sorting the **OrderDate** column in both ways.

INDEX.TS

```

import { Grid, Sort, Page, SortEventArgs } from '@syncfusion/ej2-grids';
import { OrderData } from './datasource.ts';
Grid.Inject(Sort, Page);
let grid: Grid = new Grid({
    dataSource: OrderData,
    allowSorting: true,
    actionBegin: actionBegin,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', width: 100 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
        { field: 'OrderDate', headerText: 'Order Date', format: 'yMd',
sortComparer: sortComparer, width: 120},
        { field: 'ShipCountry', headerText: 'Ship Country', width: 150 }
    ],
    height: 265
});
let action: string;
function actionBegin(args: SortEventArgs) {
    if (args.requestType === 'sorting') {
        action = args.direction;
    }
}
function sortComparer(reference, comparer) {
    const sortAsc = action === 'Ascending' ? true : false;

```

```

        if (sortAsc && reference === null) {
            return 1;
        } else if (sortAsc && comparer === null) {
            return -1;
        } else if (!sortAsc && reference === null) {
            return -1;
        } else if (!sortAsc && comparer === null) {
            return 1;
        } else {
            return reference - comparer;
        }
    }
    grid.appendTo('#Grid');

```

Enable editing in single click in EJ2 JavaScript Grid control

Normal Editing

You can make a row editable on a single click with **Normal** mode of editing in Grid, by using the [startEdit](#) and [endEdit](#) methods.

Bind the **mouseup** event for Grid and in the event handler call the [startEdit](#) and [endEdit](#), based on the clicked target element.

INDEX.TS

```
import { Grid, Edit, IGrid, Toolbar } from '@syncfusion/ej2-grids';
import { MouseEventArgs } from '@syncfusion/ej2-base';
import { data } from './datasource.ts';
Grid.Inject(Edit, Toolbar);
let grid: Grid = new Grid({
  dataSource: data,
  editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
  toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C2' },
    { field: 'ShipCountry', headerText: 'Ship Country', width: 150 }
  ],
  load: () => {
    let instance: IGrid =
document.getElementById('Grid').ej2_instances[0];
    instance.element.addEventListener('mouseup', (e: MouseEventArgs) =>
{
      if (e.target.classList.contains("e-rowcell")) {
        if (instance.isEdit)
          instance.endEdit();
        let index: number =
parseInt(e.target.getAttribute("Index"));
        instance.selectRow(index);
        instance.startEdit();
      }
    })
  })
});
```

```

    }
    height: 220
  });
  grid.appendTo('#Grid');

```

```

Open dropdown edit popup on single click

You can open the default dropdown edit popup with single click edit by focusing the dropdown element and calling the EJ2 dropdown list's [showPopup](#) method in the Grid's [actionComplete](#) event. In this demo we have used a global flag variable in the 'mouseup' event to ensure if the dropdown column is the clicked edit target.

INDEX.TS

```

import { Grid, Edit, IGrid, Toolbar } from '@syncfusion/ej2-grids';
import { MouseEventArgs } from '@syncfusion/ej2-base';
import { data } from './datasource.ts';
Grid.Inject(Edit, Toolbar);
let isDropdown = false;
let grid: Grid = new Grid({
    dataSource: data,
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
    toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C2' },
        { field: 'ShipCountry', headerText: 'Ship Country', editType:
'dropdownedit', width: 150 }
    ],
    actionComplete: onActionComplete,
    load: () => {
        let instance: IGrid =
document.getElementById('Grid').ej2_instances[0];
        instance.element.addEventListener('mouseup', (e: MouseEventArgs) =>
{
            if (e.target.classList.contains("e-rowcell")) {
                if (instance.isEdit)

```

```

        instance.endEdit();
        let rowInfo = instance.getRowInfo(e.target);
        if (rowInfo.column.field === "ShipCountry")
            isDropdown = true;
        instance.selectRow(rowInfo.rowIndex);
        instance.startEdit();
    }
    })
    },
    height: 220
});
grid.appendTo('#Grid');
function onActionComplete(args) {
    if (args.requestType === "beginEdit" && isDropdown) {
        isDropdown = false;
        let dropdownObj = args.form.querySelector('.e-
dropdownlist').ej2_instances[0];
        dropdownObj.element.focus();
        dropdownObj.showPopup();
    }
}

Change hierarchy grid icon in EJ2 JavaScript Grid control

You can change default expand/collapse icon of the Hierarchy Grid by using custom Css.

You can change the content code of the corresponding icon which you want.

To use hierarchical binding, inject the [DetailRow](#) module in the grid.

Css:

Use the below css in your `index.html` file.

```

,

.e-grid .e-icon-grightarrow::before,
.e-grid-menu .e-icon-grightarrow::before {
content: '\e7f9';
}

.e-grid .e-icon-gdownarrow::before,
.e-grid-menu .e-icon-gdownarrow::before {
content: '\e934';
}
,

```

In this below demo, we have changed the expand/collapse icon to Plus/Minus icon.

INDEX.TS

```

import { Grid, DetailRow } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
import { employeeData } from './employeeData.ts';
Grid.Inject(DetailRow);
let grid: Grid = new Grid({

```

```

        dataSource: employeeData,
        columns: [
            { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 120 },
            { field: 'FirstName', headerText: 'First Name', width: 150 },
            { field: 'City', headerText: 'City', width: 150 },
            { field: 'Country', headerText: 'Country', width: 150 }
        ],
        childGrid: {
            dataSource: data,
            queryString: 'EmployeeID',
            columns: [
                { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
                { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
                { field: 'ShipCity', headerText: 'Ship City', width: 150 },
                { field: 'ShipName', headerText: 'Ship Name', width: 150 }
            ],
        },
        height: 315
    });
    grid.appendTo('#Grid');

```

Render image in drop down list in EJ2 JavaScript Grid control

To display an image in the DropDownList editor component, you can utilize the `itemTemplate` property. This property allows you to customize the content of each item in the dropdown list.

The below example shows how to use the `itemTemplate` property in the DropDownList editor component to display an image in the dropdown list. Here, we render the image for each item in the dropdown list of the foreign key column `Employee Name`.

INDEX.TS

```

import { Grid, ForeignKey, Edit, Toolbar, Page } from '@syncfusion/ej2-
grids';
import { data } from './datasource.ts';
import { employeeData } from './employeeData.ts';
Grid.Inject(ForeignKey, Edit, Toolbar, Page);
let grid: Grid = new Grid(
    {
        dataSource: data,
        allowPaging: true,
        toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
        editSettings: { allowEditing: true, allowAdding: true,
allowDeleting: true },

```

```

        columns: [
            { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100 },
            { field: 'EmployeeID', headerText: 'Employee Name', width: 150,
foreignKeyValue: 'FirstName',dataSource: employeeData,
editType:'dropdownedit', edit: { params: { itemTemplate:'<div>' + '<div class="ename"> ${FirstName} </div></div>', }, },
            { field: 'Freight', headerText: 'Freight', width: 100,
textAlign: 'Right'},
            { field: 'ShipName', headerText: 'Ship Name', width: 180 }
        ],
        height: 315
    });
    grid.appendTo('#Grid');

```

Customize the Empty Record Template in EJ2 JavaScript Grid control

The empty record template feature in the Grid allows you to use custom content such as images, text, or other components, when the grid doesn't contain any records to display. This feature replaces the default message of 'No records to display' typically shown in the grid.

To activate this feature, set the `emptyRecordTemplate` property of the Grid. The `emptyRecordTemplate` property expects the HTML element or a function that returns the HTML element.

In the following example, an image and text have been rendered as a template to indicate that the grid has no data to display.

INDEX.TS

```

import { Grid, Page, Selection, Toolbar, Edit } from '@syncfusion/ej2-
grids';
import { data } from './datasource.ts';
import { DataManager } from '@syncfusion/ej2-data';
Grid.Inject(Page, Selection, Toolbar, Edit );
let dropDownDataSource = new DataManager(data);
let grid: Grid = new Grid(
    {

```

```

        dataSource: [],
        allowPaging: true,
        toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
        emptyRecordTemplate: '#emptytemplate',
        editSettings: { allowEditing: true, allowAdding: true,
allowDeleting: true},
        columns: [
            { field: 'OrderID', isPrimaryKey: true, headerText: 'Order ID',
textAlign: 'Right', validationRules: { required: true, number: true },
width: 140 },
            { field: 'CustomerID', headerText: 'Customer ID',
validationRules: { required: true }, width: 140 },
            { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
editType: 'numericedit', width: 140, format: 'C2', validationRules: {
required: true } },
            { field: 'OrderDate', headerText: 'Order Date', editType:
'datetimepickeredit', width: 160, format: { type: 'dateTime', format: 'M/d/y
hh:mm a' }, },
            { field: 'ShipCountry', headerText: 'Ship Country', editType:
'dropdownedit', width: 150, edit: { params: { dataSource: dropDownDataSource
, fields: {text:"ShipCountry",value:"ShipCountry"}}}}
        ],
        pageSettings: { pageCount: 5 }
    });
    grid.appendTo('#Grid');

```

<script src="index.js" type="text/javascript"></script>
</body></html>

```

HeatMap Chart

Getting started in EJ2 JavaScript Heatmap chart control

The Essential JS 2 for JavaScript (global script) is an ES5 formatted pure JavaScript framework which can be directly used in latest web browsers.

control Initialization

The Essential JS 2 JavaScript controls can be initialized by using either of the following ways.

- Using local script and style references in a HTML page.
- Using CDN link for script and style reference.

Using local script and style references in a HTML page

Step 1: Create an app folder `myapp` for Essential JS 2 JavaScript controls.

Step 2: You can get the global scripts and styles from the [Essential Studio JavaScript \(Essential JS 2\)](#) build installed location.

Syntax:

Script: `(installed location)/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/dist/global/{PACKAGE_NAME}.min.js`

Example:

Script: `C:/Program Files (x86)/Syncfusion/Essential Studio/16.2.45/Essential JS 2/ej2-heatmap/dist/global/ej2-heatmap.min.js`

Step 3: Create a folder `myapp/resources` and copy/paste the dependent scripts and styles from the above installed location to `myapp/resources` location.

Step 4: Create a HTML page (`index.html`) in `myapp` location and add the Essentials JS 2 script and style references.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<script src="resources/ej2-base.min.js" type="text/javascript"></script>
<script src="resources/ej2-data.min.js" type="text/javascript"></script>
<script src="resources/ej2-svg-base.min.js" type="text/javascript"></script>
<script src="resources/ej2-heatmap.min.js" type="text/javascript"></script>
</head>
<body>
</body>
</html>
`
```

Step 5: Now, add the `div` element and initiate the `Essential JS 2 Heatmap` control in the `index.html` by using following code

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
```

```

<script src="resources/ej2-base.min.js" type="text/javascript"></script>
<script src="resources/ej2-data.min.js" type="text/javascript"></script>
<script src="resources/ej2-svg-base.min.js" type="text/javascript"></script>
<script src="resources/ej2-heatmap.min.js" type="text/javascript"></script>
</head>
<body>
<!-- Add the HTML <div> element -->
<div id="container"></div>
<script>
// initialize heatmap control
var heatmap = new ej.heatmap.HeatMap();
// Render initialized heatmap.
heatmap.appendTo('#container')
</script>
</body>
</html>

```

Step 6: Now, run the **index.html** in web browser, it will render the **Essential JS 2 HeatMap** control.

Using CDN link for script and style reference

Step 1: Create an app folder **quickstart** for the Essential JS 2 JavaScript controls.

Step 2: The Essential JS 2 controls' global scripts are already hosted in the below CDN link formats.

Common Control Script:

Syntax: https://cdn.syncfusion.com/ej2/{RELEASE_VERSION}/dist/ej2.min.js

Example:

Script: <https://cdn.syncfusion.com/ej2/23.1.36/dist/ej2.min.js>

or

Individual Control Scripts:

Syntax

http://cdn.syncfusion.com/ej2/{RELEASEVERSION}/{PACKAGENAME}/dist/global/{PACKAGE_NAME}.min.js

Example:

HeatMap Script: <https://cdn.syncfusion.com/ej2/23.1.36/ej2-heatmap/dist/global/ej2-heatmap.min.js>

Dependency Scripts

<https://cdn.syncfusion.com/ej2/23.1.36/ej2-base/dist/global/ej2-base.min.js>

<https://cdn.syncfusion.com/ej2/23.1.36/ej2-data/dist/global/ej2-data.min.js>

<https://cdn.syncfusion.com/ej2/23.1.36/ej2-svg-base/dist/global/ej2-svg-base.min.js>

Step 3: Create a HTML page (index.html) in quickstart location and add the CDN link references. Now, add the `div` element and initiate the **Essential JS 2 Heatmap** control in the index.html by using following code.

INDEX.HTML

```
<!DOCTYPE html><html xmlns="http://www.w3.org/1999/xhtml"><head>
  <title>Essential JS 2</title>
  <script src="http://cdn.syncfusion.com/ej2/ej2-
base/dist/global/ej2-base.min.js" type="text/javascript"></script>
  <script src="http://cdn.syncfusion.com/ej2/ej2-
data/dist/global/ej2-data.min.js" type="text/javascript"></script>
  <script src="http://cdn.syncfusion.com/ej2/ej2-svg-
base/dist/global/ej2-svg-base.min.js" type="text/javascript"></script>
  <script src="http://cdn.syncfusion.com/ej2/ej2-
heatmap/dist/global/ej2-heatmap.min.js" type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
  <body>
    <!-- Add the HTML <div> element -->
    <div id="container"></div>
    <script>
      // initialize heatmap component
      var heatmap = new ej.heatmap.HeatMap();
      // Render initialized heatmap.
      heatmap.appendTo('#container')
    </script>

    <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
    </script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Step 4: Now, run the **index.html** in web browser, it will render the **Essential JS 2 HeatMap** control.

Populate HeatMap with data

This section explains how to populate the following two-dimensional array data to the HeatMap.

INDEX.JS

```
var heatmapData = [
    [73, 39, 26, 39, 94, 0],
    [93, 58, 53, 38, 26, 68],
    [99, 28, 22, 4, 66, 90],
    [14, 26, 97, 69, 69, 3],
    [7, 46, 47, 47, 88, 6],
    [41, 55, 73, 23, 3, 79],
    [56, 69, 21, 86, 3, 33],
    [45, 7, 53, 81, 95, 79],
    [60, 77, 74, 68, 88, 51],
    [25, 25, 10, 12, 78, 14],
    [25, 56, 55, 58, 12, 82],
    [74, 33, 88, 23, 86, 59]];
var heatmap = new ej.heatmap.HeatMap({
    dataSource: heatmapData
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 HeatMap</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Enable axis labels

You can add axis labels to the HeatMap and format those labels using the [xAxis](#) and [yAxis](#) properties. Axis labels provide additional information about the data points populated in the HeatMap.

INDEX.JS

```

var heatmapData = [
    [73, 39, 26, 39, 94, 0],
    [93, 58, 53, 38, 26, 68],
    [99, 28, 22, 4, 66, 90],
    [14, 26, 97, 69, 69, 3],
    [7, 46, 47, 47, 88, 6],
    [41, 55, 73, 23, 3, 79],
    [56, 69, 21, 86, 3, 33],
    [45, 7, 53, 81, 95, 79],
    [60, 77, 74, 68, 88, 51],
    [25, 25, 10, 12, 78, 14],
    [25, 56, 55, 58, 12, 82],
    [74, 33, 88, 23, 86, 59]];
var heatmap = new ej.heatmap.HeatMap({
    xAxis: {
        labels: ['Nancy', 'Andrew', 'Janet', 'Margaret', 'Steven',
            'Michael', 'Robert', 'Laura', 'Anne', 'Paul',
            'Karin', 'Mario'],
    },
    yAxis: {
        labels: ['Mon', 'Tues', 'Wed', 'Thurs', 'Fri', 'Sat'],
    },
    dataSource: heatmapData,
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 HeatMap</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
    type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
    ="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Add HeatMap title

Add a title using the [titleSettings](#) property to the HeatMap to provide quick information to the user about the data populated in the HeatMap.

INDEX.JS

```
var heatmapData = [
    [73, 39, 26, 39, 94, 0],
    [93, 58, 53, 38, 26, 68],
    [99, 28, 22, 4, 66, 90],
    [14, 26, 97, 69, 69, 3],
    [7, 46, 47, 47, 88, 6],
    [41, 55, 73, 23, 3, 79],
    [56, 69, 21, 86, 3, 33],
    [45, 7, 53, 81, 95, 79],
    [60, 77, 74, 68, 88, 51],
    [25, 25, 10, 12, 78, 14],
    [25, 56, 55, 58, 12, 82],
    [74, 33, 88, 23, 86, 59]];
var heatmap = new ej.heatmap.HeatMap({
    titleSettings: {
        text: 'Sales Revenue per Employee (in 1000 US$)',
        textStyle: {
            size: '15px',
            fontWeight: '500',
            fontStyle: 'Normal',
            fontFamily: 'Segoe UI'
        }
    },
    xAxis: {
        labels: ['Nancy', 'Andrew', 'Janet', 'Margaret', 'Steven',
            'Michael', 'Robert', 'Laura', 'Anne', 'Paul',
            'Karin', 'Mario'],
    },
    yAxis: {
        labels: ['Mon', 'Tues', 'Wed', 'Thurs', 'Fri', 'Sat'],
    },
    dataSource: heatmapData,
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 HeatMap</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
    type="text/javascript"></script>
```

```

<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
</script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Enable legend

Use a legend for the HeatMap in the [legendSettings](#) object by setting the [visible](#) property to **true** and injecting the **Legend** module using the **HeatMap.Inject(Legend)** method.

INDEX.JS

```

var heatmapData = [
    [73, 39, 26, 39, 94, 0],
    [93, 58, 53, 38, 26, 68],
    [99, 28, 22, 4, 66, 90],
    [14, 26, 97, 69, 69, 3],
    [7, 46, 47, 47, 88, 6],
    [41, 55, 73, 23, 3, 79],
    [56, 69, 21, 86, 3, 33],
    [45, 7, 53, 81, 95, 79],
    [60, 77, 74, 68, 88, 51],
    [25, 25, 10, 12, 78, 14],
    [25, 56, 55, 58, 12, 82],
    [74, 33, 88, 23, 86, 59]];
var heatmap = new ej.heatmap.HeatMap({
    titleSettings: {
        text: 'Sales Revenue per Employee (in 1000 US$)',
        textStyle: {
            size: '15px',
            fontWeight: '500',
            fontStyle: 'Normal',
            fontFamily: 'Segoe UI'
        }
    },
    xAxis: {
        labels: ['Nancy', 'Andrew', 'Janet', 'Margaret', 'Steven',
            'Michael', 'Robert', 'Laura', 'Anne', 'Paul',
            'Karin', 'Mario'],
    },
    yAxis: {
        labels: ['Mon', 'Tues', 'Wed', 'Thurs', 'Fri', 'Sat'],
    },
    dataSource: heatmapData,
    legendSettings: {

```

```

        position: 'Right',
        showLabel: true,
        height: "150"
    }
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 HeatMap</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Add data label

Add data labels to improve the readability of the HeatMap. This can be achieved by setting the [showLabel](#) property to **true** in the [cellSettings](#) object.

INDEX.JS

```

var heatmapData = [
  [73, 39, 26, 39, 94, 0],
  [93, 58, 53, 38, 26, 68],
  [99, 28, 22, 4, 66, 90],
  [14, 26, 97, 69, 69, 3],
  [7, 46, 47, 47, 88, 6],
  [41, 55, 73, 23, 3, 79],
  [56, 69, 21, 86, 3, 33],
  [45, 7, 53, 81, 95, 79],
  [60, 77, 74, 68, 88, 51],
  [25, 25, 10, 12, 78, 14],
  [25, 56, 55, 58, 12, 82],
  [74, 33, 88, 23, 86, 59]];

```

```

var heatmap = new ej.heatmap.HeatMap({
  titleSettings: {
    text: 'Sales Revenue per Employee (in 1000 US$)',
    textStyle: {
      size: '15px',
      fontWeight: '500',
      fontStyle: 'Normal',
      fontFamily: 'Segoe UI'
    }
  },
  cellSettings: {
    showLabel: true,
  },
  xAxis: {
    labels: ['Nancy', 'Andrew', 'Janet', 'Margaret', 'Steven',
      'Michael', 'Robert', 'Laura', 'Anne', 'Paul',
      'Karin', 'Mario'],
  },
  yAxis: {
    labels: ['Mon', 'Tues', 'Wed', 'Thurs', 'Fri', 'Sat'],
  },
  dataSource: heatmapData,
  legendSettings: {
    position: 'Right',
    showLabel: true,
    height: "150"
  }
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 HeatMap</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>

```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Add custom cell palette

The default palette settings of the HeatMap cells can be customized by using the [paletteSettings](#) property.

Using the [palette](#) property in `paletteSettings` object, you can change the color set for the cells.

You can change the color mode of the cells to fixed or gradient mode using the [type](#) property.

INDEX.JS

```
var heatmapData = [
  [73, 39, 26, 39, 94, 0],
  [93, 58, 53, 38, 26, 68],
  [99, 28, 22, 4, 66, 90],
  [14, 26, 97, 69, 69, 3],
  [7, 46, 47, 47, 88, 6],
  [41, 55, 73, 23, 3, 79],
  [56, 69, 21, 86, 3, 33],
  [45, 7, 53, 81, 95, 79],
  [60, 77, 74, 68, 88, 51],
  [25, 25, 10, 12, 78, 14],
  [25, 56, 55, 58, 12, 82],
  [74, 33, 88, 23, 86, 59]];
var heatmap = new ej.heatmap.HeatMap({
  titleSettings: {
    text: 'Sales Revenue per Employee (in 1000 US$)',
    textStyle: {
      size: '15px',
      fontWeight: '500',
      fontStyle: 'Normal',
      fontFamily: 'Segoe UI'
    }
  },
  cellSettings: {
    showLabel: true,
  },
  xAxis: {
    labels: ['Nancy', 'Andrew', 'Janet', 'Margaret', 'Steven',
      'Michael', 'Robert', 'Laura', 'Anne', 'Paul',
      'Karin', 'Mario'],
  },
  yAxis: {
    labels: ['Mon', 'Tues', 'Wed', 'Thurs', 'Fri', 'Sat'],
  },
  dataSource: heatmapData,
  legendSettings: {
    position: 'Right',
    showLabel: true,
    height: "150"
  },
  paletteSettings: {
    palette: [{ value: 0, color: '#C06C84' },
      { value: 50, color: '#6C5B7B' }],
  }
});
```

```

Enable tooltip

The tooltip is used when you cannot display information by using the data labels due to space constraints. You can enable the tooltip by setting the [showTooltip](#) property to **true** and injecting the **Tooltip** module using the **HeatMap.Inject(Tooltip)** method.

INDEX.JS

```

Working with data in EJ2 JavaScript Heatmap chart control

Heat map visualizes the JSON data and two-dimensional array data. Using the data adaptor support, data can be bound to the heat map.

Data adaptor

Heat map supports the following types of data binding with the adaptor support.

- Array
- Table binding
- Cell binding
- JSON data
- Table binding
- Cell binding

Array - table binding

This data type is a collection of one dimensional array objects, at which each inner array contains data points for an X-axis data label.

This is the default data binding type for heat map. You can also directly bind the array object to the [dataSource](#) property.

INDEX.TS

```

import { HeatMap, Legend, Tooltip, ITooltipEventArgs } from '@syncfusion/ej2-heatmap';
HeatMap.Inject(Legend, Tooltip);
let heatmapData: Object = [
  [9.5, 2.2, 4.2, 8.2, -0.5, 3.2, 5.4, 7.4, 6.2, 1.4],
  [4.3, 8.9, 10.8, 6.5, 5.1, 6.2, 7.6, 7.5, 6.1, 7.6],
  [3.9, 2.7, 2.5, 3.7, 2.6, 5.1, 5.8, 2.9, 4.5, 5.1],
  [2.4, -3.7, 4.1, 6.0, 5.0, 2.4, 3.3, 4.6, 4.3, 2.7],
  [2.0, 7.0, -4.1, 8.9, 2.7, 5.9, 5.6, 1.9, -1.7, 2.9],

JSON data - table binding

In JSON table data binding, each JSON object contains an X-axis data point as row header and all the corresponding Y-axis data values.

You can bind the JSON table data to the heat map using the [data](#) property in [dataSource](#). To achieve this, you should enable the [isJsonData](#) property and define the [adaptorType](#) property as **Table**. The [xDataMapping](#) property is used to map the row header in JSON data.

INDEX.TS

```

import { HeatMap, Legend, Tooltip, Adaptor} from '@syncfusion/ej2-heatmap';
HeatMap.Inject(Legend, Tooltip, Adaptor);
let heatmapData: object = [
  { 'Region': 'USA', '2000': 93, '2004': 101, '2008': 112, '2012': 103, '2016': 121 },
  { 'Region': 'GBR', '2000': 28, '2004': 30, '2008': 49, '2012': 65, '2016': 67 },
  { 'Region': 'China', '2000': 58, '2004': 63, '2008': 100, '2012': 91, '2016': 70 },
  { 'Region': 'Russia', '2000': 89, '2004': 90, '2008': 60, '2012': 69, '2016': 55 },

JSON data - Cell binding

In JSON cell data binding, each JSON object consists a value for each cell along with a mapping value for row and column. You can bind the JSON cell data having information for each cell to the heat map using the [data](#) property in [dataSource](#). To achieve this, you should define the [adaptorType](#) property as **Cell**,

and enable the [isJsonData](#) property. Now, map the fields of data by using the [valueMapping](#), [xDataMapping](#) and [yDataMapping](#) properties.

INDEX.TS

```
import { HeatMap, Legend, Tooltip, Adaptor} from '@syncfusion/ej2-heatmap';
HeatMap.Inject(Legend, Tooltip, Adaptor);
let heatmapData: object = [
    { 'rowid': 'France', 'columnid': '2010', 'value': '77.6' },
    { 'rowid': 'France', 'columnid': '2011', 'value': '79.4' },
    { 'rowid': 'France', 'columnid': '2012', 'value': '80.8' },
    { 'rowid': 'France', 'columnid': '2013', 'value': '86.6' },
    { 'rowid': 'France', 'columnid': '2014', 'value': '83.7' },
    { 'rowid': 'France', 'columnid': '2015', 'value': '84.5' },
    { 'rowid': 'France', 'columnid': '2016', 'value': '82.6' },
    { 'rowid': 'USA', 'columnid': '2010', 'value': '60.6' },
    { 'rowid': 'USA', 'columnid': '2011', 'value': '65.4' },
    { 'rowid': 'USA', 'columnid': '2012', 'value': '70.8' },

```

Empty points

The data points that use the **null** or **undefined** or empty string as value are considered as empty points. Empty data points are ignored and not displayed in the heat map, and these points are rendered with default palette. You can customize the empty data point color value using the [emptyPointColor](#) property.

Binding nested JSON data

In complex data binding, you can bind the nested JSON data to the data points in the heat map. The nested data can be mapped using the [xDataMapping](#), [yDataMapping](#), [valueMapping](#) and [bubbleDataMapping](#) properties as string value concatenated by a dot.

- [To bind data for bubble heat map with size and color attributes](#)

Bubble heatmap in EJ2 JavaScript Heatmap chart control

Data points represent the data source values with **gradient** or **fixed** colors in the HeatMap. You can customize the appearance of these data points by changing the **color** and **size** attributes.

The data points can be represented in color fill or bubble shape by defining the [tileType](#) property.

By default, the data points are color filled with gradient or fixed colors and this depiction of data points is defined as **Rect** in the [tileType](#) property.

The cell customizations and color mapping for rect tile type is defined in [appearance](#) and [palette](#) sections in detail.

Bubble types

The data points can be represented in the bubble along with its attributes by setting the [tileType](#) property to **Bubble**.

In bubble HeatMap, you can display the data points with bubble size, bubble colors, and sector attributes of the bubble.

Bubble size

In this bubble HeatMap type, the size factor of the bubble is used to denote the data variations. The radius of the bubble varies according to data values.

By default, the bubble with small size denotes the data value with small magnitude and the larger bubble size denotes the data value with larger magnitude. This behavior can be inverted by using the [isInversedBubbleSize](#) property.

To render a bubble HeatMap with size series, set the [bubbleType](#) property to **Size**.

Bubble color

In HeatMap, defined with this tile type, the data points will be represented with same sized bubbles and the data value variations are represented with the bubble colors.

To represent the data points with variations in bubble colors, set the [bubbleType](#) property to **Color**.

INDEX.TS

```

import { HeatMap, Legend, Tooltip } from '@syncfusion/ej2-heatmap';
HeatMap.Inject(Legend, Tooltip);
let heatmapData: any [] = [
    [73, 39, 26, 39, 94, 0],

Combining size and color bubble types

In this bubble HeatMap type, size and color of the bubble represents the data value variation. To render this bubble HeatMap type, set the [bubbleType](#) property to **SizeAndColor**.

The following examples demonstrate different data binding with the **SizeAndColor** bubble type set in the HeatMap.

<!-- markdownlint-disable MD036 -->

Array binding

When an array of numbers is specified as the data source, the bubble HeatMap can be rendered with different sizes and colors depending on the bound data.

<!-- markdownlint-disable MD036 -->

Table

The following example illustrates how to render a bubble HeatMap with different sizes and colors using array table binding.

INDEX.TS

```

import { HeatMap, Legend, Tooltip, BubbleTooltipData, ITooltipEventArgs }
from '@syncfusion/ej2-heatmap';
HeatMap.Inject(Legend, Tooltip);
let heatmapData: any [] = [
    [[4,39], [3,8], [1,3], [1,10], [4,4], [2,15]],
    [[4,28], [5,92], [5,73], [3,1], [3,4], [4,126]],
    [[4,45], [5,152], [0,44], [4,54], [5,243], [2,45]]
];
let heatmap: HeatMap = new HeatMap({
    titleSettings: {

```

```

        text: 'Commercial Aviation Accidents and Fatalities by year 2012
- 2017',
        textStyle: {
            size: '15px',
            fontWeight: '500',
            fontStyle: 'Normal',
            fontFamily: 'Segoe UI'
        },
    },
    xAxis: {
        labels: ['2017', '2016', '2015']
    },
    yAxis: {

Binding size and color values from datasource

The size and color of the bubbles in the **SizeAndColor** bubble HeatMap type can be customized by binding the datasource field name that holds the size and color values to the [size](#) and [color](#) properties in the [bubbleDataMapping](#).

The `bubbleDataMapping` supports only for the JSON data with cell adaptor type.

INDEX.TS

```

import { HeatMap, Legend, Adaptor, Tooltip, BubbleTooltipData,
ITooltipEventArgs } from '@syncfusion/ej2-heatmap';
HeatMap.Inject(Legend, Adaptor, Tooltip);
let jsonCellBubbleData: Object = [
    { Year: '2017', Months: 'Jan-Feb', Accidents: 4, Fatalities: 39 },
    { Year: '2017', Months: 'Mar-Apr', Accidents: 3, Fatalities: 8 },
    { Year: '2017', Months: 'May-Jun', Accidents: 1, Fatalities: 3 },
    { Year: '2017', Months: 'Jul-Aug', Accidents: 1, Fatalities: 10 },

Rendering mode in EJ2 JavaScript Heatmap chart control

Heat map can be displayed using **Canvas** or **Scalable Vector Graphics (SVG)** rendering logic to improve the initial load performance and scalability. Heat map can also be automatically switched between **Canvas** and **SVG** modes based on dataset size. You can enable this mode by

setting the [renderingMode](#) property as **Auto**.

If the **Auto** mode is enabled in the heat map and there are more than 10,000 data points, then the heat map will be rendered in a **Canvas** mode; Otherwise, the heat map will be rendered in a **SVG** mode.

INDEX.TS

```
import { HeatMap, Legend, Tooltip, Adaptor } from '@syncfusion/ej2-heatmap';
HeatMap.Inject(Legend, Tooltip, Adaptor);

Axis in EJ2 JavaScript HeatMap chart control

HeatMap consists of two axes namely, X-axis and Y-axis that displays the row headers and column headers to plot the data points respectively.

You can define the type, format, and other customizing options for both axes in the HeatMap.

Types

There are three different axis types available in the HeatMap, which defines the data type of the axis labels. You can define the axis type by using the [valueType](#) property in the HeatMap.

Category axis

Category axis type is used to represent the string values in axis labels.

INDEX.TS

```

import { HeatMap, Legend, Tooltip, Adaptor } from '@syncfusion/ej2-heatmap';
HeatMap.Inject(Legend, Tooltip, Adaptor);
let heatmapData: any [] = [
    [73, 39, 26, 39, 94, 0],
    [93, 58, 53, 38, 26, 68],
    [99, 28, 22, 4, 66, 90],
    [14, 26, 97, 69, 69, 3],
    [7, 46, 47, 47, 88, 6],

Axis labels customization

Customizing the text style

The text style of the axis labels can be customized using the following options available in the [textStyle](#) property.

- [color](#) - It is used to change the text color of the axis labels.
- [fontFamily](#) - It is used to change the font family of the axis labels.
- [fontStyle](#) - It is used to change the font style of the axis labels.
- [fontWeight](#) - It is used to change the font weight of the axis labels.
- [size](#) - It is used to change the font size of the axis labels.
- [textAlignment](#) - It is used to position and align the axis labels. This property allows you to specify values such as **Near**, **Center**, and **Far**.
- [textOverflow](#) - When the axis label exceeds the intended space, this property is used to trim or wrap it. This property takes values such as **None**, **Trim**, and **Wrap**.

INDEX.TS

```

```

Providing line breaks

Axis labels with line breaks improve the readability of the HeatMap by splitting the text on an axis into multiple lines. The “`
`” character is used to add line breaks to the axis labels.

INDEX.TS

```

import { HeatMap, Tooltip, Legend } from '@syncfusion/ej2-heatmap';
HeatMap.Inject(Tooltip, Legend);
let heatmapData: any[] = [
  [1, 76],
  [19, 3]
];
let heatmap: HeatMap = new HeatMap({
  xAxis: {
    labels: ['Actual<br>Accept', 'Actual<br>Reject'],
    opposedPosition: true,
  },
  yAxis: {
    labels: ['Actual<br>Accept', 'Actual<br>Reject'],
    maxLabelLength: 50,
  },
  dataSource: heatmapData
});
heatmap.appendTo('#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Customizing labels when intersecting with other labels

When the axis labels intersect, [labelIntersectAction](#) property is used to handle the intersection. The [labelIntersectAction](#) property can take the following values.

- **None** - It specifies that no action is taken when the axis labels intersect.
- **Trim** - It specifies to trim the axis labels when they intersect.
- **Rotate45** - When the axis labels intersect, they are rotated to 45 degrees.
- **MultipleRows** - It specifies to show all the axis labels as multiple rows when they intersect.

The below example demonstrates to trim the axis labels by using the [labelIntersectAction](#) property.

INDEX.TS

```

Label formatting

HeatMap supports formatting the axis labels by using the [labelFormat](#) property. Using this property, you can customize the axis label by global string format ('P', 'C', etc) or customized format like '{value}°C'.

INDEX.TS

```

import { HeatMap, Legend, Tooltip, Adaptor } from '@syncfusion/ej2-heatmap';

Axis intervals

In HeatMap, you can define an interval between the axis labels using the [interval](#) property. In date-time axis, you can change the interval mode by using the [intervalType](#) property. The date-time axis supports the following interval types:

- Years
- Months
- Days
- Hours
- Minutes

<script src="index.js" type="text/javascript"></script>
</body></html>

```

Axis label increment

Axis label increment in the HeatMap is used to display the axis labels with regular interval values in numeric and date-time axes. The labels will be displayed with tick gaps when you set the label interval. But, to achieve the same behavior without tick gaps, use the label increment. You can set the axis label increment using the [increment](#) property and the default value of this property is **1**.

INDEX.TS

```

import { HeatMap, Legend } from '@syncfusion/ej2-heatmap';
HeatMap.Inject(Legend);
let heatmapData: any [] = [

Limiting labels in date-time axis

You can display the axis labels at specific time intervals along with the date-time axis using the [showLabelOn](#) property. This property supports the following types:

- None: Displays the axis labels based on the `intervalType` and `interval` property of the axis. This type is default value of the `showLabelOn` property.
- Years: Displays the axis labels on every year between given date-time range.
- Months: Displays the axis labels on every month between given date-time range.
- Days: Displays the axis labels on every day between given date-time range.
- Minutes: Displays the axis labels on every minute between given date-time range.

Multilevel Labels

Multilevel labels are used to classify a group of axis labels as a single category, which is then displayed with a label. By using [multiLevelLabels](#), you can add multiple levels on top of the axis labels.

To divide and group the axis labels, you can use [multiLevelLabels](#) property. The starting and ending indexes of the axis labels can be set using the [start](#) and [end](#) properties in the [categories](#). The [text](#) property can be used to specify a name for the grouped axis labels.

The multilevel labels can be customized by using the following properties.

- [overflow](#) - It is used to trim or wrap the multilevel labels when the label overflows the intended space. NOTE: This property is only for x-axis.
- [alignment](#) - It is used to place and align the multilevel labels.
- [maximumTextWidth](#) - It is used to set the maximum width of the text. When the text length exceeds the maximum text width, the overflow action will be performed.
- [textStyle](#) - It is used to customize the font style of the multilevel labels.
- [border](#) - It is used to customize the border of the multilevel labels displayed in the x-axis and y-axis.

Palette in EJ2 JavaScript Heatmap chart control

In heat map, each data point is displayed as a cell with applied color based on the data value. The palette in the heat map is used to define the color range for cells and gradient type for colors. You can define the colors either in RGB or hex codes using the [color](#) property in the `palette`. The defined colors are applied to the cell background based on the palette type and cell value.

Palette types

You can display the heat map cells either in gradient colors or fixed colors.

Gradient

The smooth transition between the given palette colors can be applied for the heat map cells based on value. The heat map calculates all the gradient colors between the start and end colors for all distinct data values. Default start color and end color will be considered for gradient calculation, if the colors are not defined. The palette type must be defined as **Gradient** for the [type](#) property in `paletteSettings` property.

INDEX.TS

```

import { HeatMap, Legend } from '@syncfusion/ej2-heatmap';
HeatMap.Inject(Legend);
let heatmapData: any [] = [
    [73, 39, 26, 39, 94, 0],
    [93, 58, 53, 38, 26, 68],
    [99, 28, 22, 4, 66, 90],

```

Defining color stops

You can define the colors ranges or color stops for data values in both gradient and fixed palette types. You need to define the data value in the **value** property for **palette** property to calculate the color stops. The heat map automatically calculates the color stops if the **value** property is is not defined. The **label** property is used to provide the additional information about the color that is to be displayed in the legend. If the label is not provided, the **value** is displayed in the legend. The labels can be automatically calculated based on data values, if both the values and labels are not defined.

INDEX.TS

```

import { HeatMap, Legend } from '@syncfusion/ej2-heatmap';
HeatMap.Inject(Legend);
let heatmapData: any [] = [
  [73, 39, 26, 39, 94, 0],
  [93, 58, 53, 38, 26, 68],
  [99, 28, 22, 4, 66, 90],
  [14, 26, 97, 69, 69, 3],

  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Color range

The color range support is used to provide a specific color for specific range in heat map. The `startValue` and `endValue` properties are used to define the range start and end value. The `minColor` and `maxColor` properties represent the colors of given range. It's possible to set the cell color for the value not in the given range using the `fillColor` property.

In Fixed type, the `minColor` value is used for cell color.

INDEX.TS

```

</body></html>

```

Legend types

Heat map supports two legend types: Gradient and list type.

- Gradient: This is a continuous color legend with smooth color transition between palette color values.
- List: List is a fixed color legend. Each palette color information is shown separately in the list item.

You can change the legend type by using the [type](#) property in the `paletteSettings` property.

INDEX.TS

```

import { HeatMap, Legend } from '@syncfusion/ej2-heatmap';
HeatMap.Inject(Legend);

```

```

let heatmapData: any [] = [
    [73, 39, 26, 39, 94, 0],
    [93, 58, 53, 38, 26, 68],

</body></html>

```

Note: To use legend feature, we need to inject **Legend** using **HeatMap.Inject(Legend)**.

Smart Legend

Smart legend is another way of showing list type legend with responsiveness and readability, when the palette has more number of items. You can enable this smart legend by using the [enableSmartLegend](#) property when the palette type is set to **Fixed**.

In smart legend, you can change the display type of legend labels by using the [labelDisplayType](#) property.

The following are the legend label display types:

- All: Displays all labels in the legend.
- Edge: Displays the legend labels only at extreme ends.
- None: None of the labels are displayed. The tooltip will appear for this type of label display when hovering over the legend item.

INDEX.TS

```

import { HeatMap, Legend } from '@syncfusion/ej2-heatmap';
HeatMap.Inject(Legend);
let heatmapData: any [] = [
  [73, 39, 26, 39, 94, 0],

Color gradient mode

The [colorGradientMode](#) property can be used to set the minimum and maximum values for colors based on row and column. Three types of color gradient modes are available.

- **Table:** The minimum and maximum value colors calculated for overall data.
- **Row:** The minimum and maximum value colors calculated for each row of data.
- **Column:** The minimum and maximum value colors calculated for each column of data.

Note: The default value of `colorGradientMode` is **Table**.

```

Template

Any HTML elements can be added as a template in the data labels by using the [labelTemplate](#) property of [cellSettings](#) in the HeatMap.

The following examples show various data binding methods in the HeatMap using the [labelTemplate](#) property.

Array binding

By including `${value}` in the template content, the value from the data source for the corresponding cell can be displayed in the HeatMap cell as data label template content. Additionally, the x-axis and y-axis label values can be displayed by including `${xLabel}` and `${yLabel}` in the template content.

Table

The following example demonstrates how to add a data label template for array table binding.

INDEX.TS

```

import { HeatMap, Tooltip, Legend } from '@syncfusion/ej2-heatmap';
HeatMap.Inject(Tooltip, Legend);
let heatmapData: any[] = [
    [[4, 39], [3, 8], [1, 3], [1, 10], [4, 4], [2, 15]],
    [[4, 28], [5, 92], [5, 73], [3, 1], [3, 4], [4, 126]],
    [[4, 45], [5, 152], [0, 44], [4, 54], [5, 243], [2, 45]]];
let heatmap: HeatMap = new HeatMap({
    titleSettings: {
        text: 'Commercial Aviation Accidents and Fatalities by year 2015 -
2017',
        textStyle: {
            size: '15px',
            fontWeight: '500',
            fontStyle: 'Normal',
            fontFamily: 'inherit',
        },
    },
    xAxis: {

```

```

        labels: ['2015', '2016', '2017']
    },
    yAxis: {
        labels: ['Jan-Feb', 'Mar-Apr', 'May-Jun', 'Jul-Aug', 'Sep-Oct',
'Nov-Dec']
    },
    cellSettings: {
        labelTemplate:
            '<div style="width:25px;height:20px;text-align:center;padding-
top:2px;background-color:#5BBB9C; border: 1px solid #000000; border-
radius:50%;font-weight:bold;">${value}</div>',
    },
    dataSource: heatmapData
});
heatmap.appendTo('#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

```

Cell

The following example demonstrates how to add a data label template for array cell binding.

INDEX.TS

```

import { HeatMap, Adaptor, Tooltip, Legend } from '@syncfusion/ej2-heatmap';
HeatMap.Inject(Tooltip, Adaptor, Legend);
let heatmapData: any[] = [

```

```

    [0, 0, [4, 39]], [0, 1, [3, 8]], [0, 2, [1, 3]], [0, 3, [1, 10]], [0, 4,
    [4, 4]], [0, 5, [2, 15]],
    [1, 0, [4, 28]], [1, 1, [5, 92]], [1, 2, [5, 73]], [1, 3, [3, 1]], [1,
    4, [3, 4]], [1, 5, [4, 126]],
    [2, 0, [4, 45]], [2, 1, [5, 152]], [2, 2, [0, 44]], [2, 3, [4, 54]], [2,
    4, [5, 243]], [2, 5, [2, 45]]];
let heatmap: HeatMap = new HeatMap({
    titleSettings: {
        text: 'Commercial Aviation Accidents and Fatalities by year 2015 -
2017',
        textStyle: {
            size: '15px',
            fontWeight: '500',
            fontStyle: 'Normal',
            fontFamily: 'inherit',
        },
    },
    xAxis: {
        labels: ['2015', '2016', '2017']
    },
    yAxis: {
        labels: ['Jan-Feb', 'Mar-Apr', 'May-Jun', 'Jul-Aug', 'Sep-Oct',
'Nov-Dec']
    },
    cellSettings: {
        labelTemplate:
            '<div style="width:25px;height:20px;text-align:center;padding-
top:2px;background-color:#5BBB9C; border: 1px solid #000000; border-
radius:50%;font-weight:bold;">${value}</div>',
    },
    dataSourceSettings: {
        isJsonData: false,
        adaptorType: 'Cell'
    },
    dataSource: heatmapData
});
heatmap.appendTo('#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 HeatMap</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
    type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
    ="text/javascript"></script>
</head>
<body>

```

```

<div id="container">
  <div id="element"></div>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

JSON binding

By including the desired field name in the template content, such as `${value}`, the value from the data source for the corresponding cell can be displayed in the HeatMap cell as data label template content.

Table

The following example demonstrates how to add a data label template for JSON table binding.

INDEX.TS

```

import { HeatMap, Tooltip, Adaptor, Legend } from '@syncfusion/ej2-heatmap';
HeatMap.Inject(Tooltip, Adaptor, Legend);
let heatmapData: any[] = [
  {
    Year: '2017',

Dimensions in EJ2 JavaScript Heatmap chart control

Size for container

Heat map can be rendered to its container size. You can set the size through inline or CSS.

```
`javascript
<div id='container'>

<div id='element' style="width:650px; height:350px;"></div>

</div>
`
```

Size for heat map

You can set the size of heat map directly by using the [width](#) and [height](#) properties.

In Pixel

You can set the size for heat map in a pixel.

INDEX.TS

```
import { HeatMap } from '@syncfusion/ej2-heatmap';
let heatmapData: any [] = [
    [73, 39, 26, 39, 94, 0],
    [93, 58, 53, 38, 26, 68],
    [99, 28, 22, 4, 66, 90],
    [14, 26, 97, 69, 69, 3],
    [7, 46, 47, 47, 88, 6],
    [41, 55, 73, 23, 3, 79],
    [56, 69, 21, 86, 3, 33],
    [45, 7, 53, 81, 95, 79],
    [60, 77, 74, 68, 88, 51],
    [25, 25, 10, 12, 78, 14],
    [25, 56, 55, 58, 12, 82],
    [74, 33, 88, 23, 86, 59]];
let heatmap: HeatMap = new HeatMap({
    width: '650px',
    height: '350px',
    titleSettings: {
        text: 'Sales Revenue per Employee (in 1000 US$)',
        textStyle: {
            size: '15px',
            fontWeight: '500',
            fontStyle: 'Normal',
            fontFamily: 'Segoe UI'
        }
    },
    xAxis: {
        labels: ['Nancy', 'Andrew', 'Janet', 'Margaret', 'Steven',
            'Michael', 'Robert', 'Laura', 'Anne', 'Paul', 'Karin',
            'Mario'],
    },
    yAxis: {
        labels: ['Mon', 'Tues', 'Wed', 'Thurs', 'Fri', 'Sat'],
    },
    dataSource: heatmapData,
});
```

```
heatmap.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 HeatMap</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>

Tooltip in EJ2 JavaScript Heatmap chart control

Tooltip is used to provide the details of the heat map cell, and this can be displayed, while hovering the cursor over the cell or performing tap action in touch devices.

Default Tooltip

You can enable the tooltip by setting the [showTooltip](#) property to **true** and injecting the **Tooltip** module using the **HeatMap.Inject(Tooltip)**.

INDEX.TS

```
import { HeatMap, Tooltip } from '@syncfusion/ej2-heatmap';
HeatMap.Inject(Tooltip);
let heatmapData: any [] = [
    [0.72, 0.71, 0.71, 0.67, 0.72, 0.53, 0.53, 0.56, 0.58, 0.56],
    [2.28, 2.29, 2.09, 1.84, 1.64, 1.49, 1.49, 1.39, 1.32, 1.23],
    [2.02, 2.17, 2.30, 2.39, 2.36, 2.52, 2.62, 2.57, 2.57, 2.74],
    [3.21, 3.26, 3.45, 3.47, 3.42, 3.34, 3.14, 2.83, 2.64, 2.61],
    [3.22, 3.13, 3.04, 2.95, 2.69, 2.49, 2.27, 2.18, 2.06, 1.87],
    [3.30, 3.39, 3.40, 3.48, 3.60, 3.67, 3.73, 3.79, 3.79, 4.07],
    [5.80, 5.74, 5.64, 5.44, 5.18, 5.08, 5.07, 5.00, 5.35, 5.47],
    [6.91, 7.40, 8.13, 8.80, 9.04, 9.24, 9.43, 9.35, 9.49, 9.69]];
let heatmap: HeatMap = new HeatMap({
    titleSettings: {
        text: 'Crude Oil Production of Non-OPEC Countries (in Million
barrels per day)',
        textStyle: {
            size: '15px',
            fontWeight: '500',

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: To use tooltip feature, we need to inject **Tooltip** using **HeatMap.Inject(Tooltip)**.

Selection in EJ2 JavaScript Heatmap chart control

In the HeatMap, the cell selection is used to select single or multiple HeatMap cells at runtime and get the selected cell details using the [cellSelected](#) event. You can enable the cell selection using the [allowSelection](#) property.

The HeatMap cells can be selected using the following interactions, as shown in the table below.

Modes of Interactions	Description
Mouse	HeatMap cells can be selected by clicking or dragging and dropping over them.
Touch	HeatMap cells can be selected by tapping or dragging and dropping over them.
Keyboard	The Ctrl key on the keyboard can be used to enable multiple cell selection with mouse and touch interaction. The Ctrl key can only be used if the enableMultiSelect property is set to true in order to enable multiple cell selection.

INDEX.TS

```

import { HeatMap, Tooltip, ICellEventArgs } from '@syncfusion/ej2-heatmap';
HeatMap.Inject(Tooltip);
let heatmapData: any [] = [

```

```

        [73, 39, 26, 39, 94, 0],
        [93, 58, 53, 38, 26, 68],
        [99, 28, 22, 4, 66, 90],
        [14, 26, 97, 69, 69, 3],
        [7, 46, 47, 47, 88, 6],
        [41, 55, 73, 23, 3, 79],
        [56, 69, 21, 86, 3, 33],
        [45, 7, 53, 81, 95, 79],
        [60, 77, 74, 68, 88, 51],
        [25, 25, 10, 12, 78, 14],
        [25, 56, 55, 58, 12, 82],
        [74, 33, 88, 23, 86, 59]];
let heatmap: HeatMap = new HeatMap({
  titleSettings: {
    text: 'Sales Revenue per Employee (in 1000 US$)',
    textStyle: {
      size: '15px',
      fontWeight: '500',
      fontStyle: 'Normal',
      fontFamily: 'Segoe UI'
    }
  },
  xAxis: {
    labels: ['Nancy', 'Andrew', 'Janet', 'Margaret', 'Steven',
'Michael', 'Robert', 'Laura', 'Anne', 'Paul', 'Karin',
'Mario'],
  },
  yAxis: {
    labels: ['Mon', 'Tues', 'Wed', 'Thurs', 'Fri', 'Sat'],
  },
  allowSelection: true,
  dataSource: heatmapData,
});
heatmap.appendTo('#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Enable single cell selection

In the HeatMap, the [enableMultiSelect](#) property is used to allow single cell selection. When you set the [enableMultiSelect](#) property to **false**, only one cell is selected. By default, [enableMultiSelect](#) property is set to **true**.

INDEX.TS

```
import { HeatMap } from '@syncfusion/ej2-heatmap';
let heatmapData: any [] = [
  [73, 39, 26, 39, 94, 0],
  [93, 58, 53, 38, 26, 68],
  [99, 28, 22, 4, 66, 90],
  [14, 26, 97, 69, 69, 3],
  [7, 46, 47, 47, 88, 6],
  [41, 55, 73, 23, 3, 79],
  [56, 69, 21, 86, 3, 33],
  [45, 7, 53, 81, 95, 79],
  [60, 77, 74, 68, 88, 51],
  [25, 25, 10, 12, 78, 14],
  [25, 56, 55, 58, 12, 82],
  [74, 33, 88, 23, 86, 59]];
let heatmap: HeatMap = new HeatMap({
  titleSettings: {
    text: 'Sales Revenue per Employee (in 1000 US$)',
    textStyle: {
      size: '15px',
      fontWeight: '500',

Accessibility in EJ2 JavaScript HeatMap chart control

HeatMap has built-in accessibility features like screen reading. Screen reading in the HeatMap control allows all users, regardless of ability or disability, to use the control. The following HeatMap elements will be read aloud with screen reading software like Narrator for Windows.

Elements	Description
---	---
Title	Reads the contents of the HeatMap chart's title.
Axis labels	Reads the x and y axis labels of the HeatMap chart.
Multilevel labels	Reads the multilevel labels in the x and y axis of the HeatMap chart.
Cell labels	Reads the labels from the cells in the Heatmap chart.
Legend title	Reads the contents of the legend's title as specified in HeatMap chart.
Legend item label	Reads the label of a legend item in HeatMap chart.

Ensuring accessibility

The HeatMap control's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the HeatMap control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the HeatMap control with accessibility tools.

Events in EJ2 JavaScript HeatMap chart control

This section describes the HeatMap chart control event, which occurs when the required actions are performed.

cellClick

When you click on a HeatMap cell, the [cellClick](#) event is triggered. To know more about arguments of this event, refer [here](#).

INDEX.TS

```

import { HeatMap, Tooltip, Legend } from '@syncfusion/ej2-heatmap';
HeatMap.Inject(Tooltip, Legend);
let heatmapData: any[] = [
    [73, 39, 26, 39, 94, 0],
    [93, 58, 53, 38, 26, 68],
    [99, 28, 22, 4, 66, 90],

```

```

[14, 26, 97, 69, 69, 3],
[7, 46, 47, 47, 88, 6],

How To

Tooltip template in EJ2 JavaScript Heatmap chart control

You can show a tooltip as a table using the `template` property in `tooltipSettings`.

The following steps describe how to show the table tooltip.

Step 1:

Initialize the tooltip template div as shown in the following html page.

,

```
<script id="tooltipTemplate" type="text/x-template">
```

```
<div id='templateWrap'>
```

<code>\${xValue}:</code>	<code>\${yValue}</code>	<code>\${value}</code>
--------------------------	-------------------------	------------------------

```
</div>
```

```
</script>
```

,

Step 2:

Set the element id to the `template` property in `tooltipSettings` to show the tooltip template.

INDEX.TS

```
import { HeatMap, Tooltip } from '@syncfusion/ej2-heatmap';
```

```

HeatMap.Inject(Tooltip);
let heatmapData: any [] = [
    [0.72, 0.71, 0.71, 0.67, 0.72, 0.53, 0.53, 0.56, 0.58, 0.56],
    [2.28, 2.29, 2.09, 1.84, 1.64, 1.49, 1.49, 1.39, 1.32, 1.23],
    [2.02, 2.17, 2.30, 2.39, 2.36, 2.52, 2.62, 2.57, 2.57, 2.74],

Legend customization in EJ2 JavaScript Heatmap chart control

You can change the legend label using the `legendRender` client-side event. You can also hide the legend label using this client-side event.

INDEX.TS

```

import { HeatMap, Legend, ILegendRenderEventArgs } from '@syncfusion/ej2-heatmap';
import { EmitType } from '@syncfusion/ej2-base';
HeatMap.Inject(Legend);
let heatmapData: any[] = [
  [73000, 39000, 26000, 39000, 94000, 0],
  [93000, 58000, 53000, 38000, 26000, 68000],
  [99000, 28000, 22000, 4000, 66000, 9000],
  [14000, 26000, 97000, 69000, 69000, 3000],

```

```

[7000, 46000, 47000, 47000, 88000, 6000],
[41000, 55000, 73000, 23000, 30000, 79000],
[56000, 69000, 21000, 86000, 3000, 33000],
[45000, 7000, 53000, 81000, 95000, 79000],
[60000, 77000, 74000, 68000, 88000, 51000],
[25000, 25000, 10000, 12000, 78000, 14000],
[25000, 56000, 55000, 58000, 12000, 82000],
[74000, 33000, 88000, 23000, 86000, 59000]];

let legendRender: EmitType<ILegendRenderEventArgs> = (args:
ILegendRenderEventArgs): void => {

Image Editor

End-user capabilities in the EJ2 JavaScript Image Editor control

The following operations are available for end-users and the same is explained briefly in these sections.

Open an image

To open an image in the image editor, do the following steps.

- Click the Open icon from the left side of the toolbar.
- The file explorer lists only JPEG, PNG, JPG format files.
- Select the image from the list of the images from the file explorer window.

Zooming

Image zooming can be performed in the following ways.

- Using toolbar.
- Using pinch zoom in touch enabled devices.
- Using mouse wheel.
- Using keyboard.

Using toolbar

To zoom in or out the image in the image editor, do the following steps.

- The Zoom In/ Out option only enabled after opening the image.

Using pinch

To zoom in or out the image in the image editor, do the following steps.

- Touch with two fingers to perform zooming.
- Zoom in and out controlled by touch gestures.

Using Mouse wheel

To zoom in or out the image in the image editor, do the following steps.

- Press the ctrl key and scroll the mouse wheel to perform zooming.
- The zoom in and out controlled by the mouse wheel.

Using keyboard

To zoom in or out the image in the image editor, do the following steps.

- Press the ctrl key with '+' button from the keyboard to zoom in an image.
- Press the ctrl key with '-' button from the keyboard to zoom out an image.

Panning

To pan an image in the image editor, do the following steps.

- Click on the image and do dragging to move or pan the image.
- Panning option will be enabled in the following two cases.
- If the selection is applied for cropping an image.
- If the image size exceeds the canvas size while zooming an image.

Cropping and image transformation

To crop an image in the image editor, do the following steps.

- Cropping can be performed based on the selection in an image editor.
- To perform selection, click the crop button in the toolbar which opens the contextual toolbar that shows crop selection options, rotate options, and flip options.
- Click the crop selection button and select the type of selection such as custom, circle, square, and ratio selection from the popup.
- Once selection is completed, do panning to move the image to get the cropped region.
- Utilize the rotate or flip buttons to execute the image transformation, including any inserted annotations.
- Once the cropping region is finalized in the image click the tick icon at the top right of the toolbar to crop the image.

Annotations

To add annotations to an image in the image editor, do the following steps.

- To add annotation, click the annotation button in the toolbar and select the type of annotations such as Line, Rectangle, Ellipse, Path, Arrow, Text, or Freehand drawing to be inserted to the image editor.
- Once the annotation is added to the image, that can be repositioned by clicking and dragging the annotations using mouse as well as resized by clicking and resizing the selection circle to be placed around the annotations.
- To rotate annotations, you can simply grab the circle located at the bottom of the annotation. The rotation can be applicable to all the annotations except text annotation.
- Customize the annotations by changing their color, stroke width, font family, and font size through the contextual toolbar. The contextual toolbar will be enabled whenever the annotations are selected.
- When annotations are selected in the Image Editor, the quick access toolbar becomes active, providing convenient access to various actions such as duplicating, deleting, or editing text associated with the selected annotation. This toolbar enables users to perform these common operations quickly and efficiently, streamlining their workflow and enhancing the overall editing experience.

Filtering and fine-tune

To perform fine-tuning on an image in the image editor, do the following steps.

- Click the fine-tune button which displays the list of fine-tuning available in the image editor.
- Click one of the fine-tune options from the list of options which shows a slider to adjust the corresponding filter.
- Click on the canvas or tick icon at the right corner of the toolbar in the image editor to apply the modifications.

To apply filters on an image in the image editor, do the following steps.

- Click the filter button which displays the list of filters available in the image editor.
- Click the filter from list of options to apply the corresponding filter to an image.
- Click on the canvas or tick icon at the right corner of the toolbar in the image editor to apply the modifications.

**Note:**

The Filters and Fine-tunes feature are not accessible within Safari due to compatibility limitations.

[Undo and redo the operations](#)

To undo and redo the actions performed in an image editor, do the following steps.

- The undo button will be enabled once the action is performed in an image editor.
- The redo button will be enabled once the undo action is performed in an image editor.
- Click the undo or redo button at the left side of the toolbar to perform undo and redo operation.
- Ctrl + Z and Ctrl + Y facilitates this process by allowing users to undo and redo actions, respectively.

Reset an image

To revert all the changes done in an image editor, do the following steps.

- Click the reset button which is located on the right side of the toolbar.
- This will revert all the changes performed in the image editor.

Export an image

To save the modified image in an image editor, do the following steps.

- Click the save button which is located on the right side of the toolbar.
- Ctrl + S facilitates this process by providing users with the ability to save the image.
- Select the type of file to be saved from the popup to save with current modification done in an image.

Open and save in the EJ2 JavaScript Image Editor control

To import an image into the canvas, it must first be converted into a blob object. The Uploader component can be used to facilitate the process of uploading an image from the user interface. Once the image has been uploaded, it can then be converted into a blob and drawn onto the canvas.

The `getImageData` method is used to get the image as `ImageData` and this can be loaded to our Image Editor control using the `open` method.

Open an image

The `open` method in the Image Editor control offers the capability to open an image by providing it in different formats. This method accepts various types of arguments, such as a base64-encoded string, raw image data, or a hosted/online URL. You can pass either the file name or the actual image data as an argument to the `open` method, and it will load the specified image into the Image Editor control. This flexibility allows you to work with images from different sources and formats, making it easier to integrate and manipulate images within the Image Editor control.

INDEX.TS

```
import { ImageEditor } from '@syncfusion/ej2-image-editor';
import { Browser } from '@syncfusion/ej2-base';
//Image Editor items definition
let imageEditorObj: ImageEditor = new ImageEditor({
  width: '550px',
  height: '330px',
  toolbar: [],
  created: () => {
    if (Browser.isDevice) {
      imageEditorObj.open('bee-eater.png');
    } else {
```

```

        imageEditorObj.open('bee-eater.png');
    }
}
});
imageEditorObj.appendTo('#imageeditor');

```

  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>

```

```
</body></html>
```

Supported image formats

The Image Editor control supports three common image formats: PNG, JPEG, and SVG. These formats allow you to work with a wide range of image files within the Image Editor.

When it comes to saving the edited image, the default file type is set as PNG. This means that when you save the edited image without specifying a different file type, it will be saved as a PNG file. However, it's important to note that the Image Editor typically provides options or methods to specify a different file type if desired. This allows you to save the edited image in formats other than the default PNG, such as JPEG or SVG, based on your specific requirements or preferences.

Save as image

The [export](#) method is used to save the modified image as an image, and it accepts a file name and file type as parameters. The file type parameter supports PNG, JPEG, and SVG and the default file type is PNG. It also saves an image by clicking the save button from the toolbar and the supported file types are PNG, JPEG, and SVG.

In the following example, the [export](#) method is used in the button click event.

INDEX.TS

</body></html>

```

File opened event

The [fileOpened](#) event is triggered in the Image Editor control after an image is successfully loaded. It provides the [openEventArgs](#) as the event argument, which contains two specific arguments:

fileName: This argument is a string that contains the file name of the opened image. It represents the name of the file that was selected or provided when loading the image into the Image Editor.

fileType: This argument is a string that contains the type of the opened image. It specifies the format or file type of the image that was loaded, such as PNG, JPEG, or SVG.

By accessing these arguments within the [fileOpened](#) event handler, you can retrieve information about the loaded image, such as its file name and file type. This can be useful for performing additional actions or implementing logic based on the specific image that was opened in the Image Editor control.

Saving event

The [saving](#) event is triggered in the Image Editor control when an image is being saved to the local disk. It provides the [SaveEventArgs](#) as the event argument, which includes the following specific arguments:

[fileName](#): This argument is a string that holds the file name of the saved image. It represents the name of the file that will be used when saving the image to the local disk.

[fileType](#): This argument is a string indicating the type or format of the saved image. It specifies the desired file type in which the image will be saved, such as PNG, JPEG, or SVG.

[cancel](#): This argument is a boolean value that can be set to true in order to cancel the saving action. By default, it is set to false, allowing the saving process to proceed. However, if you want to prevent the saving action from occurring, you can set Cancel to true within the event handler.

By accessing these arguments within the Saving event handler, you can retrieve information about the file name and file type of the image being saved. Additionally, you have the option to cancel the saving action if necessary.

Created event

The [created](#) event is triggered once the Image Editor control is created. This event serves as a notification that the component has been fully initialized and is ready to be used. It provides a convenient opportunity to render the Image Editor with a predefined set of initial settings, including the image, annotations, and transformations.

In the following example, the [created](#) event is used to load an image.

INDEX.TS

```

Destroyed event

The [destroyed](#) event is triggered once the Image Editor control is destroyed or removed from the application. This event serves as a notification that the component and its associated resources have been successfully cleaned up and are no longer active.

Reset an image

The [reset](#) method in the Image Editor control provides the capability to undo all the changes made to an image and revert it back to its original state. This method is particularly useful when multiple adjustments, annotations, or transformations have been applied to an image and you want to start over with the original, unmodified version of the image.

By invoking the [reset](#) method, any modifications or edits made to the image will be undone, and the image will be restored to its initial state. This allows you to easily discard any changes and begin again with the fresh, unaltered image.

Selection cropping in the EJ2 JavaScript Image Editor control

The cropping feature in the Image Editor allows you to select and crop specific regions of an image. It offers different selection options, including custom shapes, squares, circles, and various aspect ratios such as 2:3, 3:2, 3:4, 4:3, 4:5, 5:4, 5:7, 7:5, 9:16, and 16:9.

To perform a selection, you can use the [select](#) method, which allows you to define the desired selection area within the image. Once the selection is made, you can then use the [crop](#) method to crop the image based on the selected region. This enables you to extract and focus on specific parts of the image while discarding the rest.

Insert custom / square / circle region

The [select](#) method allows to perform selection based on the type of selection. Here, the [select](#) method is used to perform the selection as custom, circle, or square. The selection region can also be customized using the select method based on the parameters below.

type - Specify the type of selection

startX - Specify the x-coordinate of the selection region's starting point

startY - Specify the y-coordinate of the selection region's starting point

width - Specify the width of the selection region

height - Specify the height of the selection region

Here is an example of square selection using the [select](#) method.

Insert selection based on aspect ratio

The [select](#) method is used to perform the selection with the various aspect ratios such as 2:3, 3:2, 3:4, 4:3, 4:5, 5:4, 5:7, 7:5, 9:16, and 16:9. The selection region can also be customized using the SelectAsync method based on the parameters below.

- type - Specify the type of selection
- startX - Specify the x-coordinate of the selection region's starting point
- startY - Specify the y-coordinate of the selection region's starting point

Here is an example of ratio selection using the [select](#) method.

In the following example, the [select](#) method is used in the button click to the ratio selection.

</body></html>

```

Resize selections

The selection region can be changed programmatically by using [selectionChanging](#) event. This event is activated during resizing the selection using mouse, and it allows for alterations to the selection region by adjusting the specified properties.

The [SelectionChangeEventArgs](#) is used in this event to customize the selection and it has the following parameters.

SelectionChangeEventArgs.cction - The type of action such as inserting or resizing

SelectionChangeEventArgs.cancel - Specifies to cancel the selection.

SelectionChangeEventArgs.currentSelectionPoint - Represents all the details of the selection including its type, position, width, and height after the current action as CropSelectionSettings.

SelectionChangeEventArgs.previousSelectionPoint - Represents all the details of the selection including its type, position, width, and height before this current action as CropSelectionSettings

Here is an example of changing the selection region using the [SelectionChangeEventArgs](#) event.

Crop an image

The [crop](#) method allows cropping based on the selected region. Here is an example of cropping the selection region using the [crop](#) method.

Here is an example of circle cropping using the [select](#) and [crop](#) method.

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Cropping event

The [cropping](#) event is triggered when performing cropping on the image. This event is passed an object that contains information about the cropping event, such as the start and end point of the selection region. And this event uses [CropEventArgs](#) to handle the cropping action in the image.

The parameter available in the [cropping](#) event is,

- CropEventArgs.startPoint – The x and y coordinates of a start point as [Point](#) of the selection region.
- CropEventArgs.endPoint - The x and y coordinates of an end point as [Point](#) of the selection region.
- CropEventArgs.cancel - To cancel the cropping action.

Annotation in the EJ2 JavaScript Image Editor control

The Image Editor allows adding annotations to the image, including text, freehand drawings, and shapes like rectangles, ellipses, arrows, paths, and lines. This gives the flexibility to mark up the image with

notes, sketches, and other visual elements as needed. These annotation tools can help to communicate and share ideas more effectively.

Text annotation

The text annotation feature in the Image Editor provides the capability to add and customize labels, captions, and other text elements directly onto the image. With this feature, you can easily insert text at specific locations within the image and customize various aspects of the text to meet your requirements.

You have control over the customization options including text content, font family, font style and font size for the text annotation.

Add a text

The [drawText](#) method in the Image Editor allows you to insert a text annotation into the image with specific customization options. This method accepts the following parameters:

- x - Specifies the x-coordinate of the text, determining its horizontal position within the image.
- y - Specifies the y-coordinate of the text, determining its vertical position within the image.
- text - Specifies the actual text content to be added to the image.
- fontFamily - Specifies the font family of the text, allowing you to choose a specific typeface or style for the text.
- fontSize - Specifies the font size of the text, determining its relative size within the image.
- bold - Specifies whether the text should be displayed in bold style. Set to true for bold text, and false for regular text.
- italic - Specifies whether the text should be displayed in italic style. Set to true for italic text, and false for regular text.
- color - Specifies the font color of the text, allowing you to define the desired color using appropriate color values or names.

By utilizing the [drawText](#) method with these parameters, you can precisely position and customize text annotations within the image. This provides the flexibility to add labels, captions, or other text elements with specific font styles, sizes, and colors, enhancing the visual presentation and clarity of the image.

Here is an example of adding a text in a button click using [drawText](#) method.

In the following example, you can using the [drawText](#) method in the button click event.

INDEX.TS

```
import { ImageEditor } from '@syncfusion/ej2-image-editor';

```

Multiline text

The [drawText](#) method in the Image Editor control is commonly used to insert text annotations into an image. If the provided text parameter contains a newline character (\n), the text will be automatically split into multiple lines, with each line appearing on a separate line in the annotation.

In the following example, you can using the [drawText](#) method in the button click event.

INDEX.TS

</body></html>

```

Delete a text

The [deleteShape](#) method in the Image Editor allows you to remove a text annotation from the image editor. To use this method, you need to pass the [shapeId](#) of the annotation as a parameter.

The [shapeId](#) is a unique identifier assigned to each text annotation within the image editor. It serves as a reference to a specific annotation, enabling targeted deletion of the desired text element. By specifying the [shapeId](#) associated with the text annotation you want to remove, you can effectively delete it from the image editor.

To retrieve the inserted text annotations, you can utilize the [getShapeSetting](#) method, which provides a collection of annotations represented by [ShapeSettings](#). This method allows you to access and work with the annotations that have been inserted into the image.

In the following example, the [deleteShape](#) method is used in the button click event.

INDEX.TS

```
import { ImageEditor } from '@syncfusion/ej2-image-editor';
import { Button } from '@syncfusion/ej2-buttons';
import { Browser } from '@syncfusion/ej2-base';
//Image Editor items definition

Customize font family and text color

The [shapeChanging](#) event in the Image Editor control is triggered when a text annotation is being modified or changed through the toolbar interaction. This event provides an opportunity to make alterations to the text's color and font family by adjusting the relevant properties.

By leveraging the [shapeChanging](#) event, you can enhance the customization options for text annotations and provide a more tailored and interactive experience within the Image Editor control.

Add Additional font family

The [fontFamily](#) property in the Image Editor control provides the flexibility to incorporate supplementary font families, expanding your options for text styling and ensuring a broader range of fonts can be utilized within your design or content. The font value will be determined by the 'id' property.

By leveraging the [fontFamily](#) property, you can elevate the scope of customization for text annotations, enriching the user experience within the Image Editor control. This enhancement offers a more personalized and dynamic interaction, empowering users to tailor their text styles for a truly engaging editing experience.

Freehand drawing

The Freehand Draw annotation tool in the Image Editor control is a versatile feature that allows users to draw and sketch directly on the image using mouse or touch input. This tool provides a flexible and creative way to add freehand drawings or annotations to the image.

The [freehandDraw](#) method is used to enable or disable the freehand drawing option in the Image Editor control.

Here is an example of using the [freeHandDraw](#) method in a button click event.

INDEX.TS

```

import { ImageEditor } from '@syncfusion/ej2-image-editor';
import { Button } from '@syncfusion/ej2-buttons';
import { Browser } from '@syncfusion/ej2-base';
//Image Editor items definition
let imageEditorObj: ImageEditor = new ImageEditor({
    width: '550px',
    height: '330px',
    toolbar: [],
    created: () => {
        if (Browser.isDevice) {
            imageEditorObj.open('bee-eater.png');
        }
    }
});

```

```

    } else {
        imageEditorObj.open('bee-eater.png');
    }
}

});
imageEditorObj.appendTo('#imageeditor');
//Button click
let button: Button = new Button({cssClass: `e-primary`,
content: 'Click'}, '#btnClick');
document.getElementById('btnClick').onclick = (): void => {
    imageEditorObj.freeHandDraw(true);
}

```

</body></html>

```

Delete a freehand drawing

The [deleteShape](#) method in the Image Editor allows you to remove a freehand annotation from the image editor. To use this method, you need to pass the [shapeld](#) of the annotation as a parameter.

The [shapeld](#) is a unique identifier assigned to each freehand annotation within the image editor. It serves as a reference to a specific annotation, enabling targeted deletion of the desired annotation. By specifying the [shapeld](#) associated with the freehand annotation you want to remove, you can effectively delete it from the image editor.

To retrieve the inserted freehand annotations, you can utilize the [getShapeSetting](#) method, which provides a collection of annotations represented by [ShapeSettings](#). This method allows you to access and work with the annotations that have been inserted into the image.

In the following example, the [deleteShape](#) method is used in the button click event.

INDEX.TS

Shape annotation

The Image Editor control provides the ability to add shape annotations to an image. These shape annotations include rectangles, ellipses, arrows, paths, and lines, allowing you to highlight, emphasize, or mark specific areas or elements within the image.

Add a rectangle / ellipse / line / arrow / path

The [drawRectangle](#) method is used to insert a rectangle to the Image Editor control. Rectangle annotations are valuable tools for highlighting, emphasizing, or marking specific areas of an image to draw attention or provide additional context.

The [drawRectangle](#) method in the Image Editor control takes seven parameters to define the properties of the rectangle annotation:

- x: Specifies the x-coordinate of the top-left corner of the rectangle.
- y: Specifies the y-coordinate of the top-left corner of the rectangle.
- width: Specifies the width of the rectangle.
- height: Specifies the height of the rectangle.
- strokeWidth: Specifies the stroke width of the rectangle's border.
- strokeColor: Specifies the stroke color of the rectangle's border.

- `fillColor`: Specifies the fill color of the rectangle.

The [drawEllipse](#) method is used to insert a ellipse to the Image Editor control. Ellipse annotations are valuable for highlighting, emphasizing, or marking specific areas of an image.

The [drawEllipse](#) method in the Image Editor control takes seven parameters to define the properties of the ellipse annotation:

- `x`: Specifies the x-coordinate of the center of the ellipse.
- `y`: Specifies the y-coordinate of the center of the ellipse.
- `radiusX`: Specifies the horizontal radius (radiusX) of the ellipse.
- `radiusY`: Specifies the vertical radius (radiusY) of the ellipse.
- `strokeWidth`: Specifies the width of the ellipse's stroke (border).
- `strokeColor`: Specifies the color of the ellipse's stroke (border).
- `fillColor`: Specifies the fill color of the ellipse.

The [drawLine](#) method is used to insert a line to the Image Editor control. Line annotations are valuable for highlighting, emphasizing, or marking specific areas of an image.

The [drawLine](#) method in the Image Editor control takes seven parameters to define the properties of the ellipse annotation:

- `startX` - Specifies the x-coordinate of the start point.
- `startY` - Specifies the y-coordinate of the start point.
- `endX` - Specifies the x-coordinate of the end point.
- `endY` - Specifies the y-coordinate of the end point.
- `strokeWidth` - Specifies the stroke width of the line.
- `strokeColor` - Specifies the stroke color of the line.

The [drawArrow](#) method is used to insert a arrow to the Image Editor control. Arrow annotations are valuable for highlighting, emphasizing, or marking specific areas of an image.

The [drawArrow](#) method in the Image Editor control takes seven parameters to define the properties of the ellipse annotation:

- `startX` - Specifies the x-coordinate of the start point.
- `startY` - Specifies the y-coordinate of the start point.
- `endX` - Specifies the x-coordinate of the end point.
- `endY` - Specifies the y-coordinate of the end point.
- `strokeWidth` - Specifies the stroke width of the arrow.
- `strokeColor` - Specifies the stroke color of the arrow.
- `arrowStart` - Specifies the arrowhead as `ImageEditorArrowHeadType` at the start of arrow.
- `arrowEnd` - Specifies the arrowhead as `ImageEditorArrowHeadType` at the end of the arrow.

The [drawPath](#) method is used to insert a path to the Image Editor control. Path annotations are valuable for highlighting, emphasizing, or marking specific areas of an image.

The [drawPath](#) method in the Image Editor control takes three parameters to define the properties of the ellipse annotation:

- **points** - Specifies collection of x and y coordinates as ImageEditorPoint to draw a path.
- **strokeWidth** - Specifies the stroke width of the path.
- **strokeColor** - Specifies the stroke color of the path.

Here is an example of inserting rectangle, ellipse, arrow, path, and line in a button click event.

Delete a shape

The [deleteShape](#) method in the Image Editor allows you to remove a shape annotation from the image editor. To use this method, you need to pass the [shapeld](#) of the annotation as a parameter.

The [shapeld](#) is a unique identifier assigned to each shape annotation within the image editor. It serves as a reference to a specific annotation, enabling targeted deletion of the desired annotation. By specifying the [shapeld](#) associated with the shape annotation you want to remove, you can effectively delete it from the image editor.

To retrieve the inserted shape annotations, you can utilize the [getShapeSetting](#) method, which provides a collection of annotations represented by [ShapeSettings](#). This method allows you to access and work with the annotations that have been inserted into the image.

Here is an example of deleting rectangle, ellipse, arrow, path, and line in a button click event.

Image annotation

The image annotation feature in the Image Editor provides the capability to add and customize images directly onto the image. With this feature, you can easily insert image or icons at specific locations within the image and customize various aspects of the image to meet your requirements. You have control over the customization options including rotate, flip, transparency for the image annotation.

Add an image annotation

The [drawImage](#) method serves the purpose of inserting an image into the Image Editor control, allowing for image annotations to be added. These image annotations can be used for various purposes, such as adding logos, watermarks, or decorative elements to the image.

The [drawImage](#) method in the Image Editor control takes six parameters to define the properties of the image annotation:

- data: Specified the image data or url of the image to be inserted.
- x: Specifies the x-coordinate of the top-left corner of the image.
- y: Specifies the y-coordinate of the top-left corner of the image.
- width: Specifies the width of the image.
- height: Specifies the height of the image.
- isAspectRatio: Specifies whether the image is rendered with aspect ratio or not.

In the following example, you can use the [drawImage](#) method in the button click event.

Transform in the EJ2 JavaScript Image Editor control

The Image Editor provides a range of transformation options for manipulating both the image and its annotations. These options include rotation, flipping, zooming, and panning. These transformations offer flexibility in adjusting the image and enhancing its visual appearance.

Rotate an image

The Image Editor allows to rotate the image and its annotations by a specific number of degrees clockwise or anti-clockwise using [rotate](#) method. This method takes a single parameter: the angle of rotation in degrees. A positive value will rotate the image clockwise, while a negative value will rotate it anti-clockwise.

Here is an example of rotating an image in a button click event.

In the following example, the [rotate](#) method is used to rotate the image.

INDEX.TS

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Flip an image

The Image Editor provides the [flip](#) method, which allows you to flip both the image and its annotations either horizontally or vertically. This method takes a single parameter of type [Direction](#), which specifies the direction in which the flip operation should be applied.

The [Direction](#) parameter accepts two values: 'Horizontal' and 'Vertical'. When you choose 'Horizontal', the image and annotations will be flipped along the horizontal axis, resulting in a mirror effect. On the other hand, selecting 'Vertical' will flip them along the vertical axis, producing a vertical mirror effect.

Here is an example of flipping an image in a button click event.

In the following example, the [flip](#) method is used to flip the image.

Straighten an image

The straightening feature in an Image Editor allows users to adjust an image by rotating it clockwise or counter clockwise. The rotating degree value should be within the range of -45 to +45 degrees for accurate straightening. Positive values indicate clockwise rotation, while negative values indicate counter clockwise rotation. The Image Editor control includes a [straightenImage](#) method, which allows you to adjust the degree of an image. This method takes one parameter that define how the straightening should be carried out:

- **degree:** Specifies the amount of rotation for straightening the image. Positive values indicate clockwise rotation, while negative values indicate counterclockwise rotation.

Here is an example of straightening the image.

Zoom in or out an image

The Image Editor allows to magnify an image using the [zoom](#) method. This method allows one to zoom in and out of the image and provides a more detailed view of the image's hidden areas. This method takes two parameters to perform zooming.

zoomFactor - Specifies a value to controlling the level of magnification applied to the image.

zoomPoint - Specifies x and y coordinates of a point as [Point](#) on image to perform zooming.

Here is an example of zooming an image in a button click event.

In the following example, you can using the [zoom](#) method in the button click event.

INDEX.TS

```

import { ImageEditor, ZoomSettingsModel } from '@syncfusion/ej2-image-
editor';
import { Button } from '@syncfusion/ej2-buttons';
import { Browser } from '@syncfusion/ej2-base';
//Image Editor items definition
let imageEditorObj: ImageEditor = new ImageEditor({
    width: '550px',
    height: '330px',
    toolbar: [],

```

```

zoomSettings: {maxZoomFactor: 30},
zoomLevel: 1,
created: () => {
    if (Browser.isDevice) {
        imageEditorObj.open('bee-eater.png');
    } else {
        imageEditorObj.open('bee-eater.png');
    }
}
});
imageEditorObj.appendTo('#imageeditor');
//Button click
let button: Button = new Button({cssClass: `e-primary`,
content: 'Click'}, '#btnClick');
document.getElementById('btnClick').onclick = (): void => {
    if (imageEditorObj.zoomLevel < 1) {
        imageEditorObj.zoomLevel += 0.1;
    }
    else {
        imageEditorObj.zoomLevel += 1;
    }
    if (imageEditorObj.zoomLevel >
imageEditorObj.zoomSettings.maxZoomFactor) {
        imageEditorObj.zoomLevel =
imageEditorObj.zoomSettings.maxZoomFactor;
    }
    imageEditorObj.zoom(imageEditorObj.zoomLevel); // Zoom in
}

```

```

Maximum and Minimum zoom level

The [maxZoomFactor](#) property is a useful feature in the Image Editor that allows you to define the maximum level of zoom permitted for an image. This property sets a limit on how much the image can be magnified, preventing excessive zooming that may result in a loss of image quality or visibility.

By default, the [maxZoomFactor](#) value is set to 10, meaning that the image can be zoomed in up to 10 times its original size. This ensures that the zooming functionality remains within reasonable bounds and maintains the integrity of the image.

The [minZoomFactor](#) property allows you to specify the minimum level of zoom that is allowed for an image. By setting this property, you can prevent the image from being zoomed out beyond a certain point, ensuring that it remains visible and usable even at the smallest zoom level.

By default, the [minZoomFactor](#) value is set to 0.1, meaning that the image can be zoomed out up to 10 times its original size.

Here is an example of specifying [minZoomFactor](#) and [maxZoomFactor](#) property in [zoomSettings](#) options in an image editor.

Panning event

The [panning](#) event is activated when the user begins dragging the image within the canvas. This event provide an opportunity to perform specific actions, like adjusting the position of an image, in response to the gesture of panning. And these event uses [panEventArgs](#) to handle the panning action when the user starts dragging the image.

The parameter available in the [panEventArgs](#) events are,

- [PanEventArgs.startPoint](#) - The x and y coordinates as [ImageEditorPoint](#) for the start point.
- [PanEventArgs.endpoint](#) - The x and y coordinates as [ImageEditorPoint](#) for the end point.
- [PanEventArgs.cancel](#) – Specifies the boolean value to cancel the panning action.

In the following example, you can use the [pan](#) method in the button click event.

INDEX.TS

Zooming event

The [zooming](#) event is triggered when performing zooming the image. This event can be used to perform certain actions, such as updating the position of the image. This event is passed an object that contains information about the zooming event, such as the amount of zooming performed. And this event uses [ZoomEventArgs](#) to handle the zooming action in the image.

The parameter available in the [zooming](#) event is,

- ZoomEventArgs.zoomPoint - The x and y coordinates as [Point](#) for the zoom point.
- ZoomEventArgs.previousZoomFactor - The previous zoom factor applied in the image editor.
- ZoomEventArgs.currentZoomFactor - The current zoom factor to be applied in the image editor.
- ZoomEventArgs.cancel – Specify a boolean value to cancel the zooming action.
- ZoomEventArgs.zoomTrigger - The type of zooming performed in the image editor.

Rotating event

The [rotating](#) event is triggered when performing rotating the image. This event is passed an object that contains information about the rotating event, such as the amount of rotation performed. And this event uses [RotateEventArgs](#) to handle the rotating action in the image.

The parameter available in the [rotating](#) event is,

- RotateEventArgs.previousDegree: The degree of rotation before the recent rotation action was applied in the Image Editor.
- RotateEventArgs.currentDegree: The current degree of rotation after the rotation action has been performed in the Image Editor.
- RotateEventArgs.cancel - Specifies a boolean value to cancel the rotating action.

Flipping event

The [flipping](#) event is triggered when performing flipping the image. This event is passed an object that contains information about the flipping event, such as the amount of flip performed. And this event uses [FlipEventArgs](#) to handle the flipping action in the image.

The parameter available in the [flipping](#) event is,

- FlipEventArgs.direction - The flip direction as [Direction](#) to be applied in the image editor.
- FlipEventArgs.cancel - Specifies a boolean value to cancel the flip action.

Toolbar in the EJ2 JavaScript Image Editor control

The toolbars in the Image Editor are a key component for interacting with and editing images. They provide a range of tools and options that can be customized to suit the needs and preferences. Add or remove items from the toolbar to create a personalized set of tools, or they can even create their own custom toolbar from scratch. This flexibility and customization allow them to create a unique image editing experience that is tailored to their specific needs and workflow.

In the Image Editor, the [toolbar](#) provides the ability to customize the toolbar by adding or removing items, as well as defining a completely custom toolbar. This feature is valuable for creating a personalized image editing experience that aligns with specific requirements and workflows.

Built-in toolbar items

Specifies the toolbar items to perform UI interactions. Refer to the built-in toolbar items for the default value.

- Crop
- Transform
- Annotate
- ZoomIn
- ZoomOut
- Open
- Reset
- Save
- Pan

Add a custom toolbar item

The [toolbar](#) property in the Image Editor allows to add or remove toolbar items to include only the tools they frequently use, streamlining the editing process and reducing clutter.

Here is an example of adding custom toolbar items to rotate and flip transformation using [toolbar](#) property.

INDEX.TS

```
import { ImageEditor } from '@syncfusion/ej2-image-editor';
import { Browser } from '@syncfusion/ej2-base';
//Image Editor items definition
let imageEditorObj: ImageEditor = new ImageEditor({
  toolbar: ['Crop', 'CustomSelection', 'SquareSelection', 'ZoomIn',
'ZoomOut', {text: 'Rotate'}],
  width: '550px',
  height: '350px',
  toolbarItemClicked: (args: ToolbarClickEventArgs) => {
    if (args.item.text === 'Rotate') {
      imageEditorObj.rotate(90);
    }
  },
},
```

```

created: () => {
  if (Browser.isDevice) {
    imageEditorObj.open('bee-eater.png');
  } else {
    imageEditorObj.open('bee-eater.png');
  }
}
});
imageEditorObj.appendTo('#imageeditor');

```

```

Show or hide a toolbar

The [toolbar](#) property controls the visibility of the toolbar in the Image Editor. When the [toolbar](#) is set to an empty list, the toolbar is hidden. Conversely, if the [toolbar](#) contains a list of items, the toolbar is shown, displaying the specified items. This feature provides flexibility for users to personalize their image editing experience.

Here is an example of hiding the toolbar of the image editor using [toolbar](#).

INDEX.TS

```

import { ImageEditor } from '@syncfusion/ej2-image-editor';
import { Browser } from '@syncfusion/ej2-base';
//Image Editor items definition
let imageEditorObj: ImageEditor = new ImageEditor({
  width: '550px',
  height: '350px',
  toolbar: [],
  created: () => {
    if (Browser.isDevice) {
      imageEditorObj.open('bee-eater.png');
    } else {
      imageEditorObj.open('bee-eater.png');
    }
  }
});
imageEditorObj.appendTo('#imageeditor');

```

```

Show or hide a toolbar Item

The [toolbar](#) property is utilized to control the visibility of toolbar items in the Image Editor. By default, the [toolbar](#) includes the default toolbar items. So, if you wish to hide the default toolbar items then you need to explicitly define the required items using [toolbar](#) property. This allows you to customize the toolbar by displaying only the specific items you require, tailoring the editing experience to your preferences.

Here is an example of hiding the cropping and selection toolbar items using [toolbar](#) property.

INDEX.TS

Enable or disable a toolbar item

The [toolbar](#) property is employed to enable or disable toolbar items in the Image Editor. By default, the [toolbar](#) property includes the default toolbar items, and these items cannot be disabled. However, if you have defined custom toolbar items using the [toolbarItemModel](#), you can enable or disable them by configuring their respective properties within the [toolbar](#) property. This provides the flexibility to control the availability and functionality of custom toolbar items based on your specific requirements.

Here is an example of disabling the custom toolbar item using [toolbar](#) property.

Enable or disable a contextual toolbar item

The [toolbarItems](#) property in the [toolbarEventArgs](#) is used to enable or disable contextual toolbar items in the Image Editor. To enable or disable the default toolbar items, you can accomplish this by setting the [Disabled](#) property to true in the [ImageEditorToolbarItemModel](#) within the [ToolbarItems](#) property. This allows you to selectively enable or disable specific default toolbar items based on your requirements, providing a customized toolbar experience in the Image Editor.

Toolbar created event

The [toolbarCreated](#) event is triggered after the toolbar is created in the Image Editor. This event can be useful when you need to perform any actions or make modifications to the toolbar once it is fully initialized and ready for interaction. By subscribing to the [toolbarCreated](#) event, you can access the toolbar object and perform tasks such as adding event handlers, customizing the appearance, or configuring additional functionality.

Toolbar item clicked event

The [toolbarItemClicked](#) event is triggered when a toolbar item is clicked in the Image Editor. This event is particularly useful when you have added custom options to both the main toolbar and contextual toolbar, as it allows you to capture the user's interaction with those custom options. By subscribing to the [toolbarItemClicked](#) event, you can execute specific actions or handle logic based on the toolbar item that was clicked.

Here is an example of toolbar item clicking event using [toolbarItemClicked](#) property.

INDEX.TS

```

import { ImageEditor } from '@syncfusion/ej2-image-editor';
import { Browser } from '@syncfusion/ej2-base';
import { ClickEventArgs } from '@syncfusion/ej2-navigations';
//Image Editor items definition
let imageEditorObj: ImageEditor = new ImageEditor({
    width: '550px',
    height: '350px',

```

```

toolbar: [{text: 'Custom'}],
created: () => {
    if (Browser.isDevice) {
        imageEditorObj.open('bee-eater.png');
    } else {
        imageEditorObj.open('bee-eater.png');
    }
},
toolbarItemClicked: (args: ClickEventArgs) => {
    if (args.item.text === 'Custom') {
        imageEditorObj.rotate(90);
    }
}
});
imageEditorObj.appendTo('#imageeditor');

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Toolbar template

The [toolbarTemplate](#) property in the Image Editor provides the capability to fully customize the toolbar by supplying a custom template. This feature is valuable when you want to create a distinct and personalized image editing experience that goes beyond the default toolbar or the customizable toolbar options offered by the Image Editor. By defining a custom template for the toolbar, you have complete control over its layout, appearance, and functionality. This empowers you to design a unique and tailored toolbar that aligns perfectly with your specific requirements and desired user experience.

Here is an example of using [toolbarTemplate](#) to render only the button to toggle the freehand draw option.

INDEX.TS

```

import { ImageEditor } from '@syncfusion/ej2-image-editor';

```

Customize Contextual Toolbar

The [toolbarUpdating](#) event is triggered when inserting or selecting annotations, which opens the contextual toolbar in the Image Editor. Within this event, the [toolbarItems](#) property in the [ToolbarEventArgs](#) is utilized to add or remove contextual toolbar items.

In the following example, the contextual toolbar for rectangle will be rendered with only stroke color by excluding fill color and stroke width using toolbarUpdating event.

INDEX.TS

```
import { ImageEditor } from '@syncfusion/ej2-image-editor';
import { Browser } from '@syncfusion/ej2-base';
//Image Editor items definition
let imageEditorObj: ImageEditor = new ImageEditor({
  width: '550px',
  height: '350px',
  toolbarUpdating: (args: ToolbarEventArgs) => {
    if (args.toolbarType === 'shapes') {
      args.toolbarItems = ['strokeColor'];
    }
  },
  created: () => {
    if (Browser.isDevice) {
      imageEditorObj.open('bee-eater.png');
    } else {
      imageEditorObj.open('bee-eater.png');
    }
  }
});
imageEditorObj.appendTo('#imageeditor');
```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Add an additional contextual Toolbar item to text shape

The contextual toolbar that appears when inserting annotations in the Image Editor is customizable using the [toolbarUpdating](#) event. This event is triggered when the contextual toolbar is rendered, allowing you to modify its contents. To add additional toolbar items to the contextual toolbar, you can access the [toolbarItems](#) property of the object within the event handler. By adding or removing items from the [toolbarItems](#) property based on the Item property, you can customize the options available in the contextual toolbar according to your needs. This gives you the ability to extend the functionality of the contextual toolbar and provide additional tools and options for working with inserted annotations.

Here is an example of adding the custom toolbar item to the contextual toolbar.

INDEX.TS

```

import { ImageEditor } from '@syncfusion/ej2-image-editor';
import { Browser } from '@syncfusion/ej2-base';
//Image Editor items definition
let imageEditorObj: ImageEditor = new ImageEditor({
    width: '550px',
    height: '330px',
    created: () => {

```

```

    if (Browser.isDevice) {
        imageEditorObj.open('bee-eater.png');
    } else {
        imageEditorObj.open('bee-eater.png');
    }
},
toolbarUpdating: (args: ToolbarEventArgs) => {
    if (args.toolbarType === 'text') {
        args.toolbarItems.push({text: 'custom'})
    }
},
});
imageEditorObj.appendTo('#imageeditor');

```

Localization in the EJ2 JavaScript Image Editor control

The **Localization** library allows you to localize the default text content of the Image Editor. The Image Editor has static text that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the **locale** value and translation object.

The following list of properties and its values are used in the Image Editor.

Locale key words	Text
-----	-----
Browse	Browse
Crop	Crop
ZoomIn	Zoom In
ZoomOut	Zoom Out
Transform	Transform
Annotation	Annotation
Text	Add Text
Pen	Pen
Reset	Reset
Save	Save
Select	Select
RotateLeft	Rotate Left
RotateRight	Rotate Right
HorizontalFlip	Horizontal Flip
VerticalFlip	Vertical Flip
OK	OK

Cancel	Cancel
FillColor	Fill Color
StrokeColor	Stroke Color
StrokeWidth	StrokeWidth
FontFamily	Font Family
FontStyle	Font Style
FontSize	Font Size
FontColor	Font Color
Pan	Pan
Move	Move
Custom	Custom
Square	Square
Circle	Circle
Rectangle	Rectangle
Line	Line
Default	Default
Bold	Bold
Italic	Italic
BoldItalic	Bold Italic
XSmall	X-Small
Small	Small
Medium	Medium
Large	Large
XLarge	X-Large
ABC	ABC

Filters in the EJ2 JavaScript Image Editor control

Filters are pre-defined effects that can be applied to an image to alter its appearance or mood. Image filters can be used to add visual interest or to enhance certain features of the image. Some common types of image filters include cold, warm, chrome, sepia, and invert. This can be done by either using the toolbar or the [applyImageFilter](#) method which takes a single parameter: the filter applied to an image.

Apply filter effect

The [applyImageFilter](#) method is utilized to apply filters to an image. By passing the desired filter type as the first parameter of the method, specified as [ImageFilterOption](#) the method applies the corresponding filter to the image. This allows for easy and convenient application of various filters to enhance or modify the image based on the chosen filter type.

- filterOption - Specifies the filter options to the image.

In the following example, you can using the applyImageFilter method in the button click event.

INDEX.TS

```

import { ImageEditor, ImageFilterOption } from '@syncfusion/ej2-image-editor';
import { Button } from '@syncfusion/ej2-buttons';
import { Browser } from '@syncfusion/ej2-base';
//Image Editor items definition
let imageEditorObj: ImageEditor = new ImageEditor({
    width: '550px',
    height: '330px',
    toolbar: [],
    created: () => {
        if (Browser.isDevice) {
            imageEditorObj.open('bee-eater.png');
        } else {
            imageEditorObj.open('bee-eater.png');
        }
    }
});
imageEditorObj.appendTo('#imageeditor');
//Button click
document.getElementById('chromeClick').onclick = (): void => {
    imageEditorObj.applyImageFilter(ImageFilterOption.Chrome);
}
document.getElementById('coldClick').onclick = (): void => {
    imageEditorObj.applyImageFilter(ImageFilterOption.Cold);
}

document.getElementById('warmClick').onclick = (): void => {
    imageEditorObj.applyImageFilter(ImageFilterOption.Warm);
}
document.getElementById('grayscaleClick').onclick = (): void => {
    imageEditorObj.applyImageFilter(ImageFilterOption.Grayscale);
}
document.getElementById('sepiaClick').onclick = (): void => {
    imageEditorObj.applyImageFilter(ImageFilterOption.Sepia);
}
document.getElementById('invertClick').onclick = (): void => {
    imageEditorObj.applyImageFilter(ImageFilterOption.Invert);
}

Apply filter effect

The [imageFiltering](#) event is triggered when applying filtering on the image. This event is passed an object that contains information about the filtering event, such as the type of filtering.

The parameter available in the [ImageFilterEventArgs](#) event is,

`ImageFilterEventArgs.filter` - The type of filtering as [ImageFilterOption](#) to be applied in the image editor.

ImageFilterEventArgs.cancel – Specifies to cancel the filtering action.

Finetuning in the EJ2 JavaScript Image Editor control

Fine-tuning involves making precise adjustments to the settings of an image filter in order to achieve a specific desired effect. It provides control over the intensity and specific aspects of the filter's impact on the image. For example, fine-tuning allows you to modify parameters like brightness, saturation, or other relevant properties to fine-tune the level or quality of the filter's effect. This level of control enables you to achieve the exact look or outcome you want for your image.

Adjust the brightness, contrast, or sharpness

The [finetuneImage](#) method is designed to facilitate fine-tuning operations on an image. It accepts two parameters: the first parameter is [ImageFinetuneOption](#) which determines the type of fine-tuning to be applied (brightness, contrast, or sharpness), and the second parameter represents the fine-tuning value, indicating the degree or intensity of the adjustment. This method allows for convenient adjustment of brightness, contrast, or sharpness by specifying the desired type and corresponding value.

The [finetuneImage](#) method is used to perform brightness, contrast, or sharpness fine-tuning by specifying this type as a first parameter and specifying the fine-tuning value as the second parameter of the method.

Here is an example of brightness, contrast, and sharpness fine-tuning using the [finetuneImage](#) method.

- finetuneOption - Specifies the finetune options to be performed in the image.
- value - Specifies the value for finetuning the image.

In the following example, you can using the finetuneImage method in the button click event.

INDEX.TS

```
import { ImageEditor, ImageFinetuneOption } from '@syncfusion/ej2-image-editor';
import { Browser } from '@syncfusion/ej2-base';
//Image Editor items definition
let imageEditorObj: ImageEditor = new ImageEditor({
  width: '550px',
  height: '330px',
  toolbar: [],
  created: () => {
    if (Browser.isDevice) {
      imageEditorObj.open('bee-eater.png');
    } else {
      imageEditorObj.open('bee-eater.png');
    }
  }
});
imageEditorObj.appendTo('#imageeditor');
//Button click
document.getElementById('brightnessClick').onclick = (): void => {
  imageEditorObj.finetuneImage(ImageFinetuneOption.Brightness,10);
}
document.getElementById('contrastClick').onclick = (): void => {
  imageEditorObj.finetuneImage(ImageFinetuneOption.Contrast,20);
}
```

```

Adjust the hue, exposure, blur, or opacity

The [finetuneImage](#) method is designed to facilitate fine-tuning operations on an image. It accepts two parameters: the first parameter is [ImageFinetuneOption](#) which determines the type of fine-tuning to be applied (hue, exposure, or blur), and the second parameter represents the fine-tuning value, indicating the degree or intensity of the adjustment. This method allows for convenient adjustment of hue, exposure, or blur by specifying the desired type and corresponding value.

Here is an example of hue, exposure, and blur fine-tuning using the [finetuneImage](#) method.

- finetuneOption - Specifies the finetune options to be performed in the image.
- value - Specifies the value for finetuning the image.

In the following example, you can using the finetuneImage method in the button click event.

INDEX.TS

Finetune value changing event

The [finetuneValueChanging](#) event is triggered when performing fine-tuning on the image. This event is passed an object that contains information about the finetuning event, such as the type of fine-tuning and the value of fine-tuning performed.

The parameter available in the [FinetuneEventArgs](#) event is,

[FinetuneEventArgs.finetune](#) - The type of fine-tuning as [ImageFinetuneOption](#) to be applied in the image editor.

[FinetuneEventArgs.value](#) - The fine-tuning value to be applied in the image editor.

[FinetuneEventArgs.cancel](#) – Specifies a boolean value to cancel the fine-tuning action.

Frame in the EJ2 JavaScript Image Editor control

The frame feature in an Image Editor provides users with the capability to add decorative borders or frames around their images. Frames are a visual design element that can enhance the overall appearance and appeal of an image.

Apply frame to the Image

The [drawFrame](#) method is a function designed to enable the application of various frame options to an image. This method simplifies the process of adding decorative frames, such as mat, bevel, line, hook, and inset, to an image by allowing users to specify their desired frame type.

Depending on the frame type selected, users may have additional customization options, such as adjusting the frame's thickness, color, texture, or other attributes. This allows for fine-tuning the appearance of the frame to match the image's theme or the user's preferences

The [drawFrame](#) method in the Image Editor control takes nine parameters to define the properties of the frame to the image:

- [frameType](#) - Specified the image data or url of the image to be inserted.
- [Color](#) - Specifies the color for the frame.
- [gradientColor](#) - Specifies the gradient color for the frame.
- [size](#) - Specifies the size of the frame.
- [inset](#) - Specifies the inset value for line, hook, and inset type frames.
- [offset](#) - Specifies the offset value for line and inset type frames.
- [borderRadius](#) - Specifies the border radius for line type frame.
- [frameLineStyle](#) - Specifies the frame line style for line type frame.
- [lineCount](#) - Specifies the line count for the line type frame.

In the following example, you can use the [drawFrame](#) method in the button click event.

INDEX.TS

```
import { ImageEditor, FrameLineStyle, FrameType } from '@syncfusion/ej2-image-editor';
import { Button } from '@syncfusion/ej2-buttons';
import { Browser } from '@syncfusion/ej2-base';
//Image Editor items definition
let imageEditorObj: ImageEditor = new ImageEditor({
  width: '550px',
  height: '330px',
  toolbar: [],
  created: () => {
    imageEditorObj.open('bee-eater.png');
  }
});
imageEditorObj.appendTo('#imageeditor');
//Button click
```

```

        document.getElementById('matClick').onclick = (): void => {
            imageEditorObj.drawFrame(FrameType.Mat, 'red', 'blue', 20, 20, 20,
20, FrameLineStyle.Solid, 1);
        }
        document.getElementById('bevelClick').onclick = (): void => {
            imageEditorObj.drawFrame(FrameType.Bevel, 'red', 'blue', 20, 20, 20,
20, FrameLineStyle.Solid, 1);
        }
        document.getElementById('lineClick').onclick = (): void => {
            imageEditorObj.drawFrame(FrameType.Line, 'red', 'blue', 20, 20, 20,
20, FrameLineStyle.Solid, 1);
        }
        document.getElementById('insetClick').onclick = (): void => {
            imageEditorObj.drawFrame(FrameType.Inset, 'red', 'blue', 20, 20, 20,
20, FrameLineStyle.Solid, 1);
        }
        document.getElementById('hookClick').onclick = (): void => {
            imageEditorObj.drawFrame(FrameType.Hook, 'red', 'blue', 20, 20, 20,
20, FrameLineStyle.Solid, 1);
        }
    }

```

</body></html>

```

Frame changing event

The [frameChanging](#) event is triggered when applying frame on the image. This event provides information encapsulated within an object, which includes details about the frame applied in an image. This information encompasses:

Frame Type: This indicates the specific type of frame being applied, whether it's a mat, bevel, line, or hook.

Customization Values: These values contain information about any adjustments or modifications made to the frame. For instance, if the frame can be customized with attributes like color, size, or style, these details are conveyed within the event object.

The parameter available in the [FrameChangeEventArgs](#) is

- [FrameChangeEventArgs.previousFrameSetting](#) - The frame settings including size, color, inset, offset, gradient color which is applied before changing the frame.
- [FrameChangeEventArgs.currentFrameSetting](#) - The frame settings including size, color, inset, offset, gradient color which is going to apply after changing the frame.
- [FrameChangeEventArgs.cancel](#) - Specifies a boolean value to cancel the frame changing action.

Resize

The resize feature in an Image Editor is a valuable tool that empowers users to modify the size or dimensions of an image to meet their specific requirements. Whether it's for printing, web display, or any other purpose, this feature allows users to tailor images to their desired specifications.

Apply resize to the image

The Image Editor control includes a [resize](#) method, which allows you to adjust the size of an image. This method takes three parameters that define how the resizing should be carried out:

- **width:** Specifies the resizing width of the image.
- **height:** Specifies the resizing height of the image.
- **isAspectRatio:** Specifies a boolean value indicating whether the image should maintain its original aspect ratio during resizing. When set to true, the image will be resized while preserving its aspect ratio

Here is an example of resizing the image using the [resize](#) method.

INDEX.TS

```
import { ImageEditor } from '@syncfusion/ej2-image-editor';
import { Button } from '@syncfusion/ej2-buttons';
import { Browser } from '@syncfusion/ej2-base';
//Image Editor items definition
let imageEditorObj: ImageEditor = new ImageEditor({
    width: '550px',
    height: '330px',
    toolbar: [],
    created: () => {
        imageEditorObj.open('bee-eater.png');
    }
});
imageEditorObj.appendTo('#imageeditor');
document.getElementById('aspectClick').onclick = (): void => {
    imageEditorObj.resize(300, 400, true);
}
document.getElementById('nonaspectClick').onclick = (): void => {
    imageEditorObj.resize(400, 100, false);
}
```

```

Resizing event

The [resizing](#) event is triggered when resizing the image. This event provides information encapsulated within an object, which includes details about the previous and current height and width of an image.

The parameter available in [ResizeEventArgs](#) is,

- [ResizeEventArgs.previousWidth](#) - The width of the image before resizing is performed.
- [ResizeEventArgs.previousHeight](#) - The height of the image before resizing is performed.
- [ResizeEventArgs.width](#) - The width of the image after resizing is performed.
- [ResizeEventArgs.height](#) - The width of the image after resizing is performed.
- [ResizeEventArgs.isAspectRatio](#) - The type of resizing performed such as aspect ratio or non-aspect ratio.
- [ResizeEventArgs.cancel](#) - Specifies a boolean value to cancel the resizing action.

Quick access toolbar in the EJ2 JavaScript Image Editor control

The quick access toolbars in the Image Editor play a vital role in facilitating interactions with annotations like Rectangle, Ellipse, Line, Arrow, and Path. These toolbars offer a diverse array of tools and options that can be tailored to match the specific requirements and preferences associated with each annotation type. The toolbar is only displayed when an annotation is selected, ensuring a focused and contextual user experience. Users have the flexibility to add or remove items from the toolbar, allowing them to create a personalized set of tools. Additionally, users can also build a completely custom toolbar from the ground up, providing them with complete control over the available options and functionality.

Add a custom toolbar item

The quick access toolbar that appears when inserting annotations in the Image Editor is customizable using the [quickAccessToolbarOpen](#) event. This event is triggered when the quick access toolbar is opened, allowing you to modify its contents. To add additional toolbar items to the quick access toolbar, you can access the `toolbarItems` property of the `QuickAccessToolbarEventArgs` within the event handler. By adding or removing items from the `toolbarItems` property based on the item property, you can customize the options available in the quick access toolbar according to your needs. This gives you the ability to extend the functionality of the quick access toolbar and provide additional tools and options for working with inserted annotations.

Here is an example of adding the custom toolbar item to the quick access toolbar.

INDEX.TS

```
import { ImageEditor } from '@syncfusion/ej2-image-editor';
import { Browser } from '@syncfusion/ej2-base';
//Image Editor items definition
let imageEditorObj: ImageEditor = new ImageEditor({
    width: '550px',
    height: '350px',
    quickAccessToolbarOpen: (args: quickAccessToolbarOpen) => {
        args.toolbarItems = ['Clone'];
    },
    created: () => {
        if (Browser.isDevice) {
            imageEditorObj.open('bee-eater.png');
        } else {
            imageEditorObj.open('bee-eater.png');
        }
    }
});
imageEditorObj.appendTo('#imageeditor');
```

Undo and Redo in the EJ2 JavaScript Image Editor control

The undo and redo functionalities provide a way to reverse and repeat editing actions performed on an image. These features are essential for maintaining control and flexibility during the editing process.

In an image editor, the undo and redo history typically have a limited capacity, and the number of steps that can be stored is 16 steps, meaning that the editor keeps track of the most recent 16 actions performed on the image. Once the history reaches its maximum capacity, any new actions beyond the 16th step will result in the removal of the oldest action from the history.

Undo the action

The undo action in an image editor allows users to revert the most recent editing action or a series of actions back to their previous state. When the undo command is triggered, the image editor undoes the last applied modification, effectively restoring the image to its state before the action was performed.

The undo action is useful for correcting mistakes, removing unwanted changes, or exploring different editing options without permanently altering the image.

Redo the action

The Redo action in an image editor allows users to reapply previously undone actions or modifications to the image. When the redo command is triggered, the image editor reapplies the last action that was undone, bringing the image back to the state it was in after the action was initially applied. The redo is useful when users want to repeat an action that was previously undone or restore changes that were temporarily reversed.

In the following example, the [undo](#) and [redo](#) method is used in the button click event.

INDEX.TS

```
import { ImageEditor } from '@syncfusion/ej2-image-editor';
import { Button } from '@syncfusion/ej2-buttons';
import { Browser } from '@syncfusion/ej2-base';
//Image Editor items definition
let imageEditorObj: ImageEditor = new ImageEditor({
  width: '550px',
  height: '330px',
  created: () => {
    if (Browser.isDevice) {
      imageEditorObj.open('bee-eater.png');
    } else {
      imageEditorObj.open('bee-eater.png');
    }
  }
});
imageEditorObj.appendTo('#imageeditor');
//Button click
let button: Button = new Button({cssClass: `e-primary`,
content: 'Click', '#btnClick'});
document.getElementById('undoClick').onclick = (): void => {
  imageEditorObj.undo();
}
document.getElementById('redoClick').onclick = (): void => {
  imageEditorObj.redo();
}

Accessibility in EJ2 JavaScript Image Editor control

The Image Editor component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Image Editor component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | `` |

| Screen Reader Support | `` |

| Right-To-Left Support | `` |

| Color Contrast | `` |

| Mobile Device Support | `` |

| Keyboard Navigation Support | `` |

| [Accessibility Checker](#) Validation | `` |

| [Axe-core](#) Accessibility Validation | `` |

`<style>`

`.post .post-content img {`

`display: inline-block;`

`margin: 0.5em 0;`

`}`

`</style>`

`<div>` - All features of the component meet the requirement.`</div>`

`<div>` - Some features of the component do not meet the requirement.`</div>`

`<div>` - The component does not meet the requirement.`</div>`

Keyboard interaction

The Image Editor component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Image Editor component.

| **Press** | **To do this** |

| --- | --- |

| **Ctrl + Z** | **Undo the last user action.** |

| **Ctrl + Y** | **Redo the last user action.** |

| **Ctrl + S** | **To save the Image.** |

| Ctrl + O | To open the Image. |

| Delete | To delete the shape once the shape got selected through mouse click . |

Ensuring accessibility

The Image Editor component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Image Editor component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Image Editor component with accessibility tools.

InPlaceEditor

Controls in EJ2 JavaScript In place editor control

In-place Editor renders various controls based on the [type](#) property and it have built-in and injectable controls. To use injectable controls, inject the required modules into **In-place Editor**. By default, the [type](#) property set to **Text** and render the **TextBox**.

The following table explains Injectable components module name and built-in components and their types.

Injectable Components Built in Components	
-----	-----
AutoComplete (AutoComplete)	TextBox (Text)
ComboBox (ComboBox)	DatePicker (Date)
MultiSelect (MultiSelect)	DateTimePicker (DateTime)
TimePicker (Time)	DropDownList (DropDownList)
DateRangePicker (DateRange)	MaskedTextBox (Mask)
Slider (Slider)	NumericTextBox (Numeric)
Rte (RTE)	
ColorPicker (Color)	

In the following sample, built-in and injectable based In-place Editor controls are rendered.

INDEX.TS

```
import { InPlaceEditor, AutoComplete, ColorPicker, ComboBox } from
 '@syncfusion/ej2-inplace-editor';
import { DateRangePicker, MultiSelect, Rte, Slider, TimePicker } from
 '@syncfusion/ej2-inplace-editor';
InPlaceEditor.Inject(AutoComplete, ColorPicker, ComboBox, DateRangePicker,
 MultiSelect, Rte, Slider, TimePicker);
let frameWorkList: string[] = ['Android', 'JavaScript', 'jQuery',
 'TypeScript', 'Angular', 'React', 'Vue', 'Ionic'];
```

```
let dateObj: InPlaceEditor = new InPlaceEditor({
  mode: 'Inline',
  type: 'Date',
  model: {
    placeholder: 'Select date'
  },
  value: new Date('11/23/2018')
});
dateObj.appendTo('#date');
let dateTimeObj: InPlaceEditor = new InPlaceEditor({
  mode: 'Inline',
  type: 'DateTime',
  model: {
    placeholder: 'Select date'
  },
  value: new Date('11/23/2018 12:30 PM')
});
dateTimeObj.appendTo('#dateTime');
let dropDownObj: InPlaceEditor = new InPlaceEditor({
  mode: 'Inline',
  type: 'DropDownList',
  value: 'Android',
  model: {
    dataSource: frameWorkList,
    placeholder: 'Select frameworks'
  }
});
dropDownObj.appendTo('#dropDowns');

Model configuration

Control properties and events can be customized using the In-place Editor [model](#) property.

In the following code, the [type](#) defined as the `Date` and `DatePicker` properties are configured through [model](#) property to customize the [DatePicker](#) control at In-place Editor.

```

`ts
model: {
showTodayButton: true,
placeholder: 'Select Date'
}
`

```

[src/app/app.ts]

```

`ts

```

```
import { InPlaceEditor } from '@syncfusion/ej2-inplace-editor';
let editObj: InPlaceEditor = new InPlaceEditor({
  type: 'Date',
  value: new Date('04/12/2018'),
  model: {
    showTodayButton: true,
    placeholder: 'Select Date'
  }
});
editObj.appendTo('#element');
```

Configuration in EJ2 JavaScript In place editor control

Rendering modes

This section explains the supported rendering modes of the In-place Editor. Possible Rendering modes are as follows.

- Popup
- Inline

By default, **Popup** mode will be rendered, when opening an editor.

- For **Popup** mode, editable container displays as like tooltip or popover above the element.
- For **Inline** mode, editable container displays as instead of the element. To render **Inline** mode while opening the editor, specify **mode** as **Inline**.

In the following sample, the In-place Editor renders with **Inline** mode. You can dynamically switch into another mode by changing the drop-down item value.

INDEX.TS

```
import { InPlaceEditor, RenderMode } from '@syncfusion/ej2-inplace-editor';
import { DropDownList, ChangeEventArgs } from '@syncfusion/ej2-dropdowns';
let modeData: string[] = ['Inline', 'Popup'];
let modeObj: DropDownList = new DropDownList({
  dataSource: modeData,
  width: 'auto',
  change: onChange,
  value: 'Inline',
  placeholder: 'Select Mode'
});
```

```

modeObj.appendTo('#dropDown');
let editObj: InPlaceEditor = new InPlaceEditor({
    mode: 'Inline',

Pop-up customization

In-place Editor popup mode can be customized by using the [title](#) and [model](#) properties in [popupSettings](#) API.

Popup mode rendered by using the Essential JS 2 Tooltip control, so you can use tooltip properties and events to customize the behavior of popup via the [model](#) property of [popupSettings](#) API.

For more details, refer the tooltip documentation [section](#).

In the following sample, popup [title](#) and [position](#) customized using the [popupSettings](#) property. All possible tooltip position data configured in the drop-down, if we change drop down item, selected value bound to [model](#) property and applied it to [Tooltip](#) control. [Tooltip](#) have following position options.

- TopLeft
- TopCenter
- TopRight
- BottomLeft
- BottomCenter
- BottomRight
- LeftTop
- LeftCenter
- LeftBottom
- RightTop
- RightCenter
- RightBottom

INDEX.TS

```

import { InPlaceEditor } from '@syncfusion/ej2-inplace-editor';
import { DropDownList, ChangeEventArgs } from '@syncfusion/ej2-dropdowns';

Event actions for editing

The event action of the editor that enable in the edit mode based on the [editableOn](#) property, by default [Click](#) is assigned, the following options are also supported.

- [Click](#): The editor will be opened as single click actions.
- [DbClick](#): The editor will be opened as double-click actions and it is not applicable for edit icon.
- [EditIconClick](#): Disables the editing of event action of input and allows user to edit only through edit icon.

In-place Editor get focus by pressing the [tab](#) key from previous focusable DOM element and then by pressing [enter](#) key, the editor will be opened.

In the following sample, when switching drop-down item, the selected value assigned to the [editableOn](#) property. If you changed to [DbClick](#), the editor will open when making a double click on the input.

INDEX.TS

```
import { InPlaceEditor, EditableType } from '@syncfusion/ej2-inplace-editor';
import { DropDownList, ChangeEventArgs } from '@syncfusion/ej2-dropdowns';
let editableOnData: string[] = ['Click', 'DbClick', 'EditIconClick'];
let dropDownObj: DropDownList = new DropDownList({
  dataSource: editableOnData,
  width: 'auto',
  value: 'Click',
  change: onChange,
  placeholder: 'Select edit type'
});
dropDownObj.appendTo('#dropDown');
let editObj: InPlaceEditor = new InPlaceEditor({
  mode: 'Inline',
  value: 'Andrew',
  model: {
    placeholder: 'Enter some text'
  }
});
editObj.appendTo('#element');
function onChange(e: ChangeEventArgs): void {
  let editType: EditableType = e.itemData.value as EditableType;
  editObj.editableOn = editType;
  editObj.dataBind();
}
```

```

Action on focus out

Action to be performed when the user clicks outside the container, that means focusing out of editable content and it can be handled by the [actionOnBlur](#) property, by default **Submit** assigned. It also has the following options.

- **[Cancel](#)**: Cancels the editing and resets the old content.
- **[Submit](#)**: Submits the edited content to the server.
- **[Ignore](#)**: No action is performed with this type and allows to edit multiple editors.

In the following sample, when switching drop-down item, the selected value assigned to the [actionOnBlur](#) property.

INDEX.TS

```

import { InPlaceEditor, ActionBlur } from '@syncfusion/ej2-inplace-editor';
import { DropDownList, ChangeEventArgs } from '@syncfusion/ej2-dropdowns';

Buttons in EJ2 JavaScript In place editor control

The In-place Editor had an action for save and cancel using buttons. The [saveButton](#) and [cancelButton](#) properties accept the [ButtonModel](#) objects for customizing the save and cancel button properties.

Buttons can be show or hide by sets a Boolean value to the [showButtons](#) property.

Without buttons value will be processed via the following ways.

- **[actionOnBlur](#)**: By clicking out side the editor control get focus out and do action based on this property value.
- **[submitOnEnter](#)**: Pressing **Enter** key it performs the submit action, if this property set to **true**.

In the following sample, the [content](#) and [cssClass](#) properties of [Button](#) value assigned to the [saveButton](#) and [cancelButton](#) properties to customize its appearance. Also check or uncheck a checkbox buttons render or removed from the editor.

To restrict either save or cancel button rendering into a DOM, simply pass empty object {} in the `saveButton` or `cancelButton` properties.

For more details about buttons, refer this documentation [section](#).

INDEX.TS

```
import { InPlaceEditor, ActionBlur } from '@syncfusion/ej2-inplace-editor';
import { CheckBox, ChangeEventArgs } from '@syncfusion/ej2-buttons';
let CheckBoxObj: CheckBox = new CheckBox({ label: 'Show', checked: true,
change: onChange });
CheckBoxObj.appendTo('#enableBtn');
let editObj: InPlaceEditor = new InPlaceEditor({
  mode: 'Inline',
  value: 'Andrew',
  model: {
    placeholder: 'Enter some text'
  },
  saveButton: {
    content: 'Ok',
    cssClass: 'e-outline'
  },
  cancelButton: {
    content: 'Cancel',
    cssClass: 'e-outline'
  }
});
editObj.appendTo('#element');
function onChange(e: ChangeEventArgs): void {
  editObj.showButtons = e.checked;
  editObj.dataBind();
}
```

Server actions in EJ2 JavaScript In place editor control

By passing In-place Editor control value to the server, the [primaryKey](#) property value must require, otherwise action not performed for remote data.

If the [URL](#) property value is empty, data passing will handled at local and also the [actionSuccess](#) event will trigger with `null` as argument value.

The following arguments are passed to the server when submit actions perform.

Arguments	Explanations
value	For processing edited value, like DB value updating.
primaryKey	For value mapping to the server, like selecting DB.
name	For field mapping to the server, like DB column field mapping.

Find the following sample server codes for defining models and controller functions to configure processing data.

```

`C#
public class SubmitModel
{
    public string Name { get; set; }
    public string PrimaryKey { get; set; }
}

```

```

public string Value { get; set; }
}
`C#
public IEnumerable<SubmitModel> UpdateData([FromBody]SubmitModel value)
{
    // User can process data
    return value;
}
`

```

- Server actions successfully done, the [actionSuccess](#) event will be fired with returned server data.
- If the server is not responding, the [actionFailure](#) event will be fired with data, but value not updated in the Editor.

In the following sample, the `actionSuccess` event will trigger once the value submitted successfully into the server. In this sample, both `actionSuccess` and `actionFailure` were configured and resulted value will be converted to chips.

INDEX.TS

```

import { InPlaceEditor, ActionEventArgs, MultiSelect } from

Data binding in EJ2 JavaScript In place editor control

The Essential JS 2 controls load the data either from local data sources or remote data services using the `dataSource` property and it supports the data type of an array or `DataManager`. Also supports different kind of data services such as OData, OData V4, Web API, and data formats such as XML, JSON, JSONP with the help of `DataManager` adaptors.

Local

To bind local data to the Essential JS 2 controls, you can assign a JavaScript array of object or string to the `dataSource` property. The local data source can also be provided as an instance of the `DataManager`.

INDEX.TS

```
import { InPlaceEditor } from '@syncfusion/ej2-inplace-editor';
let gameList: { [key: string]: Object }[] = [
  { Id: '1', Name: 'Maria Anders' },
  { Id: '2', Name: 'Ana Trujillo' },
  { Id: '3', Name: 'Antonio Moreno' },
  { Id: '4', Name: 'Thomas Hardy' },
  { Id: '5', Name: 'Chiristina Berglund' },
  { Id: '6', Name: 'Hanna Moos' }
];
let editObj: InPlaceEditor = new InPlaceEditor({
  mode: 'Inline',
  type: 'DropDownList',
  value: 'Maria Anders',
  model: {
    dataSource: gameList,
    fields: { text: 'Name' },
    placeholder: 'Select a customer'
  }
});
editObj.appendTo('#element');
```

Remote

To bind remote data to the Essential JS 2 control, assign service data as an instance of **DataManager** to the **dataSource** property. To interact with remote data source, provide the endpoint URL.

OData V4

The OData V4 is an improved version of OData protocols, and the **DataManager** can also retrieve and consume OData V4 services. To fetch data from the server by using **DataManager** with the adaptor property configure as **ODataV4Adaptor**.

In the following sample, In-place Editor renders a **DropDownList** control and its **dataSource** property configured for fetching a data from the server by using **ODataV4Adaptor** with **DataManager**.

INDEX.TS

```

import { DataManager, ODataV4Adaptor, Query } from '@syncfusion/ej2-data';
import { InPlaceEditor } from '@syncfusion/ej2-inplace-editor';
let editObj: InPlaceEditor = new InPlaceEditor({
    mode: 'Inline',
    type: 'DropDownList',
    value: 'Maria Anders',
    model: {
        dataSource: new DataManager({
            url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
            adaptor: new ODataV4Adaptor,
            crossDomain: true
        }),
        placeholder: "Select a customer",
        query: new Query().from('Customers').select(['ContactName',
        'CustomerID']).take(6),
        fields: { text: 'ContactName', value: 'CustomerID' }
    }
});
editObj.appendTo('#element');

```

```

Integration in EJ2 JavaScript In place editor control

The In-place Editor supports adding HTML5 input controls using the [template](#) property. The Template property can be given as either a [string](#) or a [query selector](#).

As a string

The HTML element tag can be given as a string for the template property. Here, the input is rendered as an HTML template.

```
`ts
```

```
template: "<div><input type='text' id='name'></input></div>"
```

```
,
```

As a selector

The template property also allows getting template content through query [selector](#). Here, the input wrapper element 'ID' attribute is specified in the template.

```
`ts
```

```
template: "#date"
```

```
,
```

Template mode, the [value](#) property not handled by the In-place Editor control. So, before sending a value to the server, you need to modify at [actionBegin](#) event, otherwise, an empty string will pass. In the

following template sample, before submitting a data to the server, event argument and [value](#) property content updated in the `actionBegin` event handler.

INDEX.TS

```
import { InPlaceEditor, ActionBeginEventArgs } from '@syncfusion/ej2-inplace-editor';
let editObj: InPlaceEditor = new InPlaceEditor({
    mode: 'Inline',
    template: '#date',
    value: '2018-05-23',
    actionBegin: function(e: ActionBeginEventArgs): void {
        let value: string =
        (<HTMLInputElement>editObj.element.querySelector('#date')).value;
        editObj.value = value;
        e.value = value;
    }
});
editObj.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 In-place Editor</title>

Validation in EJ2 JavaScript In place editor control

In-place Editor control supports validation and it can be achieved by adding rules to the [validationRules](#) property, its child property `key` must be same as [name](#) property, otherwise validation not performed. Submitting data to the server or calling the [validate](#) method validation executed.

Validation Rules

In-place Editor has following validation rules, which are used to perform validation.

Rules	Description	Example
----- ----- -----		
required	The input element must have any input values	a or 1 or -
email	The input element must have valid email format values	<inplace@syncfusion.com>
url	The input element must have valid url format values	http://syncfusion.com/
date	The input element must have valid date format values	12/25/2019
dateIso	The input element must have valid dateIso format values	2019-12-25
number	The input element must have valid number format values	1.0 or 1
maxLength	Input value must have less than or equal to maxLength character length	if maxLength : 5, [check] is valid and [checking] is invalid
minLength	Input value must have less than or equal to minLength character length	if minLength : 5, [testing] is valid and [test] is invalid
rangeLength	Input value must have value between rangeLength character length	if rangeLength : [4,5], [test] is valid and [key] is invalid
range	Input value must have value between range number	if range : [4,5], [4] is valid and [6] is invalid
max	Input value must have less than or equal to max number	if max : 3, [3] is valid and [4] is invalid
min	Input value must have less than or equal to min number	if min : 4, [5] is valid and [2] is invalid

Accessibility in EJ2 JavaScript Inplace editor component

Style in EJ2 JavaScript In place editor control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the In-place Editor text

Use the following CSS to customize the default In-place Editor's text content properties like font-family, font-size, color and border bottom.

```
`css
/ To change color, font family and font size /
.e-inplaceeditor .e-editable-value-wrapper .e-editable-value {
border-bottom: 2px dotted green;
color: red;
font-size: 12px;
font-family: Segoe UI
}
`
```

[Customizing the In-place Editor action buttons](#)

Use the following CSS to customize the default In-place Editor's action buttons.

```
`css
/ To change icon color for save button /
.e-inplaceeditor .e-editable-action-buttons .e-btn-save.e-icon-btn .e-btn-icon.e-icons,
.e-inplaceeditor-tip .e-editable-action-buttons .e-btn-save.e-icon-btn .e-btn-icon.e-icons{
color: green;
}

/ To change icon color for cancel button /
.e-inplaceeditor .e-editable-action-buttons .e-btn-cancel.e-icon-btn .e-btn-icon.e-icons, .e-
inplaceeditor-tip .e-editable-action-buttons .e-btn-cancel.e-icon-btn .e-btn-icon.e-icons {
color: red;
}

/ To change background color for save button /
.e-inplaceeditor .e-editable-action-buttons .e-btn-save.e-icon-btn,
.e-inplaceeditor-tip .e-editable-action-buttons .e-btn-save.e-icon-btn {
background-color: antiquewhite;
}

/ To change background color for cancel button /
.e-inplaceeditor .e-editable-action-buttons .e-btn-cancel.e-icon-btn,
.e-inplaceeditor-tip .e-editable-action-buttons .e-btn-cancel.e-icon-btn {
background-color: antiquewhite;
}
`
```

Localization in EJ2 JavaScript In place editor control

Localization

Localization library allows you to localize the default text content of the In-place Editor to different cultures using the [locale](#) property. In-place Editor following keys will be localize based on culture.

| Locale key | en-US (default) |

|-----|-----|

| save | Close |

| cancel | Cancel |

| loadingText | Loading... |

| editIcon | Click to edit |

| editAreaClick | Click to edit |

| editAreaDoubleClick | Double click to edit |

To load translation object in an application use `load` function of `L10n` class. In the following sample, **French** culture is set to In-place Editor and change the tooltip text.

INDEX.TS

```
import { L10n } from '@syncfusion/ej2-base';
import { InPlaceEditor, EditableType } from '@syncfusion/ej2-inplace-editor';
import { DropDownList, ChangeEventArgs } from '@syncfusion/ej2-dropdowns';
L10n.load({
    'fr-BE': {
        'inplace-editor': {
            'save': 'enregistrer',
            'cancel': 'Annuler',
            'loadingText': 'Chargement...',
            'editIcon': 'Cliquez pour éditer',
            'editAreaClick': 'Cliquez pour éditer',
            'editAreaDoubleClick': 'Double-cliquez pour éditer'
        }
    }
});
let editableOnData: string[] = ['Click', 'DbClick', 'EditIconClick'];
let dropDownObj: DropDownList = new DropDownList({
    dataSource: editableOnData,
    width: 'auto',
    value: 'Click',
    change: onChange,
    placeholder: 'Select edit type'
});
dropDownObj.appendTo('#dropDown');
let editObj: InPlaceEditor = new InPlaceEditor({
    mode: 'Inline',
    value: 'Andrew',
    locale: 'fr-BE',
    model: {
        placeholder: 'Enter some text'
    }
});
```

```
});
editObj.appendTo('#element');
function onChange(e: ChangeEventArgs): void {
    let editType: EditableType = e.itemData.value as EditableType;
    editObj.editableOn = editType;
    editObj.dataBind();
}
```

INDEX.HTML

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Right to left

Specifies the direction of the In-place Editor control using the enableRtl property. For writing systems that require it like Arabic, Hebrew, etc., the direction can be switched to right-to-left.

It will not change based on the locale property.

INDEX.TS

```
import { InPlaceEditor } from '@syncfusion/ej2-inplace-editor';
let editObj: InPlaceEditor = new InPlaceEditor({
  mode: 'Inline',
  value: 'Andrew',
  enableRtl: true
});
editObj.appendTo('#element');
```

INDEX.HTML

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Format

Formatting is a way of representing the value in different format. You can format the following mentioned controls with its `format` property, when it passed through the In-place Editor [model](#) property.

- [DatePicker](#)
- [DateRangePicker](#)
- [DateTimePicker](#)
- [NumericTextBox](#)
- [Slider](#)
- [TimePicker](#)

INDEX.TS

```
import { InPlaceEditor } from '@syncfusion/ej2-inplace-editor';
let editObj: InPlaceEditor = new InPlaceEditor({
  type: 'Date',
  value: new Date('11/23/2018'),
  model: {
    placeholder: 'Select date',
    format: 'yyyy-MM-dd'
  }
});
editObj.appendTo('#element');
```

```

How To

Dynamic edit mode in EJ2 JavaScript In place editor control

At control initial load, if you want to open editor state without interacting In-place Editor input element, it can be achieved by configuring the [enableEditMode](#) property to [true](#).

In the following sample, editor opened at initial load and when toggling a checkbox, it will remove or open the editor.

INDEX.TS

```
import { InPlaceEditor, ActionBlur } from '@syncfusion/ej2-inplace-editor';
import { CheckBox, ChangeEventArgs } from '@syncfusion/ej2-buttons';
let CheckBoxObj: CheckBox = new CheckBox({ label: 'Enable', checked: true,
change: onChange });
CheckBoxObj.appendTo('#enable');
let editObj: InPlaceEditor = new InPlaceEditor({
    mode: 'Inline',
    value: 'Andrew',
    enableEditMode: true,
    actionOnBlur: 'Ignore'
    model: {
        placeholder: 'Enter some text'
    }
});
editObj.appendTo('#element');
function onChange(e: ChangeEventArgs): void {
    editObj.enableEditMode = e.checked;
    editObj.dataBind();
}
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 In-place Editor</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript In-place Editor Control">

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Disable edit mode in EJ2 JavaScript In place editor control

The edit mode of In-place Editor can be disabled by setting the [disabled](#) property value to **true**. In the following sample, when check or uncheck the checkbox, In-place Editor control will disable or enable the edit mode.

INDEX.TS

```

import { InPlaceEditor } from '@syncfusion/ej2-inplace-editor';
import { CheckBox, ChangeEventArgs } from '@syncfusion/ej2-buttons';
let CheckBoxObj: CheckBox = new CheckBox({ label: 'Disable', checked: false,
change: onChange });
CheckBoxObj.appendTo('#enable');
let editObj: InPlaceEditor = new InPlaceEditor({
  mode: 'Inline',
  value: 'Andrew',
  model: {
    placeholder: 'Enter some text'
  }
});
editObj.appendTo('#element');
function onChange(e: ChangeEventArgs): void {
  editObj.disabled = e.checked;
  editObj.dataBind();
}

```

                <td class="sample-td">
                    <div id="element"></div>
                </td>
            </tr>
        </tbody></table>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Custom indication in EJ2 JavaScript In place editor control

You can add custom indication to unsaved input value by using the [actionSuccess](#) event, when data not submitted to the server.

In this sample, the `actionSuccess` event configured and the `URL` property not included. Then submit button clicked, the current editor value saved into input and data sending to server action prevented due to the `URL` property not configured.

But `actionSuccess` event will trigger the handler function with `null` argument values. In handler function data property `primaryKey` value checked, whether it empty or not. If it is empty custom class, added in the `e-value-wrapper` element to customize its styles.

To send input value to local, set the `URL` property as empty.

INDEX.TS

```

import { isNullOrUndefined as isNOU } from '@syncfusion/ej2-base';
import { InPlaceEditor, ActionEventArgs } from '@syncfusion/ej2-inplace-editor';
let editObj: InPlaceEditor = new InPlaceEditor({
    mode: 'Inline',

```

```

    value: 'Andrew',
    model: {
        placeholder: 'Enter some text'
    },
    actionSuccess: function(e: ActionEventArgs): void {
        let pk: string = e.data['PrimaryKey'];
        if (isNOU(pk) || pk === '') {
            document.querySelector('.e-editable-value').classList.add('e-send-error');
        }
    }
});
editObj.appendTo('#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 In-place Editor</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

Custom animation in EJ2 JavaScript In place editor control

In popup mode, the In-place Editor rendered with the Essential JS 2 **Tooltip** control. You can use tooltip properties and events to customize the popup by configure properties into the [model](#) property inside the [popupSettings](#) API.

In the following sample, popup animation can be customized by passing animation effect using the `model` property and the dynamic animation effect changes configured from the Essential JS 2 `DropDownList` control `change` event.

INDEX.TS

```
import { InPlaceEditor } from '@syncfusion/ej2-inplace-editor';
import { DropDownList, ChangeEventArgs } from '@syncfusion/ej2-dropdowns';
var openAnimateData = ['None', 'FadeIn', 'FadeZoomIn', 'ZoomIn'];
let openDropObj: DropDownList = new DropDownList({
    value: 'ZoomIn',
    dataSource: openAnimateData,
    placeholder: 'Select a animate type',
    popupHeight: '150px',
    change: function(e: ChangeEventArgs): void {
        editObj.popupSettings.model.animation.open.effect = e.value;
        editObj.dataBind();
    }
});
openDropObj.appendTo('#openDropDown');
let editObj: InPlaceEditor = new InPlaceEditor({
    mode: 'Popup',
    value: 'Andrew',
    model: {
        placeholder: 'Enter some text'
    },
    popupSettings: {
        model: {
            animation: {
                open: { effect: 'ZoomIn', duration: 1000, delay: 0 }
            }
        }
    }
});
editObj.appendTo('#element');
```

Kanban

Getting started in EJ2 JavaScript Kanban control

This section briefly explains how to create the **Kanban** component and configure its available functionalities in a JavaScript application.

Dependencies

The following list of dependencies are required to use the Kanban component in your application:

`javascript

```
|-- @syncfusion/ej2-kanban
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-buttons
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-dropdowns
|-- @syncfusion/ej2-icons
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-layouts
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-popups
```

```
|-- @syncfusion/ej2-splitbuttons
`
```

Setup for local environment

Refer to the following steps to setup your local environment:

Step 1: Create a root folder `myapp` for your application.

Step 2: Create `myapp/resources` folder to store local scripts and styles files.

Step 3: Create `myapp/index.js` and `myapp/index.html` files for initializing Essential JS 2 Kanban control.

Adding Syncfusion resources

The Essential JS 2 Kanban control can be initialized by using one of the following ways.

- Using local scripts and styles.
- Using CDN links for scripts and styles.

Using local scripts and styles

You can get the global scripts and styles from the [Essential Studio JavaScript \(Essential JS 2\)](#) build installed location.

After installing the Essential JS 2 product build, you can copy the Kanban and its dependency scripts and style files into the `resources/scripts` and `resources/styles` folder respectively.

Refer to the following location from where the Kanban's script and styles can be referenced.

Syntax:

Script: `(installed location)/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/dist/global/{PACKAGE_NAME}.min.js`

Styles: `(installed location)/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/styles/material.css`

Example:

Script: `C:/Program Files (x86)/Syncfusion/Essential Studio/17.4.39/Essential JS 2/ej2-kanban/dist/global/ej2-kanban.min.js`

Styles: `C:/Program Files (x86)/Syncfusion/Essential Studio/17.4.39/Essential JS 2/ej2-kanban/styles/material.css`

After copying the files, you can refer the Kanban's scripts and styles into the `index.html` file. The following HTML code example shows the dependency of Kanban.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
```

```
<head>
<title>Essential JS 2 Kanban</title>
<!-- Essential JS 2 Kanban's dependent material theme -->
<link href="resources/base/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/buttons/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/dropdowns/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/inputs/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/layouts/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/popups/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/navigations/styles/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 Kanban's material theme -->
<link href="resources/kanban/styles/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 Kanban's dependent scripts -->
<script src="resources/scripts/ej2-base.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-buttons.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-data.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-dropdowns.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-inputs.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-splitbuttons.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-lists.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-popups.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-navigations.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-layouts.min.js" type="text/javascript"></script>
<!-- Essential JS 2 Kanban's global script -->
<script src="resources/scripts/ej2-kanban.min.js" type="text/javascript"></script>
</head>
<body>
</body>
</html>
```

Using CDN links for scripts and styles

Using CDN link, you can directly refer the Kanban's script and styles into the `index.html` file.

Refer to the Kanban's CDN links given as follows.

Syntax:

Script: `http://cdn.syncfusion.com/ej2/{PACKAGENAME}/dist/global/{PACKAGENAME}.min.js`

Styles: `http://cdn.syncfusion.com/ej2/{PACKAGE_NAME}/styles/material.css`

Example:

Script: <http://cdn.syncfusion.com/ej2/ej2-kanban/dist/global/ej2-kanban.min.js>

Styles: <http://cdn.syncfusion.com/ej2/ej2-kanban/styles/material.css>

The following HTML code example shows the dependency of Kanban with `ej2-kanban.min.js`.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2 Kanban</title>
<!-- Essential JS 2 Kanban's dependent material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-base/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-buttons/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-dropdowns/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-inputs/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-layouts/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-popups/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-navigations/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 Kanban's material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-kanban/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 Kanban's dependent script -->
<script src="http://cdn.syncfusion.com/ej2/ej2-base/dist/global/ej2-base.min.js"
type="text/javascript"></script>
```

```

<script src="http://cdn.syncfusion.com/ej2/ej2-data/dist/global/ej2-data.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-data/dist/global/ej2-dropdown.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-inputs/dist/global/ej2-inputs.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-buttons/dist/global/ej2-buttons.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-layouts/dist/global/ej2-layouts.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-splitbuttons/dist/global/ej2-splitbuttons.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-lists/dist/global/ej2-lists.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-popups/dist/global/ej2-popups.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-navigations/dist/global/ej2-navigations.min.js"
type="text/javascript"></script>
<!-- Essential JS 2 Kanban's global script -->
<script src="http://cdn.syncfusion.com/ej2/ej2-kanban/dist/global/ej2-kanban.min.js"
type="text/javascript"></script>
</head>
<body>
<!-- Add the HTML <div> element for kanban -->
<div id="Kanban"></div>
<script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Place the following Kanban code in the `index.js` file.

```

`javascript
var kanbanObj = new ej.kanban.Kanban({
columns: [
{ headerText: 'Backlog', keyField: 'Open' },
{ headerText: 'In Progress', keyField: 'InProgress' },
{ headerText: 'Testing', keyField: 'Testing' },

```

```
{ headerText: 'Done', keyField: 'Close' }
]
});
kanbanObj.appendTo('#Kanban');
`
```

Initialize the Kanban

Now, you can add the Kanban control to the application. For getting started, add a `div` element for Kanban control in `index.html`. Then refer the `index.js` file into the `index.html` file.

In this document context, we are going to use `ej2.min.js`, which includes all the Essential JS 2 components and their dependent scripts.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2 Kanban</title>
<!-- Essential JS 2 Kanban's dependent material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-base/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-buttons/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-dropdowns/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-inputs/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-layouts/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-popups/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-navigations/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 Kanban's material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-kanban/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 all script -->
<script src="http://cdn.syncfusion.com/ej2/dist/ej2.min.js" type="text/javascript"></script>
</head>
```

```

<body>
<!-- Add the HTML <div> element for kanban -->
<div id="Kanban"></div>
<script src="index.js" type="text/javascript"></script>
</body>
</html>
,

```

Place the following Kanban code in the `index.js` file.

```

`javascript
var kanbanObj = new ej.kanban.Kanban({
columns: [
{ headerText: 'Backlog', keyField: 'Open' },
{ headerText: 'In Progress', keyField: 'InProgress' },
{ headerText: 'Testing', keyField: 'Testing' },
{ headerText: 'Done', keyField: 'Close' }
]
});
kanbanObj.appendTo('#Kanban');
,

```

INDEX.JS

```

var kanbanObj = new ej.kanban.Kanban({
  columns: [
    { headerText: 'Backlog', keyField: 'Open' },
    { headerText: 'In Progress', keyField: 'InProgress' },
    { headerText: 'Testing', keyField: 'Testing' },
    { headerText: 'Done', keyField: 'Close' }
  ]
});
kanbanObj.appendTo('#Kanban');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Kanban Columns Header</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Kanban Columns Header">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">

```

```

<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
inputs/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
dropdowns/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
layouts/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
navigations/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
kanban/styles/material.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div class="content-wrapper">
            <div id="Kanban"></div>
        </div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Populating cards

To populate the empty Kanban with cards, define the local JSON data or remote data using the `dataSource` property. To define `dataSource`, the mandatory fields in JSON object should be relevant to `keyField`. In the following example, you can see the cards defined with default fields such as ID, Summary, and Status.

INDEX.JS

```

var kanbanObj = new ej.kanban.Kanban({
    dataSource: kanbanData,
    keyField: 'Status',
    columns: [
        { headerText: 'Backlog', keyField: 'Open' },
        { headerText: 'In Progress', keyField: 'InProgress' },
        { headerText: 'Testing', keyField: 'Testing' },
        { headerText: 'Done', keyField: 'Close' }
    ],
    cardSettings: {

```

```
        contentField: 'Summary',
        headerField: 'Id',
    }
});
kanbanObj.appendTo('#Kanban');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Kanban Cards</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Kanban Cards">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
inputs/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
dropdowns/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
layouts/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
navigations/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
kanban/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="es5-datasource.js" type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div class="content-wrapper">
      <div id="Kanban"></div>
    </div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Enable swimlane

Swimlane can be enabled by mapping the fields `swimlaneSettings.keyField` to appropriate column name in `dataSource`. This enables the grouping of the cards based on the mapped column values.

INDEX.JS

```
var kanbanObj = new ej.kanban.Kanban({
  dataSource: kanbanData,
  keyField: 'Status',
  columns: [
    { headerText: 'Backlog', keyField: 'Open' },
    { headerText: 'In Progress', keyField: 'InProgress' },
    { headerText: 'Testing', keyField: 'Testing' },
    { headerText: 'Done', keyField: 'Close' }
  ],
  cardSettings: {
    contentField: 'Summary',
    headerField: 'Id',
  },
  swimlaneSettings: {
    keyField: 'Assignee'
  }
});
kanbanObj.appendTo('#Kanban');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Kanban with Swimlane Rows</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

</body></html>

```

Columns in EJ2 JavaScript Kanban control

The **Kanban** columns represent the each stage of the process. The column definitions are used as the **dataSource** schema in the Kanban. The Kanban operations such as drag-and-drop, swimlane, and toggle columns are performed based on column definitions.

Single-key mapping

Kanban columns are categorized by mapping the **key** from the datasource using the **keyField** property. The corresponding **value** in the datasource is mapped inside the columns **keyField**. Based on this categorization, Kanban columns are split on this board.

The **keyField** property is mandatory to render the columns in the Kanban board.

INDEX.TS

```

import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
    dataSource: kanbanData,
    keyField: 'Status',
    columns: [
        { headerText: 'Backlog', keyField: 'Open' },
        { headerText: 'In Progress', keyField: 'InProgress' },
        { headerText: 'Testing', keyField: 'Testing' },
        { headerText: 'Done', keyField: 'Close' }
    ],
    cardSettings: {
        contentField: 'Summary',
        headerField: 'Id'
    }
});
kanbanObj.appendTo('#Kanban');

```

```

Multi-key mapping

Kanban board allows to render a single column by mapping multiple keys using `keyField` property. In below sample, specified the multiple keys(Open, Validate) to a single column.

INDEX.TS

```

import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
    dataSource: kanbanData,
    keyField: 'Status',

```

```

columns: [
    { headerText: 'Backlog', keyField: 'Open, Validate' },
    { headerText: 'In Progress', keyField: 'InProgress' },
    { headerText: 'Testing', keyField: 'Testing' },
    { headerText: 'Done', keyField: 'Close' }
],
cardSettings: {
    contentField: 'Summary',
    headerField: 'Id'
}
});
kanbanObj.appendTo('#Kanban');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Multiple Key Columns</title>

  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {

```

```
    ele.style.visibility = "visible";
  }
  </script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Header text

You can provide the column header text of Kanban columns using the `headerText` property. If you have not specified any header text, it will render the header without any text.

Header template

You can customize the column header with any HTML or CSS element using the `template` property as shown in the following code.

You can get the following columns data when using header template.

- `keyField`
- `headerText`
- `minCount`
- `maxCount`
- `allowToggle`
- `isExpanded`
- `showItemCount`
- `count`

INDEX.TS

```
import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
  dataSource: kanbanData,
  keyField: 'Status',
  columns: [
    { headerText: 'Backlog', keyField: 'Open', template:
    '#headerTemplate' },
    { headerText: 'In Progress', keyField: 'InProgress', template:
    '#headerTemplate' },
    { headerText: 'Review', keyField: 'Review', template:
    '#headerTemplate' },
    { headerText: 'Done', keyField: 'Close', template: '#headerTemplate'
  }
  ],
  cardSettings: {
    contentField: 'Summary',
    headerField: 'Id'
  }
});
kanbanObj.appendTo('#Kanban');
```

INDEX.HTML

```

Toggle columns

Kanban allows to expand or collapse its columns using `allowToggle` inside the `columns` property. When enable the property, it will render the expand or collapse icon to the column header.

By default, collapsed column width is set to `50px`.

INDEX.TS

```
import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
  dataSource: kanbanData,
  keyField: 'Status',
  columns: [
    { headerText: 'Backlog', keyField: 'Open', allowToggle: true },
    { headerText: 'In Progress', keyField: 'InProgress', allowToggle:
true },
    { headerText: 'Testing', keyField: 'Testing', allowToggle: true },
    { headerText: 'Done', keyField: 'Close', allowToggle: true }
  ],
  cardSettings: {
    contentField: 'Summary',
    headerField: 'Id'
  }
});
kanbanObj.appendTo('#Kanban');
```

INDEX.HTML

```

<script src="index.js" type="text/javascript"></script>
</body></html>

```

Initially collapsed column

By default, all columns are on expanded state when loading the Kanban board initially. But, you can render the columns with collapsed state using the `isExpanded` property.

The `isExpanded` property only works when enabling the `allowToggle` property on particular column.

In the following example, the backlog column is collapsed on initialization of Kanban board.

INDEX.TS

```

import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
    dataSource: kanbanData,
    keyField: 'Status',
    columns: [
        { headerText: 'Backlog', keyField: 'Open', allowToggle: true,
isExpanded: false },
        { headerText: 'In Progress', keyField: 'InProgress', allowToggle:
true },

```

Stacked headers

Stacked headers are the additional headers to column header that will group the similar columns.

Define the grouping of columns **key** value to the **keyFields** property and provide the custom header text name to grouped columns using the **text** property, which is placed inside the **stackedHeaders** property.

In the following code, the kanban columns 'InProgress, Review' are grouped under 'Development Phase' category.

INDEX.TS

```
import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
    dataSource: kanbanData,
    keyField: 'Status',
    columns: [
        { headerText: 'Backlog', keyField: 'Open' },
        { headerText: 'In Progress', keyField: 'InProgress' },
        { headerText: 'Review', keyField: 'Review' },
        { headerText: 'Done', keyField: 'Close' }
    ],
    stackedHeaders: [
        { text: 'To Do', keyFields: 'Open' },
        { text: 'Development Phase', keyFields: 'InProgress, Review' },
        { text: 'Done', keyFields: 'Close' }
    ],
    cardSettings: {
        contentField: 'Summary',
        headerField: 'Id'
    }
});
kanbanObj.appendTo('#Kanban');
```

Cards in EJ2 JavaScript Kanban control

The cards are main elements in Kanban board, which represent the task information with header and content. The header and content of a card is fetched from the corresponding mapping fields. The card layout can be customized with template also.

Drag-and-drop

Transit or change the card position using the drag-and-drop functionality. By default, the `allowDragAndDrop` property is enabled on the Kanban board, which is used to change the card position by column-to-column or within the column.

Added dotted border on Kanban cells except the dragged clone cells when dragging, which indicates the possible ways for dropping the cards into the cells.

Header

The card header is achieved by mapping the `headerField` property, which is placed inside the `cardSettings` property. By default, the `showHeader` property enabled by Kanban board that is used to show the header at the top of the card.

The `headerField` property of `cardSettings` is mandatory to render the cards in the Kanban board. It acts as a unique field that is used to avoid the duplication of card data. You can not change the `headerField` of mapped data value using the `updateCard` public method or server-side update of data.

In the following demo, the `showHeader` property is disabled on Kanban board.

INDEX.TS

```
import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
  dataSource: kanbanData,
  keyField: 'Status',
  columns: [
    { headerText: 'Backlog', keyField: 'Open' },
    { headerText: 'In Progress', keyField: 'InProgress' },
    { headerText: 'Testing', keyField: 'Testing' },
    { headerText: 'Done', keyField: 'Close' }
  ],
  cardSettings: {
```

```

        showHeader: false,
        contentField: 'Summary',
        headerField: 'Id'
    }
});
kanbanObj.appendTo('#Kanban');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

        </div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Content

The card's content is fetched from data source using the `contentField` property, which is placed inside the `cardSettings` property. If the `contentField` property is not used, card is rendered with empty content.

Template

You can customize the default card layout using template as per your application needs. This can be achieved by template of the `cardSettings` property.

INDEX.TS

```
import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
    dataSource: kanbanData,
    keyField: 'Status',
    columns: [
        { headerText: 'Backlog', keyField: 'Open' },
        { headerText: 'In Progress', keyField: 'InProgress' },
        { headerText: 'Done', keyField: 'Close' }
    ],
    cardSettings: {
        contentField: 'Summary',
        headerField: 'Id',
        template: '#cardTemplate'
    }
});
kanbanObj.appendTo('#Kanban');

```

Selection

Kanban board allows to select single and multiple selection of cards when mouse or keyboard interactions using `selectionType` property. The property contains following types.

- **None:** No cards are allowed to select from Kanban board.
- **Single:** Only one card allowed to select at a time in the Kanban board.
- **Multiple:** Multiple cards are allowed to select in a board.

Multiple Selection

Select the multiple cards randomly using Ctrl + mouse click and select the multiple cards continuously using Shift + mouse click action on Kanban board. Set **Multiple** in `selectionType` to enable the multiple selection in a board.

INDEX.TS

```
import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({

Data binding in EJ2 JavaScript Kanban control

The Kanban uses **DataManager**, which supports both RESTful data service binding and JavaScript object array binding. The [dataSource](#) property of Kanban can be assigned either with the instance of **DataManager** or JavaScript object array collection, as it supports the following two data binding methods:

- Local data
- Remote data

Local data

To bind local JSON data to the Kanban, you can simply assign a JavaScript object array to the [dataSource](#) property. The JSON object data source can also be provided as an instance of **DataManager** and assigned to the Kanban **dataSource** property.

INDEX.TS

```

import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
    dataSource: kanbanData,
    keyField: 'Status',

```

```

        columns: [
            { headerText: 'Backlog', keyField: 'Open' },
            { headerText: 'In Progress', keyField: 'InProgress' },
            { headerText: 'Testing', keyField: 'Testing' },
            { headerText: 'Done', keyField: 'Close' }
        ],
        cardSettings: {
            contentField: 'Summary',
            headerField: 'Id'
        }
    });
    kanbanObj.appendTo('#Kanban');

```

INDEX.HTML

```

</head>
<body>

    <div id="container">
        <div class="content-wrapper">
            <div id="Kanban"></div>
        </div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {

```

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

By default, **DataManager** uses **JsonAdaptor** for binding local data.

Remote data

To bind remote data to kanban component, assign service data as an instance of [DataManager](#) to the [dataSource](#) property. To interact with remote data source, provide the endpoint [url](#).

INDEX.TS

```

import { Kanban, DialogEventArgs } from '@syncfusion/ej2-kanban';
import { DataManager, ODataAdaptor } from '@syncfusion/ej2-data';
let data: DataManager = new DataManager({
    url: 'https://ej2services.syncfusion.com/production/web-
services/api/Kanban',
    adaptor: new ODataAdaptor
});
let kanbanObj: Kanban = new Kanban({
    dataSource: data,
    keyField: 'Status',
    columns: [
        { headerText: 'Backlog', keyField: 'Open' },
        { headerText: 'In Progress', keyField: 'InProgress' },
        { headerText: 'Testing', keyField: 'Testing' },
        { headerText: 'Done', keyField: 'Close' }
    ],
    cardSettings: {
        contentField: 'Summary',
        headerField: 'Id'
    },
    allowDragAndDrop: false,
    dialogOpen: dialogOpen
});
kanbanObj.appendTo('#Kanban');
function dialogOpen(args: DialogEventArgs): void {
    args.cancel = true;
}

```

var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

By default, [DataManager](#) uses **ODataAdaptor** for remote data-binding.

OData services

[OData](#) is a standardized protocol for creating and consuming data. You can retrieve data from OData service using the DataManager. Refer to the following code example for remote Data binding using OData service.

INDEX.TS

```

import { Kanban } from '@syncfusion/ej2-kanban';
import { DataManager, ODataAdaptor } from '@syncfusion/ej2-data';
let data: DataManager = new DataManager({
    url: 'https://ej2services.syncfusion.com/production/web-
services/api/Kanban',
    adaptor: new ODataAdaptor,
    crossDomain: true
});
let kanbanObj: Kanban = new Kanban({
    dataSource: data,
    keyField: 'Status',
    columns: [

```

```

        { headerText: 'Backlog', keyField: 'Open' },
        { headerText: 'In Progress', keyField: 'InProgress' },
        { headerText: 'Testing', keyField: 'Testing' },
        { headerText: 'Done', keyField: 'Close' }
    ],
    cardSettings: {
        contentField: 'Summary',
        headerField: 'Id'
    },
    allowDragAndDrop: false,
    dialogOpen: dialogOpen
});
kanbanObj.appendTo('#Kanban');
function dialogOpen(args: DialogEventArgs): void {
    args.cancel = true;
}

```

INDEX.HTML

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

OData v4 services

The ODataV4 is an improved version of OData protocols, and the [DataManager](#) can also retrieve and consume OData v4 services. For more details on OData v4 services, refer to the [odata documentation](#). To bind OData v4 service, use the **ODataV4Adaptor**.

INDEX.TS

```
import { Kanban } from '@syncfusion/ej2-kanban';
import { DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
let data: DataManager = new DataManager({
    url: 'https://services.odata.org/v4/northwind/northwind.svc/Suppliers',
    adaptor: new ODataV4Adaptor
});
let kanbanObj: Kanban = new Kanban({
    dataSource: data,
    keyField: 'ContactTitle',
    columns: [
        { headerText: 'Order Administrator', keyField: 'Order Administrator' },
        { headerText: 'Sales Representative', keyField: 'Sales Representative' },
        { headerText: 'Export Administrator', keyField: 'Export Administrator' }
    ],
    cardSettings: {
        contentField: 'ContactName',
        headerField: 'SupplierID'
    },
    allowDragAndDrop: false,
    dialogOpen: dialogOpen
});
kanbanObj.appendTo('#Kanban');
function dialogOpen(args: DialogEventArgs): void {
    args.cancel = true;
}
```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Web API

You can use **WebApiAdaptor** to bind kanban with Web API created using OData endpoint.

```
`ts
```

```

import { Kanban } from '@syncfusion/ej2-kanban';
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';

let data: DataManager = new DataManager({
    url: '/api/Tasks',
    adaptor: new WebApiAdaptor
});

let kanbanObj: Kanban = new Kanban({

```

```

dataSource: data,
keyField: 'Status',
columns: [
{ headerText: 'Backlog', keyField: 'Open' },
{ headerText: 'In Progress', keyField: 'InProgress' },
{ headerText: 'Testing', keyField: 'Testing' },
{ headerText: 'Done', keyField: 'Close' }
],
cardSettings: {
contentField: 'Summary',
headerField: 'Id'
},
allowDragAndDrop: false,
dialogOpen: dialogOpen
});
kanbanObj.appendTo('#Kanban');
function dialogOpen(args: DialogEventArgs): void {
args.cancel = true;
}

```

Below server-side controller code to get the Kanban data.

```

`ts
[HttpGet]
public object Get()
{
var data = OrdersDetails.GetAllRecords().ToList();
return data;
}

```

URL adaptor

The CRUD (Create, Read, Update and Delete) actions can be performed easily on Kanban cards using the various adaptors available within the **DataManager**. Most preferably, we will be using **UrlAdaptor** for performing CRUD actions on Kanban.

The CRUD operation in Kanban can be mapped to server-side controller actions using the properties `insertUrl`, `removeUrl`, `updateUrl`, and `crudUrl`.

- `insertUrl` – You can perform a single insertion operation on the server-side.
- `updateUrl` – You can update single data on the server-side.
- `removeUrl` – You can remove single data on the server-side.
- `crudUrl` – You can perform bulk data operation on the server-side.

```
`ts
```

```
import { Kanban } from '@syncfusion/ej2-kanban';
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';

let data: DataManager = new DataManager({
  url: 'Home/DataSource',
  updateUrl: 'Home/Update',
  insertUrl: 'Home/Insert',
  removeUrl: 'Home/Delete',
  adaptor: new UrlAdaptor(),
  crossDomain: true
});

let kanbanObj: Kanban = new Kanban({
  dataSource: data,
  keyField: 'Status',
  columns: [
    { headerText: 'Backlog', keyField: 'Open' },
    { headerText: 'In Progress', keyField: 'InProgress' },
    { headerText: 'Testing', keyField: 'Testing' },
    { headerText: 'Done', keyField: 'Close' }
  ],
  cardSettings: {
    contentField: 'Summary',
    headerField: 'Id'
  }
});

kanbanObj.appendTo('#Kanban');
```

The server-side controller code to handle the CRUD operations are as follows.

```
`ts
private NORTHWNDEntities db = new NORTHWNDEntities();
public ActionResult DataSource() {
    var DataSource = db.Tasks.ToList();
    return Json(DataSource, JsonRequestBehavior.AllowGet);
}
public ActionResult Insert(Params value) {
    //Insert card data into the database
    return Json(value, JsonRequestBehavior.AllowGet);
}
public ActionResult Update(Params value) {
    //Update card data into the database
    return Json(value, JsonRequestBehavior.AllowGet);
}
public void Delete(Params value) {
    //Delete card data from the database
}

public class Params {
    public int Id { get; set; }
    public string Status { get; set; }
    public string Summary { get; set; }
    public string Assignee { get; set; }
}
`
```

The `crudUrl` is used to update the bulk data sent to the server-side. Multiple selections and `sortBy` as `Index` properties are used for `crudUrl` properties to update the modified bulk data to the server-side.

Custom adaptor

It is possible to create your own custom adaptor by extending the built-in available adaptors. The following example demonstrates the custom adaptor usage and how to add a custom field `TaskId` for the cards by overriding the built-in response processing using the `processResponse` method of the `ODataAdaptor`.

INDEX.TS

```
import { Kanban } from '@syncfusion/ej2-kanban';
import { DataManager, ODataAdaptor } from '@syncfusion/ej2-data';
```

```

class TaskIdAdaptor extends ODataAdapter {
  processResponse(): Object {
    let i: number = 0;
    // calling base class processResponse function
    let original: Object[] = super.processResponse.apply(this,
arguments);
    // adding Task Id
    original.forEach((item: { [key: string]: Object }) => item['Id'] =
'Task - ' + ++i);
    return original;
  }
}
let data: DataManager = new DataManager({
  url: 'https://ej2services.syncfusion.com/production/web-
services/api/Kanban',
  adaptor: new TaskIdAdaptor
});
let kanbanObj: Kanban = new Kanban({
  dataSource: data,
  keyField: 'Status',
  columns: [
    { headerText: 'Backlog', keyField: 'Open' },
    { headerText: 'In Progress', keyField: 'InProgress' },
    { headerText: 'Testing', keyField: 'Testing' },
    { headerText: 'Done', keyField: 'Close' }
  ],
  cardSettings: {
    contentField: 'Summary',
    headerField: 'Id'
  },
  allowDragAndDrop: false,
  dialogOpen: dialogOpen
});
kanbanObj.appendTo('#Kanban');
function dialogOpen(args: DialogEventArgs): void {
  args.cancel = true;
}

```

INDEX.HTML

```

```

Sending additional parameters to the server

To add a custom parameter to the data request, use the **addParams** method of **Query** class. Assign the **Query** object with additional parameters to the kanban [query](#) property.

INDEX.TS

```

import { Kanban, DialogEventArgs } from '@syncfusion/ej2-kanban';
import { DataManager, ODataAdaptor, Query } from '@syncfusion/ej2-data';
let data: DataManager = new DataManager({
    url: 'https://ej2services.syncfusion.com/production/web-
services/api/Kanban',
    adaptor: new ODataAdaptor
});
let kanbanObj: Kanban = new Kanban({
    dataSource: data,
    query: new Query().addParams('ej2kanban', 'true'),
    keyField: 'Status',
    columns: [
        { headerText: 'Backlog', keyField: 'Open' },
        { headerText: 'In Progress', keyField: 'InProgress' },
        { headerText: 'Testing', keyField: 'Testing' },
        { headerText: 'Done', keyField: 'Close' }
    ],
    cardSettings: {
        contentField: 'Summary',

```

```

        headerField: 'Id'
    },
    allowDragAndDrop: false,
    dialogOpen: dialogOpen
});
kanbanObj.appendTo('#Kanban');
function dialogOpen(args: DialogEventArgs): void {
    args.cancel = true;
}

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Kanban Additional Parameter</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

</head>
<body>

    <div id="container">
        <div class="content-wrapper">
            <div id="Kanban"></div>
        </div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>

```

```
</body></html>
```

The parameters added using the [query](#) property will be sent along with the data request for every kanban action.

Handling HTTP error

During server interaction from the kanban, some server-side exceptions may occur, and you can acquire those error messages or exception details

in client-side using the [actionFailure](#) event.

The argument passed to the [actionFailure](#) event contains the error details returned from the server.

INDEX.TS

```
import { Kanban, DialogEventArgs } from '@syncfusion/ej2-kanban';
import { DataManager } from '@syncfusion/ej2-data';
let data: DataManager = new DataManager({
    url: 'http://some.com/invalidUrl'
});
let kanbanObj: Kanban = new Kanban({
    dataSource: data,
    keyField: 'Status',
    columns: [
        { headerText: 'Backlog', keyField: 'Open' },
        { headerText: 'In Progress', keyField: 'InProgress' },
        { headerText: 'Testing', keyField: 'Testing' },
        { headerText: 'Done', keyField: 'Close' }
    ],
    cardSettings: {
        contentField: 'Summary',
        headerField: 'Id'
    },
    actionFailure: (e) => {
        let span: HTMLElement = document.createElement('span');
        kanbanObj.element.parentNode.insertBefore(span, kanbanObj.element);
        span.style.color = '#FF0000';
        span.innerHTML = 'Server exception: 404 Not found';
    }
});
kanbanObj.appendTo('#Kanban');
```

```

Server exception: 404 Not found

The [actionFailure](#) event will be triggered not only for the server errors, but also when there is an exception while processing the kanban actions.

Loading data via ajax

You can use Kanban [dataSource](#) property to bind the datasource to Kanban from external ajax request. In the following code, we have fetched the datasource from the server using ajax request and provided that to the [dataSource](#) property by using the **onSuccess** event of ajax.

INDEX.TS

```

import { Kanban, DialogEventArgs } from '@syncfusion/ej2-kanban';
import { Ajax } from '@syncfusion/ej2-base';
let kanbanObj: Kanban = new Kanban({
    keyField: 'ShipCountry',
    columns: [
        { headerText: 'Denmark', keyField: 'Denmark' },
        { headerText: 'Brazil', keyField: 'Brazil' },
        { headerText: 'Switzerland', keyField: 'Switzerland' },
        { headerText: 'Germany', keyField: 'Germany' }
    ],
    cardSettings: {
        contentField: 'ShippedDate',
        headerField: 'OrderID'
    }
});
kanbanObj.appendTo('#Kanban');
let button = document.getElementById('btn');
button.addEventListener("click", function(e) {
    let ajax = new Ajax("https://ej2services.syncfusion.com/production/web-services/api/Orders", "GET");
    ajax.send();
    ajax.onSuccess = function (data: string) {
        kanbanObj.dataSource = JSON.parse(data);
    };
});

```

INDEX.HTML

```

* If you bind the dataSource from this way, then it acts like a local dataSource. So you cannot perform any server-side crud actions.

Swimlane in EJ2 JavaScript Kanban control

Swimlanes are horizontal categorizations of cards on the Kanban board. It is used for grouping of cards, which brings transparency to the workflow process.

Render swimlane row

Cards can be grouped based on **keyField** and displayed in rows, which are separated by columns. It is mandatory to define the **keyField** that is mapped from the datasource for rendering swimlane rows in the Kanban board.

INDEX.TS

```

import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
    dataSource: kanbanData,
    keyField: 'Status',
    columns: [
        { headerText: 'Backlog', keyField: 'Open' },
        { headerText: 'In Progress', keyField: 'InProgress' },
        { headerText: 'Testing', keyField: 'Testing' },
        { headerText: 'Done', keyField: 'Close' }
    ],
    cardSettings: {
        contentField: 'Summary',
        headerField: 'Id'
    },
    swimlaneSettings: {
        keyField: 'Assignee'
    }
});
kanbanObj.appendTo('#Kanban');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Kanban Swimlane</title>

  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Custom row text

Customize the swimlane row header text by using the `textField` property mapped from datasource.

It is not mandatory to define the `textField` to `swimlaneSettings`. It will automatically consider the `keyField` to swimlane row header text.

If the mapping `textField` key is not present in the datasource, it will consider the swimlane `keyField` as swimlane row header text.

INDEX.TS

```
import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
    dataSource: kanbanData,
    keyField: 'Status',
    columns: [
        { headerText: 'Backlog', keyField: 'Open' },
        { headerText: 'In Progress', keyField: 'InProgress' },
        { headerText: 'Testing', keyField: 'Testing' },
        { headerText: 'Done', keyField: 'Close' }
    ],
    cardSettings: {
        contentField: 'Summary',
        headerField: 'Id'
    },
    swimlaneSettings: {
        keyField: 'Assignee',
        textField: 'AssigneeName'
    }
});
kanbanObj.appendTo('#Kanban');
```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Template

You can customize the Kanban swimlane row by using the `template` property, which is specified within the `swimlaneSettings` property. In this demo, the swimlane header is customized with HTML element.

You can get the following swimlane data when using a swimlane template.

- `keyField`
- `textField`
- `count`

INDEX.TS

```

import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
    dataSource: kanbanData,
    keyField: 'Status',
    columns: [
        { headerText: 'Backlog', keyField: 'Open' },
        { headerText: 'In Progress', keyField: 'InProgress' },
        { headerText: 'Testing', keyField: 'Testing' },
        { headerText: 'Done', keyField: 'Close' }
    ],
    cardSettings: {
        contentField: 'Summary',
        headerField: 'Id'
    },
    swimlaneSettings: {
        keyField: 'Assignee',
        textField: 'AssigneeName',
        template: '#swimlaneTemplate'
    }
});
kanbanObj.appendTo('#Kanban');

```

INDEX.HTML

```

Drag-and-drop

By default, The Kanban does not allow dragging the cards across the swimlane rows. Enabling the `dragAndDrop` property allows you to drag the cards across the swimlane rows, which is specified inside `swimlaneSettings` property.

INDEX.TS

```

import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
    dataSource: kanbanData,
    keyField: 'Status',
    columns: [
        { headerText: 'Backlog', keyField: 'Open' },
        { headerText: 'In Progress', keyField: 'InProgress' },
        { headerText: 'Testing', keyField: 'Testing' },
        { headerText: 'Done', keyField: 'Close' }
    ],
    cardSettings: {
        contentField: 'Summary',

```

```

        headerField: 'Id'
    },
    swimlaneSettings: {
        keyField: 'Assignee',
        allowDragAndDrop: true
    }
});
kanbanObj.appendTo('#Kanban');

```

Create empty row

You can render the empty swimlane row by enabling the `showEmptyRow` property. If mapping `keyField` does not have cards, empty swimlane row will be rendered.

INDEX.TS

```
import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
  dataSource: kanbanData,
  keyField: 'Status',
  columns: [
    { headerText: 'Backlog', keyField: 'Open' },
    { headerText: 'In Progress', keyField: 'InProgress' },
    { headerText: 'Done', keyField: 'Close' }
  ],
  cardSettings: {
    contentField: 'Summary',
    headerField: 'Id'
  },
  swimlaneSettings: {
    keyField: 'Assignee',
    showEmptyRow: true
  }
});
kanbanObj.appendTo('#Kanban');
```

INDEX.HTML

Calculate cards count

Users can show or hide the cards count by swimlane row in header when enabling the `showItemCount` property, which is enabled by default on the Kanban board.

Provided localization support for **items** text.

In below demo, disabled on `showItemCount` property on rendering swimlane row without total count.

INDEX.TS

```

import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
    dataSource: kanbanData,
    keyField: 'Status',
    columns: [
        { headerText: 'Backlog', keyField: 'Open' },
        { headerText: 'In Progress', keyField: 'InProgress' },
        { headerText: 'Testing', keyField: 'Testing' },
        { headerText: 'Done', keyField: 'Close' }
    ],
    cardSettings: {
        contentField: 'Summary',
        headerField: 'Id'
    },
    swimlaneSettings: {
        keyField: 'Assignee',
        showItemCount: false
    }
});
kanbanObj.appendTo('#Kanban');

```

  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Enable frozen rows

Frozen rows provide an option to make the current swimlane row header text always visible on top of the content while scrolling the Kanban content. The swimlane header text will be changed dynamically, when you scroll to another swimlane row.

By default, the `enableFrozenRows` property is set as `false`. If you wish to show the swimlane frozen rows, you can enable the `enableFrozenRows` property.

This feature support only when using Kanban content scrolling.

INDEX.TS

```
import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';

Drag and drop in EJ2 JavaScript Kanban control

All cards can be dragged and dropped across the columns or within the columns or swimlane row or kanban to an external source and vice versa.

The following drag and drop types are available in the Kanban board.

- Internal drag and drop
- Column drag and drop
- Swimlane drag and drop
- External drag and drop
- Kanban to Kanban
- Kanban to External source and vice versa.

Dropped card position varies based on the `sortSettings` property.

Internal drag and drop

Allows the user to drag and drop the cards within the kanban board. Based on this, we can categorize into two ways.

- Column drag and drop
- Swimlane drag and drop

Column drag and drop

By default, all cards can be dragged and dropped across the columns and within the columns. You cannot drag and drop the cards when disabling the `allowDragAndDrop` property.

You can prevent the drag or drop behavior of the particular column by disabling the `allowDrag` or `allowDrop` property.

You can also control the flow of transition cards between the columns by using the `transitionColumns` property.

In the following example, disable the drag and drop behavior on the Kanban board.

INDEX.TS

```
import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
    dataSource: kanbanData,
    keyField: 'Status',
    columns: [
        { headerText: 'Backlog', keyField: 'Open' },
        { headerText: 'In Progress', keyField: 'InProgress' },
        { headerText: 'Testing', keyField: 'Testing' },
        { headerText: 'Done', keyField: 'Close' }
    ],
    cardSettings: {
        contentField: 'Summary',
        headerField: 'Id'
    },
    allowDragAndDrop: false
});
kanbanObj.appendTo('#Kanban');
```

var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Swimlane drag and drop

By default, Swimlane allows drag and drop across the columns within the swimlane row. Kanban does not allow dragging the cards across the swimlane rows.

Enabling the `dragAndDrop` property allows you to drag the cards across the swimlane rows, which is specified inside the `swimlaneSettings` property.

External drag and drop

Allows the user to drag and drop the cards from one kanban to another kanban or Kanban to an external source and vice versa.

Kanban to kanban

Drag and drop the card from one kanban to another kanban and vice versa. This can be achieved by specifying the `externalDropId` property which is used to specify the id of the dropped kanban element and the `dragStop` event which is used to delete the card on dragged Kanban and add the card on dropped Kanban using the `deleteCard` and `addCard` public methods.

Before adding a card to dropped kanban, you can manually change the card data `headerField` when the same card data `headerField` is dropped to another Kanban.

In the following example, Drag the card from one Kanban and drop it into another kanban using the `dragStop` event. In this event, remove the card from the dragged Kanban by using the `deleteCard` public method and add the card to the dropped Kanban by using the `addCard` public method.

INDEX.TS

```
import { Kanban } from '@syncfusion/ej2-kanban';
import { closest } from '@syncfusion/ej2-base';
import { kanbanAData, kanbanBData } from './datasource.ts';

Sort in EJ2 JavaScript Kanban control

The Kanban provides built-in support to arrange the cards in their columns based on the JSON data order and drop the cards in the columns based on the dropped clone. Initially, users can change the arrangement of cards in the columns and position of the dropped card by using the [sortBy](#) property. The [sortBy](#) property contains three enumeration values as follows.

- Index
- DataSourceOrder
- Custom

Index

SortBy **Index** property can be used with or without [field](#) mapping.

Index without field mapping

By default, SortBy **Index** property support without any [field](#) mapping. In this behavior, cards are loaded based on the JSON data order and cards are dropped based on the dropped clone.

INDEX.TS

```

import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
  dataSource: kanbanData,
  keyField: 'Status',
  columns: [
    { headerText: 'Backlog', keyField: 'Open' },
    { headerText: 'In Progress', keyField: 'InProgress' },
    { headerText: 'Testing', keyField: 'Testing' },
    { headerText: 'Done', keyField: 'Close' }
  ]
});

```

```

    ],
    cardSettings: {
        contentField: 'Summary',
        headerField: 'Id'
    }
});
kanbanObj.appendTo('#Kanban');

```

INDEX.HTML

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Index with field mapping

SortBy **Index** property also supports with **field** mapping. In this behavior, cards are loaded based on mapping **field** values, and cards are dropped based on the dropped clone.

Cards are placed in a particular position in the columns where you can drop the cards by specifying the **field** property, which is mapped from the data source. This property allows the users to drop the cards in the Kanban board where the dropped clone is created exactly. It is also helpful to render the cards based on the **field** property value.

The **field** property mapping key value must be in **number** format.

The following cases will dynamically change their **field** value when dropping the cards.

- If the cell has no cards, the dropped card **field** value does not change.
- If the cell has one card and dropped a card to the last position or previous/next cards that do not have continuous order, then the dropped card **field** value will be changed based on their previous card value.
- If the cell has one card and dropped a card on the previous position, then it will compare both the values, and the dropped card **field** value will be changed if the cards have continuous order otherwise values will not be changed.
- When the previous and next cards do not have continuous order, the dropped card **field** value will be changed based on the previous card value.
- When the previous and next cards have continuous order or odd/even value, then the **field** value of the dropped card and the cards followed by the dropped card will be changed based on the **previous** card value with continuous order.

For Example,

Continuous Order -

Consider, Column A has Card A with priority value **1**, Card B with priority value **2**, and Card C with priority value **3**.

and Column B has Card D with priority value **5**, then the dropped Card D will be placed between Card A and Card B. Now, the Cards D, B, and C will be dynamically changed to the priority values as **2**, **3**, and **4** respectively.

Odd/Even order -

Consider, Column A has Card A with priority value **1**, Card B with priority value **3**, and Card C with priority value **5**.

and Column B has Card D with priority value **5**, then the Dropped Card D will be placed between Card A and Card B. Now, the Cards D, B, and C will be dynamically changed to the priority values as **2**, **3**, and **5** respectively.

INDEX.TS

```
import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
  dataSource: kanbanData,
```

```

    keyField: 'Status',
    columns: [
        { headerText: 'Backlog', keyField: 'Open' },
        { headerText: 'In Progress', keyField: 'InProgress' },
        { headerText: 'Testing', keyField: 'Testing' },
        { headerText: 'Done', keyField: 'Close' }
    ],
    cardSettings: {
        contentField: 'Summary',
        headerField: 'Id'
    },
    sortSettings: {
        sortBy: 'Index',
        field: 'RankId'
    }
});
kanbanObj.appendTo('#Kanban');

```

Custom

Custom with field mapping

The SortBy **Custom** property must require datasource [field](#) mapping. In this behavior, cards are loaded based on the [field](#) mapping value and also cards are dropped based on the [field](#) mapping value.

INDEX.TS

```

import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
    dataSource: kanbanData,
    keyField: 'Status',
    columns: [
        { headerText: 'Backlog', keyField: 'Open' },
        { headerText: 'In Progress', keyField: 'InProgress' },
        { headerText: 'Testing', keyField: 'Testing' },
        { headerText: 'Done', keyField: 'Close' }
    ],
    cardSettings: {
        contentField: 'Summary',
        headerField: 'Id'
    },
    sortSettings: {

```

```

        sortBy: 'Custom',
        field: 'Summary'
    }
});
kanbanObj.appendTo('#Kanban');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

</body></html>

```

Change the direction

Kanban board also provides support for aligning the cards in the columns using the [direction](#) property inside the [sortSettings](#) property. Based on this, cards can be aligned in the columns either in **Ascending** or **Descending** order. Sorting direction will be performed based on [sortBy](#) property.

By default, cards are aligned in the columns based on **Ascending** order.

In the following sample, cards are aligned in **Descending** order.

INDEX.TS

```
import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
    dataSource: kanbanData,
    keyField: 'Status',
    columns: [
        { headerText: 'Backlog', keyField: 'Open' },
        { headerText: 'In Progress', keyField: 'InProgress' },
        { headerText: 'Testing', keyField: 'Testing' },
        { headerText: 'Done', keyField: 'Close' }
    ],
    cardSettings: {
        contentField: 'Summary',
        headerField: 'Id'
    },
    sortSettings: {
        sortBy: 'Custom',
        field: 'Summary',
        direction: 'Descending'
    }
});
kanbanObj.appendTo('#Kanban');
```

INDEX.HTML

Dialog in EJ2 JavaScript Kanban control

The Kanban provides built-in support to add, edit and delete a card using dialog module. User can edit a card using the following ways.

- Built-in dialog module
- Custom Fields
- Dialog template

Default Dialog

When double-click on the cards, the dialog is opened with below fields to edit a card. This dialog contains **Delete**, **Save** and **Cancel** buttons.

- To edit a card, modify the card details and click the **Save** button.
- To delete a card, click **Delete** button.
- Click on the **Cancel** button to cancel the editing action.

The dialog displays with the following fields which mapped to dialog fields by default.

Key | Type | Text

cardSettings.headerField | Input | ID

keyField | DropDown | -

cardSettings.contentField | TextArea | -

cardSettings.priority(If applicable) | Numeric | -

swimlaneSettings.keyField(If applicable) | DropDown | -

INDEX.TS

```
import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
    dataSource: kanbanData,
    keyField: 'Status',
    columns: [
        { headerText: 'Backlog', keyField: 'Open' },
        { headerText: 'In Progress', keyField: 'InProgress' },
        { headerText: 'Testing', keyField: 'Testing' },
        { headerText: 'Done', keyField: 'Close' }
    ],
    cardSettings: {
        contentField: 'Summary',

</body></html>
```

Custom Fields

You can change the default fields of dialog using `fields` property inside the `dialogSettings` property. The `key` property used to map the `dataSource` value and rendered the corresponding component based on specified `type` property.

The following types are available in dialog fields.

- String
- Numeric
- TextArea
- DropDown
- TextBox
- Input

If `type` is not defined in the fields, then it renders as the HTML input element in dialog.

INDEX.TS

```
import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
  dataSource: kanbanData,
  keyField: 'Status',
  columns: [
    { headerText: 'Backlog', keyField: 'Open' },
    { headerText: 'In Progress', keyField: 'InProgress' },
    { headerText: 'Testing', keyField: 'Testing' },
    { headerText: 'Done', keyField: 'Close' }
  ],
  cardSettings: {
    contentField: 'Summary',
    headerField: 'Id'
  },
  dialogSettings: {
    fields: [
      { key: 'Id', type: 'Input' },
      { key: 'Status', type: 'DropDown' },
      { key: 'Estimate', type: 'Numeric' },
```

```

        { key: 'Summary', type: 'TextArea' }
    ]
}
});
kanbanObj.appendTo('#Kanban');

```

Prevent Dialog

The Kanban allows to prevent to open a dialog on card double-click by enabling `args.cancel` in `dialogOpen` event.

INDEX.TS

```
import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData, DialogEventArgs } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
  dataSource: kanbanData,
  keyField: 'Status',
  columns: [
    { headerText: 'Backlog', keyField: 'Open' },
    { headerText: 'In Progress', keyField: 'InProgress' },
    { headerText: 'Testing', keyField: 'Testing' },
    { headerText: 'Done', keyField: 'Close' }
  ],
  cardSettings: {
    contentField: 'Summary',
    headerField: 'Id'
  },
  dialogOpen: 'dialogOpen'
});
kanbanObj.appendTo('#Kanban');
function dialogOpen(args: DialogEventArgs): void {
  args.cancel = true;
}
```

Persisting data in server

The modified card data can be persisted in the database using the RESTful web services. All the CRUD operations in the Kanban are done through [DataManager](#). The [DataManager](#) has an option to bind all the CRUD related data in server-side.

For your information, the ODataAdaptor persists data in the server as per OData protocol.

In the below section covers how to get the edited data details on the server-side using the [UrlAdaptor](#).

URL adaptor

You can use the [UrlAdaptor](#) of [DataManager](#) when binding data source for remote data. In the initial load of Kanban, data are fetched from remote data and bound to the Kanban using [url](#) property of [DataManager](#).

You can map the CRUD operation in Kanban can be mapped to server-side controller actions using the properties [insertUrl](#), [removeUrl](#), [updateUrl](#), and [crudUrl](#).

- [insertUrl](#) – You can perform single insertion operation on server-side.
- [updateUrl](#) – You can update single data on server-side.
- [removeUrl](#) – You can remove single data on server-side.
- [crudUrl](#) – You can perform bulk data operation on server-side.

The following code example describes the above behavior.

```
`ts
```

```

import { Kanban } from '@syncfusion/ej2-kanban';
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
let data: DataManager = new DataManager({

```

```

url: 'Home/DataSource',
updateUrl: 'Home/Update',
insertUrl: 'Home/Insert',
removeUrl: 'Home/Delete',
adaptor: new UrlAdaptor(),
crossDomain: true
});
let kanbanObj: Kanban = new Kanban({
dataSource: data,
keyField: 'Status',
columns: [
{ headerText: 'Backlog', keyField: 'Open' },
{ headerText: 'In Progress', keyField: 'InProgress' },
{ headerText: 'Testing', keyField: 'Testing' },
{ headerText: 'Done', keyField: 'Close' }
],
cardSettings: {
contentField: 'Summary',
headerField: 'Id'
}
});
kanbanObj.appendTo('#Kanban');

```

The server-side controller code to handle the CRUD operations are as follows.

```

`ts
private NORTHWNDEntities db = new NORTHWNDEntities();
public ActionResult DataSource() {
var DataSource = db.Tasks.ToList();
return Json(DataSource, JsonRequestBehavior.AllowGet);
}
public ActionResult Insert(Params value) {
//Insert card data into the database
return Json(value, JsonRequestBehavior.AllowGet);
}

```

```

}
public ActionResult Update(Params value) {
//Update card data into the database
return Json(value, JsonRequestBehavior.AllowGet);
}
public void Delete(Params value) {
//Delete card data from the database
}
public class Params {
public int Id { get; set; }
public string Status { get; set; }
public string Summary { get; set; }
public string Assignee { get; set; }
}
`ts

```

Insert card

Using the `insertUrl` property, you can specify the controller action mapping URL to perform insert operation on the server-side.

The following code example describes the above behavior.

```

`ts
public ActionResult Insert(Params value)
{
//Insert card in the database
}
`ts

```

The newly added record details are bound to the `value` parameter.

Update card

Using the `updateUrl` property, the controller action mapping URL can be specified to perform save/update operation on the server-side.

The following code example describes the above behavior.

```

`ts
public ActionResult Update(Params value)
{
//Update card data in the database
}
`ts

```

```
}
,
```

The updated record details are bound to the `value` parameter.

Delete card

Using the `removeUrl` property, the controller action mapping URL can be specified to perform delete operation on the server-side.

The following code example describes the above behavior.

```
`ts
public void Delete(int key)
{
//Delete card in the database
}
,
```

The deleted card primary key value is bound to the `key` parameter.

CRUD URL

Using the `crudUrl` property, the controller action mapping URL can be specified to perform all the CRUD operations at the server-side using a single method instead of specifying a separate controller action method for CRUD (insert, update and delete) operations.

The action parameter of `crudUrl` is used to get the corresponding CRUD action.

The following code example describes the above behavior.

```
`ts
import { Kanban } from '@syncfusion/ej2-kanban';
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
let data: DataManager = new DataManager({
url: 'Home/DataSource',
updateUrl: 'Home/UpdateData',
insertUrl: 'Home/UpdateData',
removeUrl: 'Home/UpdateData',
crudUrl: 'Home/UpdateData',
adaptor: new UrlAdaptor(),
crossDomain: true
});
let kanbanObj: Kanban = new Kanban({
dataSource: data,
```

```

keyField: 'Status',
columns: [
{ headerText: 'Backlog', keyField: 'Open' },
{ headerText: 'In Progress', keyField: 'InProgress' },
{ headerText: 'Testing', keyField: 'Testing' },
{ headerText: 'Done', keyField: 'Close' }
],
cardSettings: {
contentField: 'Summary',
headerField: 'Id'
}
});
kanbanObj.appendTo('#Kanban');
`ts
private NORTHWNDEntities db = new NORTHWNDEntities();
public ActionResult DataSource() {
var DataSource = db.Tasks.ToList();
return Json(DataSource, JsonRequestBehavior.AllowGet);
}
public ActionResult UpdateData(EditParams param) {
if (param.action == "insert" || (param.action == "batch" && param.added != null)) {
if (param.action == "insert") {
db.Tasks.Add(param.value);
} else {
foreach (var temp in param.added) {
db.Tasks.Add(temp);
}
}
}
if (param.action == "update" || (param.action == "batch" && param.changed != null)) {
if (param.action == "update") {
Task old = db.Tasks.Where(o => o.Id == param.value.Id).SingleOrDefault();

```

```
if (old != null) {
    db.Entry(old).CurrentValues.SetValues(param.value);
}
} else {
    foreach (var temp in param.changed) {
        Task old = db.Tasks.Where(o => o.Id == temp.Id).SingleOrDefault();
        if (old != null) {
            db.Entry(old).CurrentValues.SetValues(temp);
        }
    }
}

if (param.action == "remove" || (param.action == "batch" && param.deleted != null)) {
    if (param.action == "remove") {
        int key = Convert.ToInt32(param.key);
        db.Tasks.Remove(db.Tasks.Where(o => o.Id == key).SingleOrDefault());
    } else {
        foreach (var temp in param.deleted) {
            db.Tasks.Remove(db.Tasks.Where(o => o.Id == temp.Id).SingleOrDefault());
        }
    }
}

db.SaveChanges();
return Json(param, JsonRequestBehavior.AllowGet);
}

public class EditParams {
    public string key { get; set; }
    public string action { get; set; }
    public List<Tasks> added { get; set; }
    public List<Tasks> changed { get; set; }
    public List<Tasks> deleted { get; set; }
    public Tasks value { get; set; }
}
```

The `crudUrl` is used to update the bulk data sent to the server-side. Multiple selections and `sortBy` as `Index` properties are used for `crudUrl` properties to update the modified bulk data to the server-side.

Tooltip in EJ2 JavaScript Kanban control

The tooltip is used to show the card information when the cursor hover over the card elements using the `enableTooltip` property. Tooltip content is dynamically set based on hovering over the card elements.

If you wish to show tooltip on Kanban board custom elements, you need to add `e-tooltip-text` class name of a particular element.

Tooltip template

You can customize the tooltip content with any HTML or CSS element and styling using the `tooltipTemplate` property. In the following demo, the tooltip is customized with HTML elements.

INDEX.TS

```
import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
  dataSource: kanbanData,
  keyField: 'Status',
  columns: [
    { headerText: 'Backlog', keyField: 'Open' },
    { headerText: 'In Progress', keyField: 'InProgress' },
    { headerText: 'Testing', keyField: 'Testing' },
    { headerText: 'Done', keyField: 'Close' }
  ],
  cardSettings: {
    contentField: 'Summary',
    headerField: 'Id'
  },
  enableTooltip: true,
  tooltipTemplate: '#tooltipTemplate'
});
kanbanObj.appendTo('#Kanban');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

```

Validation in EJ2 JavaScript Kanban control

Validate particular column using the **minCount** or **maxCount** properties. The corresponding columns gets different appearance when validation fails. In default layout, **constraintType** property accept only **Column** type. In swimlane layout, accept both **Column** and **Swimlane** constraint type.

There are two types of constraints:

1. Column
2. Swimlane

By default, the column count validation is performed based on Kanban **columns**.

Minimum card limit

The **minCount** property is used to specify the minimum cards hold on particular column or swimlane cell. If the column or swimlane total card count falls short of the minimum count value, it shows the column or cell background colour with validation fails.

Maximum card limit

The **maxCount** property is used to specify the maximum cards hold on particular column or swimlane cell. If the column or swimlane cell total card count exceeds the maximum count value, it shows the column or cell background colour with validation fails.

INDEX.TS

```

import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
    dataSource: kanbanData,
    keyField: 'Status',
    columns: [

```

```

    { headerText: 'Backlog', keyField: 'Open', showItemCount: true,
minCount: 6 },
    { headerText: 'In Progress', keyField: 'InProgress', showItemCount:
true, maxCount: 5 },
    { headerText: 'Testing', keyField: 'Testing', showItemCount: true,
maxCount: 4, minCount: 3 },
    { headerText: 'Done', keyField: 'Close', showItemCount: true }
  ],
  cardSettings: {
    contentField: 'Summary',
    headerField: 'Id'
  }
});
kanbanObj.appendTo('#Kanban');
```

```

Virtualization in EJ2 JavaScript Kanban control

Kanban allows you to load a large amount of data without any performance degradation. This feature can be enabled by setting the [enableVirtualization](#) property in the Kanban to `true`.

Virtual scrolling

Virtual scrolling optimizes data rendering within each column when using large datasets. Only a subset of cards that are visible and about to be loaded on the screen are rendered. The number of records displayed in the Kanban is determined implicitly by the height of the Kanban area and the card height. The [cardHeight](#) property of Kanban can be used to set the cards' height in pixel value. By default, the card height will be `auto`.

When the Kanban column is scrolled, the virtual scrolling feature dynamically loads additional data on demand into view and unloads the data that is no longer visible.

INDEX.TS

```

import { Kanban } from '@syncfusion/ej2-kanban';
import { generateKanbanDataVirtualScrollData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
    enableVirtualization: true, // To enable virtual scrolling feature.
    dataSource: generateKanbanDataVirtualScrollData(),
    keyField: 'Status',
    enableTooltip: true,
    columns: [
        { headerText: 'To Do', keyField: 'Open' },
        { headerText: 'In Progress', keyField: 'InProgress' },
        { headerText: 'Code Review', keyField: 'Review' },
        { headerText: 'Done', keyField: 'Close' }
    ],
    cardSettings: {
        headerField: 'Id',
        contentField: 'Summary',
        selectionType: 'Multiple'
    },
    dialogSettings : {
        fields: [
            {key: 'Id', text: 'ID', type: 'TextBox'},
            {key: 'Status', text: 'Status', type: 'DropDown'},
            {key: 'StoryPoints', text: 'Story Points', type: 'Numeric' },
            {key: 'Summary', text: 'Summary', type: 'TextArea'}
        ]
    }
});
kanbanObj.appendTo('#Kanban');

```

INDEX.HTML

</body></html>

```

Configure the remote data service

When the remote data is configured for the [dataSource](#), the service method will receive an additional **KanbanVirtualization** parameter to handle the initial data load for Kanban Virtualization.

To handle Kanban virtual scrolling, the server-side code needs to handle the **Where** and **Take** queries differently using the **KanbanVirtualization** parameter. The following is the example code for handling Kanban virtualization's initial data load using the **KanbanVirtualization** parameter.

```
`ts
```

```
public IActionResult LoadCard([FromBody] ExtendedDataManagerRequest dm)
{
    kanbanData = _context.KanbanCards.ToList();
    IEnumerable<KanbanCard> DataSource = kanbanData.AsEnumerable();
    DataOperations operation = new DataOperations();
    // For normal kanban data load Where query handling.
    if (dm.Where != null && dm.Where.Count > 0 && dm.KanbanVirtualization != "KanbanVirtualization")
    {
        dm.Where[0].value = dm.Where[0].value.ToString();
        DataSource = operation.PerformFiltering(DataSource, dm.Where, dm.Where[0].Operator);
    }
    if (dm.Skip != 0)
    {
        DataSource = operation.PerformSkip(DataSource, dm.Skip);
    }
    // For normal Kanban data load Take query handling.
    if (dm.Take != 0 && dm.KanbanVirtualization != "KanbanVirtualization")
    {
        DataSource = operation.PerformTake(DataSource, dm.Take);
    }
    // For Kanban virtual scrolling data load Where and Take query handling.
    var columnCount = new List<KeyValuePair<string, int>>();
    if (dm.KanbanVirtualization == "KanbanVirtualization" && dm.Where != null && dm.Where.Count > 0
        && dm.Take != 0)
    {
        IEnumerable<KanbanCard> currentData = new List<KanbanCard>();
        List<WhereFilter> currentFilter = new List<WhereFilter>();
        for (int i = 0; i < dm.Where.Count; i++)
        {
            dm.Where[i].value = dm.Where[i].value.ToString();
            currentFilter.Add(dm.Where[i]);
            var filterData = operation.PerformFiltering(DataSource, currentFilter, dm.Where[i].Operator);
            columnCount.Add(new KeyValuePair<string, int>(dm.Where[i].value.ToString(), filterData.Count()));
        }
    }
}
```

```

filterData = operation.PerformTake(filterData, dm.Take);
currentData = currentData.Concat(filterData);
currentFilter.Clear();
}
DataSource = currentData;
}
// To return the data for Kanban virtual scrolling.
if (dm.KanbanVirtualization == "KanbanVirtualization") {
return Json(new { result = DataSource, count = columnCount });
}
// To return the data for Kanban virtual scrolling.
else
{
return Json(DataSource);
}
}
`

```

Limitations for virtual scrolling

- When virtualization is enabled in a Kanban board and the card height is not explicitly set, it will not default to `auto` height. Instead, a fixed height of `100px` will be applied to the cards. It's important to note that the card height should be specified in pixel values, as percentage values are not accepted.
- When a card is dragged and dropped, the index position of the card will not be preserved when scrolling through the column.
- Virtualization is not supported for swimlanes in the Kanban board.

Localization in EJ2 JavaScript Kanban control

The localization library allows you to localize the default text content of the Kanban to different cultures using the `locale` property.

In Kanban, total count and min or max count text alone will be localized based on culture.

| Locale key | en-US (default) |

|-----|-----|

| items | items |

| min | Min |

| max | Max |

| cardsSelected | Cards Selected |

| addTitle | Add New Card |

| editTitle | Edit Card Details |

| deleteTitle | Delete Card |

| deleteContent | Are you sure you want to delete this card? |

| save | Save |

| delete | Delete |

| cancel | Cancel |

| yes | Yes |

| no | No |

| close | Close |

| noCard | No cards to display |

| unassigned | Unassigned |

Loading translations

To load translation object in an application, use `load` function of `L10n` class.

The following example demonstrates the Kanban in `Deutsch` culture.

INDEX.TS

```
import { Kanban } from '@syncfusion/ej2-kanban';
import { L10n } from '@syncfusion/ej2-base';
import { kanbanData } from './datasource.ts';
L10n.load({
  'de': {
    'kanban': {
      'items': 'Artikel',
      'min': 'Min',
      'max': 'Max',
      'cardsSelected': 'Karten ausgewählt',
      'addTitle': 'Neue Karte hinzufügen',
      'editTitle': 'Kartendetails bearbeiten',
      'deleteTitle': 'Karte löschen',
      'deleteContent': 'Möchten Sie diese Karte wirklich löschen?',
      'save': 'speichern',
      'delete': 'Löschen',
      'cancel': 'Stornieren',
      'yes': 'Ja',
      'no': 'Nein',
      'close': 'Schließen',
      'noCard': 'Keine Karten zum Anzeigen',
      'unassigned': 'nicht zugewiesen'
    }
  }
});
let kanbanObj: Kanban = new Kanban({
  dataSource: kanbanData,
  keyField: 'Status',
```

```

    locale: 'de',
    columns: [
        { headerText: 'Backlog', keyField: 'Open', showItemCount: true,
minCount: 6 },
        { headerText: 'In Progress', keyField: 'InProgress', showItemCount:
true, maxCount: 3 },
        { headerText: 'Done', keyField: 'Close', showItemCount: true }
    ],
    cardSettings: {
        contentField: 'Summary',

Right to left (RTL)

The Kanban provides an option to switch its text direction and layout from right to left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Farsi, Urdu, etc.). To enable right-to-left mode in Kanban, set the `enableRtl` to true.

INDEX.TS

```

Dimensions in EJ2 JavaScript Kanban control

The Kanban dimensions refers to both height and width of the entire layout and it accepts three types of values.

- Auto
- Pixel
- Percentage

Auto height and width

When height and width of the Kanban are set to **auto**, it will try as hard as possible to keep an element the same width as its parent container. In other words, the parent container that holds Kanban, its width or height will be the sum of its children. By default, Kanban is assigned with **auto** values for both the height and width properties.

INDEX.TS

```
import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
  dataSource: kanbanData,
  keyField: 'Status',
  columns: [
    { headerText: 'Backlog', keyField: 'Open' },
    { headerText: 'In Progress', keyField: 'InProgress' },
    { headerText: 'Testing', keyField: 'Testing' },
    { headerText: 'Done', keyField: 'Close' }
  ],
  width: 'auto',
  height: 'auto',
  cardSettings: {
    contentField: 'Summary',
    headerField: 'Id'
  }
});
kanbanObj.appendTo('#Kanban');
```

Persistence in EJ2 JavaScript Kanban control

State persistence refers to the Kanban state maintained in the browser's [localStorage](#) even if the browser is refreshed or if you move to the next page within the browser.

State persistence stores Kanban datasource, column and swimlane expand/collapse state in the local storage when the [enablePersistence](#) is defined as true.

INDEX.TS

```

import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
    dataSource: kanbanData,
    keyField: 'Status',
    enablePersistence: true,
    columns: [
        { headerText: 'Backlog', keyField: 'Open', allowToggle: true },
        { headerText: 'In Progress', keyField: 'InProgress', allowToggle:
true },
        { headerText: 'Testing', keyField: 'Testing', allowToggle: true },
        { headerText: 'Done', keyField: 'Close', allowToggle: true }
    ],
    cardSettings: {
        contentField: 'Summary',
        headerField: 'Id'
    },
    swimlaneSettings: {
        keyField: 'Assignee'
    }
});
kanbanObj.appendTo('#Kanban');

Responsive mode in EJ2 JavaScript Kanban control

The Kanban component has support for responsive behavior based on the client browser's width and height.

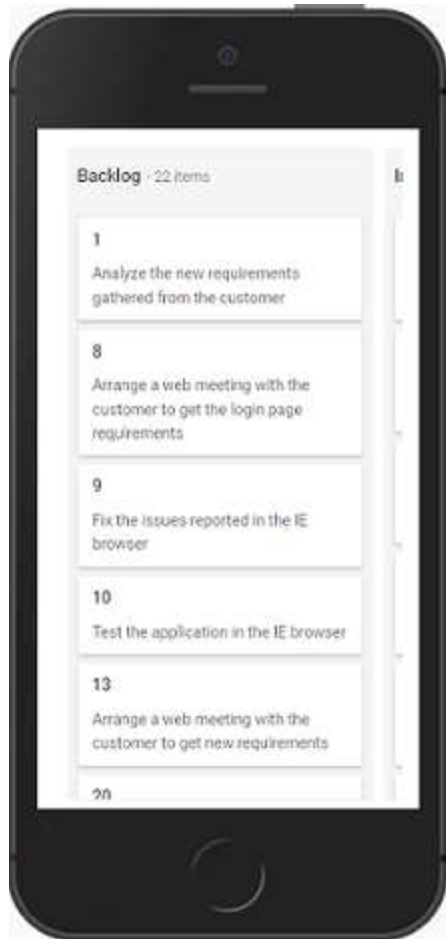

Layouts

Possible layouts are:

- Default Layout
- Swimlane Layout

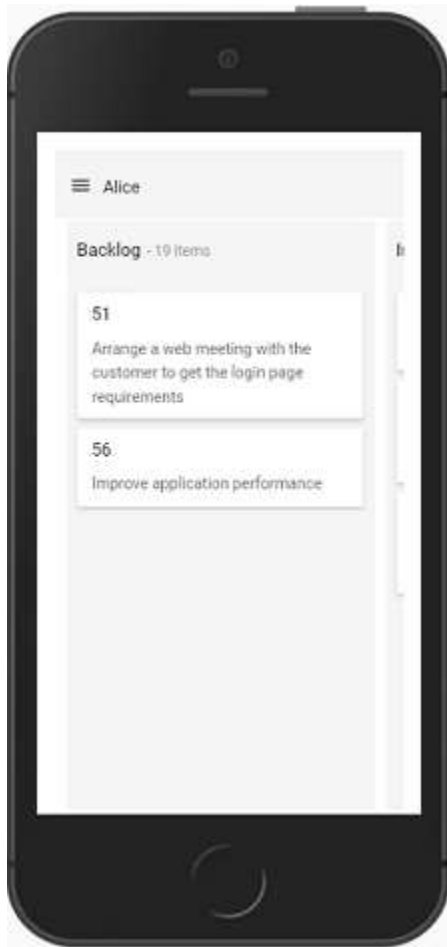

Default Layout

Kanban user interface is customized and redesigned for the best view on small screens. In responsive mode, the first column occupies 80% and the second column occupies 20% of the screen layout. Tap and hold the Kanban card to drag and drop it. Swipe left or right to view the columns.

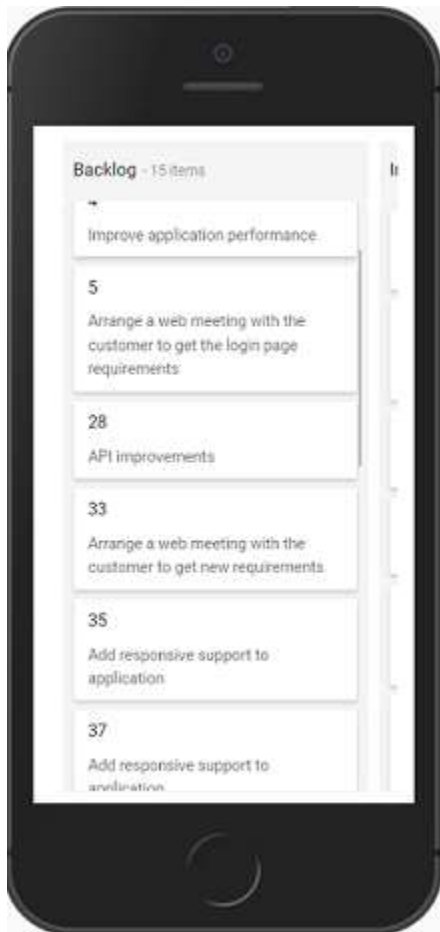

Swimlane Layout

Kanban swimlane header is rendered with menu icon on top of the kanban board. It will show all the available swimlane groups of the header text with a popup when clicking the menu icon. Swimlane selected grouped header text resultant data is rendered on the Kanban board. By default, the first swimlane grouped header text is selected and the resultant data is shown on the Kanban board. The Kanban board data will be changed when changing the swimlane group header text.

Scrolling

Column scrolling will be shown when exceeding the screen size in the columns.

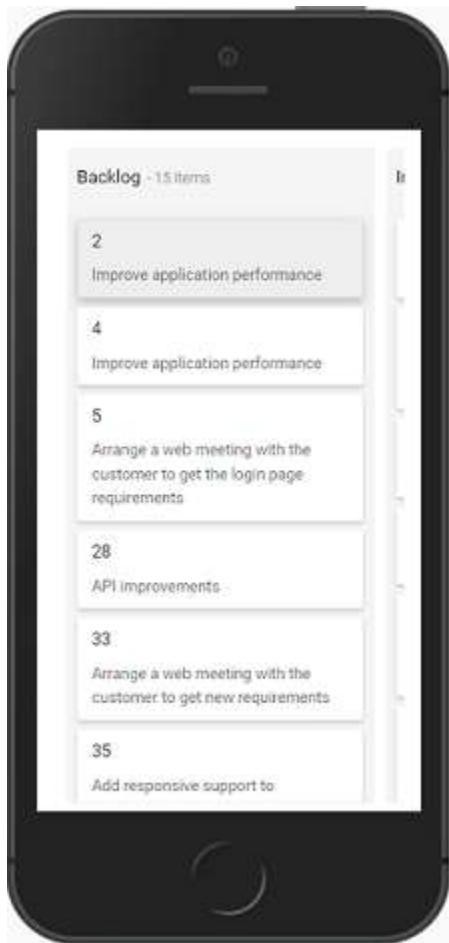

Selection

Select particular cards in the Kanban board by tapping the card.

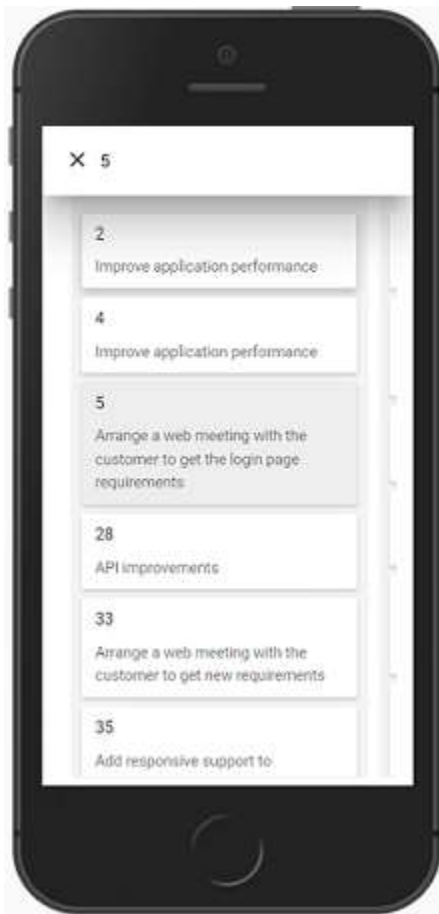

Single Selection

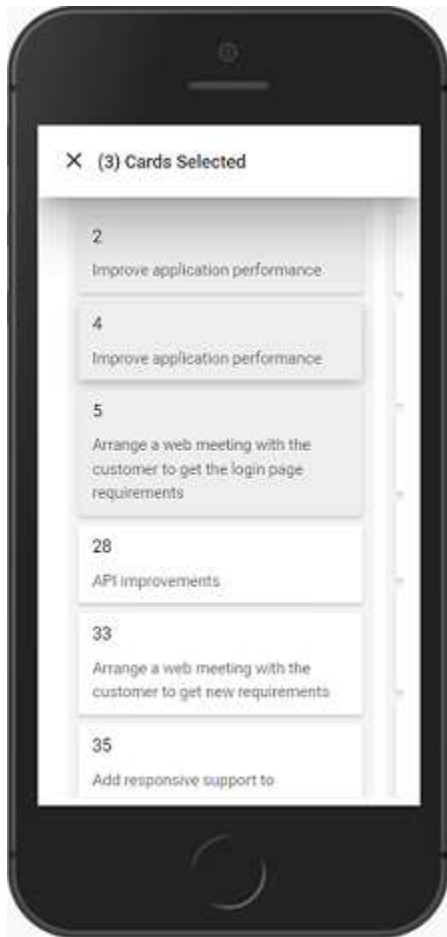

Single card will be selected when you tap the card once and selection will be removed when you select another card.

Multiple Selection

Enable [selectionType](#) as **Multiple** to select multiple cards. It will open the popup on the screen top. Selected card header text will be shown when selecting single card with a tap and hold action. If single card is selected, only tap action is required to select multiple cards. Multiple Selected card count will be shown on the popup when selecting multiple cards.

Style in EJ2 JavaScript Kanban control

To modify the Kanban appearance, you need to override the default CSS of Kanban. Also, you have an option to create your own custom theme using our [Theme Studio](#). Please find the list of CSS classes in Kanban.

Css class	Purpose
-----	-----
.e-kanban .e-kanban-table	customize the kanban.
.e-kanban .e-kanban-header .e-header-cells	Header cells of kanban.
.e-kanban .e-kanban-header .e-header-cells .e-header-wrap .e-header-title	Header title of kanban.
.e-kanban .e-kanban-header .e-header-cells.e-min-color	Header cells minimum color of kanban.
.e-kanban .e-kanban-header .e-header-cells.e-max-color	Header cells maximum color of kanban.
.e-kanban .e-kanban-header .e-header-cells.e-collapsed.e-min-color	Header cells of collapsed column minimum color in column constraint type of kanban.
.e-kanban .e-kanban-header .e-header-cells.e-collapsed.e-max-color	Header cells of collapsed column maximum color in column constraint type of kanban.
.e-kanban .e-kanban-header .e-header-cells .e-header-text	Header text of Kanban.

| .e-kanban .e-kanban-header .e-header-cells .e-item-count | Header cells Item count of Kanban. |

| .e-kanban .e-kanban-header .e-header-cells .e-limits | Header cells limits in column constraint type of kanban. |

| .e-kanban .e-kanban-header .e-header-cells .e-limits .e-min-count | Header cells minimum count of kanban. |

| .e-kanban .e-kanban-header .e-header-cells .e-limits .e-max-count | Header cells maximum count of kanban. |

| .e-kanban .e-kanban-content | Customize kanban Content. |

| .e-kanban .e-kanban-content .e-content-row .e-content-cells .e-limits | Content cells limits in swimlane constraint type of kanban. |

| .e-kanban .e-kanban-content .e-content-row .e-content-cells .e-limits .e-min-count | Content cells minimum count of kanban. |

| .e-kanban .e-kanban-content .e-content-row .e-content-cells .e-limits .e-max-count | Content cells maximum count of kanban. |

| .e-kanban .e-kanban-content .e-content-row .e-content-cells.e-min-color | Content cells minimum color of kanban. |

| .e-kanban .e-kanban-content .e-content-row .e-content-cells.e-max-color | Content cells maximum color of kanban. |

To set fixed position to the Kanban header

The Fixed header in Kanban control can be customized in following ways,

By setting a fixed height to the Kanban content,

```
`css
.e-kanban .e-kanban-content {
height: 500px;
}
`
```

By customizing the CSS for the Kanban header.

```
`css
.e-kanban-header {
position: -webkit-sticky;
position: sticky;
z-index: 100;
top: 0;
}
`
```

Note: It will not affect the Kanban content's height.

Accessibility in EJ2 JavaScript Kanban control

The Kanban component has been designed, keeping in mind the WAI-ARIA specifications, and applies the WAI-ARIA roles, states, and properties. This component is characterized by complete ARIA accessibility support that makes it easy for people who use assistive technologies (AT) or those who completely rely on keyboard navigation.

The accessibility compliance for the Kanban component is outlined below.

Accessibility Criteria	Compatibility
--	--
WCAG 2.2 Support	![Yes](https://cdn.syncfusion.com/content/images/landing-page/yes.png)
Section 508 Support	![Yes](https://cdn.syncfusion.com/content/images/landing-page/yes.png)
Screen Reader Support	![Yes](https://cdn.syncfusion.com/content/images/landing-page/yes.png)
Right-To-Left Support	![Yes](https://cdn.syncfusion.com/content/images/landing-page/yes.png)
Color Contrast	![Intermediate](https://cdn.syncfusion.com/content/images/landing-page/intermediate.png)
Mobile Device Support	![Yes](https://cdn.syncfusion.com/content/images/landing-page/yes.png)

| [Keyboard Navigation Support](#) | ![Yes](https://cdn.syncfusion.com/content/images/landing-page/yes.png) |

| [Accessibility Checker Validation](#) |
 ![Intermediate](https://cdn.syncfusion.com/content/images/landing-page/intermediate.png) |

| [Axe-core Accessibility Validation](#) | ![Yes](https://cdn.syncfusion.com/content/images/landing-page/yes.png) |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

![Yes](https://cdn.syncfusion.com/content/images/landing-page/yes.png) - All features of the component meet the requirement.

![Intermediate](https://cdn.syncfusion.com/content/images/landing-page/intermediate.png) - Some features of the component do not meet the requirement.

![No](https://cdn.syncfusion.com/content/images/landing-page/no.png) - The component does not meet the requirement.

WAI-ARIA attributes

The Kanban component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Kanban component:

| Attributes | Purpose |

| --- | --- |

| **aria-label** | It helps to provides information about elements in a kanban component for assistive technology. |

| **aria-expanded** | Attributes indicate the state of a collapsible element. |

| **aria-selected** | This attribute is assigned to the Kanban component for the selection of elements, and its default value is **false**. The value changes to true when the user selects a Kanban card. |

| **aria-grabbed** | Indicates whether the attribute is set to true. It has been selected for dragging. If this attribute is set to false, the element can be grabbed for a drag-and-drop operation but will not be currently grabbed. |

| **aria-describedby** | This attribute contains the ID of the Kanban header column to indicate that the attribute establishes an association between the Kanban header column and the Kanban column body. |

| **aria-roledescription** | This attribute is assigned to the Kanban component and is used to provide alternative descriptions for card elements. |

Keyboard interaction

The Kanban component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Kanban component.

| **Press** | **To do this** |

| --- | --- |

| **Home** | **To select the first card in the kanban** |

| **End** | **To select the last card in the kanban** |

| **Arrow Up** | **Select the card through the up arrow** |

| **Arrow Down** | **Select the card through the down arrow** |

| **Arrow Right** | **Move the column selection to the right** |

| **Arrow Left** | **Move the column selection to the left** |

| **Ctrl + Enter** | **Used to select the multi cards** |

| **Ctrl + Space** | **Used to select the multi cards** |

| **Shift + Arrow Up** | **Used to select the multiple cards towards up** |

| **Shift + Arrow Down** | **Used to select the multiple cards towards down** |

| **Shift + Tab** | **Reverse order of the tab action** |

| **Enter** | **Open the selected cards** |

| **Tab** | **To navigate the Kanban column** |

| **Delete** | **To delete the selected cards** |

| **ESC** | **Escape from the modified details** |

| **Space** | **Used to open the card edit dialog based on the column selection** |

Disable keyboard interaction

Disables all the functionalities in the Kanban board performed using keyboard by setting the `allowKeyboard` properties to `false`.

INDEX.TS

```
import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
  dataSource: kanbanData,
  keyField: 'Status',
  allowKeyboard: false,
  columns: [
    { headerText: 'Backlog', keyField: 'Open', allowToggle: true },
    { headerText: 'In Progress', keyField: 'InProgress', allowToggle:
true },
    { headerText: 'Testing', keyField: 'Testing', allowToggle: true },
    { headerText: 'Done', keyField: 'Close', allowToggle: true }
  ],
});
```

```

    cardSettings: {
        contentField: 'Summary',
        headerField: 'Id'
    },
    swimlaneSettings: {
        keyField: 'Assignee'
    }
});
kanbanObj.appendTo('#Kanban');

```

Ensuring accessibility

The Kanban component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Kanban component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Kanban component with accessibility tools.

How To

Header double click in EJ2 JavaScript Kanban control

You can bind the header double click event by using the [dataBound](#) event at the initial rendering. You can get the column header text when you double click on the headers.

INDEX.TS

```
import { Kanban } from '@syncfusion/ej2-kanban';
import { DialogUtility } from '@syncfusion/ej2-popups';
import { closest } from '@syncfusion/ej2-base';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
    dataSource: kanbanData,
    keyField: 'Status',
    columns: [
        { headerText: 'Backlog', keyField: 'Open' },
        { headerText: 'In Progress', keyField: 'InProgress' },
        { headerText: 'Testing', keyField: 'Testing' },
        { headerText: 'Done', keyField: 'Close' }
    ],
    cardSettings: {
        contentField: 'Summary',
        headerField: 'Id'
    },
    dataBound: function () {
        let headerEle: HTMLElement = document.querySelector('.e-header-row');
        headerEle.addEventListener("dblclick", function (e: Event) {
            let target = closest((<HTMLElement>e.target), '.e-header-cells');
            DialogUtility.alert({
                title: 'Header',
                content: "Double clicked on " +
                    (<HTMLElement>target.querySelector('.e-header-text')).innerText + " header",
                showCloseIcon: true,
                closeOnEscape: true,
                animationSettings: { effect: 'Zoom' }
            });
        });
    }
});
```

```

    }
  });
  kanbanObj.appendTo('#Kanban');

```

```

Dynamically change columns in EJ2 JavaScript Kanban control

You can dynamically change the Kanban columns by using the [columns](#) property.

In the below sample, you can dynamically change the [allowToggle](#) property at the particular column when you click on the button. You can also change the initially created columns to the new Kanban columns by using the [columns](#) property when you click on the button.

INDEX.TS

```
import { Kanban } from '@syncfusion/ej2-kanban';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
    dataSource: kanbanData,
    keyField: 'Status',
    columns: [
        { headerText: 'Backlog', keyField: 'Open' },
        { headerText: 'In Progress', keyField: 'InProgress' },
        { headerText: 'Testing', keyField: 'Testing' },
        { headerText: 'Done', keyField: 'Close' }
    ],
    cardSettings: {
        contentField: 'Summary',
        headerField: 'Id'
    }
});
kanbanObj.appendTo('#Kanban');
let particularColumn: HTMLElement =
document.getElementById('particularColumn');
let column: HTMLElement = document.getElementById('column');
particularColumn.onclick = () => {
    kanbanObj.columns[1].allowToggle= true;
};
column.onclick = () => {
    kanbanObj.columns = [
        { headerText: 'To Do', keyField: 'Open' },
        { headerText: 'Done', keyField: 'Close' }
    ]
};
```

```

Filter cards in EJ2 JavaScript Kanban control

You can filter the collection of cards from the dataSource and display it on the Kanban board by using the [query](#) property.

In the below sample, you can filter the cards based on the 'where' query and display the filtered data to the Kanban board.

INDEX.TS

```

import { Kanban } from '@syncfusion/ej2-kanban';
import { DropDownList, ChangeEventArgs } from '@syncfusion/ej2-dropdowns';
import { Query } from '@syncfusion/ej2-data';
import { kanbanData } from './datasource.ts';
let kanbanObj: Kanban = new Kanban({
    dataSource: kanbanData,
    keyField: 'Status',
    columns: [
        { headerText: 'Backlog', keyField: 'Open' },
        { headerText: 'In Progress', keyField: 'InProgress' },
        { headerText: 'Testing', keyField: 'Testing' },
        { headerText: 'Done', keyField: 'Close' }
    ],
    cardSettings: {

```

```

        contentField: 'Summary',
        headerField: 'Id'
    }
});
kanbanObj.appendTo('#Kanban');
let priorityObj: DropDownList = new DropDownList({
    dataSource: ['None', 'High', 'Normal', 'Low'],
    index: 0,
    placeholder: 'Select a priority',
    width: 100,
    change: change
});
priorityObj.appendTo('#filter');
function change(args: ChangeEventArgs): void {
    let filterQuery: Query = new Query();
    if (args.value !== 'None') {
        filterQuery = new Query().where('Priority', 'equal', args.value);
    }
    (kanbanObj as any).query = filterQuery;
}

```

```

Search cards in EJ2 JavaScript Kanban control

You can search the cards in Kanban by using the `query` property.

In the following sample, the searching operation starts as soon as you start typing characters in the external text box. It will search the cards based on the `Id` and `Summary` using the `search` query with `contains` operator.

INDEX.TS

```

import { Kanban } from '@syncfusion/ej2-kanban';
import { TextBox } from '@syncfusion/ej2-inputs';
import { Query } from '@syncfusion/ej2-data';
import { kanbanData } from '../datasource.ts';
let kanbanObj: Kanban = new Kanban({
  dataSource: kanbanData,
  keyField: 'Status',
  columns: [
    { headerText: 'Backlog', keyField: 'Open' },
    { headerText: 'In Progress', keyField: 'InProgress' },
    { headerText: 'Testing', keyField: 'Testing' },
    { headerText: 'Done', keyField: 'Close' }
  ],
  cardSettings: {
    contentField: 'Summary',
    headerField: 'Id'
  }
});
kanbanObj.appendTo('#Kanban');
let textObj: TextBox = new TextBox({
  placeholder: 'Enter search text',
  showClearButton: true,
  width: 180
});
textObj.appendTo('#search');
document.getElementById('reset').onclick = () => {
  textObj.value = '';
  kanbanObj.query = new Query();
};
document.getElementById('search').onkeyup = (e: KeyboardEvent) => {
  let searchValue: string = (<HTMLInputElement>e.target).value;
  let searchQuery: Query = new Query();

```

```

    if (searchValue !== '') {
        searchQuery = new Query().search(searchValue, ['Id', 'Summary'],
        'contains', true);
    }
    kanbanObj.query = searchQuery;
};

```

INDEX.HTML

```

Ej1 api migration in EJ2 JavaScript Kanban control

This article describes the API migration process of Kanban component from Essential JS 1 to Essential JS 2.

Columns

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| **Default** | **Property** : *columns* </br></br> \$("#Kanban").ejKanban({ </br> columns : [] }); | **Property** : *columns* </br></br> var obj = new </br>ej.kanban.Kanban({ </br>columns : [] }) </br>obj.appendTo("#Kanban"); |

| **Header Text** | **Property** : *headerText* </br></br> \$("#Kanban").ejKanban({ </br>columns: [{ </br>headerText : "Backlog"}] </br> }); | **Property** : *headerText* </br> </br> var obj = new </br>ej.kanban.Kanban({ columns: [{ </br>headerText : "Backlog"}] </br> }); </br>obj.appendTo("#Kanban"); |

| **Key Field** | **Property** : *key* </br></br> \$("#Kanban").ejKanban({ columns: [{ </br>key : "Open"}] }); | **Property** : *keyField* </br></br> var obj = new </br>ej.kanban.Kanban({ columns: [{ </br>keyField : "Open"}] }); </br>obj.appendTo("#Kanban"); |

| **Initial Collapsed Columns** | **Property** : *isCollapsed* </br></br> \$("#Kanban").ejKanban({ </br>columns: [{ </br>headerText: "Backlog", </br>key: "Open", </br>isCollapsed : true}] }); | **Property** : *isExpanded* </br></br> var obj= new </br>ej.kanban.Kanban({ columns:[{ </br>headerText: "Backlog", </br>keyField: "Open", </br>isExpanded : true}] }); </br>obj.appendTo("#kanban"); |

| **Cell Add card button** | **Property** : *showAddButton* </br></br> \$("#Kanban").ejKanban({ </br>columns: [{ </br>headerText: "Backlog", </br>key: "Open", </br>showAddButton : true}] }); | **Property** : *showAddButton* </br> </br> var obj = new </br>ej.kanban.Kanban({ columns: [{ </br>headerText: "Backlog", </br>keyField: "Open", </br>showAddButton : true}] }); </br>obj.appendTo("#kanban"); |

| **Column card count** | **Property** : *enableTotalCount* </br></br> \$("#Kanban").ejKanban({ </br>enableTotalCount : true}); | **Property** : *showItemCount* </br> </br> var obj = new </br>ej.kanban.Kanban({ columns: [{ </br>headerText: "Backlog", </br>keyField: "Open", </br>showItemCount : true}] }); </br>obj.appendTo("#kanban"); |

| **Template** | **Property** : *headerTemplate* </br></br> \$("#Kanban").ejKanban({ </br>columns: [{ </br>headerText: "Backlog", </br>key: "Open", </br>headerTemplate : "#template"}] }); | **Property** : *template* </br></br> var obj = new </br>ej.kanban.Kanban({ columns: [{ </br>template : "#headerTemplate"}] }); </br>obj.appendTo("#kanban"); |

| **Allow Drop** | **Property** : *allowDrop* </br> </br> \$("#Kanban").ejKanban({ </br>columns: [{ </br>headerText: "Backlog", </br>key: "Open", </br>allowDrop: false}] }); | **Not Available** |

| Allow Drag | **Property:** *allowDrag* </br> </br>\$("#Kanban").ejKanban({</br>columns: [{</br>headerText: "Backlog",</br> key: "Open",</br>allowDrag : false</br>}]); | **Not Available** |

| Total Count text | **Property:** *totalCount* </br> </br>\$("#Kanban").ejKanban({</br>enableTotalCount: true,</br> columns: [{</br> headerText: "Backlog",</br> key: "Open", </br>totalCount : </br>{text: "Backlog Count"}</br>}]); | **Not Available** |

| Width | **Property:** *width*</br></br>\$("#Kanban").ejKanban({</br>enableTotalCount: true,</br> columns: [{</br> headerText: "Backlog",</br> key: "Open", </br>width : 200</br>}]); | **Not Available** |

| Visible | **Property:** *visible*</br></br>\$("#Kanban").ejKanban({</br>enableTotalCount: true,</br>columns: [{</br>headerText: "Backlog",</br> key: "Open", </br>visible : false</br>}]); | **Not Available** |

| Add/Delete Columns | **Method:** *columns(column, key,</br> [action])*</br></br>**Add :**</br>var kanbanObj = </br>\$("#Kanban").data("ejKanban");</br>kanbanObj.columns</br>("Review", "Review", "add");</br></br>**Delete:** </br>var kanbanObj = </br>\$("#Kanban").data("ejKanban");</br>kanbanObj.columns</br>("Review", "Review", "remove");</br> | **Method:** *addColumn(columnOptions,</br> index)*</br></br>var obj = new </br>ej.kanban.Kanban({});</br>obj.appendTo("#kanban");</br>obj.addColumn({</br>headerText: "Review",</br> keyField: "Review"</br>}, 2);</br></br>**Method:** *deleteColumn(index)* </br></br>var obj = new </br>ej.kanban.Kanban({});</br>obj.appendTo("#kanban");</br>obj.deleteColumn(2); |

| Show Columns | **Method:** *showColumns(headerText)* </br></br>var kanbanObj = </br>\$("#Kanban")</br>.data("ejKanban");</br>kanbanObj.</br>showColumns("Testing"); | **Method:** *showColumn(key)* </br></br>var obj = </br>new ej.kanban.Kanban({});</br>obj.appendTo("#kanban");</br>obj.showColumn</br>("Testing"); |

| Hide Column | **Method:** *hideColumns(headerText)* </br></br>var kanbanObj = </br>\$("#Kanban")</br>.data("ejKanban");</br>kanbanObj.</br>hideColumns("Testing"); | **Method:** *hideColumn(key)*</br></br>var obj = </br>new ej.kanban.Kanban({});</br>obj.appendTo("#kanban");</br>obj.hideColumn("Testing"); |

| Get Visible Column Names | **Method:** *getVisibleColumnNames()*</br></br>var kanbanObj = </br>\$("#Kanban")</br>.data("ejKanban");</br>kanbanObj.</br>getVisibleColumnNames(); | **Not Applicable** |

| Get Column By</br>Header Text | **Method:** *getColumnByHeaderText</br>(headerText)*</br></br>var kanbanObj = </br>\$("#Kanban")</br>.data("ejKanban");</br>kanbanObj.</br>getColumnByHeaderText</br>("Testing"); | **Not Applicable** |

| Get Column Data | **Not Applicable** | **Method:** *getColumnData()*</br></br>var obj = </br>new ej.kanban.Kanban({});</br>obj.appendTo("#kanban");</br>obj.getColumnData(); |

| Triggers after</br>cell is click | **Event:** *cellClick*</br></br>\$("#Kanban").ejKanban({</br>cellClick : function (args) {}}); | **Not Applicable** |

Cards

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Card unique field | **Property :** </br>*fields.primaryKey*</br></br>\$("#Kanban").ejKanban({</br> fields: { primaryKey: "Id"</br> } }); | **Property :** </br>*cardSettings.headerField*</br>var obj = </br>new

```

ej.kanban.Kanban({ cardSettings: { headerField: "Id" } });obj.appendTo("#kanban");
|
| Content | Property: fields.content $("#Kanban").ejKanban({ fields: {
content: "Summary" } }; | Property: cardSettings.contentField var obj =
new ej.kanban.Kanban({ cardSettings: { contentField: "Id" }
});obj.appendTo("#kanban") |
| Tag | Property: fields.tag $("#Kanban").ejKanban({ fields: { tag:
"Tags" } }; | Property: cardSettings.tagsField var obj = new ej.kanban.Kanban({
cardSettings: { tagsField: "Tags" } }; obj.appendTo("#kanban"); |
| Left border color | Property: fields.color $("#Kanban").ejKanban({ fields: {
color: "Type" }, cardSettings: { colorMapping: { "cb2027": "Issue,Story",
"#67ab47": "Improvement" } }; | Property: cardSettings.grabberField var obj = new
ej.kanban.Kanban({ cardSettings: { grabberField: "color" }
});obj.appendTo("#kanban"); |
| Header | Property: fields.title $("#Kanban").ejKanban({ fields: { title:
"Assignee" } }; | Card Unique mapping field is displayed on card header. |
| Image | Property: fields.imageUrl $("#Kanban").ejKanban({ fields: {
imageUrl: "ImgUrl" } }; | Not Applicable |
| CSS class | Not Applicable | Property : cardSettings.footerCssField var obj = new
ej.kanban.Kanban({ cardSettings: { footerCssField: "classNames" }
});obj.appendTo("#kanban"); |
| Template | Property: cardSettings.template $("#Kanban").ejKanban({ cardSettings:
{ template: "#cardTemplate" } }; | Property: cardSettings.template var obj =
new ej.kanban.Kanban({ cardSettings: { template:
"#cardTemplate" } }; obj.appendTo("#kanban"); |
| Toggle Card | Method: toggleCard($div or id) var kanbanObj =
$("#Kanban").data("ejKanban");kanbanObj.toggleCard("2"); | Not Applicable |
| Get Card Details | Not Applicable | Method: getCardDetails(target) var obj = new
ej.kanban.Kanban({});obj.appendTo("#kanban");obj.getCardDetails(obj.element
querySelector(".e-card")); |
| Get Selected Cards | Not Applicable | Method: getSelectedCards() var obj = new
ej.kanban.Kanban({});obj.appendTo("#kanban");obj.getSelectedCards(); |
| Card Click | Event: cardClick $("#Kanban").ejKanban({ cardClick: function (args)
{ } }; | Event: cardClick var obj = new ej.kanban.Kanban({ cardClick:
function(args) { } }; |
| Card Double Click | Event:
cardDoubleClick $("#Kanban").ejKanban({ cardDoubleClick: function (args) { } }; |
Event: cardDoubleClick var obj = new
ej.kanban.Kanban({ cardDoubleClick: function(args) { } }; |
| Triggers when start the drag | Event: cardDragStart $("#Kanban").ejKanban({
cardDragStart: function (args) { } }; | Event: dragStart var obj = new ej.kanban.Kanban({
dragStart: function(args) { } }; |

```

| Triggers when card is dragged | **Event:**

cardDrag | **Event:** *drag*
 var obj = new ej.kanban.Kanban({ drag: function(args) {} }); |

| Triggers when card dragging stops | **Event:**

cardDragStop | **Event:** *dragStop*
 var obj = new ej.kanban.Kanban({ dragStop: function(args) {} }); |

| Triggers after save the data when dropped | **Event:**

cardDrop | **Not Applicable**
 |

| Triggers after cell is click | **Event:** *cellClick* | **Not Applicable** |

| Triggers each card rendered | **Event:**

queryCellInfo | **Event:** *cardRendered*
 var obj = new ej.kanban.Kanban({ cardRendered: function(args) {} }); |

DataSource

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| **DataSource** | **Property:** *dataSource* | **Method:** *dataSource(datasource)*
 var kanbanObj = \$("#kanban").ejKanban({ dataSource: new DataSource() }); | **Property:** *dataSource*
 var obj = new ej.kanban.Kanban({ datasource: new DataSource() }); | **Method:** *dataSource(datasource)*
 var obj = new ej.kanban.Kanban({}); obj.appendTo("#kanban"); obj.dataSource(new DataSource()); |

| Triggers before data load | **Event:** *load* | **Event:** *dataBinding*
 var obj = new ej.kanban.Kanban({ load: function(args) {} }); | **Event:** *dataBinding*
 var obj = new ej.kanban.Kanban({ dataBinding: function(args) {} }); |

| Triggers after data bounded | **Event:**

dataBound | **Event:** *dataBound*
 var obj = new ej.kanban.Kanban({ dataBound: function(args) {} }); |

Common:

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Drag And Drop | **Property:**

allowDragAndDrop | **Property:** *allowDragAndDrop*
 var obj = new ej.kanban.Kanban({ allowDragAndDrop: true }); | **Property:** *allowDragAndDrop*
 var obj = new ej.kanban.Kanban({ allowDragAndDrop: true }); obj.appendTo("#kanban"); |

| Key Field | **Property:** *keyField* | **Property:** *keyField*
 var obj = new ej.kanban.Kanban({ keyField: "Status" }); | **Property:** *keyField*
 var obj = new ej.kanban.Kanban({ keyField: "Status" }); obj.appendTo("#kanban"); |

| Title | **Property:** *allowTitle*
 | **Applicable** |
 | CssClass | **Property:** *cssClass*
 | **Property:** *cssClass*
 var obj = new ej.kanban.Kanban({cssClass : "custom-class"});
 obj.appendTo("#kanban"); |
 | Print | **Property:** *allowPrinting*
 true});
 | **Method:** *print()*
 var kanbanObj = \$("#Kanban").data("ejKanban");
 kanbanObj.print(); | **Not Applicable** |
 | Touch | **Property:** *enableTouch*
 | **Applicable** |
 | Locale | **Property:** *locale*
 | **Property:** *locale*
 var obj = new ej.kanban.Kanban({locale: "de-DE"});
 obj.appendTo("#kanban"); |
 | Query | **Property:** *query*
 ej.Query().select(["Status", "Id", "Summary"]); | **Property :** *query*
 var obj = new ej.kanban.Kanban({query: new Query().select("")});
 obj.appendTo("#kanban"); |
 | Refresh | **Method:** *refresh([templateRefresh])*
 var kanbanObj = \$("#Kanban").data("ejKanban");
 kanbanObj.refresh(); | **Method:** *refresh()*
 var obj = new ej.kanban.Kanban({});
 obj.appendTo("#kanban");
 obj.refresh(); |
 | Refresh Template | **Method:** *refreshTemplate()*
 var kanbanObj = \$("#Kanban").data("ejKanban");
 kanbanObj.refreshTemplate(); | **Not Applicable** |
 | Destroy | **Method:** *destroy()*
 var kanbanObj = \$("#Kanban").data("ejKanban");
 kanbanObj.destroy(); | **Method:** *destroy()*
 var obj = new ej.kanban.Kanban({});
 obj.appendTo("#kanban");
 obj.destroy(); |
 | Get Header Table | **Method:** *getHeaderTable()*
 var kanbanObj = \$("#Kanban").data("ejKanban");
 kanbanObj.getHeaderTable(); | **Not Applicable** |
 | Show Spinner | **Not Applicable** | **Method:** *showSpinner()*
 var obj = new ej.kanban.Kanban({});
 obj.appendTo("#kanban");
 obj.showSpinner(); |
 | Hide Spinner | **Not Applicable** | **Method:** *hideSpinner()*
 var obj = new ej.kanban.Kanban({});
 obj.appendTo("#kanban");
 obj.hideSpinner(); |
 | Triggers before every action | **Event:** *actionBegin*
 | **Event:** *actionBegin*
 var obj = new ej.kanban.Kanban({actionBegin: function(args) {} }); |
 | Triggers on successfully completion of actions | **Event:** *actionComplete*
 | **Event:** *actionComplete*
 var obj = new ej.kanban.Kanban({actionComplete: function(args) {} }); |
 | Triggers on action failure | **Event:** *actionFailure*
 | **Event:** *actionFailure*
 var obj = new ej.kanban.Kanban({actionFailure: function(args) {} }); |

| Triggers after
Kanban rendered | **Event:** *create*

\$("#Kanban").ejKanban({
create: function (args) {} }); | **Event:** *created*

var obj = new ej.kanban.Kanban({
created: function(args){} }); |

| Triggers when
header click | **Event:**

headerClick

\$("#Kanban").ejKanban({
headerClick: function (args) {} }); | **Not Applicable** |

| Triggers when
destroy | **Event:** *destroy*

\$("#Kanban").ejKanban({
destroy: function (args) {} }); | **Event:** *destroy*

var obj = new ej.kanban.Kanban({
destroy: function(args){} }); |

Swimlane:

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Default | **Property:** *swimlaneKey*

\$("#Kanban").ejKanban({
fields: {
swimlaneKey: "Assignee"} }); | **Property:** *keyField*

var obj = new ej.kanban.Kanban({
swimlaneSettings: {
keyField: "Assignee" } });
obj.appendTo("#kanban"); |

| Header | **Property:** *headers*

\$("#Kanban").ejKanban({
headers: [{
text: "Andrew",
key: "Andrew Fuller" }] }); | **Property:** *textField*

var obj = new ej.kanban.Kanban({
swimlaneSettings: {
textField: "AssigneeName" } });
obj.appendTo("#kanban"); |

| Drag And Drop | **Property:** *allowDragAndDrop*

\$("#Kanban").ejKanban({
swimlaneSettings: {
allowDragAndDrop: true } }); | **Property:** *allowDragAndDrop*

var obj = new ej.kanban.Kanban({

allowDragAndDrop: true } });
obj.appendTo("#kanban"); |

| Card Count | **Property:** *showCount*

\$("#Kanban").ejKanban({
swimlaneSettings: {
showCount: true } }); | **Property:** *showItemCount*

var obj = new ej.kanban.Kanban({
swimlaneSettings: {
showItemCount: true } });
obj.appendTo("#kanban"); |

| Empty Row | **Property:**
showEmptySwimlane

\$("#Kanban").ejKanban({
swimlaneSettings: {
showEmptySwimlane: true } }); | **Property:** *showEmptyRow*

var obj = new ej.kanban.Kanban({
swimlaneSettings: {
showEmptyRow: true } });
obj.appendTo("#kanban"); |

| Sorting | **Not Available** | **Property:**
sortDirection

var obj = new
ej.kanban.Kanban({
swimlaneSettings: {
sortDirection:
"Descending" } });
obj.appendTo("#kanban"); |

| Expand All | **Method:** *expandAll()*

var kanbanObj = \$("#Kanban")
.data("ejKanban");
kanbanObj.KanbanSwimlane
.expandAll(); | **Not Applicable** |

| Collapse All | **Method:** *collapseAll()*

var kanbanObj = \$("#Kanban")
.data("ejKanban");
kanbanObj.KanbanSwimlane
.collapseAll(); | **Not Applicable** |

| Toggle | **Method:** *toggle(\$div or key)*

var kanbanObj = \$("#Kanban")
.data("ejKanban");
kanbanObj.KanbanSwimlane
.toggle(\$(".e-slexpandcollapse")
.eq(1)); | **Not Applicable** |

| Get Swimlane Data | **Not Applicable** | **Method:** `</br>getSwimlaneData(keyField)</br></br>var obj = new ej.kanban.Kanban({});</br>obj.appendTo("#kanban");</br>obj.</br>getSwimlaneData("Janet"); |`

| Triggers before swimlane</br>icon click event | **Event:** `swimlaneClick</br></br>$("#Kanban").ejKanban({</br>swimlaneClick:</br>function (args) {}}); |` **Not Applicable** |

Stacked Headers

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Multiple stacked headers | **Property:** `stackedHeaderColumns</br></br>$("#Kanban").ejKanban({</br>stackedHeaderRows: [{</br>stackedHeaderColumns: [{</br>headerText: "Status",</br>column: "Backlog,</br>In Progress, Testing,</br>Done"}] },</br> { stackedHeaderColumns: [{</br>headerText: "Unresolved",</br>column: "Backlog,</br>In Progress"}]}}}); |` **Not Applicable** |

| Single Stacked Header | **Property:** `stackedHeaderColumns</br></br>$("#Kanban").ejKanban({</br>stackedHeaderRows: [{</br>stackedHeaderColumns: [{</br>headerText: "Unresolved",</br>column: "Backlog,</br>In Progress"}]}}}); |` **Property:** `</br>stackedHeaders</br>var obj = new </br>ej.kanban.Kanban({</br>stackedHeaders: [{</br>text: "To Do",</br>keyField: "Open,</br>InProgress"}]};</br>obj.appendTo("#kanban"); |`

WIP Validation

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Constraints Type | **Property:** `</br>constraints.type</br></br>$("#Kanban").ejKanban({</br>columns: [{</br>headerText: "Backlog",</br>key: "Open",</br>constraints: {</br>type: "swimlane", max: 5}}]); |` **Property:** `</br>constraintType</br></br>var kanban = new</br>ej.kanban.Kanban({</br>constraintType:</br>"swimlane" }); |`

| Maximum card Count at</br>particular column/swimlane | **Property:** `</br>constraints.max</br></br>$("#Kanban").ejKanban({</br>columns: [{</br>headerText: "Backlog",</br>key: "Open",</br>constraints: {</br>type: "swimlane",</br>max: 5}}]); |` **Property:** `</br>maxCount</br></br>var obj = new ej.kanban.Kanban({</br>columns:[</br>headerText: "Backlog",</br>keyField: "Open",</br>maxCount: 5}]};</br>obj.appendTo("#kanban"); |`

| Minimum card Count at</br>particular column | **Property:** `</br>constraints.min</br></br>$("#Kanban").ejKanban({</br>columns: [{</br>headerText: "Backlog",</br>key: "Open",</br>constraints: {</br>type: "swimlane",</br>min: 2} }]); |` **Property:** `minCount</br>var obj = new </br>ej.kanban.Kanban({</br>columns:[</br>headerText: "Backlog",</br>keyField: "Open",</br>minCount: 2}]};</br>obj.appendTo("#kanban"); |`

Keyboard

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| KeyBoard | **Property:** `</br>allowKeyboardNavigation</br></br>$("#Kanban").ejKanban({</br>allowKeyboardNavigation:</br>true}); |` **Property:** `</br>allowKeyboard</br></br>var obj = new </br>ej.kanban.Kanban({</br>allowKeyboard: true });</br>obj.appendTo("#kanban"); |`

| Settings | **Property:** `</br>keySettings</br></br>$("#Kanban").ejKanban({</br>keySettings: {</br>focus: "e",</br>insertCard: "45"</br>}});` | **Not Applicable** |

Toggle Columns

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Default | **Property:** `</br>allowToggleColumn</br></br>$("#Kanban").ejKanban({</br>allowToggleColumn</br>: true});` | **Property:** `</br>allowToggle</br></br>var obj = new ej.kanban.Kanban({</br>columns:[{</br>allowToggle: true</br>}]);</br>obj.appendTo("#kanban");` |

| Toggle | **Method:** `toggleColumn</br>(headerText or $div)</br></br>var kanbanObj = $("#Kanban")</br>.data("ejKanban");</br>kanbanObj.toggleColumn</br>("Backlog");` | **Not Applicable** |

Dialog Editing

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Fields | **Property:** `editItems</br></br>$("#Kanban").ejKanban({</br>editSettings: {</br>editItems: [{}}});` | **Property:** `fields</br></br>var obj = new ej.kanban.Kanban({</br>dialogSettings: {</br>fields: [{}}});</br>obj.appendTo("#kanban");` |

| Dialog Model | **Not Available** | **Property:** `model</br></br>var obj = new </br>ej.kanban.Kanban({</br>dialogSettings: {</br>model: {</br>width: 250}}});</br>obj.appendTo("#kanban");` |

| Template | **Property:** `dialogTemplate</br></br>$("#Kanban").ejKanban({</br>editSettings: {</br>dialogTemplate: "#template" } });` | **Property:** `template</br></br>var obj = new ej.kanban.Kanban({</br>dialogSettings: {</br>template: </br>"#dialogTemplate"}});</br>obj.appendTo("#kanban");` |

| Enable Editing | **Property:** `allowEditing</br></br>$("#Kanban").ejKanban({</br>editSettings: {</br>allowEditing: true } });` | **In default allowed for editing.** |

| Enable Adding | **Property:** `allowAdding</br></br>$("#Kanban").ejKanban({</br>editSettings: {</br>allowAdding: true } });` | **Adding applicable using column</br> show add button or</br>public method.** |

| Edit Mode | **Property:** `editMode</br></br>$("#Kanban").ejKanban({</br>editSettings: {</br>editMode: ej.Kanban</br>.EditMode.Dialog } });` | **Not Applicable** |

| External Form template |

Property: `</br>externalFormTemplate</br></br>$("#Kanban").ejKanban({</br>editSettings: {</br>externalFormTemplate:</br>ej.Kanban.EditMode.Dialog</br>}});` | **Not Applicable** |

| External Form Position | **Property:**

`</br>externalFormPosition</br></br>$("#Kanban").ejKanban({</br>editSettings: {</br>externalFormPosition:</br>ej.Kanban.FormPosition.Bottom</br>}});` | **Not Applicable** |

| Add Card | **Method:** `</br>KanbanEdit.addCard</br>([primaryKey], [card])</br></br>var kanbanObj = $("#Kanban")</br>.data("ejKanban");</br>kanbanObj.KanbanEdit</br>.addCard("2",</br>{ Id: 2, Status: Open});` | **Method:** `</br></br>addCard(cardData)</br></br>var obj = new ej.kanban.Kanban({});</br>obj.appendTo("#kanban");</br>obj.addCard({ Id: 2,</br>Status: Open});` |

| Update Card | **Method:** *updateCard(key, data)*

```
var kanbanObj =
$("#Kanban").data("ejKanban");
kanbanObj.KanbanEdit.updateCard(2, { Id:
2, Status: Open});
```

| **Method:** *updateCard(cardData)*

```
var obj = new
ej.kanban.Kanban({});
obj.appendTo("#kanban");
obj.updateCard({ Id: 2, Status:
Open});
```

| Delete Card | **Method:** *KanbanEdit.deleteCard(key)*

```
var kanbanObj =
$("#Kanban").data("ejKanban");
kanbanObj.KanbanEdit.deleteCard(2);
```

| **Method:** *deleteCard()*

```
var obj = new
ej.kanban.Kanban({});
obj.appendTo("#kanban");
obj.deleteCard(2);
```

| Cancel Edit | **Method:** *KanbanEdit.cancelEdit()*

```
var kanbanObj =
$("#Kanban").data("ejKanban");
kanbanObj.KanbanEdit.cancelEdit();
```

| **Not Available** |

| End Edit | **Method:** *KanbanEdit.endEdit()*

```
var kanbanObj =
$("#Kanban").data("ejKanban");
kanbanObj.KanbanEdit.endEdit();
```

| **Not Available** |

| Start Edit | **Method:** *KanbanEdit.startEdit(\$div or key)*

```
var kanbanObj =
$("#Kanban").data("ejKanban");
kanbanObj.KanbanEdit.startEdit(2);
```

| **Method:** *openDialog(action, data)*

```
var obj = new
ej.kanban.Kanban({});
obj.appendTo("#kanban");
obj.openDialog("Add");
```

| Set Validation | **Method:** *KanbanEdit.setValidationToField(name, rules)*

```
var kanbanObj =
$("#Kanban").data("ejKanban");
kanbanObj.KanbanEdit.setValidationToField("Sum
mary", { required: true });
```

| **Not Available** |

| Close Dialog | **Not Applicable** | **Method:** *closeDialog()*

```
var obj = new
ej.kanban.Kanban({});
obj.appendTo("#kanban");
obj.closeDialog();
```

| Triggers before dialog Open | **Not Applicable** | **Event:** *dialogOpen*

```
var obj = new
ej.kanban.Kanban({
dialogOpen: function(args){}});
```

| Triggers when dialog close | **Not Applicable** | **Event:** *dialogClose*

```
var obj = new
ej.kanban.Kanban({
dialogClose: function(args){}});
```

| Triggers after the card is edited | **Event:** *endEdit*

```
$("#Kanban").ejKanban({
endEdit: function (args) {} });
```

| **Not Applicable** |

| Triggers after the card is deleted | **Event:** *endDelete*

```
$("#Kanban").ejKanban({
endDelete: function (args) {} });
```

| **Not Applicable** |

| Triggers before task is edited | **Event:** *beginEdit*

```
$("#Kanban").ejKanban({
beginEdit: function (args) {} });
```

| **Not Applicable** |

Dialog Editing Fields

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Fields | **Property:** *editItems*

```
$("#Kanban").ejKanban({
editSettings: {
editItems: [{]} });
```

| **Property:** *fields*

```
var obj = new ej.kanban.Kanban({
dialogSettings: {
fields: [{]} });
obj.appendTo("#kanban");
```

| Mapping key | **Property:** *field*
 {{{ "#Kanban").ejKanban({ editSettings: { editItems: { field: "Id" } } }); | **Property:** *key*
 {{{ "#Kanban").ejKanban({ dialogSettings: { fields: { key: "Id" } } }); obj.appendTo("#kanban"); |

| Label | **Not Applicable** | **Property:** *text*
 {{{ "#Kanban").ejKanban({ dialogSettings: { fields: { text: "ID", key: "Id" } } }); obj.appendTo("#kanban"); |

| Type | **Property:** *editType*
 {{{ "#Kanban").ejKanban({ editSettings: { editItems: { editType: ej.Kanban.EditingType.String } } }); | **Property:** *type*
 {{{ "#Kanban").ejKanban({ dialogSettings: { fields: { type: "TextBox", key: "Id" } } }); obj.appendTo("#kanban"); |

| Validation Rules | **Property:** *validationRules*
 {{{ "#Kanban").ejKanban({ editSettings: { editItems: { validationRules: { required: true } } } }); | **Property:** *validationRules*
 {{{ "#Kanban").ejKanban({ dialogSettings: { fields: { validationRules: { required: true } } } }); obj.appendTo("#kanban"); |

| Params | **Property:** *editParams*
 {{{ "#Kanban").ejKanban({ editSettings: { editItems: { editParams: { decimalPlaces: 2 } } } }); | **Not Applicable** |

| Default value | **Property:** *defaultValue*
 {{{ "#Kanban").ejKanban({ editSettings: { editItems: { defaultValue: "Open" } } }); | **Not Applicable** |

Tooltip

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Default | **Property:** *tooltipSettings.enable*
 {{{ "#Kanban").ejKanban({ tooltipSettings: { enable: true } }); | **Property:** *enableTooltip*
 {{{ "#Kanban").ejKanban({ enableTooltip: true }); obj.appendTo("#kanban"); |

| Template | **Property:** *tooltipSettings.template*
 {{{ "#Kanban").ejKanban({ tooltipSettings: { template: "#tooltipTemplate" } }); | **Property:** *tooltipTemplate*
 {{{ "#Kanban").ejKanban({ tooltipTemplate: "#tooltipTemplate" }); obj.appendTo("#kanban"); |

Context Menu

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Default | **Property:** *enable*
 {{{ "#Kanban").ejKanban({ contextMenuSettings: { enable: true } }); | **Not Applicable** |

| Menu Items | **Property:** *menuItems*
 {{{ "#Kanban").ejKanban({ contextMenuSettings: { enable: true, menuItems: ["Move Right"] } }); | **Not Applicable** |

| Disable default Items | **Property:** *disableDefaultItems*
 {{{ "#Kanban").ejKanban({ contextMenuSettings: { enable: true, disableDefaultItems: [ej.Kanban.MenuItem.MoveLeft] } }); | **Not Applicable** |

| Custom Menu Items | **Property:** *customMenuItems*
 {{{ "#Kanban").ejKanban({ contextMenuSettings: { enable: true, customMenuItems: { text: "Menu1" } } }); | **Target:** *target*
 {{{ "#Kanban").ejKanban({ contextMenuSettings: { enable: true, customMenuItems: { text: "Menu1" } } }); obj.appendTo("#kanban"); |

`{enable: true, customMenuItems: [{target: ej.Kanban.Target.Header }]};`
Template: `$("#Kanban").ejKanban({contextMenuSettings: {enable: true, customMenuItems: [{text: "Hide Column", template: "#template" }]};` | **Not Applicable** |

| Triggers when context menu item click | **Event:**
`contextClick` `$("#Kanban").ejKanban({contextClick: function (args) {};` | **Not Applicable** |

| Triggers when context menu open | **Event:**
`contextOpen` `$("#Kanban").ejKanban({contextOpen: function (args) {};` | **Not Applicable** |

WorkFlows

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Default | **Property:** `workFlows` `$("#Kanban").ejKanban({workFlows: [{}];` | **Not Applicable** |

| Key | **Property:** `key` `$("#Kanban").ejKanban({workFlows: [{key: "Order"}];` | **Not Applicable** |

| Allowed Transition | **Property:** `allowedTransition` `$("#Kanban").ejKanban({workFlows: [{key: "Order", allowedTransitions: "Served"}];` | **Not Applicable** |

Filtering

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Default | **Property:** `filterSettings` `$("#Kanban").ejKanban({filterSettings: [{}];` | **Not Applicable** |

| Enable | **Property:** `allowFiltering` `$("#Kanban").ejKanban({allowFiltering: true};` | **Not Applicable** |

| Text | **Property:** `text` `$("#Kanban").ejKanban({filterSettings: [{text: "Janet Issues"}];` | **Not Applicable** |

| Query | **Property:** `query` `$("#Kanban").ejKanban({filterSettings: [{query: new ej.Query().where("Assignee", "equal", "Janet")};` | **Not Applicable** |

| Description | **Property:** `description` `$("#Kanban").ejKanban({filterSettings: [{description: "Display Issues"}];` | **Not Applicable** |

| Filter Cards | **Method:** `filterCards(query)` `var kanbanObj = $("#Kanban").data("ejKanban"); kanbanObj.KanbanFilter.filterCards(new ej.Query().where("Assignee", "equal", "Janet"));` | **Not Applicable** |

| Clear | **Method:** `clearFilter()` `var kanbanObj = $("#Kanban").data("ejKanban"); kanbanObj.KanbanFilter.clearFilter();` | **Not Applicable** |

Searching

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Default | **Property:** `</br>searchSettings</br></br>$("#Kanban").ejKanban({</br>searchSettings: []});` | **Not Applicable** |

| Enable | **Property:** `</br>allowSearching</br></br>$("#Kanban").ejKanban({</br>allowSearching: true</br>});` | **Not Applicable** |

| Fields | **Property:** `fields</br></br>$("#Kanban").ejKanban({</br>searchSettings: [{</br>fields: ["Summary"]}]);` | **Not Applicable** |

| Key | **Property:** `key</br></br>$("#Kanban").ejKanban({</br>searchSettings: [{</br>key: "Task 1"}]);` | **Not Applicable** |

| Operator | **Property:** `operator</br></br>$("#Kanban").ejKanban({</br>searchSettings: [{</br>operator: "contains"}]);` | **Not Applicable** |

| Ignore Case | **Property:** `ignoreCase</br></br>$("#Kanban").ejKanban({</br>searchSettings: [{</br>ignoreCase: true}]);` | **Not Applicable** |

| Search Cards | **Method:** `</br>searchCards(searchString)</br></br>var kanbanObj = $("#Kanban")</br>.data("ejKanban");</br>kanbanObj.KanbanFilter</br>.searchCards("Analyze");` | **Not Applicable** |

| Clear | **Method:** `clearSearch()</br></br>var kanbanObj = $("#Kanban")</br>.data("ejKanban");</br>kanbanObj.KanbanFilter</br>.clearSearch();` | **Not Applicable** |

External Drag And Drop

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Default | **Property:** `</br>allowExternalDragAndDrop</br></br>$("#Kanban").ejKanban({</br>allowExternalDragAndDrop</br>: true});` | **Not Applicable** |

| Target | **Property:** `</br>externalDropTarget</br></br>$("#Kanban").ejKanban({</br>cardSettings: {</br>externalDropTarget:</br>"#DroppedKanban" } });` | **Not Applicable** |

Scrolling

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Default | **Property:** `allowScrolling</br></br>$("#Kanban").ejKanban({</br>allowScrolling: true});` | **Not Applicable** |

| height | **Property:** `height</br></br>$("#Kanban").ejKanban({</br>allowScrolling: true,</br>scrollSettings: {</br>height: 400 } });` | **Property:** `height</br></br>var obj = new ej.kanban.Kanban({</br>height: 400});</br>obj.appendTo("#kanban");` |

| width | **Property:** `width</br></br>$("#Kanban").ejKanban({</br>allowScrolling: true,</br>scrollSettings: {</br>width: 400 } });` | **Property:** `width</br></br>var obj = new ej.kanban.Kanban({</br>width: 400});</br>obj.appendTo("#kanban");` |

| Freeze Swimlane | **Property:** `allowFreezeSwimlane</br></br>$("#Kanban").ejKanban({</br>allowScrolling: true,</br>scrollSettings: {</br>allowFreezeSwimlane: true</br>}});` | **Not Applicable** |

| Get Scroll Object | **Method:** `getScrollObject()`
`$("#Kanban").data("ejKanban");` | **Not Applicable** |

Card Selection and Hover

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Enable | **Property:** `allowSelection`
`$("#Kanban").ejKanban({allowSelection: true});` |
Property: `cardSettings.selectionType`
`var obj = new ej.kanban.Kanban({`
`cardSettings: {selectionType: "Single"};});` | **Not Applicable** |

| Type | **Property:** `selectionType`
`$("#Kanban").ejKanban({selectionType: "single"});` | It
 is covered under `selectionType` property. |

| Hover | **Property:** `allowHover`
`$("#Kanban").ejKanban({allowHover: true});` | **Not Applicable** |

| Clear | **Method:** `clear()`
`$("#Kanban").data("ejKanban").KanbanSelection.clear();` | **Not Applicable** |

| Triggers before card selected | **Event:**
`beforeCardSelect`
`$("#Kanban").ejKanban({beforeCardSelect: function (args)`
`{};});` | **Event:** `cardSelecting`
`$("#Kanban").ejKanban({cardSelecting: function`
`(args) {};});` | **Not Applicable** |

| Triggers after card selected | **Event:**
`cardSelect`
`$("#Kanban").ejKanban({cardSelect: function (args) {};});` | **Not Applicable** |

Toolbar

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Custom Toolbar | **Property:**
`customToolbarItems.template`
`$("#Kanban").ejKanban({customToolbarItems:`
`{template: "#Delete"};});` | **Not Applicable** |

| Triggers toolbar item click | **Event:**
`toolbarClick`
`$("#Kanban").ejKanban({toolbarClick: function (args) {};});` | **Not Applicable** |

Responsive

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Default | **Property:** `isResponsive`
`$("#Kanban").ejKanban({isResponsive: true});` | **Not Applicable** |

| Minimum width | **Property:** `minWidth`
`$("#Kanban").ejKanban({isResponsive:`
`true,minWidth: 400});` | **Not Applicable** |

State Persistence

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Persistence | **Not Applicable** | **Property:** `enablePersistence`
var obj = new ej.kanban.Kanban({enablePersistence: true});obj.appendTo("#kanban"); |

Right to Left - RTL

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| default | **Property:** `enableRTL`
\$("#Kanban").ejKanban({enableRTL: true}) | **Property:** `enableRtl`
var obj = new ej.kanban.Kanban({enableRtl: true});obj.appendTo("#kanban"); |

Linear Gauge

Linear gauge dimensions in EJ2 JavaScript Linear gauge control

Size for Linear Gauge

The height and width of the Linear Gauge can be set using the [width](#) and [height](#) properties in Linear Gauge.

In Pixel

The size of the Linear Gauge can be set in pixel as demonstrated below.

INDEX.TS

```
import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
  width: '650px',
  height: '350px'
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container" style="margin-top: 20%;">
    <div id="element" style="margin-top: 20%;"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
```

```

    ele.style.visibility = "visible";
  }
  </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

In Percentage

By setting value in percentage, Linear Gauge receives its dimension matching to its parent. For example, when the height is set as **50%**, Linear Gauge renders to half of the parent height. The Linear Gauge will be responsive when the width is set as **100%**.

```

<div id='container'>
<div id='element' style="width:1000px; height:600px;"></div>
</div>

```

INDEX.TS

```

import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
  width: '100%',
  height: '50%'
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container" style="margin-top: 20%;">
    <div id="element" style="margin-top: 20%;"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
<script src="index.js" type="text/javascript"></script>

```

```
</body></html>
```

Note: When the component's size is not specified, the height will be **450px** and the width will be the same as the parent element's width.

Axis in EJ2 JavaScript Linear gauge control

Axis is used to indicate the numeric values in the linear scale. The Linear Gauge component can have any number of axes. The sub-elements of an axis are line, ticks, labels, ranges, and pointers.

Setting the start value and end value of the axis

The start value and end value for the Linear Gauge can be set using the [minimum](#) and [maximum](#) properties in the [axes](#) respectively. By default, the start value of the axis is **0** and the end value of the axis is **100**.

INDEX.TS

```
import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
  axes: [{
    minimum: 20,
    maximum: 140,
  }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Line Customization

The following properties in the [line](#) can be used to customize the axis line in the Linear Gauge.

- [height](#) - To set the length of the axis line.
- [width](#) - To set the thickness of the axis line.
- [color](#) - To set the color of the axis line.
- [offset](#) - To render the axis line with the specified distance from the Linear Gauge.

INDEX.TS

```
import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
  axes: [{
    line: {
      height: 150,
      width: 2,
      color: '#4286f4',
      offset: 2
    }
  }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Ticks Customization

Ticks are used to specify the interval in the axis. Ticks are of two types, major ticks and minor ticks. The following properties in the [majorTicks](#) and [minorTicks](#) can be used to customize the major ticks and minor ticks respectively

- [height](#) - To set the length of the major and minor ticks in pixel values.
- [color](#) - To set the color of the major and minor ticks of the Linear Gauge.
- [width](#) - To set the thickness of the major and minor ticks in pixel values.
- [interval](#) - To set the interval for the major ticks and minor ticks in the Linear Gauge.

INDEX.TS

```
import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
  axes: [{
    minimum: 20,
    maximum: 140,
    majorTicks: {
      interval: 20
    },
    minorTicks: {
      interval: 5,
      color: 'red'
    }
  }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Positioning the ticks

The minor and major ticks can be positioned by using [offset](#) and [position](#) properties. The [offset](#) is used to render the ticks with the specified distance from the axis. By default, the offset value is **0**. The possible values of the [position](#) property are **Inside**, **Outside**, **Cross**, and **Auto**. By default, the ticks will be placed inside the axis.

INDEX.TS

```
import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
  axes: [{
    minimum: 20,
    maximum: 140,
    majorTicks: {
      interval: 20,
      position: "Cross"
    },
    minorTicks: {
      interval: 5,
      color: 'red',
      position: "Outside",
      offset: 15
    }
  }]
}, '#element');
```

    <div id="element"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
```

```

    </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Labels Customization

The style of the labels can be customized using the following properties in the [font](#) property in [labelStyle](#).

- [color](#) - To set the color of the axis label.
- [fontFamily](#) - To set the font family of the axis label.
- [fontStyle](#) - To set the font style of the axis label.
- [fontWeight](#) - To set the font weight of the axis label.
- [opacity](#) - To set the opacity of the axis label.
- [size](#) - To set the size of the axis label.

INDEX.TS

```

import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
  axes: [{
    labelStyle: {
      font: {
        color: 'red'
      }
    }
  }]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";

```

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Positioning the axis label

Labels can be positioned by using [offset](#) and [position](#) properties in the [labelStyle](#). The [offset](#) defines the distance between the labels and ticks. By default, the offset value is 0. The possible values of the [position](#) property are **Inside**, **Outside**, **Cross**, and **Auto**. By default, labels will be placed inside the axis.

INDEX.TS

```

import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
  axes: [{
    labelStyle: {
      position: "Outside"
    }
  }]
}, '#element');

```

INDEX.HTML

}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Customizing the display of the last label

If the last label is not in the visible range, it will be hidden by default. The last label can be made visible by setting the [showLastLabel](#) property as **true** in the [axes](#).

INDEX.TS

```
import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
  axes: [{
    showLastLabel: true,
    maximum: 115,
    line: {
      color: '#9E9E9E'
    },
    pointers: [{
      value: 20,
      height: 15,
      width: 15,
      color: '#757575',
      offset: 30
    }],
  }],
}, '#element');
```

INDEX.HTML

var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Label Format

Axis labels in the Linear Gauge control can be formatted using the [format](#) property in the [labelStyle](#). It is used to render the axis labels in a certain format or to add a user-defined unit in the label. It works with the help of placeholder like {value}°C, where **value** represents the axis value. For example, 20°C.

INDEX.TS

```
import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
  axes:[{
    labelStyle: {
      format: "{value}°C"
    }
  }]
}, '#element');
```

INDEX.HTML

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Displaying numeric format in labels

The numeric formats such as currency, percentage, and so on can be displayed in the labels of the Linear Gauge using the [format](#) property in the Linear Gauge component. The following table describes the result of applying some commonly used label formats on numeric values.

Label Value	Label Format property value	Result	Description
1000	n1	1000.0	The number is rounded to 1 decimal place.
1000	n2	1000.00	The number is rounded to 2 decimal place.
1000	n3	1000.000	The Number is rounded to 3 decimal place.

0.01	p1	1.0%	The number is converted to percentage with 1 decimal place.
0.01	p2	1.00%	The Number is converted to percentage with 2 decimal place.
0.01	p3	1.000%	The number is converted to percentage with 3 decimal place.
1000	c1	\$1,000.0	The currency symbol is appended to number and number is rounded to 1 decimal place.
1000	c2	\$1,000.00	The currency symbol is appended to number and number is rounded to 2 decimal place.

INDEX.TS

```
import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
    format: 'c',
    axes:[{
    }]
}, '#element');
```

INDEX.HTML

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Inverted Axis

The axis of the Linear Gauge component can be inverted by setting the [isInversed](#) property to **true** in the [axes](#).

INDEX.TS

```
import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
  axes: [{
    isInversed: true
  }]
});
```

```
    }}
  }, '#element');
```

</body></html>

```

Multiple Axes

Multiple axes can be added to the Linear Gauge by adding multiple [axis](#) object in the [axes](#) and customization can be done with the [axis](#). Each axis can be customized separately as shown in the following example.

INDEX.TS

```

import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
    axes: [{
        labelStyle: {
            format: '{value}°C'
        }
    },
    {
        opposedPosition: true,
        labelStyle: {
            format: '{value}°F'
        }
    }
], '#element');

```

INDEX.HTML

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Ranges in EJ2 JavaScript Linear gauge control

Range is the set of values in the axis. The range can be defined using the [start](#) and [end](#) properties in the [ranges](#). Any number of ranges can be added to the Linear Gauge using the [ranges](#).

INDEX.TS

```

import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
    axes: [{
        ranges: [{
            start: 50,
            end: 80
        }]
    }]
}, '#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
    type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
    ="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>

```

```

    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customizing the range

Ranges can be customized using the following properties in [ranges](#).

- [startWidth](#) - To set the thickness of the range at the start axis value.
- [endWidth](#) - To set the thickness of the range at the end axis value.
- [color](#) - Customize the range color.
- [position](#) - To place the range. By default, the range is placed outside of the axis. To change the position, this property can be set as "Inside", "Outside", "Cross", or "Auto".
- [Offset](#) - To place the range with specified distance from the axis.
- [border](#) - Customize color and width of range border.

INDEX.TS

```

import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
    axes: [{
        ranges: [{
            start: 50,
            end: 80,
            startWidth: 10,
            endWidth: 20,
            color: 'red'
        }]
    }]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Setting the range color of the labels

To set the color of the labels like the range color, set the [useRangeColor](#) property as **true** in the [labelStyle](#).

INDEX.TS

```

import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
  axes: [{
    ranges: [{
      start: 40,
      end: 80,
      startWidth: 10,
      endWidth: 10,
      color: 'red'
    }],
    labelStyle: {
      useRangeColor: true
    }
  }]
}, '#element');

```

INDEX.HTML

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Multiple ranges

Multiple ranges can be added to the Linear Gauge by adding collections of [range](#) in the [ranges](#) and customization of ranges can be done with [range](#).

INDEX.TS

```

import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
    axes: [{
        ranges: [
            {
                start: 0,
                end: 30,
                startWidth: 10,
                endWidth: 10,
                color: '#41f47f'
            },
            {
                start: 30,
                end: 50,
                startWidth: 10,
                endWidth: 10,
                color: '#f49441'
            },
            {
                start: 50,
                end: 100,
                startWidth: 10,
                endWidth: 10,
                color: '#cd41f4'
            }
        ]
    }
}],
    '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Gradient Color

Gradient support allows the addition of multiple colors in the range. The following gradient types are supported in the Linear Gauge.

- Linear Gradient
- Radial Gradient

Linear Gradient

Using linear-gradient, colors will be applied in a linear progression. The start value of the linear gradient can be set using the [startValue](#) property. The end value of the linear gradient will be set using the [endValue](#) property. The color stop values such as [color](#), [opacity](#), and [offset](#) to be defined in [colorStop](#).

INDEX.TS

```

import { LinearGauge, Gradient } from '@syncfusion/ej2-lineargauge';
LinearGauge.Inject(Gradient);
let gauge: LinearGauge = new LinearGauge({
    orientation: 'Horizontal',
    container: {
        width: 30, offset: 30
    },
    axes: [{
        line: { width: 0 },
        majorTicks: { height: 0, interval: 25 },
        minorTicks: { height: 0 },
        labelStyle: {
            font: { color: '#424242',
            }, offset: 55
        },
        pointers: [{
            value: 80, height: 25,
            width: 35, placement: 'Near',
            offset: -44, markerType: 'Triangle',
            color: '#f54ea2'
        }],
    }],

```

```

        ranges: [{
            start: 0, end: 80,
            startWidth: 30, endWidth: 30,
            offset: 30,
            linearGradient: {
                startValue: '0%',
                endValue: '100%',
                colorStop: [
                    { color: '#fef3f9', offset: '0%', opacity: 1 },
                    { color: '#f54ea2', offset: '100%', opacity: 1 }
                ]
            }
        }]
    }
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">

  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Radial Gradient

Using radial gradient, colors will be applied in circular progression. The inner circle position of the radial gradient will be set using the [innerPosition](#) property. The outer circle position of the radial gradient can be set using the [outerPosition](#) property. The color stop values such as [color](#), [opacity](#), and [offset](#) to be defined in [colorStop](#).

INDEX.TS

```

import { LinearGauge, Gradient } from '@syncfusion/ej2-lineargauge';

```

```

LinearGauge.Inject(Gradient);
let gauge: LinearGauge = new LinearGauge({
  orientation: 'Horizontal',
  container: {
    width: 30, offset: 30
  },
  axes: [{
    line: { width: 0 },
    majorTicks: { height: 0, interval: 25 },
    minorTicks: { height: 0 },
    labelStyle: {
      font: { color: '#424242',
        }, offset: 55
    },
  },
  pointers: [{
    value: 80, height: 25,
    width: 35, placement: 'Near',
    offset: -44, markerType: 'Triangle',
    color: '#f54ea2'
  }],
  ranges: [{
    start: 0, end: 80,
    startWidth: 30, endWidth: 30,
    offset: 30,
    radialGradient: {
      radius: '65%',
      outerPosition: { x: '50%', y: '70%' },
      innerPosition: { x: '60%', y: '60%' },
      colorStop: [
        { color: '#fff5f5', offset: '5%', opacity: 0.9 },
        { color: '#f54ea2', offset: '100%', opacity: 0.9 }
      ]
    }
  }
]}
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">

```

```

        <div id="element"></div>
    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

If we set both gradients for the range, only the linear gradient gets rendered. If we set the [startValue](#) and [endValue](#) of the [linearGradient](#) as empty strings, then the radial gradient gets rendered in the pointer of the Linear Gauge.

Pointers in EJ2 JavaScript Linear gauge control

Pointers are used to indicate values on an axis. The value of the pointer can be modified using the [value](#) property in [pointers](#).

INDEX.TS

```

import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
    axes: [{
        pointers: [{
            value: 80
        }]
    }]
}, '#element');

```

INDEX.HTML

<script src="index.js" type="text/javascript"></script>
</body></html>

```

Types of pointer

The Linear Gauge supports the following types of pointers:

- Bar
- Marker

The type of pointer can be modified by using the [type](#) property in [pointers](#).

Marker pointer

A marker pointer is a shape that can be used to mark the pointer value in the Linear Gauge.

Types of marker shapes

By default, the marker shape for the pointer is **InvertedTriangle**. To change the shape of the pointer, use the [markerType](#) property in [pointers](#). The following marker types are available in Linear Gauge.

- Circle
- Rectangle
- Triangle
- InvertedTriangle
- Diamond
- Image
- Text

INDEX.TS

```

import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
    axes: [{
        pointers: [{
            value: 80,
            type: 'Marker',
            markerType: 'Circle'
        }]
    }]
}, '#element');

```

```

Text can be added instead of rendering a shape as a pointer. It can be achieved by setting the [markerType](#) property to **Text**, and the text content can be set using the [text](#) property in [pointers](#).

The following properties in the [textStyle](#) property can be used to set the text style for the text pointer.

- [fontFamily](#) - It is used to set the font family for the text pointer.
- [fontStyle](#) - It is used to set the font style for the text pointer.
- [fontWeight](#) - It is used to set the font weight for the text pointer.
- [size](#) - It is used to set the font size for the text pointer.

INDEX.TS

```

Marker Pointer Customization

The marker pointer can be customized using the following properties.

- [height](#) - To set the height of the pointer.
- [position](#) - The position of the pointer can be changed by setting the value as **Inside**, **Outside**, **Cross**, or **Auto**.
- [width](#) - To set the width of the pointer.
- [color](#) - To set the color of the pointer.
- [placement](#) - To place the pointer in the specified position. By default, the pointer is placed **Far** from the axis. To change the placement, set the [placement](#) property as **Near**, **Center**, or **None**.
- [offset](#) - To place the pointer with specified distance from the axis.
- [opacity](#) - To set the opacity of the pointer.
- [animationDuration](#) - To specify the duration of the animation in pointer.
- [border](#) - To set the color and width for the border of the pointer.

INDEX.TS

```
import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
  axes: [{
    pointers: [{
      value: 80,
      markerType: 'Circle',
      height: 15,
      width: 15,
      color: '#cd41f4'
    }]
  }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>

  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
```

```

    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Bar Pointer

The bar pointer is used to track the axis value. The bar pointer starts from the beginning of the gauge and ends at the pointer value. To enable bar pointer set the [type](#) property property in [pointer](#) as Bar.

INDEX.TS

```

import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
    axes: [{
        pointers: [{
            value: 60,
            type: 'Bar'
        }]
    }]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Bar pointer customization

The bar pointer can be customized using following properties.

- [width](#) - To set the thickness of the bar pointer.
- [color](#) - To set the color of the bar pointer.
- [offset](#) - To place the bar pointer with the specified distance from it's default position.
- [opacity](#) - To set the opacity of the bar pointer.
- [roundedCornerRadius](#) - To set the corner radius for the bar pointer.
- [border](#) - To set the color and width for the border of the pointer.
- [animationDuration](#) - To set the duration of the animation in bar pointer.

Note: The placement property is not applicable for the bar pointer.

INDEX.TS

```
import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
  axes: [{
    pointers: [{
      value: 60,
      type: 'Bar',
      width: 20,
      color: '#f44141'
    }]
  }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

<script src="index.js" type="text/javascript"></script>
</body></html>

```

Multiple pointers

Multiple pointers can be added to the Linear Gauge by adding multiple [pointer](#) objects in the [pointers](#) and customization for the pointers can be done with the [pointer](#) object.

INDEX.TS

```

import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
  axes: [{
    pointers: [
      {
        value: 80
      },
      {
        value: 60,
        markerType: 'Circle'
      },
      {
        value: 30,
        markerType: 'Diamond'
      }
    ]
  }]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

```

Gradient Color

Gradient support allows the addition of multiple colors in the pointers of the Linear Gauge. The following gradient types are supported in the Linear Gauge.

- Linear Gradient
- Radial Gradient

Linear Gradient

Using linear gradient, colors will be applied in a linear progression. The start value of the linear gradient can be set using the [startValue](#) property. The end value of the linear gradient will be set using the [endValue](#) property. The color stop values such as [color](#), [opacity](#), and [offset](#) are set using [colorStop](#) property. The linear gradient can be rendered for the pointer in the Linear Gauge by using the below example.

INDEX.TS

```
import { LinearGauge, Gradient } from '@syncfusion/ej2-lineargauge';
LinearGauge.Inject(Gradient);
let gauge: LinearGauge = new LinearGauge({
  orientation: 'Horizontal',
  container: {
    width: 30, offset: 30
  },
  axes: [{
    line: { width: 0 },
    majorTicks: { height: 0, interval: 25 },
    minorTicks: { height: 0 },
    labelStyle: {
      font: { color: '#424242',
        }, offset: 55
    },
  },
  pointers: [{
    value: 80, height: 25,
    width: 35, placement: 'Near',
    offset: -44, markerType: 'Triangle',
    color : '#f54ea2',
    linearGradient: {
      startValue: '0%',
      endValue: '100%',
      colorStop: [
        { color: '#fef3f9', offset: '0%', opacity: 1 },
        { color: '#f54ea2', offset: '100%', opacity: 1 }]
    }
  }],
  ranges: [{
    start: 0, end: 80,
    startWidth: 30, endWidth: 30,
    color: '#f54ea2', offset: 30,
  }]
}],
'#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
```

```

<meta name="author" content="Syncfusion">
<link href="index.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Radial Gradient

Using radial gradient, colors will be applied in circular progression. The inner circle position of the radial gradient will be set using the [innerPosition](#) property. The outer circle position of the radial gradient can be set using the [outerPosition](#) property. The color stop values such as [color](#), [opacity](#), and [offset](#) are set using [colorStop](#) property. The radial gradient can be rendered for the pointer in the Linear Gauge by using the below example.

INDEX.TS

```

import { LinearGauge, Gradient } from '@syncfusion/ej2-lineargauge';
LinearGauge.Inject(Gradient);
let gauge: LinearGauge = new LinearGauge({
    orientation: 'Horizontal',
    container: {
        width: 30, offset: 30
    },
    axes: [{
        line: { width: 0 },
        majorTicks: { height: 0, interval: 25 },
        minorTicks: { height: 0 },
        labelStyle: {
            font: { color: '#424242',
            }, offset: 55
        },
    },
    pointers: [{
        value: 80, height: 25,
        width: 35, placement: 'Near',
        offset: -44, markerType: 'Triangle',
        color : '#f54ea2',
        radialGradient: {
            radius: '60%',
            outerPosition: { x: '50%', y: '50%' },

```

```

        innerPosition: { x: '50%', y: '50%' },
        colorStop: [
            { color: '#fff5f5', offset: '0%', opacity: 0.9 },
            { color: '#f54ea2', offset: '100%', opacity: 0.8 }
        ]
    }
},
ranges: [{
    start: 0, end: 80,
    startWidth: 30, endWidth: 30,
    color: '#f54ea2', offset: 30,
}]
}]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: If we set both gradients, only the linear gradient gets rendered. If we set the [startValue](#) and [endValue](#) of the [linearGradient](#) as empty strings, then the radial gradient gets rendered in the pointer of the Linear Gauge.

Annotations in EJ2 JavaScript Linear gauge control

Annotations are used to mark the specific area of interest in the Linear Gauge with text, HTML elements, or images. Any number of annotations can be added to the Linear Gauge component.

Adding annotation

To render the custom HTML elements in the Linear Gauge component, use the [content](#) property in the [annotations](#). The annotation can be rendered either by specifying the id of the element or specifying the code to create a new element that needs to be displayed in the gauge area.

```
,
<script id='fruits' type='text/x-template'>
<div id='apple'>
<img src='src/lineargauge/images/apple.png'>
</div>
</script>
,
`ts
import { LinearGauge, Annotations } from '@syncfusion/ej2-lineargauge';
LinearGauge.Inject(Annotations);
let gauge: LinearGauge = new LinearGauge({
  annotations: [{
    content: '#fruits',
    x: 100,
    y: 100,
    zIndex: "1"
  }]
}, '#element');
,
```

Customization

The following properties are used to customize the annotation.

- [zIndex](#) - Bring the annotation to the front or back, when annotation overlaps with another element.
- [axisValue](#) - To place the annotation in the specified axis value with respect to the provided axis index.
- [axisIndex](#) - To place the annotation in the specified axis with respect to the provided axis value.
- [horizontalAlignment](#) - To place the annotation horizontally.
- [verticalAlignment](#) - To place the annotation vertically.
- [x](#), [y](#) - To place the annotation in the specified location.

Changing the z-index

To change the stack order of an annotation element, the [zIndex](#) property of the [annotations](#) can be used.

INDEX.TS

```
import { LinearGauge, Annotations } from '@syncfusion/ej2-lineargauge';
LinearGauge.Inject(Annotations);
let gauge: LinearGauge = new LinearGauge({
  annotations: [{
    content: '<div id="first"><h1>Gauge</h1></div>',
    verticalAlignment: 'Center',
    horizontalAlignment: 'Center',
    zIndex: '1'
  }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Positioning an annotation

The annotation can be placed anywhere in the Linear Gauge by setting the pixel value to the [x](#) and [y](#) properties in the [annotations](#).

INDEX.TS

```
import { LinearGauge, Annotations } from '@syncfusion/ej2-lineargauge';
LinearGauge.Inject(Annotations);
let gauge: LinearGauge = new LinearGauge({
  annotations: [{
    content: '<div id="first"><h1>Gauge</h1></div>',
    x: 100,
    y: 100,
```

```

        zIndex: '1'
    }]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Alignment of annotation

The annotation can be aligned horizontally and vertically by using [horizontalAlignment](#) and [verticalAlignment](#) properties respectively. The possible values can be **Center**, **Far**, **Near**, and **None**. The [horizontalAlignment](#) and [verticalAlignment](#) properties are not applicable when the [x](#) and [y](#) properties are set in the [annotations](#).

INDEX.TS

```

import { LinearGauge, Annotations } from '@syncfusion/ej2-lineargauge';
LinearGauge.Inject(Annotations);
let gauge: LinearGauge = new LinearGauge({
  annotations: [{
    content: '<div id="first"><h1>Gauge</h1></div>',
    verticalAlignment: 'Center',
    horizontalAlignment: 'Center',
    zIndex: '1'
  }]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Multiple annotations

Multiple annotations can be added to the Linear Gauge component by adding the multiple [annotation](#) in the [annotations](#) and customization for the annotation can be done with the [annotation](#).

INDEX.TS

```

import { LinearGauge, Annotations } from '@syncfusion/ej2-lineargauge';
LinearGauge.Inject(Annotations);
let gauge: LinearGauge = new LinearGauge({
  annotations: [
    {
      content: '<div><h1 style="color:red;">Speed</h1></div>',
      verticalAlignment: 'Near',
      horizontalAlignment: 'Center',
      x: 100,
      y: 150,
      zIndex: '1'
    },
    {
      content: '<div><h1 style="color:blue;">Meter</h1></div>',
      verticalAlignment: 'Center',
      horizontalAlignment: 'Center',
      x: -100,
      y: -100,
      zIndex: '1'
    }
  ]
}, '#element');

```

</body></html>

```

Animation in EJ2 JavaScript Linear Gauge control

All of the elements in the Linear Gauge, such as the axis lines, ticks, labels, ranges, pointers, and annotations, can be animated sequentially by using the [animationDuration](#) property. The animation for the Linear Gauge is enabled when the [animationDuration](#) property is set to an appropriate value in milliseconds, providing a smooth rendering effect for the control. If the [animationDuration](#) property is set to **0**, which is the default value, the animation effect is disabled. If the animation is enabled, the control will behave in the following order.

1. The axis line, ticks, labels, and ranges will all be animated at the same time.
2. If available, pointers will be animated in the same way as [pointer animation](#).
3. If available, annotations will be animated.

The animation of the Linear Gauge is demonstrated in the following example.

INDEX.TS

```

import { LinearGauge, Annotations } from '@syncfusion/ej2-lineargauge';
LinearGauge.Inject(Annotations);
let gauge: LinearGauge = new LinearGauge({
  animationDuration: 3000,
  orientation: 'Horizontal',
  axes: [
    {
      pointers: [

```

```

        {
            value: 10,
            height: 15,
            width: 15,
            placement: 'Near',
            offset: -38,
            markerType: 'Triangle',
        },
    ],
    ranges: [
        {
            start: 0,
            end: 50,
            startWidth: 10,
            endWidth: 10,
            color: '#F45656',
            offset: 35,
        },
    ],
    majorTicks: {
        interval: 10,
        height: 20,
        color: '#9E9E9E',
    },
    minorTicks: {
        interval: 2,
        height: 10,
        color: '#9E9E9E',
    },
    labelStyle: {
        offset: 48,
        font: {
            fontFamily: 'inherit',
        },
    },
    ],
    annotations: [
        {
            content:
                '<div id="pointer" style="width:70px;margin-left:-3%;margin-top: 21%;font-size:16px;">10 MPH</div>',
            axisIndex: 0,
            axisValue: 10,
            x: 10,
            y: -70,
            zIndex: '1',
        },
    ],
    });
gauge.appendTo('#element');

```

User interaction in EJ2 JavaScript Linear gauge control

Tooltip

Linear gauge displays the details about a pointer value through [tooltip](#), when the mouse hovers over the pointer. To enable the tooltip, set the [enable](#) property to **true** and inject the **GaugeTooltip** module in Linear Gauge.

INDEX.TS

```

import { LinearGauge, GaugeTooltip } from '@syncfusion/ej2-lineargauge';
LinearGauge.Inject(GaugeTooltip);
let gauge: LinearGauge = new LinearGauge({
    tooltip: {
        enable: true
    },
    axes: [{
        pointers: [{
            value: 80
        }]
    }]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">

```

```

="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Tooltip Format

Tooltip in the Linear Gauge control can be formatted using the [format](#) property in [tooltip](#) object. It is used to render the tooltip in certain format or to add a user-defined unit in the tooltip. By default, the tooltip shows the pointer value only. In addition to that, more information can be added in the tooltip. For example, the format **{value}km** shows pointer value with kilometer unit in the tooltip.

INDEX.TS

```

import { LinearGauge, GaugeTooltip } from '@syncfusion/ej2-lineargauge';
LinearGauge.Inject(GaugeTooltip);
let gauge: LinearGauge = new LinearGauge({
    tooltip: {
        enable: true,
        format: '{value}km'
    },
    axes: [{
        pointers: [{
            value: 80
        }]
    }]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Tooltip Template

The HTML element can be rendered in the tooltip of the Linear Gauge using the [template](#) property in the [tooltip](#). The `${value}` can be used as placeholders in the HTML element to display the pointer values of the corresponding axis.

INDEX.TS

```

import { LinearGauge, GaugeTooltip } from '@syncfusion/ej2-lineargauge';
LinearGauge.Inject(GaugeTooltip);
let gauge: LinearGauge = new LinearGauge({
    tooltip: {
        enable: true,
        //tooltip template for Linear gauge
        template: '<div>Pointer: 80 </div>'
    },
    axes: [{
        pointers: [{
            value: 80
        }]
    }]
}, '#element');

```

INDEX.HTML

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customize the appearance of the tooltip

The tooltip can be customized using the following properties in [tooltip](#).

- [fill](#) - To fill the color for tooltip.
- [enableAnimation](#) - To enable or disable the tooltip animation.
- [border](#) - To set the border color and width of the tooltip.
- [textStyle](#) - To customize the style of the text in tooltip.
- [showAtMousePosition](#) - To show the tooltip at the mouse position.

INDEX.TS

```

import { LinearGauge, GaugeTooltip } from '@syncfusion/ej2-lineargauge';
LinearGauge.Inject(GaugeTooltip);
let gauge: LinearGauge = new LinearGauge({
    tooltip: {
        enable: true,
        fill: '#e5bcbc',
        border: {
            color: '#d80000',
            width: 2
        }
    },
    axes: [{
        pointers: [{
            value: 80
        }]
    }]
}, '#element');

Linear gauge print and export in EJ2 JavaScript Linear gauge control

Print

The rendered linear gauge can be printed directly from the browser by calling the [print](#) method. To use the print functionality, set the [allowPrint](#) property as **true**.

INDEX.JS

```

var gauge = new ej.lineargauge.LinearGauge({
  allowPrint: true
}, '#element');
document.getElementById('print').onclick = () => {
  gauge.print();
};

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

```

```

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin-top: 20%;">
        <div id="element" style="margin-top: 20%;"></div>
        <button id="print" type="button" width="15%" style="float:
right">Print</button>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Export

Image Export

To use the image export functionality, set the [allowImageExport](#) property as **true**. The rendered linear gauge can be exported as an image using the [export](#) method. This method requires two parameters: export type and file name. The Linear Gauge can be exported as an image with the following formats.

- JPEG
- PNG
- SVG

INDEX.JS

```

var gauge = new ej.linearGauge.LinearGauge({
    allowImageExport: true
}, '#element');
document.getElementById('export').onclick = () => {
    gauge.export("PNG", "Gauge");
};

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">

<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin-top: 20%;">
        <div id="element" style="margin-top: 20%;"></div>
        <button id="export" type="button" width="15%" style="float:
right">Export</button>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

PDF Export

To use the PDF export functionality, set the [allowPdfExport](#) property as **true**. The rendered Linear Gauge can be exported as PDF using the [export](#) method. The [export](#) method requires three parameters: file type, file name, and orientation of the PDF document. The orientation of the PDF document can be set as **Portrait** or **Landscape**.

INDEX.JS

```

var gauge = new ej.linearGauge.LinearGauge({
    allowPdfExport: true
}, '#element');
document.getElementById('export').onclick = () => {
    gauge.export("PDF", "Gauge", 0);
};

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

    </div>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Exporting Linear Gauge as base64 string of the file

The Linear Gauge can be exported as base64 string for the JPEG, PNG and PDF formats. The rendered Linear Gauge can be exported as base64 string of the exported image or PDF document used in the [export](#) method. The arguments that are required for this method is export type, file name, orientation of the exported PDF document and **allowDownload** boolean value that is set as **false** to return base64 string. The value for the orientation of the exported PDF document is set as **null** for image export and **Portrait** or **Landscape** for the PDF document.

INDEX.JS

```

var gauge = new ej.lineargauge.LinearGauge({
    allowImageExport: true
}, '#element');
document.getElementById('export').onclick = () => {
    gauge.export('JPEG', 'Gauge', null, false).then((data) => {
        var base64 = data;
        document.writeln(base64);
    });
};

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin-top: 20%;">
        <div id="element" style="margin-top: 20%;"></div>
        <button id="export" type="button" width="15%" style="float:
right">Export</button>

```

```

    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The exporting of the Linear Gauge as base64 string is not applicable for the SVG format.

Linear gauge appearance in EJ2 JavaScript Linear gauge control

Customizing the Linear Gauge area

The following properties are available in the [LinearGauge](#) to customize the Linear Gauge area.

- [background](#) - Applies the background color for the Linear Gauge.
- [border](#) - To customize the color and width of the border in Linear Gauge.
- [margin](#) - To customize the margins of the Linear Gauge.

INDEX.TS

```

import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
    background: 'skyblue',
    border: {
        color: "#FF0000",
        width: 2
    },
    margin: {
        left: 40,
        right: 40,
        top: 40,
        bottom: 40
    }
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

    <link href="index.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
    type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
    ="text/javascript"></script>
</head>
<body>

```

```
<div id="container">
  <div id="element"></div>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Setting up the Linear Gauge title

The title for the Linear Gauge can be set using [title](#) property in Linear Gauge. Its appearance can be customized using the [titleStyle](#) with the below properties.

- [color](#) - Specifies the text color of the title.
- [fontFamily](#) - Specifies the font family of the title.
- [fontStyle](#) - Specifies the font style of the title.
- [fontWeight](#) - Specifies the font weight of the title.
- [opacity](#) - Specifies the opacity of the title.
- [size](#) - Specifies the font size of the title.

INDEX.TS

```
import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
  // Title for linear gauge.
  title: 'linear gauge',
  titleStyle: {
    fontFamily: 'Arial',
    fontStyle: 'italic',
    fontWeight: 'regular',
    color: '#E27F2D',
    size: '23px'
  }
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
```

```

<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customizing the Linear Gauge container

The area used to render the ranges and pointers at the center position of the gauge is called container. The following types of container to be applicable for Linear Gauge.

- Normal
- Rounded Rectangle
- Thermometer

The type of the container can be modified by using the [type](#) property in [container](#). The container can be customized by using the following properties in [container](#).

- [offset](#) - To place the container with the specified distance from the axis of the Linear Gauge.
- [width](#) - To set the thickness of the container.
- [height](#) - To set the length of the container.
- [backgroundColor](#) - To set the background color of the container.
- [border](#) - To set the color and width for the border of the container.

Normal

The **Normal** type will render the container as a rectangle and this is the default container type.

INDEX.TS

```

import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
    container: {
        width: 30
    },
    axes: [{
        pointers: [{
            value: 50,
            width: 15,
            type: 'Bar'
        }]
    }]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Rounded Rectangle

The **RoundedRectangle** type will render the container as a rectangle with rounded corner radius. The rounded corner radius of the container can be customized using the [roundedCornerRadius](#) property in [container](#).

INDEX.TS

```

import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
  container: {
    width: 30,
    type: 'RoundedRectangle'
  },
  axes: [{
    pointers: [{
      value: 50,
      width: 15,
      type: 'Bar'
    }]
  }]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Thermometer

The **Thermometer** type will render the container similar to the appearance of thermometer.

INDEX.TS

```

import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
    container: {
        width: 30,
        type: 'Thermometer'
    },
    axes: [{
        pointers: [{
            value: 50,
            width: 15,
            type: 'Bar'
        }]
    }]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
<title>EJ2 Animation</title>
<meta charset="utf-8">
<meta name="viewport" content="width=device-width, initial-scale=1.0">

</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Fitting the Linear Gauge to the control

The Linear Gauge component is rendered with margin by default. To remove the margin around the Linear Gauge, the [allowMargin](#) property in [LinearGauge](#) is set as **false**.

INDEX.TS

```

import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
    allowMargin: false,
    background: "skyblue",
    border: {
        width: 3,
        color: "red"
    },
    margin: {
        left: 0,
        right: 0,
        top: 0,
        bottom: 0
    },
    axes: [{
    }]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

```

```

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

To use this feature, set the [allowMargin](#) property to **false**, the [width](#) property to **100%** and the properties of [margin](#) to **0**.

Accessibility in EJ2 JavaScript Linear Gauge control

Linear Gauge has built-in accessibility features like screen reading and WAI-ARIA attributes.

WAI-ARIA attributes

The Linear Gauge control followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Linear Gauge control:

Attributes	Purpose
role=region	It is specified in the pointer where the interactive drag and drop function is supported to update the pointer value.
aria-label	Provides an accessible name for the axis labels, text pointer and annotation.

Screen reading in Linear Gauge

Accessibility in the Linear Gauge control ensures that all users, regardless of ability or disability, can use screen reading. The following Linear Gauge elements will be read aloud using screen reading software, such as Narrator for Windows.

Elements	Description
Axis labels	Reads the axis labels of the Linear Gauge.
Text pointer	Reads the text content shown as a pointer in Linear Gauge.
Annotation	Reads the content specified in the annotation.

Ensuring accessibility

The Linear Gauge control's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Linear Gauge control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Linear Gauge control with accessibility tools.

Internationalization in EJ2 JavaScript Linear gauge control

Globalization is the process of designing and developing a component that works in different cultures. Internationalization is used to globalize the number content in Linear Gauge component using [format](#) property in Linear Gauge component. It has static text on some features such as

- Axis label
- Tooltip

The static text on above features can be changed to any culture such as Arabic, Deutsch and French. To know more about the globalization in JavaScript components, refer [here](#)

Numeric Format

The text in axis labels and tooltip can be displayed in the numeric format such as currency, percentage and so on. To know more about the numeric formats in axis labels, refer [here](#). In the below example, the axis label is displayed in the currency format.

INDEX.TS

```
import { LinearGauge } from '@syncfusion/ej2-lineargauge';
import { loadCldr, setCulture, Ajax, setCurrencyCode } from
 '@syncfusion/ej2-base';
setCulture("de");
setCurrencyCode('EUR');
let gauge: LinearGauge = new LinearGauge({
  locale: "de",
  format: 'c',
  axes: [{
    labelStyle: {
      font: {
        color: 'red'
      }
    }
  }]
}, '#element');
```

INDEX.HTML

```

Events in EJ2 JavaScript Linear gauge control

This section describes the Linear Gauge component's event that gets triggered when corresponding operations are performed.

animationComplete

When the pointer animation is completed, the [animationComplete](#) event will be triggered. To know more about the arguments of this event, refer [here](#).

INDEX.TS

```

import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
    animationComplete: function() {
    },
    axes:[{
        pointers:[{
            value: 10
        }]
    }]
}, '#element');

```

Methods in EJ2 JavaScript Linear gauge control

The following methods are available in the Linear Gauge component.

setPointerValue

To change the pointer value dynamically, use the [setPointerValue](#) method in the Linear Gauge component. The following are the arguments for this method.

Argument name	Description
axisIndex	Specifies the index of the axis in which the pointer value is to be updated.
pointerIndex	Specifies the index of the pointer to be updated.
pointerValue	Specifies the value of the pointer to be updated.

INDEX.TS

```

import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
  axes: [{
    pointers: [{
      value: 80
    }]
  }]
});

```

```

    }}
  }, '#element');
document.getElementById('btn').onclick = () => {
  gauge.setPointerValue(0, 0, 30);
};

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

setAnnotationValue

To change the annotation content dynamically, use the [setAnnotationValue](#) method in the Linear Gauge component. The following are the arguments for this method.

Argument name	Description
-----	-----
annotationIndex	Specifies the index number of the annotation to be updated.
content	Specifies the text for the annotation to be updated.
axisValue	Specifies the value of the axis where the annotation is to be placed.

INDEX.TS

```

import { LinearGauge, Annotations } from '@syncfusion/ej2-lineargauge';
LinearGauge.Inject(Annotations);

```

```
let gauge: LinearGauge = new LinearGauge({
  annotations: [{
    content: '10',
    zIndex: '1',
    axisValue: 0
  }]
}, '#element');
document.getElementById('btn').onclick = () => {
  gauge.setAnnotationValue(0, '50', 50);
};
```

    <div id="element" style="margin-top: 20%;"></div>
    <button id="btn" type="button" width="15%" style="float:
right">Click me</button>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

refresh

The [refresh](#) method can be used to change the state of the component and render it again.

INDEX.TS

```
import { LinearGauge } from '@syncfusion/ej2-lineargauge';
let gauge: LinearGauge = new LinearGauge({
  axes:[{
    pointers:[{
      value: 10
    }]
  }]
}, '#element');
```

```
document.getElementById('btn').onclick = () => {
    gauge.refresh();
};
```

Ej1 api migration in EJ2 JavaScript Linear gauge control

This article describes the API migration process of Accordion component from Essential JS 1 to Essential JS 2.

Linear gauge dimensions

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Height | **Property:** *height*

 \$("#container").ejLinearGauge({ height: 150 }); | **Property:** *height*

 let gauge: LinearGauge = new LinearGauge({
 height : '150px'
 });
 gauge.appendTo('#container'); |

| Width | **Property:** *width*

 \$("#container").ejLinearGauge({ width: 200 }); | **Property:** *width*

 let gauge: LinearGauge = new LinearGauge({
 width : '200px'
 });
 gauge.appendTo('#container'); |

| Height(In Percentage) | Not Applicable | **Property:** *height*

 let gauge: LinearGauge = new LinearGauge({
 height : '70%'
 });
 gauge.appendTo('#container'); |

|Width(In Percentage)| Not Applicable | **Property:** *width*
 let gauge: LinearGauge = new LinearGauge({ width : '100%' }); gauge.appendTo('#container');

Line customizaton

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

|Height| **Property:** *scales.length*
 \$("#container").ejLinearGauge({ scales:[{ length: 300 }]});
Property: *axes.line.height*
 let gauge: LinearGauge = new LinearGauge({ axes: [{ line: { height : 150 } }]}); gauge.appendTo('#container');

|Width| **Property:** *scales.width*
 \$("#container").ejLinearGauge({ scales:[{ width: 300 }]});
Property: *axes.line.width*
 let gauge: LinearGauge = new LinearGauge({ axes: [{ line: { width : 2 } }]}); gauge.appendTo('#container');

|Color| **Property:** *scales.backgroundColor*
 \$("#container").ejLinearGauge({ scales:[{ backgroundColor: "blue" }]});
Property: *axes.line.color*
 let gauge: LinearGauge = new LinearGauge({ axes: [{ line: { color : '#4286f4' } }]}); gauge.appendTo('#container');

|Offset| Not Applicable | **Property:** *axes.line.offset*
 let gauge: LinearGauge = new LinearGauge({ axes: [{ line: { offset : 2 } }]}); gauge.appendTo('#container');

|Opacity| **Property:** *scales.opacity*
 \$("#container").ejLinearGauge({ scales:[{ opacity: 0.2 }]}); | Not Applicable |

|DashArray| Not Applicable | **Property:** *axes.line.dashArray*
 let gauge: LinearGauge = new LinearGauge({ axes: [{ line: { dashArray : '1' } }]}); gauge.appendTo('#container');

Ticks

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

|Type of Ticks| **Property:** *scales.ticks.type*
 \$("#container").ejLinearGauge({ scales:[{ ticks: [{ type: "majorinterval" }] }]});
Property: *axes.majorTicks.height*
 let gauge: LinearGauge = new LinearGauge({ axes: [{ majorTicks: { } }]}); gauge.appendTo('#container');

|Height of Major Ticks| **Property:** *scales.ticks.height*
 \$("#container").ejLinearGauge({ scales: [{ ticks: [{ type: "majorinterval", height: 8 }] }]});
Property: *axes.majorTicks.height*
 let gauge: LinearGauge = new LinearGauge({ axes: [{ majorTicks: { height : 10 } }]}); gauge.appendTo('#container');

|Width of Major Ticks| **Property:** *scales.ticks.width*
 \$("#container").ejLinearGauge({ scales:[{ ticks: [{ type: "majorinterval", width: 5 }] }]});
Property: *axes.majorTicks.width*
 let gauge: LinearGauge = new LinearGauge({ axes: [{ majorTicks: { width : 2 } }]}); gauge.appendTo('#container');

| Color of Major Ticks | **Property:** *scales.ticks.color*
 \$("#container").ejLinearGauge({
 scales:[
 ticks: [{ type: "majorinterval", color: "Blue" }]
 }]);
Property: *axes.majorTicks.color*
 let gauge: LinearGauge = new LinearGauge({
 axes: [{
 majorTicks: { color: "Blue: }
 }];
 gauge.appendTo('#container');

| Offset for Major Ticks | **Property:** *scales.ticks.distanceFromScale*
 \$("#container").ejLinearGauge({
 scales:[
 ticks: [{ distanceFromScale:
 { x: 5, y: 5 }, type: "majorinterval" }]
 }]);
Property: *axes.majorTicks.offset*
 let gauge: LinearGauge = new LinearGauge({
 axes: [{
 majorTicks: { offset
 : 1 }
 }];
 gauge.appendTo('#container');

| Interval of Major Ticks | **Property:** *scales.majorIntervalValue*
 \$("#container").ejLinearGauge({
 scales: [{ majorIntervalValue: 15 }]
 }]);
Property: *axes.majorTicks.interval*
 let gauge: LinearGauge = new LinearGauge({
 axes: [{
 majorTicks: { interval : 20 }
 }];
 gauge.appendTo('#container');

| Angle of Major Ticks | **Property:** *scales.ticks.angle*
 \$("#container").ejLinearGauge({
 scales:[
 ticks: [{ type: "majorinterval", angle: 30 }]
 }]);
 Not Applicable

| Opcity of Major Ticks | **Property:** *scales.ticks.opacity*
 \$("#container").ejLinearGauge({
 scales:[
 ticks: [{ type: "majorinterval", opacity: 0.5 }]
 }]);
 Not Applicable

| Height of Minor Ticks | **Property:** *scales.ticks.height*
 \$("#container").ejLinearGauge({
 scales: [{
 ticks: [{ type: "minorinterval", height: 8 }]
 }]
 }]);
Property: *axes.minorTicks.height*
 let gauge: LinearGauge = new LinearGauge({
 axes: [{
 minorTicks: { height : 10 }
 }];
 gauge.appendTo('#container');

| Width of Minor Ticks | **Property:** *scales.ticks.width*
 \$("#container").ejLinearGauge({
 scales:[
 ticks: [{ type: "minorinterval", width: 5 }]
 }]
 }]);
Property: *axes.minorTicks.width*
 let gauge: LinearGauge = new LinearGauge({
 axes: [{
 minorTicks: { width : 2 }
 }];
 gauge.appendTo('#container');

| Color of Minor Ticks | **Property:** *scales.ticks.color*
 \$("#container").ejLinearGauge({
 scales:[
 ticks: [{ type: "minorinterval", color: "Blue" }]
 }]);
Property: *axes.minorTicks.color*
 let gauge: LinearGauge = new LinearGauge({
 axes: [{
 minorTicks: { color: "Blue: }
 }];
 gauge.appendTo('#container');

| Offset for Minor Ticks | **Property:** *scales.ticks.distanceFromScale*
 \$("#container").ejLinearGauge({
 scales:[
 ticks: [{ distanceFromScale:
 { x: 5, y: 5 }, type: "minorinterval" }]
 }]);
Property: *axes.minorTicks.offset*
 let gauge: LinearGauge = new LinearGauge({
 axes: [{
 minorTicks: { offset
 : 1 }
 }];
 gauge.appendTo('#container');

| Interval of Minor Ticks | **Property:** *scales.minorIntervalValue*
 \$("#container").ejLinearGauge({
 scales: [{ minorIntervalValue: 8 }]
 }]);
Property:

axes.minorTicks.interval
let gauge: LinearGauge = new LinearGauge({ axes: [{
minorTicks: { interval : 5 } }]; gauge.appendTo('#container');

| Angle of Minor Ticks | **Property:** *scales.ticks.angle* \$("#container").ejLinearGauge({ scales: [{ ticks: [{ type: "minorinterval", angle: 30 }] }]; | Not Applicable |

| Opacity of Minor Ticks | **Property:** *scales.ticks.opacity* \$("#container").ejLinearGauge({ scales: [{ ticks: [{ type: "minorinterval", opacity: 0.5 }] }]; | Not Applicable |

Labels

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Angle | **Property:** *scales.labels.angle* \$("#container").ejLinearGauge({ scales: [{ labels: [{ angle: 15 }] }]; | Not Applicable |

| Offset | **Property:** *scales.labels.distanceFromScale* \$("#container").ejLinearGauge({ scales: [{ labels: [{ distanceFromScale: { x: -5, y: 10 } }] }]; **Property:** *axes.labelStyle.offset* let gauge: LinearGauge = new LinearGauge({ axes: [{ labelStyle: { offset : 3 } }]; gauge.appendTo('#container');

| Format | **Property:** *scales.labels.unitText* \$("#container").ejLinearGauge({ scales: [{ labels: [{ unitText: "F" }] }]; **Property:** *axes.labelStyle.format* let gauge: LinearGauge = new LinearGauge({ axes: [{ labelStyle: { format: 'c' } }]; gauge.appendTo('#container');

| Unit Text Placement | **Property:** *scales.labels.unitTextPlacement* \$("#container").ejLinearGauge({ scales: [{ labels: [{ unitTextPlacement: "front" }] }]; | Not Applicable |

| Label Range Color | Not Applicable | **Property:** *axes.labelStyle.useRangeColor* let gauge: LinearGauge = new LinearGauge({ axes: [{ labelStyle: { useRangeColor: true } }]; gauge.appendTo('#container');

| Opacity | **Property:** *scales.labels.opacity* \$("#container").ejLinearGauge({ scales: [{ labels: [{ opacity: 0.5 }] }]; **Property:** *axes.labelStyle.font.opacity* let gauge: LinearGauge = new LinearGauge({ axes: [{ labelStyle: { font: { opacity: 5 } } }]; gauge.appendTo('#container');

| Label Text Color | **Property:** *scales.labels.textColor* \$("#container").ejLinearGauge({ scales: [{ labels: [{ textColor: "Red" }] }]; **Property:** *axes.labelStyle.font.color* let gauge: LinearGauge = new LinearGauge({ axes: [{ labelStyle: { font: { color: 'red' } } }]; gauge.appendTo('#container');

| Label Font Family | **Property:** *scales.labels.font.fontFamily* \$("#container").ejLinearGauge({ scales: [{ labels: [{ font: { fontFamily: "Segoe UI" } }] }]; **Property:** *axes.labelStyle.font.fontFamily* let gauge: LinearGauge = new LinearGauge({

```
</> &#160; axes: [{ </> &#160; &#160; labelStyle: { font:{ fontFamily: 'Arial' } } </> &#160; } ] };
</> gauge.appendTo('#container');
```

| Label Font Style | **Property:** *scales.labels.font.fontStyle*

 \$("#container").ejLinearGauge({

 scales:[{
 labels: [{ font: {
 fontStyle:
 ej.datavisualization.LinearGauge.FontStyle.Normal } }]
 }] }; | **Property:**
axes.labelStyle.font.fontStyle

 let gauge: LinearGauge = new LinearGauge({
 axes:
 [{
 labelStyle: { font: { fontStyle: 'Bold' } }
 }] };

 gauge.appendTo('#container');

| Label Size | **Property:** *scales.labels.font.size*

 \$("#container").ejLinearGauge({

 scales:[{
 labels: [{ font: { size: "20px" } }]
 }] }; | **Property:**
axes.labelStyle.font.size

 let gauge: LinearGauge = new LinearGauge({
 axes: [{

 labelStyle: { font:{ size: "15px" } }
 }] };

 gauge.appendTo('#container');

| Label Font Weight | Not Applicable | **Property:** *axes.labelStyle.font.fontWeight*

 let gauge:
 LinearGauge = new LinearGauge({
 axes: [{
 labelStyle: { font:{
 fontWeight: '4' } }
 }] };
 gauge.appendTo('#container');

Axis

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Minimum Value | **Property:** *scales.minimum*

 \$("#container").ejLinearGauge({

 scales: [{ minimum: 20 }]
 }]; | **Property:** *axes.minimum*

 let gauge: LinearGauge = new
 LinearGauge({
 axes: [{ minimum: 20 }]
 }];
 gauge.appendTo('#container');

| Maximum Value | **Property:** *scales.maximum*

 \$("#container").ejLinearGauge({

 scales: [{ maximum: 120 }]
 }]; | **Property:** *axes.maximum*

 let gauge: LinearGauge = new
 LinearGauge({
 axes: [{ maximum: 120 }]
 }];
 gauge.appendTo('#container');

| Inverted Position | Not Applicable | **Property:** *axes.isInversed*

 let gauge: LinearGauge = new
 LinearGauge({
 axes: [{ isInversed: true }]
 }];
 gauge.appendTo('#container');

| Opposed Position | Not Applicable | **Property:** *axes.opposedPosition*

 let gauge: LinearGauge
 = new LinearGauge({
 axes: [{ opposedPosition: true }]
 }];

 gauge.appendTo('#container');

Ranges

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Start Value | **Property:** *scales.ranges.startValue*

 \$("#container").ejLinearGauge({

 scales:[{
 ranges: [{ startValue: 20 }]
 }] }; | **Property:**
axes.ranges.start

 let gauge: LinearGauge = new LinearGauge({
 axes: [{

 ranges: [{ start: 20 }]
 }] };
 gauge.appendTo('#container');

| End Value | **Property:** *scales.ranges.endValue*

 \$("#container").ejLinearGauge({

 scales:[{
 ranges: [{ endValue: 20 }]
 }] }; | **Property:**
axes.ranges.end

 let gauge: LinearGauge = new LinearGauge({
 axes: [{

 ranges: [{ end: 20 }]
 }] };
 gauge.appendTo('#container');

|Start Width| **Property:** *scales.ranges.startWidth*
 let gauge: LinearGauge = new LinearGauge({ scales: [{ ranges: [{ startWidth: 10 }] }] });
 gauge.appendTo('#container');

|End Width| **Property:** *scales.ranges.endWidth*
 let gauge: LinearGauge = new LinearGauge({ scales: [{ ranges: [{ endWidth: 15 }] }] });
 gauge.appendTo('#container');

|Color| **Property:** *scales.ranges.backgroundColor*
 let gauge: LinearGauge = new LinearGauge({ scales: [{ ranges: [{ backgroundColor: "red" }] }] });
 gauge.appendTo('#container');

|Offset| **Property:** *scales.ranges.distanceFromScale*
 let gauge: LinearGauge = new LinearGauge({ scales: [{ ranges: [{ distanceFromScale: 10 }] }] });
 gauge.appendTo('#container');

|Range Position| **Property:** *scales.ranges.placement*
 let gauge: LinearGauge = new LinearGauge({ scales: [{ ranges: [{ placement: "Near" }] }] });
 gauge.appendTo('#container');

|Opacity| **Property:** *scales.ranges.opacity*
 scales: [{ ranges: [{ opacity: 0.3 }] }];
 Not Applicable

|Border Customization| **Property:** *scales.ranges.border*
 let gauge: LinearGauge = new LinearGauge({ scales: [{ ranges: [{ border: { color: "green", width: 2 } }] }] });
 let gauge: LinearGauge = new LinearGauge({ axes: [{ ranges: [{ border: { color: "blue", width: 2 } }] }] });
 gauge.appendTo('#container');

Bar Pointer

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

|Bar Pointer| **Property:** *scales.barPointers.value*
 let gauge: LinearGauge = new LinearGauge({ scales: [{ barPointers: [{ value: 20 }] }] });
 let gauge: LinearGauge = new LinearGauge({ axes: [{ pointers: [{ type: 'Bar', value: 20 }] }] });
 gauge.appendTo('#container');

|Color of Bar Pointer| **Property:** *scales.barPointers.backgroundColor*
 let gauge: LinearGauge = new LinearGauge({ scales: [{ barPointers: [{ value: 20, backgroundColor: "red" }] }] });
 let gauge: LinearGauge = new LinearGauge({ axes: [{ pointers: [{ type: 'Bar', value: 20, color: 'red' }] }] });
 gauge.appendTo('#container');

| Offset of Bar Pointer | **Property:** *scales.barPointers.distanceFromScale*
 \$("#container").ejLinearGauge({ scales: [{ value: 40, distanceFromScale: 20 }]; | **Property:** *axes.pointers.offset* let gauge: LinearGauge = new LinearGauge({ axes: [{ pointers: [{ type: 'Bar', value: 20, offset: 20 }]; gauge.appendTo('#container'); |

| Opacity of Bar Pointer | **Property:** *scales.barPointers.opacity*
 \$("#container").ejLinearGauge({ scales: [{ value: 40, opacity: 0.5 }]; | **Property:** *axes.pointers.opacity* let gauge: LinearGauge = new LinearGauge({ axes: [{ pointers: [{ type: 'Bar', value: 20, opacity: 0.5 }]; gauge.appendTo('#container'); |

| Width of Bar Pointer | **Property:** *scales.barPointers.width*
 \$("#container").ejLinearGauge({ scales: [{ value: 40, width: 25 }]; | **Property:** *axes.pointers.width* let gauge: LinearGauge = new LinearGauge({ axes: [{ pointers: [{ type: 'Bar', value: 20, width: 25 }]; gauge.appendTo('#container'); |

| Gradients of Bar Pointer | **Property:** *scales.barPointers.gradients*
 \$("#container").ejLinearGauge({ scales: [{ value: 40, gradients: { colorInfo: [{ colorStop : 0, color: "#FFFFFF" }] }]; | Not Applicable |

| Border of Bar Pointer | **Property:** *scales.barPointers.border*
 \$("#container").ejLinearGauge({ scales: [{ value: 40, border: { color: "red", width: 2 } }]; | **Property:** *axes.pointers.border* let gauge: LinearGauge = new LinearGauge({ axes: [{ pointers: [{ type: 'Bar', value: 20, border: { color: 'red', width: 2.5 } }]; gauge.appendTo('#container'); |

| Animation of Bar Pointer | **Property:** *enableAnimation*
 \$("#container").ejLinearGauge({ enableAnimation: true }; | **Property:** *axes.pointers.animationDuration* let gauge: LinearGauge = new LinearGauge({ axes: [{ pointers: [{ type: 'Bar', value: 20, animationDuration: 2500 }]; gauge.appendTo('#container'); |

| Rounded Corner of Bar Pointer | Not Applicable | **Property:** *axes.pointers.roundedCornerRadius* let gauge: LinearGauge = new LinearGauge({ axes: [{ pointers: [{ type: 'Bar', value: 20, roundedCornerRadius: 15 }]; gauge.appendTo('#container'); |

Marker Pointer

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Marker Pointer | **Property:** *scales.markerPointers.value*
 \$("#container").ejLinearGauge({ scales: [{ markerPointers: [{ value: 20 }]; | **Property:** *axes.pointers.value* let gauge: LinearGauge = new LinearGauge({ axes: [{

```
&#160; &#160; pointers: [{ type: 'Marker', value: 20 } <br/> &#160; } &#160; }]; <br/>
gauge.appendTo('#container');|
```

| Color of Marker Pointer | **Property:** *scales.markerPointers.backgroundColor*

 \$("#container").ejLinearGauge({
 scales:[{
 markerPointers: [{ value: 20, backgroundColor: "blue" }]
 } }]; | **Property:** *axes.pointers.color*

 let gauge: LinearGauge = new LinearGauge({
 axes: [{
 pointers: [{ type: 'Marker', value: 20, color: 'red' }]
 } }];
 gauge.appendTo('#container');|

| Offset of Marker Pointer | **Property:** *scales.markerPointers.distanceFromScale*

 \$("#container").ejLinearGauge({
 scales:[{
 markerPointers: [{ value: 40, distanceFromScale: 10 }]
 } }]; | **Property:** *axes.pointers.offset*

 let gauge: LinearGauge = new LinearGauge({
 axes: [{
 pointers: [{ type: 'Marker', value: 20, offset: 10 }]
 } }];
 gauge.appendTo('#container');|

| Opacity of Marker Pointer | **Property:** *scales.markerPointers.opacity*

 \$("#container").ejLinearGauge({
 scales:[{
 markerPointers: [{ value: 40, opacity: 1 }]
 } }]; | **Property:** *axes.pointers.opacity*

 let gauge: LinearGauge = new LinearGauge({
 axes: [{
 pointers: [{ type: 'Marker', value: 20, opacity: 1 }]
 } }];
 gauge.appendTo('#container');|

| Width of Marker Pointer | **Property:** *scales.markerPointers.width*

 \$("#container").ejLinearGauge({
 scales:[{
 markerPointers: [{ value: 40, width: 20 }]
 } }]; | **Property:** *axes.pointers.width*

 let gauge: LinearGauge = new LinearGauge({
 axes: [{
 pointers: [{ type: 'Marker', value: 20, width: 25 }]
 } }];
 gauge.appendTo('#container');|

| Gradients of Marker Pointer | **Property:** *scales.markerPointers.gradients*

 \$("#container").ejLinearGauge({
 scales:[{
 markerPointers: [{
 value: 40,
 gradients:{colorInfo:[{colorStop : 0, color:"#FFFFFF"}]}
 } } }]; | Not Applicable|

| Border of Marker Pointer | **Property:** *scales.markerPointers.border*

 \$("#container").ejLinearGauge({
 scales:[{
 markerPointers: [{
 value: 40,
 border: { color: "red", width: 2 } }]
 } }]; | **Property:** *axes.pointers.border*

 let gauge: LinearGauge = new LinearGauge({
 axes: [{
 pointers: [{
 type: 'Marker',
 value: 20,
 border: { color: 'red', width: 2.5 } }]
 } }];
 gauge.appendTo('#container');|

| Animation of Marker Pointer | **Property:** *enableMarkerPointerAnimation*

 \$("#container").ejLinearGauge({
 enableMarkerPointerAnimation: true
 } }]; | **Property:** *axes.pointers.animationDuration*

 let gauge: LinearGauge = new LinearGauge({
 axes: [{
 pointers: [{
 type: 'Marker',
 value: 20,
 animationDuration: 1000 }]
 } }];
 gauge.appendTo('#container');|

| Type of Marker Pointer | **Property:** *scales.markerPointers.type*

 \$("#container").ejLinearGauge({
 scales:[{
 markerPointers: [{
 value: 40,
 type: ej.datavisualization.LinearGauge.
 MarkerType.Diamond }]
 } }]; | **Property:** *axes.pointers.markerType*

 let gauge: LinearGauge = new LinearGauge({
 axes: [{

```
<br/> &#160; &#160; pointers: [{ <br/> &#160; &#160; &#160; type: 'Marker', <br/> &#160; &#160; &#160; &#160; value: 20, <br/> &#160; &#160; &#160; &#160; markerType: 'Diamond' }] <br/> &#160; &#160; &#160; &#160; gauge.appendTo('#container');|
```

```
| Placement of Marker Pointer | Property: scales.markerPointers.placement  
$("#container").ejLinearGauge({ scales: [{ markerPointers: [{  
&#160; &#160; &#160; value: 40, &#160; &#160; &#160; placement:  
ej.datavisualization.LinearGauge. &#160; &#160; &#160; &#160; PointerPlacement.Near }} &#160; &#160; &#160; &#160; ] }]); Property: axes.pointers.placement  
let gauge: LinearGauge = new LinearGauge({  
&#160; &#160; axes: [{ pointers: [{ type: 'Marker',  
&#160; &#160; &#160; value: 20, &#160; &#160; &#160; placement: 'Center' }]  
&#160; &#160; &#160; &#160; } ]}); gauge.appendTo('#container');
```

 let gauge: LinearGauge = new
 LinearGauge({
 annotation: [{ content: "Annotation", axisIndex: 0 }]
 });
 gauge.appendTo('#container');

| Axis Value | Not Applicable | **Property:** *annotations.axisValue*
 let gauge: LinearGauge = new
 LinearGauge({
 annotation: [{ content: "Annotation", axisValue: 35 }]
 });
 gauge.appendTo('#container');

| Font customization | **Property:** *scales.customLabels.font*
 \$("#container").ejLinearGauge({
 scales: [{
 showCustomLabels: true,
 customLabels: [{ value: "LinearGauge", font: { size: "30px" } }]
 }]; | **Property:** *annotations.font*
 let gauge: LinearGauge = new LinearGauge({
 annotation: [{ content: "Annotation", font: { size: '15px' } }] };
 gauge.appendTo('#container');

| Annotation Color | **Property:** *scales.customLabels.color*
 \$("#container").ejLinearGauge({
 scales: [{
 showCustomLabels: true,
 customLabels: [{ value: "LinearGauge", color: "yellow" }]
 }]; | **Property:** *annotations.font*
 let gauge: LinearGauge = new LinearGauge({
 annotation: [{ content: "Annotation", font: { color: 'red' } }] };
 gauge.appendTo('#container');

| Opacity of Annotation | **Property:** *scales.customLabels.opacity*
 \$("#container").ejLinearGauge({
 scales: [{
 showCustomLabels: true,
 customLabels: [{ value: "LinearGauge", opacity: 0.5 }]
 }]; | **Property:** *annotations.font*
 let gauge: LinearGauge = new LinearGauge({
 annotation: [{ content: "Annotation", font: { opacity: 0.7 } }] };
 gauge.appendTo('#container');

| Position Type | **Property:** *scales.customLabels.positionType*
 \$("#container").ejLinearGauge({
 scales: [{
 showCustomLabels: true,
 customLabels: [{ value: "LinearGauge", positionType: "outer" }]
 }]; | Not applicable

| TextAngle of Annotation | **Property:** *scales.customLabels.textAngle*
 \$("#container").ejLinearGauge({
 scales: [{
 showCustomLabels: true,
 customLabels: [{ value: "LinearGauge", textAngle: 25
 }]
 }]; | Not applicable

Tooltip

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Tooltip for Pointer| Not Applicable| **Property:** *tooltip.enable*
 let gauge: LinearGauge = new LinearGauge({ tooltip: { enable: true } });
 gauge.appendTo('#container');

| Tooltip for Label| **Property:** *tooltip.showLabelTooltip*
 \$("#container").ejLinearGauge({ tooltip: { showLabelTooltip: true } });
 | Not Applicable|

| Tooltip Format| Not Applicable| **Property:** *tooltip.format*
 let gauge: LinearGauge = new LinearGauge({ tooltip: { enable: true, format: \${pointers.value}cm } });
 gauge.appendTo('#container');

| Tooltip Color| Not Applicable| **Property:** *tooltip.fill*
 let gauge: LinearGauge = new LinearGauge({ tooltip: { enable: true, fill: 'gray' } });
 gauge.appendTo('#container');

| Tooltip Template| **Property:** *tooltip.templateID*
 \$("#container").ejLinearGauge({ tooltip: { templateID: true } });
Property: *tooltip.template*
 let gauge: LinearGauge = new LinearGauge({ tooltip: { enable: true, template: 'Template' } });
 gauge.appendTo('#container');

| Tooltip Animation| Not Applicable| **Property:** *tooltip.enableAnimation*
 let gauge: LinearGauge = new LinearGauge({ tooltip: { enable: true, enableAnimation: true } });
 gauge.appendTo('#container');

| Tooltip Border| Not Applicable| **Property:** *tooltip.border*
 let gauge: LinearGauge = new LinearGauge({ tooltip: { enable: true, border: { width: 2, color: 'red' } } });
 gauge.appendTo('#container');

| Tooltip TextStyle| Not Applicable| **Property:** *tooltip.textStyle*
 let gauge: LinearGauge = new LinearGauge({ tooltip: { enable: true, textStyle: { color: 'white', size: '10px' } } });
 gauge.appendTo('#container');

Appearance of Linear Gauge

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Background Color| **Property:** *backgroundColor*
 \$("#container").ejLinearGauge({ backgroundColor: "Red" });
Property: *background*
 let gauge: LinearGauge = new LinearGauge({ background: 'skyblue' });
 gauge.appendTo('#container');

| Border Color| **Property:** *borderColor*
 \$("#container").ejLinearGauge({ borderColor: "Black" });
Property: *border.color*
 let gauge: LinearGauge = new LinearGauge({ border: { color: 'red' } });
 gauge.appendTo('#container');

| Margin| Not Applicable| **Property:** *margin*
 let gauge: LinearGauge = new LinearGauge({ margin: { left: 40, right: 40, top: 40, bottom: 40 } });
 gauge.appendTo('#container');

| Orientation| **Property:** *orientation*
 \$("#container").ejLinearGauge({ orientation: "Vertical" });
Property: *orientation*
 let gauge: LinearGauge = new LinearGauge({ orientation: 'Horizontal' });
 gauge.appendTo('#container');

| Locale| **Property:** *locale*
 \$("#container").ejLinearGauge({ locale: "en-US" });| **Property:** *locale*
 let gauge: LinearGauge = new LinearGauge({ locale: 'en-US' }
); gauge.appendTo('#container');

| Theme| **Property:** *theme*
 \$("#container").ejLinearGauge({ theme: ej.datavisualization.LinearGauge.flatdark });| **Property:** *theme*
 let gauge: LinearGauge = new LinearGauge({ theme: 'Highcontrast' }
); gauge.appendTo('#container');

| Gauge Title| Not Applicable| **Property:** *title*
 let gauge: LinearGauge = new LinearGauge({ title: 'Linear Gauge' }
); gauge.appendTo('#container');

Gauge Container type

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Container Type| **Property:** *scales.type*
 \$("#container").ejLinearGauge({ scales: { type: 'thermometer' } }
);| **Property:** *container.type*
 let gauge: LinearGauge = new LinearGauge({ container: { type: 'Thermometer' } }
); gauge.appendTo('#container');

| Container Height| Not Applicable| **Property:** *container.height*
 let gauge: LinearGauge = new LinearGauge({ container: { height: 20 } }
); gauge.appendTo('#container');

| Container Width| Not Applicable| **Property:** *container.width*
 let gauge: LinearGauge = new LinearGauge({ container: { width: 10 } }
); gauge.appendTo('#container');

| Container Offset| Not Applicable| **Property:** *container.offset*
 let gauge: LinearGauge = new LinearGauge({ container: { offset: 5 } }
); gauge.appendTo('#container');

Events

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Animation Complete Event| Not Applicable| **Event:** *animationComplete*
 let gauge: LinearGauge = new LinearGauge({ animationComplete: function(e: IAnimationCompleteEventArgs): void { } }
); gauge.appendTo('#container');

| Annotation Render Event| **Event:** *drawCustomLabel*
 \$("#container").ejLinearGauge({ drawCustomLabel: function (args) { } }
);| **Event:** *annotationRender*
 let gauge: LinearGauge = new LinearGauge({ annotationRender: function(e: IAnnotationRenderEventArgs): void { } }
); gauge.appendTo('#container');

| AxisLabel Render Event| **Event:** *drawLabels*
 \$("#container").ejLinearGauge({ drawLabels: function (args) { } }
);| **Event:** *axisLabelRender*
 let gauge: LinearGauge = new LinearGauge({ axisLabelRender: function(e: IAxisLabelRenderEventArgs): void { } }
); gauge.appendTo('#container');

| Load Event| **Event:** *load*
 \$("#container").ejLinearGauge({ load: function (args) {}

});| **Event:** *load*
 let gauge: LinearGauge = new LinearGauge({ load:
 function(e: ILoadEventArgs): void { }
 }
 gauge.appendTo('#container');|

| Loaded Event| Not Applicable| **Event:** *loaded*
 let gauge: LinearGauge = new LinearGauge({
 loaded: function(e: ILoadedEventArgs): void { }
 }

 gauge.appendTo('#container');|

| Resize Event| Not Applicable| **Event:** *resized*
 let gauge: LinearGauge = new LinearGauge({
 resized: function(e: IResizeEventArgs): void { }
 }

 gauge.appendTo('#container');|

| Tooltip Render Event| Not Applicable| **Event:** *tooltipRender*
 let gauge: LinearGauge = new
 LinearGauge({ tooltipRender: function(e: ITooltipRenderEventArgs): void { }
 }

 gauge.appendTo('#container');|

| Value Change Event| Not Applicable| **Event:** *valueChange*
 let gauge: LinearGauge = new
 LinearGauge({ valueChange: function(e: IValueChangeEventArgs): void { }
 }

 gauge.appendTo('#container');|

| Mouse Move Event| **Event:** *mouseClickMove*
 \$("#container").ejLinearGauge({
 mouseClickMove: function (args) {}
 });| **Event:** *gaugeMouseMove*
 let gauge:
 LinearGauge = new LinearGauge({ gaugeMouseMove: function(e: IMouseEventArgs): void
 { }
 }
 gauge.appendTo('#container');|

| Mouse Up Event| **Event:** *mouseClickUp*
 \$("#container").ejLinearGauge({
 mouseClickUp: function (args) {}
 });| **Event:** *gaugeMouseUp*
 let gauge: LinearGauge =
 new LinearGauge({ gaugeMouseUp: function(e: IMouseEventArgs): void { }
 }

 gauge.appendTo('#container');|

| Mouse Down Event| Not Applicable| **Event:** *gaugeMouseDown*
 let gauge: LinearGauge =
 new LinearGauge({ gaugeMouseDown: function(e: IMouseEventArgs): void { }
 }

 gauge.appendTo('#container');|

| Mouse Leave Event| Not Applicable| **Event:** *gaugeMouseLeave*
 let gauge: LinearGauge =
 new LinearGauge({ gaugeMouseLeave: function(e: IMouseEventArgs): void { }
 }

 gauge.appendTo('#container');|

| Mouse Click Event| **Event:** *mouseClick*
 \$("#container").ejLinearGauge({
 mouseClick: function (args) {}
 });| Not Applicable|

| Render Complete Event| **Event:** *renderComplete*
 \$("#container").ejLinearGauge({ renderComplete: function (args) {}
 });| Not
 Applicable|

| Double Click Event| **Event:** *doubleClick*
 \$("#container").ejLinearGauge({
 doubleClick: function (args) {}
 });| Not Applicable|

| Right Click Event| **Event:** *rightClick*
 \$("#container").ejLinearGauge({ rightClick:
 function (args) {}
 });| Not Applicable|

| BarPointers Event| **Event:** *drawBarPointers*
 \$("#container").ejLinearGauge({
 drawBarPointers: function (args) {}
 });| Not Applicable|

| Indicators Event| **Event:** *drawIndicators*
 \$("#container").ejLinearGauge({
 drawIndicators: function (args) {}
 });| Not Applicable|

| MarkerPointer Event| **Event:** *drawMarkerPointers*

 \$("#container").ejLinearGauge({
 drawMarkerPointers: function (args) {}
 });| Not Applicable|

| Ranges Event| **Event:** *drawRange*

 \$("#container").ejLinearGauge({
 drawRange: function (args) {}
 });| Not Applicable|

| Gauge Initialized Event| **Event:** *init*

 \$("#container").ejLinearGauge({
 init: function (args) {}
 });| Not Applicable|

List Box

Getting started in EJ2 JavaScript List box control

The Essential JS 2 for JavaScript (global script) is an ES5 formatted pure JavaScript framework which can be directly used in latest web browsers.

Component Initialization

The Essential JS 2 JavaScript components can be initialized by using either of the following ways.

- Using local script and style references in a HTML page.
- Using CDN link for script and style reference.

Using local script and style references in a HTML page

Step 1: Create an app folder **myapp** for Essential JS 2 JavaScript components.

Step 2: You can get the global scripts and styles from the [Essential Studio JavaScript \(Essential JS 2\)](#) build installed location.

Syntax:

Script: **(installed location)/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/dist/global/{PACKAGE_NAME}.min.js**

Styles: **(installed location)/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/styles/material.css**

Example:

Script: **C:/Program Files (x86)/Syncfusion/Essential Studio/15.4.30/Essential JS 2/ej2-dropdowns/dist/global/ej2-dropdowns.min.js**

Styles: **C:/Program Files (x86)/Syncfusion/Essential Studio/15.4.30/Essential JS 2/ej2-dropdowns/styles/material.css**

Step 3: Create a folder **myapp/resources** and copy/paste the global scripts and styles from the above installed location to **myapp/resources** location.

Step 4: Create a HTML page (index.html) in **myapp** location and add the Essentials JS 2 script and style references.

`html

```
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 material theme -->
<link href="resources/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 ListBox's global script -->
<script src="resources/ej2-dropdowns.min.js" type="text/javascript"></script>
</head>
<body>
</body>
</html>
`
```

Step 5: Now, add the `input` element and initiate the `Essential JS 2 ListBox` component in the `index.html` by using following code

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 material theme -->
<link href="resources/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 ListBox's global script -->
<script src="resources/ej2-dropdowns.min.js" type="text/javascript"></script>
</head>
<body>
<!-- Add the HTML <input> element -->
<input id='listbox' />
<script>
// initialize ListBox component
var listObj = new ej.dropdowns.ListBox();
// Render initialized ListBox.
listObj.appendTo('#listbox');
```

```

</script>
</body>
</html>
`

```

Step 6: Now, run the `index.html` in web browser, it will render the **Essential JS 2 ListBox** component.

Using CDN link for script and style reference

Step 1: Create an app folder `myapp` for the Essential JS 2 JavaScript components.

Step 2: The Essential JS 2 component's global scripts and styles are already hosted in the below CDN link formats.

Syntax:

Script: `http://cdn.syncfusion.com/ej2/{PACKAGENAME}/dist/global/{PACKAGENAME}.min.js`

Styles: `http://cdn.syncfusion.com/ej2/{PACKAGE_NAME}/styles/material.css`

Example:

Script: <http://cdn.syncfusion.com/ej2/ej2-dropdowns/dist/global/ej2-dropdowns.min.js>

Styles: <http://cdn.syncfusion.com/ej2/ej2-dropdowns/styles/material.css>

Step 3: Create a HTML page (`index.html`) in `myapp` location and add the CDN link references. Now, add the `input` element and initiate the **Essential JS 2 ListBox** component in the `index.html` by using following code.

INDEX.HTML

```

<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
  <head>

    <title>Essential JS 2</title>
    <!-- Essential JS 2 material theme -->
    <link href="http://cdn.syncfusion.com/ej2/21.2.3/ej2-
base/styles/material.css" rel="stylesheet" type="text/css"/>
    <link href="http://cdn.syncfusion.com/ej2/21.2.3/ej2-
inputs/styles/material.css" rel="stylesheet" type="text/css"/>
    <link href="http://cdn.syncfusion.com/ej2/21.2.3/ej2-
dropdowns/styles/material.css" rel="stylesheet" type="text/css"/>
    <link href="http://cdn.syncfusion.com/ej2/21.2.3/ej2-
buttons/styles/material.css" rel="stylesheet" type="text/css"/>
    <!-- Essential JS 2 ListBox's global script -->
    <script src="http://cdn.syncfusion.com/ej2/21.2.3/ej2-
dropdowns/dist/global/ej2-dropdowns.min.js" type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
  </head>
  <body>
    <!-- Add the HTML <input> element -->

```

```
<input id='listbox' />
<script>
  // initialize ListBox component
  var listObj = new ej.dropdowns.ListBox();
  // Render initialized ListBox.
  listObj.appendTo('#listbox');
</script>
</body>
</html>
```

Step 4: Now, run the `index.html` in web browser, it will render the `Essential JS 2 ListBox` component.

Binding data source

After initialization, populate the ListBox with data using the `dataSource` property. Here, an array of object values is passed to the ListBox component.

``html`

```
<!DOCTYPE html>

<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-base/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-inputs/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-dropdowns/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-buttons/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 ListBox's global script -->
<script src="http://cdn.syncfusion.com/ej2/ej2-dropdowns/dist/global/ej2-dropdowns.min.js"
type="text/javascript"></script>
</head>
<body>
<!-- Add the HTML <input> element -->
<input id='listbox' />
<script>
var data = [
{ text: 'Hennessey Venom', id: 'list-01' },
{ text: 'Bugatti Chiron', id: 'list-02' },
```

```

{ text: 'Bugatti Veyron Super Sport', id: 'list-03' },
{ text: 'SSC Ultimate Aero', id: 'list-04' },
{ text: 'Koenigsegg CCR', id: 'list-05' },
{ text: 'McLaren F1', id: 'list-06' },
{ text: 'Aston Martin One- 77', id: 'list-07' },
{ text: 'Jaguar XJ220', id: 'list-08' },
{ text: 'McLaren P1', id: 'list-09' },
{ text: 'Ferrari LaFerrari', id: 'list-10' },
];
// initialize ListBox component
var listObj = new ej.dropdowns.ListBox({
dataSource: data
});
listObj.appendTo('#listbox');
</script>
</body>
</html>
`

```

Data binding in EJ2 JavaScript List box control

The ListBox loads the data either from local data sources or remote data services using the [dataSource](#) property. It supports the data type of `array` or `DataManager`.

The ListBox also supports different kinds of data services such as OData, OData V4, and Web API, and data formats such as XML, JSON, and JSONP with the help of `DataManager` adaptors.

Fields	Type	Description
<code>text</code>	<code>string</code>	Specifies the display text of each list item.
<code>value</code>	<code>string</code>	Specifies the hidden data value mapped to each list item that should contain a unique value.
<code>groupBy</code>	<code>string</code>	Specifies the category under which the list item has to be grouped.
<code>iconCss</code>	<code>string</code>	Specifies the iconCss class that needs to be mapped.

| [htmlAttributes](#) | `string` | Allows additional attributes to configure the elements in various ways to meet the criteria. |

When binding complex data to the ListBox, fields should be mapped correctly. Otherwise, the selected item remains undefined.

Local Data

Local data can be represented by the following ways as described below.

Array of string

The ListBox has support to load array of primitive data such as strings or numbers. Here, both value and text field acts as same.

INDEX.TS

```
import { ListBox } from '@syncfusion/ej2-dropdowns';
// define array of string
let sportsData: string[] = ['Badminton', 'Cricket', 'Football', 'Golf',
'Tennis', 'Basket Ball', 'Base Ball', 'Hockey', 'Volley Ball'];
// initialize ListBox component
let listObj: ListBox = new ListBox({
    //set the data to dataSource property
    dataSource: sportsData
});
listObj.appendTo('#listbox');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 ListBox</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="styles.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
inputs/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
dropdowns/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container" style="margin:0 auto; width:250px;">
    <h4>Select your favorite sports:</h4>
    <input id="listbox">
  </div>
```

```

<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Array of object

The ListBox can generate its list items through an array of object data. For this, the appropriate columns should be mapped to the [fields](#) property.

In the following example, **id** and **sports** column from complex data have been mapped to the **value** field and **text** field, respectively.

INDEX.TS

```

import { ListBox } from '@syncfusion/ej2-dropdowns';
let sportsData: { [key: string]: Object }[] = [
    { id: 'game1', sports: 'Badminton' },
    { id: 'game2', sports: 'Cricket' },
    { id: 'game3', sports: 'Football' },
    { id: 'game4', sports: 'Golf' },
    { id: 'game5', sports: 'Tennis' },
    { id: 'game6', sports: 'Basket Ball' },
    { id: 'game7', sports: 'Base Ball' },
    { id: 'game8', sports: 'Hockey' },
    { id: 'game9', sports: 'Volley Ball' }];
// initialize ListBox component
let listObj: ListBox = new ListBox({
    //set the dataSource property
    dataSource: sportsData,
    // maps the appropriate column to fields property
    fields: { text: 'sports', value: 'id' }
});
listObj.appendTo('#listbox');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 ListBox</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="styles.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-base/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-inputs/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-dropdowns/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-buttons/styles/material.css" rel="stylesheet">

```

```

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin:0 auto; width:250px;">
        <h4>Select your favorite sports:</h4>
        <input id="listbox">
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Array of complex object

The ListBox can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [fields](#) property.

In the following example, **Sports.Name** column from complex data have been mapped to the **text** field.

INDEX.TS

```

import { ListBox } from '@syncfusion/ej2-dropdowns';
let sportsData: { [key: string]: Object }[] = [
    { Id: 'game1', Sports: { Name: 'Badminton' } },
    { Id: 'game2', Sports: { Name: 'Cricket' } },
    { Id: 'game3', Sports: { Name: 'Football' } },
    { Id: 'game4', Sports: { Name: 'Golf' } },
    { Id: 'game5', Sports: { Name: 'Tennis' } },
    { Id: 'game6', Sports: { Name: 'Basket Ball' } },
    { Id: 'game7', Sports: { Name: 'Base Ball' } },
    { Id: 'game8', Sports: { Name: 'Hockey' } },
    { Id: 'game9', Sports: { Name: 'Volley Ball' } }];
// initialize ListBox component
let listObj: ListBox = new ListBox({
    //set the dataSource property
    dataSource: sportsData,
    // maps the appropriate column to fields property
    fields: { text: 'Sports.Name' }
});
listObj.appendTo('#listbox');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 ListBox</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

```

```

<meta name="description" content="Typescript UI Controls">
<meta name="author" content="Syncfusion">
<link href="styles.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">

dropdowns/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin:0 auto; width:250px;">
        <h4>Select your favorite sports:</h4>
        <input id="listbox">
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The ListBox has also be rendered through `<input>`, ``, `select` element.

Remote Data

The ListBox supports retrieval of data from remote data services with the help of [DataManager](#) component. The [Query](#) property is used to fetch data from the database and bind it to the ListBox.

The following sample displays the first 10 products from `Products` table of the `Northwind` Data Service.

INDEX.TS

```

import { ListBox } from '@syncfusion/ej2-dropdowns';
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
//initiates the component
let listObj: ListBox = new ListBox({
    //bind the DataManager instance to dataSource property
    dataSource: new DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ODataV4Adaptor
    }),
    //bind the Query instance to query property
    query: new
Query().from('Products').select('ProductID,ProductName').take(10),
    //map the appropriate columns to fields property

```

```

    fields: { text: 'ProductName', value: 'ProductID' }
  });
  listObj.appendTo('#listbox');

```

INDEX.HTML

Icons and templates in EJ2 JavaScript List box control

Icons

To place the icon on a list box, set the [iconCss](#) property to **e-icons** with the required icon CSS. By default, the icon is positioned to the left side of the list.

In the following sample, icon classes are mapped with **iconCss** field.

INDEX.TS

```

import { ListBox, CheckBoxSelection } from '@syncfusion/ej2-dropdowns';
ListBox.Inject(CheckBoxSelection);
// define the array of object
let data: { [key: string]: Object }[] = [
  { text: 'Account Settings', iconCss: 'e-list-icons e-list-user-settings' },
  { text: 'Address Book', iconCss: 'e-list-icons e-list-address-book' },
  { text: 'Delete', iconCss: 'e-list-icons e-list-delete' },
  { text: 'Forward', iconCss: 'e-list-icons e-list-forward' },
  { text: 'Reply', iconCss: 'e-list-icons e-list-reply' },
  { text: 'Reply All', iconCss: 'e-list-icons e-list-reply-all' },
  { text: 'Save All Attachments', iconCss: 'e-list-icons e-list-save-all-attachments' },
  { text: 'Save As', iconCss: 'e-list-icons e-list-icon-save-as' },
  { text: 'Touch/Mouse Mode', iconCss: 'e-list-icons e-list-touch' },
  { text: 'Undo', iconCss: 'e-list-icons e-list-undo' }
];
// initialize ListBox component
let listObj: ListBox = new ListBox({
  //set the data to dataSource property
  dataSource: data,

- [How to enable or disable items in the list box](#)

Selection in EJ2 JavaScript List box control

The ListBox provides support to select an item or a group of item by mouse or keyboard action. There are two selection modes available in list box,

- Single - To select single item in the list box.
- Multiple - To select multiple items in the list box.

On selection of each list box item, [change](#) event is triggered.

Single selection

To enable single selection in the list box, [mode](#) should be set as **Single** in [selectionSettings](#) property.

INDEX.TS

```
import { ListBox } from '@syncfusion/ej2-dropdowns';
// define the array of object
let data: { [key: string]: Object }[] = [
  { text: 'Hennessey Venom' },
  { text: 'Bugatti Chiron' },
  { text: 'Bugatti Veyron Super Sport' },
  { text: 'SSC Ultimate Aero' },
  { text: 'Koenigsegg CCR' },
  { text: 'McLaren F1' },
  { text: 'Aston Martin One- 77' },
  { text: 'Jaguar XJ220' },
  { text: 'McLaren P1' },
  { text: 'Ferrari LaFerrari' }
];
// initialize ListBox component
let listObj: ListBox = new ListBox({
  //set the data to dataSource property
  dataSource: data,
  selectionSettings: {
    mode: 'Single'
  }
});
listObj.appendTo('#listbox');
```

INDEX.HTML

```

Checkbox selection

The ListBox supports checkbox in default and grouped list box which is used to select multiple items. CheckBox selection can be enabled by injecting `CheckBoxSelection` module and also [showCheckBox](#) property should be set as `true`.

Select All

To select all the items in the list box, [showSelectAll](#) should be set as `true`.

INDEX.TS

```

import { ListBox, CheckBoxSelection } from '@syncfusion/ej2-dropdowns';
ListBox.Inject(CheckBoxSelection);
// define the array of object
let data: { [key: string]: Object }[] = [
  { text: 'Hennessey Venom' },

- [How to select items in list box](#)

Sorting and grouping in EJ2 JavaScript List box control

Sorting

The ListBox supports sorting of available items in the alphabetical order that can be either ascending or descending. This can be achieved using

[sortOrder](#) property. Sort order can be **None**, **Ascending** or **Descending**.

In the following example, the **SortOrder** is set as **Descending**.

INDEX.TS

```
import { ListBox } from '@syncfusion/ej2-dropdowns';
let countryData: { [key: string]: Object }[] = [
  { "Name": "Australia", "Code": "AU" },
  { "Name": "Bermuda", "Code": "BM" },
  { "Name": "Canada", "Code": "CA" },
  { "Name": "Cameroon", "Code": "CM" },
  { "Name": "Denmark", "Code": "DK" },
  { "Name": "France", "Code": "FR" },
  { "Name": "Finland", "Code": "FI" },
  { "Name": "Germany", "Code": "DE" },
  { "Name": "Hong Kong", "Code": "HK" }
];
//initiates the component
let listObj: ListBox = new ListBox({
  dataSource: countryData,
  fields: { text: 'Name' },
  sortOrder: 'Descending'
});
listObj.appendTo('#listbox');
```

INDEX.HTML

Grouping

The ListBox supports to wrap the nested element into a group based on its category. The category of each list item can be mapped with

[groupBy](#) field in the data table.

In the following example, vegetables are grouped based on its category.

INDEX.TS

```

import { ListBox } from '@syncfusion/ej2-dropdowns';
let vegetableData: { [key: string]: Object }[] = [
    { "Vegetable": "Cabbage", "Category": "Leafy and Salad", "Id": "item1"
},
    { "Vegetable": "Spinach", "Category": "Leafy and Salad", "Id": "item2"
},
    { "Vegetable": "Wheat grass", "Category": "Leafy and Salad", "Id":
"item3" },
    { "Vegetable": "Yarrow", "Category": "Leafy and Salad", "Id": "item4" },
    { "Vegetable": "Pumpkins", "Category": "Leafy and Salad", "Id": "item5"
},
    { "Vegetable": "Chickpea", "Category": "Beans", "Id": "item6" },
    { "Vegetable": "Green bean", "Category": "Beans", "Id": "item7" },
    { "Vegetable": "Horse gram", "Category": "Beans", "Id": "item8" },
    { "Vegetable": "Garlic", "Category": "Bulb and Stem", "Id": "item9" },
    { "Vegetable": "Nopal", "Category": "Bulb and Stem", "Id": "item10" },
    { "Vegetable": "Onion", "Category": "Bulb and Stem", "Id": "item11" }
];
//initiates the component
let listObj: ListBox = new ListBox({
    dataSource: vegetableData,
    // Map the appropriate columns to fields property along with groupBy
option.

```

```
fields: { groupBy: 'Category', text: 'Vegetable', value: 'Id' }
});
listObj.appendTo('#listbox');
```

INDEX.HTML

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

HTML element

The ListBox also supports grouping of list items under specific groups by initiating the `<select>` element using `optgroup`. The nested items are wrapped based on the `<optgroup>` tag that is presents in the `<select>` element.

INDEX.TS

```
import { ListBox } from '@syncfusion/ej2-dropdowns';
//initiates the component
let listObj: ListBox = new ListBox({});
listObj.appendTo('#listbox');
```

Drag and drop in EJ2 JavaScript List box control

The ListBox has support to drag an item or a group of selected items and drop it within the same list box or into another list box.

The elements can be customized on drag and drop by using the following events,

Events	Description
dragStart	Triggers when the selected element is being dragged.
drag	Triggers when the selected element is being dragged.
drop	Triggers when the selected element is being dropped.

Single listbox

To drag and drop an item or group of item within the list box can be achieved by setting [allowDragAndDrop](#) property as `true`.

The following sample illustrates how to drag and drop an item within the same list box by enabling [allowDragAndDrop](#) property.

INDEX.TS

```
import { ListBox } from '@syncfusion/ej2-dropdowns';
let groupA: { [key: string]: Object }[] = [
  { "Name": "Australia", "Code": "AU" },
  { "Name": "Bermuda", "Code": "BM" },
  { "Name": "Canada", "Code": "CA" },
  { "Name": "Cameroon", "Code": "CM" },
  { "Name": "Denmark", "Code": "DK" },
  { "Name": "France", "Code": "FR" },
  { "Name": "Finland", "Code": "FI" },
  { "Name": "Germany", "Code": "DE" },
  { "Name": "Hong Kong", "Code": "HK" }
];
let listObj: ListBox = new ListBox({
  // Set the groupa data to the data source.
  dataSource: groupA,
  // Set allowDragAndDrop as `true`.
  allowDragAndDrop: true,
  // Map the appropriate columns to fields property.
  fields: { text: 'Name' }
});
listObj.appendTo('#listbox');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 ListBox</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Multiple listbox

To drag and drop an item or group of item between two list boxes can be achieved by setting `allowDragAndDrop` property as `true` and `scope` property should be set to both the list boxes.

In the following sample, the `allowDragAndDrop` property is set as `true` and `scope` is set as `combined-list` to enable drop and drop in both list boxes.

INDEX.TS

```

import { ListBox } from '@syncfusion/ej2-dropdowns';
let groupA: { [key: string]: Object }[] = [
    { "Name": "Australia", "Code": "AU" },

Dual list box in EJ2 JavaScript List box control

The dual list box allows the user to move items between two list boxes by clicking the toolbar buttons.

Dual list box can be created by listing items in the [toolbarSettings](#) along with the [scope](#) property.

The following operations can be performed in dual list box,

Options	Description
moveUp	Move the selected item in the upward direction within the list box.
moveDown	Move the selected item in the downward direction within the list box.
moveTo	Move the selected item to the another list box.
moveFrom	Move the selected item from one list box to the another list box.
moveAllTo	Move all the items to the another list box.
moveAllFrom	Move all the items from one list box to the another list box.

The following example illustrates how to move items from Group A to Group B list box.

INDEX.TS

```

import { ListBox } from '@syncfusion/ej2-dropdowns';
let groupA: { [key: string]: Object }[] = [
    { "Name": "Australia", "Code": "AU" },

Accessibility in EJ2 JavaScript List box control

The ListBox component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the ListBox component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

WAI-ARIA attributes

The ListBox component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the ListBox component:

| Attributes | Purpose |

| --- | --- |

| **role** | Indicates the ListBox component wrapper element as **listbox**, the **UL** element as **presentation**, and its list item as **option**. |

| **aria-label** | Provides an accessible name for the ListBox component. |

| **aria-multiselectable** | Applied to the element with the ListBox role, tells assistive technologies that the list supports multiple selection. The default value is true. |

| **aria-selected** | Applied to elements with role option that are visually styled as selected to inform assistive technologies that the options are selected. |

Keyboard interaction

The ListBox component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the ListBox component.

| Press | To do this |

| --- | --- |

| **Up arrow** | Moves focus to the previous option. |

- | Down arrow | Moves focus to the next option. |
- | Home | Moves focus to first option. |
- | End | Moves focus to last option. |
- | Space | Changes the selection state of the focused option. |
- | Ctrl + A | Selects all options in the list. |
- | Ctrl + Shift + Home | Selects the focused option and all options up to the first option. |
- | Ctrl + Shift + End | Selects the focused option and all options down to the last option. |
- | Ctrl + (Up or Down) | Press Ctrl key with up / down arrow or mouse to select multiple items. |

Ensuring accessibility

The ListBox component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the ListBox component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the ListBox component with accessibility tools.

Style and appearance in EJ2 JavaScript List box control

To modify the ListBox appearance, you need to override the default CSS of ListBox component. Please find the list of CSS classes and its corresponding section in ListBox component. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

CSS Class | Purpose of Class

- |.e-listbox-wrapper|To customize the listbox wrapper
- |.e-list-parent .e-list-item|To customize the listbox list items
- |.e-list-parent .e-list-item:hover|To customize the listbox list items on hover
- |.e-list-parent .e-list-item.e-selected|To customize the listbox selected list item
- |.e-listboxtool-wrapper .e-listbox-tool|To customize the listbox toolbar
- |.e-listboxtool-wrapper .e-listbox-tool .e-btn|To customize the listbox toolbar button
- |.e-listboxtool-wrapper .e-listbox-tool .e-btn .e-btn-icon.e-icons::before|To customize the listbox toolbar icon

Horizontal ListBox

You can use [cssClass](#) property to display the Listbox horizontally.

INDEX.TS

```
import { ListBox } from '@syncfusion/ej2-dropdowns';
// define the array of object
let data: { [key: string]: Object }[] = [
  { text: 'Hennessey Venom' },
```

```

    { text: 'Bugatti Chiron' },
    { text: 'Bugatti Veyron Super Sport' },
    { text: 'SSC Ultimate Aero' },
    { text: 'Koenigsegg CCR' },
    { text: 'McLaren F1' },
    { text: 'Aston Martin One- 77' },
    { text: 'Jaguar XJ220' },
    { text: 'McLaren P1' },
    { text: 'Ferrari LaFerrari' },
  ];
  // initialize ListBox component
  let listObj: ListBox = new ListBox({
    //set the data to dataSource property
    dataSource: data,
    cssClass: 'e-horizontal-listbox'
  });
  listObj.appendTo('#listbox');

How To

Enable scroller in EJ2 JavaScript List box control

The ListBox supports scrolling and it can be achieved by restricting the height of the list box using [height](#) property.

In the following sample, `height` of the list box is restricted to `290px`.

INDEX.TS

```
import { ListBox } from '@syncfusion/ej2-dropdowns';
// define the array of object
let data: { [key: string]: Object }[] = [
  { text: 'Account Settings', id: 'list-01' },
  { text: 'Address Book', id: 'list-02' },
  { text: 'Delete', id: 'list-03' },
  { text: 'Forward', id: 'list-04' },
  { text: 'Reply', id: 'list-05' },
  { text: 'Reply All', id: 'list-06' },
  { text: 'Save All Attachments', id: 'list-07' },
  { text: 'Save As', id: 'list-08' },
  { text: 'Touch/Mouse Mode', id: 'list-09' },
  { text: 'Undo', id: 'list-10' }
];
// initialize ListBox component
let listObj: ListBox = new ListBox({
  //set the data to dataSource property
  dataSource: data,
  height: '290px'
});
listObj.appendTo('#listbox');
```

INDEX.HTML

```

</body>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Add items in EJ2 JavaScript List box control

To add an item or multiple items, [addItem](#) method can be used. In the following example, the Bugatti Veyron Super Sport and SSC Ultimate Aero items will be added while clicking Add Items button.

INDEX.TS

```

import { ListBox } from '@syncfusion/ej2-dropdowns';
// define the array of object
let data: { [key: string]: Object }[] = [
    { text: 'Hennessey Venom', id: 'list-01' },
    { text: 'Bugatti Chiron', id: 'list-02' },
    { text: 'Koenigsegg CCR', id: 'list-05' },
    { text: 'McLaren F1', id: 'list-06' },
    { text: 'Aston Martin One- 77', id: 'list-07' },
    { text: 'Jaguar XJ220', id: 'list-08' },
    { text: 'McLaren P1', id: 'list-09' },
    { text: 'Ferrari LaFerrari', id: 'list-10' }
];
// initialize ListBox component
let listObj: ListBox = new ListBox({
    //set the data to dataSource property
    dataSource: data
});
listObj.appendTo('#listbox');
document.getElementById('additem').onclick = () => {
    if (!listObj.getDataByValue('Bugatti Veyron Super Sport')) {
        listObj.addItems([
            { text: 'Bugatti Veyron Super Sport', id: 'list-03' },
            { text: 'SSC Ultimate Aero', id: 'list-04' }
        ]);
    }
}

```

INDEX.HTML

```

```

Enable or disable items in EJ2 JavaScript List box control

To enable or disable items in the list box, [enableItems](#) method can be used. In the following example, the Bugatti Veyron Super Sport and SSC Ultimate Aero items are disabled by default and by clicking Enable Items buttons, the disabled items will be enabled.

INDEX.TS

```

import { ListBox } from '@syncfusion/ej2-dropdowns';
// define the array of object
let data: { [key: string]: Object }[] = [
    { text: 'Hennessey Venom', id: 'list-01' },
    { text: 'Bugatti Chiron', id: 'list-02' },
    { text: 'Bugatti Veyron Super Sport', id: 'list-03' },
    { text: 'SSC Ultimate Aero', id: 'list-04' },
    { text: 'Koenigsegg CCR', id: 'list-05' },
    { text: 'McLaren F1', id: 'list-06' },
    { text: 'Aston Martin One- 77', id: 'list-07' },
    { text: 'Jaguar XJ220', id: 'list-08' },
    { text: 'McLaren P1', id: 'list-09' },
    { text: 'Ferrari LaFerrari', id: 'list-10' }
];
// initialize ListBox component
let listObj: ListBox = new ListBox({
    //set the data to dataSource property
    dataSource: data,

```

```

        created: () => {
            listObj.enableItems(['Bugatti Veyron Super Sport', 'SSC Ultimate
Aero'], false);
        }
    });
    listObj.appendTo('#listbox');
    document.getElementById('enableitem').onclick = () => {
        listObj.enableItems(['Bugatti Veyron Super Sport', 'SSC Ultimate
Aero']);
    }
}

```

INDEX.HTML

ListView

Getting started in EJ2 JavaScript Listview control

The Essential JS 2 for JavaScript (global script) is an ES5 formatted pure JavaScript framework which can be directly used in latest web browsers.

control Initialization

The Essential JS 2 JavaScript controls can be initialized by using either of the following ways.

- Using local script and style references in a HTML page.
- Using CDN link for script and style reference.

Using local script and style references in a HTML page

Step 1: Create an app folder **myapp** for Essential JS 2 JavaScript controls.

Step 2: You can get the global scripts and styles from the [Essential Studio JavaScript \(Essential JS 2\)](#) build installed location.

Syntax:

Script: **(installed location)\Syncfusion\Essential Studio\JavaScript - EJ2\{RELEASEVERSION}\Web (Essential JS 2)\JavaScript\{PACKAGENAME}\dist\global\{PACKAGE_NAME}.min.js**

Styles: **(installed location)\Syncfusion\Essential Studio\JavaScript - EJ2\{RELEASEVERSION}\Web (Essential JS 2)\JavaScript\{PACKAGENAME}\styles\material.css**

Example:

Script: C:\Program Files (x86)\Syncfusion\Essential Studio\JavaScript - EJ2\16.3.0.17\Web (Essential JS 2)\JavaScript\ej2-lists\dist\global\ej2-lists.min.js

Styles: C:\Program Files (x86)\Syncfusion\Essential Studio\JavaScript - EJ2\16.3.0.17\Web (Essential JS 2)\JavaScript\ej2-lists\styles\material.css

The below located script and style file contains all Syncfusion JavaScript (ES5) UI control resources in a single file.

Scripts: **(installed location)**\Syncfusion\Essential Studio\JavaScript - EJ2\{RELEASE_VERSION}\Web (Essential JS 2)\JavaScript\ej2\dist\ej2.min.js

Styles: **(installed location)**\Syncfusion\Essential Studio\JavaScript - EJ2\{RELEASE_VERSION}\Web (Essential JS 2)\JavaScript\ej2\material.css

Step 3: Create a folder **myapp/resources** and copy/paste the global scripts and styles from the above installed location to **myapp/resources** location.

Step 4: Create a HTML page (index.html) in **myapp** location and add the Essentials JS 2 script and style references.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 material theme -->
<link href="resources/base/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/lists/styles/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 List's global and dependent scripts -->
<script src="resources/scripts/ej2-data.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-base.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-lists.min.js" type="text/javascript"></script>
</head>
<body>
</body>
</html>
`
```

Step 5: Now, add the **ListView** element and initiate the **Essential JS 2 ListView** control in the **index.html** by using following code

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 material theme -->
<link href="resources/base/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/lists/styles/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 List's global and dependent scripts -->
<script src="resources/scripts/ej2-data.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-base.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-lists.min.js" type="text/javascript"></script>
</head>
<body>
<!-- Add the HTML <div> element -->
<div id='element'></div>
<script>
//define the array of string
var arts = ["Artwork", "Abstract", "Modern Painting", "Ceramics", "Animation Art", "Oil Painting"];
// Initialize Essential JS 2 JavaScript ListView control
var listViewInstance = new ej.lists.ListView({
//set the data to datasource property
dataSource: arts
});
//Render initialized ListView
listviewInstance.appendTo("#element");
</script>
</body>
</html>
`
```

Step 6: Now, run the `index.html` in web browser, it will render the **Essential JS 2 ListView** control.

Using [CDN link for script and style reference](#)

Step 1: Create an app folder `myapp` for the Essential JS 2 JavaScript controls.

Step 2: The Essential JS 2 control's global scripts and styles are already hosted in the below CDN link formats.

Syntax:

Script: <https://cdn.syncfusion.com/ej2/{PACKAGENAME}/dist/global/{PACKAGENAME}.min.js>

Styles: https://cdn.syncfusion.com/ej2/{PACKAGE_NAME}/styles/material.css

Example:

Script: <https://cdn.syncfusion.com/ej2/ej2-lists/dist/global/ej2-lists.min.js>

Styles: <https://cdn.syncfusion.com/ej2/ej2-lists/styles/material.css>

Step 3: Create a HTML page (index.html) in myapp location and add the CDN link references. Now, add the **ListView** element and initiate the **Essential JS 2 List** control in the index.html by using following code.

INDEX.HTML

```
<html><head><script
src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head><body><script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Step 4: Now, run the **index.html** in web browser, it will render the **Essential JS 2 ListView** control.

Need to refer dependency control styles and scripts as like above example. We can also use [CRG](#) to generate combined control styles.

Note: You can refer to our [JavaScript ListView](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript ListView Example](#) that show you how to render and configure the ListView in JavaScript.

Data binding in EJ2 JavaScript Listview control

ListView provides an option to load the data either from local dataSource or remote data services. This can be done through the dataSource property that supports the data type of array or [DataManager](#).

ListView supports different kind of data services such as OData, OData V4, and Web API, and data formats like XML, JSON, and, JSONP with the help of DataManager Adaptors.

Fields	Type	Description
id	string	Specifies ID attribute of list item, mapped in dataSource.
text	string	Specifies list item display text field.
isChecked	boolean	Specifies checked status of list item.
isVisible	boolean	Specifies visibility state of list item.
enabled	boolean	Specifies enabled state of list item.
iconCss	string	Specifies the icon class of each list item that will be added before to the list item text.
child	string	Specifies child dataSource fields.
tooltip	string	Specifies tooltip title text field.
groupBy	string	Specifies category of each list item.
sortBy	string	Specifies sorting field, that is used to sort the listview data.
htmlAttributes	string	Specifies list item html attributes field.

When complex data bind to ListView, you should map the fields properly. Otherwise, the ListView properties remain as undefined or null.

Bind to local data

Local data can be represented in two ways, they are as follows:

- Array of simple data.
- Array of JSON data.

Array of simple data

ListView supports to load the array of primitive data like string and numbers. Here, both value and text field act as same.

INDEX.TS

```
import { ListView } from '@syncfusion/ej2-lists';
//define the array of string
let arts: string[] = ["Artwork", "Abstract", "Modern Painting", "Ceramics",
"Animation Art", "Oil Painting"];
//Initialize ListView control
let listViewInstance: ListView = new ListView({
    //set the data to datasource property
    dataSource: arts
});
//Render initialized ListView
```

```
listviewInstance.appendTo("#element");
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 for ListView </title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Essential JS 2 for ListView UI
Control">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
lists/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Array of JSON data

ListView can generate its list items through an array of complex data. To get it work properly, you should map the appropriate columns to the field property.

In the following example, role column is mapped with the text field.

INDEX.TS

```
import { ListView } from '@syncfusion/ej2-lists';
//define the array of JSON
let settings: { [key: string]: Object }[] = [
  {
    'Name': 'Display',
    'id': 'list-01'
  },
  {
    'Name': 'Notification',
    'id': 'list-02'
  },
];
```

```

    {
        'Name': 'Sound',
        'id': 'list-03'
    },
    {
        'Name': 'Apps',
        'id': 'list-04'
    },
    {
        'Name': 'Storage',
        'id': 'list-05'
    },
    {
        'Name': 'Battery',
        'id': 'list-06'
    }
];
//Initialize ListView control
let listViewInstance: ListView = new ListView({
    //set the data to datasource property
    dataSource: settings,
    //map the appropriate columns to fields property
    fields: { text: 'Name', tooltip: 'Name', id:'id'},
    //set the header tittle for the list
    headerTitle: 'Device settings',
    showHeader: true
});
//Render initialized ListView
listviewInstance.appendTo("#element");

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 for ListView </title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Essential JS 2 for ListView UI
Control">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
lists/styles/material.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>

```

```
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Bind to remote data

The ListView supports to retrieve the data from remote data services with the help of DataManager control. The Query property allows to fetch data and return it to the ListView from the database.

In the following sample, first 10 employees from the ListView table are displayed.

INDEX.TS

```
import { ListView } from '@syncfusion/ej2-lists';
//import DataManager related classes
import { DataManager, Query } from '@syncfusion/ej2-data';
//Initialize ListView control
let listViewInstance: ListView = new ListView({
    //bind the DataManager instance to dataSource property
    dataSource: new DataManager({
        url: 'https://services.syncfusion.com/js/production/api/',
        crossDomain: true
    }),
    //Initialize query with the Query instance to get specified set of data
    query: new
    Query().from('ListView').select('EmployeeID,FirstName').take(10),
    //Map the appropriate columns to fields property
    fields: { id: 'EmployeeID', text: 'FirstName' },
    //Set header title
    headerTitle: 'Employees',
    //Set true to show header title
    showHeader: true
});
//Render initialized ListView
listviewInstance.appendTo("#element");
```

Grouping in EJ2 JavaScript Listview control

The ListView supports to wrap the nested element into a group based on the category. The category of each list item can be mapped with `groupBy` field in the data table, that also support single-level navigation.

In the following sample, The cars are grouped based on its category by using the `groupBy` field.

INDEX.TS

```

import { ListView } from '@syncfusion/ej2-lists';
//define the array of JSON
let cars: { [key: string]: Object }[] = [
    {
        'text': 'Audi A4',
        'id': '9bdb',
        'category': 'Audi'
    },
    {
        'text': 'Audi A5',
        'id': '4589',
        'category': 'Audi'
    },
    {
        'text': 'Audi A6',
        'id': 'e807',
        'category': 'Audi'
    },
    {
        'text': 'Audi A7',
        'id': 'a0cc',
        'category': 'Audi'
    },
    {
        'text': 'Audi A8',
        'id': '5e26',
        'category': 'Audi'
    },
],

```

```

    {
        'text': 'BMW 501',
        'id': 'f849',
        'category': 'BMW'
    },
    {
        'text': 'BMW 502',
        'id': '7aff',
        'category': 'BMW'
    },
    {
        'text': 'BMW 503',
        'id': 'b1da',
        'category': 'BMW'
    },
    {
        'text': 'BMW 507',
        'id': 'de2f',
        'category': 'BMW'
    },
    {
        'text': 'BMW 3200',
        'id': 'b2b1',
        'category': 'BMW'
    }
];
//Initialize ListView control
let listViewInstance: ListView = new ListView({
    //set the data to datasource property
    dataSource: cars,
    // map the groupBy field with category column
    fields: { groupBy: 'category', tooltip: 'text' }
});
//Render initialized ListView
listviewInstance.appendTo("#element");

```

```

Customization

The grouping header can be customized by using the groupTemplate property for both inline and fixed group header. The complete customization description and explanation with an example is given in the following link.

[Group Template.](#)

Check list in EJ2 JavaScript Listview control

The ListView supports checkbox in default and group-lists which is used to select multiple items. The checkbox can be enabled by the `showCheckBox` property.

The Checkbox will be useful in the scenario where we need to select multiple options. For Example, In Shipping cart we can be able to select or unselect the desired items before checkout and also it will be useful in selecting multiple items that belongs to the same category using the group list.

INDEX.TS

```

import { ListView } from '@syncfusion/ej2-lists';
let listData: { [key: string]: Object }[] = [
    {text: 'Do Meditation', id: '1'},
    {text: 'Go Jogging', id: '2'},
    {text: 'Buy Groceries', id: '3'},
    {text: 'Pay Phone bill', id: '4'},
    {text: 'Play Football with your friends', id: '5'},
];
// Initialize the ListView control
let listObj: ListView = new ListView({
    //Set the defined data to the data source property
    dataSource: listData,
    headerTitle: 'To DO List',
    showHeader: true,
    //Set true to enable CheckBox
    showCheckBox: true
});
//Render the initialized ListView control
listObj.appendTo('#element');

```

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Checkbox Position

In ListView the checkbox can be positioned into either **Left** or **Right** side of the list-item text. This can be achieved by **checkboxPosition** property. By default, checkbox will be positioned to **Left** of list-item text.

INDEX.TS

```

import { ListView } from '@syncfusion/ej2-lists';
//define the array of JSON
let data: { [key: string]: Object }[] = [
    { text: 'Hennessey Venom', id: 'list-01' },

Customizing templates in EJ2 JavaScript Listview control

The ListView control is designed to customize list items, group title and header title. It uses Essential JS2 [Template engine](#) to render the elements.

Header template

ListView header can be customized with the help of the [headerTemplate](#) property.

To customize header template in your application, set your customized template string to [headerTemplate](#) property along with [showHeader](#) property as `true` to display the ListView header.

`ts

```
let listViewInstance: ListView = new ListView({
  data: listData,
  headerTemplate: '<div class="header-content"><span>Header</span></div>',
  showHeader: true
})
,
```

In the following example, we have rendered Listview with customized header which contains search, add and sort buttons.

INDEX.TS

```
import { ListView } from '@syncfusion/ej2-lists';
import { Button } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let fruitsdata: { [key: string]: Object }[] = [
  { text: 'Date', id: '1', imgUrl: './dates.jpg' },
  { text: 'Fig', id: '2', imgUrl: './fig.jpg' },
  { text: 'Apple', id: '3', imgUrl: './apple.png' },
  { text: 'Apricot', id: '4', imgUrl: './apricot.jpg' },
  { text: 'Grape', id: '5', imgUrl: './grape.jpg' },
  { text: 'Strawberry', id: '6', imgUrl: './strawberry.jpg' },
  { text: 'Pineapple', id: '7', imgUrl: './pineapple.jpg' },
  { text: 'Melon', id: '8', imgUrl: './melon.jpg' },
  { text: 'Lemon', id: '9', imgUrl: './lemon.jpg' },
  { text: 'Cherry', id: '10', imgUrl: './cherry.jpg' },
];
let listViewInstance: any = new ListView({
  dataSource: fruitsdata,
  headerTemplate: '<div class="headerContainer"><span
class="fruitHeader">Fruits</span><button id="search"></button><button
id="add"></button><button id="sort"></button></div>',
  showHeader: true,
  actionComplete: renderHeaderButtons
});
listViewInstance.appendTo('#element');
function renderHeaderButtons() {
  ['search', 'sort', 'add'].forEach((item: string) => {
    new Button({ iconCss: `e-icons e-${item}-icon`, cssClass: 'e-small
e-round', isPrimary: true }, `#${item}`)
  });
}
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 for ListView </title>
  <meta charset="utf-8">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Template

ListView items can be customized with the help of the [template](#) property.

To customize list items in your application, set your customized template string to `template` property.

`ts

```

let listViewInstance: ListView = new ListView({
data: listData,
template: '<div class="list-tem"><span>${text}</span></div>',
})
`

```

We provided the following built-in CSS classes to customize the list-items. Refer to the following table.

CSS class	Description
e-list-template, e-list-wrapper	These classes are used to differentiate normal and template rendering, which are mandatory for template rendering. The <code>e-list-template</code> class should be added to the root of the ListView element and <code>e-list-wrapper</code> class should be added to the template element wrapper

```

new ListView({
  dataSource: data,
  cssClass: 'e-list-template',
  template: '<div class="e-list-wrapper"></div>', '#list');

```

| e-list-content | This class is used to align list content and it should be added to the content element
`

 <div class="e-list-wrapper">
ListItem
</div>|`

| e-list-avatar | This class is used for avatar customization. It should be added to the template element wrapper. After adding it, we can customize our element with [Avatar](#) classes
`

 <div class="e-list-wrappere-list-avatar">
 MR
ListItem
</div>|`

| e-list-avatar-right | This class is used to align avatar to right side of the list item. It should be added to the template element wrapper. After adding it, we can customize our element with [Avatar](#) classes
`

 <div class="e-list-wrappere-list-avatar-right">
 ListItem
MR
</div>|`

| e-list-badge | This class is used for badge customization .It should be added to the template element wrapper. After adding it, we can customize our element with [Badge](#) classes
`

 <div class="e-list-wrappere-list-badge">
 ListItem
MR
</div>|`

| e-list-multi-line | This class is used for multi-line customization. It should be added to the template element wrapper. After adding it, we can customize List item's header and description
`

<div class="e-list-wrappere-list-multi-line">
 ListItem
</div>|`

| e-list-item-header | This class is used to align a list header and it should be added to the header element along with the multi-line class
`

 <div class="e-list-wrappere-list-multi-line">
 ListItem Header
 ListItem
</div>|`

In the following example, we have customized list items with built-in CSS classes.

INDEX.TS

```
import { ListView } from "@syncfusion/ej2-lists";
let template: string = '<div class="e-list-wrapper e-list-multi-line e-list-avatar">' +
    '${if (avatar!=="")}' +
    '<span class="e-avatar e-avatar-circle">${avatar}</span>' +
    '${else}' +
    '<span class="${pic} e-avatar e-avatar-circle"> </span>' +
    '${/if}' +
    '<span class="e-list-item-header">${text}</span>' +
    '<span class="e-list-content">${contact}</span>' +
    '</div>';
//Define an array of JSON data
let dataSource: any = [
    {
        text: "Jenifer",
        contact: "(206) 555-985774",
        id: "1",
        avatar: "",
    }
];
```

```

        pic: "pic01"
    },
    { text: "Amenda", contact: "(206) 555-3412", id: "2", avatar: "A", pic: ""
    },
    {
        text: "Isabella",
        contact: "(206) 555-8122",
        id: "4",
        avatar: "",
        pic: "pic02"
    },
    {
        text: "William ",
        contact: "(206) 555-9482",
        id: "5",
        avatar: "W",
        pic: ""
    },
    {
        text: "Jacob",
        contact: "(71) 555-4848",
        id: "6",
        avatar: "",
        pic: "pic04"
    },
    { text: "Matthew", contact: "(71) 555-7773", id: "7", avatar: "M", pic: ""
    },
    {
        text: "Oliver",
        contact: "(71) 555-5598",
        id: "8",
        avatar: "",
        pic: "pic03"
    },
    {
        text: "Charlotte",
        contact: "(206) 555-1189",
        id: "9",
        avatar: "C",
        pic: ""
    }
    ];
// Initialize the ListView control
let listObj: ListView = new ListView({
    //Set the defined data to the dataSource property
    dataSource: dataSource,
    //Map the appropriate columns to the fields property
    fields: { text: "text" },
    //Set the width of the ListView
    width: "350px",
    //Enable the header of the ListView
    showHeader: true,
    //Set the header title
    headerTitle: "Contacts",
    //set cssClass for template customization
    cssClass: 'e-list-template',
    //Set the customized template

```

```

    template: template,
    sortOrder: "Ascending"
  });
  //Render the initialized ListView control
  listObj.appendTo("#List");

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 for ListView </title>
  <meta charset="utf-8">

```

Group template

ListView group header can be customized with the help of the [groupTemplate](#) property.

To customize the group template in your application, set your customized template string to [groupTemplate](#) property.

```
`ts
```

```

let listViewInstance: ListView = new ListView({
  data: listData,
  groupTemplate: '<div class="group-header"><span>${items[0].category}</span></div>',

```

```

})
`

```

In the following example, we have grouped Listview based on the category. The category of each list item should be mapped with [groupBy](#) field of the data. We have also displayed grouped list items count in the group list header.

INDEX.TS

```

import { ListView } from '@syncfusion/ej2-lists';
let template: string = '<div class="e-list-wrapper e-list-multi-line e-list-avatar">' +
    '<img class="e-avatar e-avatar-circle" src=${image}
style="background:#BCBCBC" />' +
    '<span class="e-list-item-header">${Name}</span>' +
    '<span class="e-list-content">${contact}</span>' +
    '</div>';
//Define an array of JSON data
let dataSource = [

="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div class="col-lg-12 control-section">
            <!-- ListView element -->
            <div id="List" tabindex="1">
                </div>
            </div>
        </div>
    </div>
    <script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>

```

We can also render other EJ2 controls in ListView templates by rendering that controls on [actionComplete](#) event. Refer to the below code snippet.

```

`ts
let listViewInstance: ListView = new ListView({
data: listData,

```

```

template: '<div><span>${text}</span><button id="delete"></button></div>',
actionComplete: () => {
  new Button({iconCss: 'e-icons e-delete-icon' cssClass: 'e-small e-round', isPrimary: true }, '#delete')
}
})
,

```

Virtualization in EJ2 JavaScript Listview control

UI virtualization loads only viewable list items in a view port, which will improve the ListView performance while loading a large number of data.

Module injection

To use UI virtualization, you should import `virtualization` module from the `ej2-lists` package and inject it using `ListView.Inject()`

method as shown in the following code snippet.

```

`ts
import { ListView, Virtualization } from '@syncfusion/ej2-lists';
ListView.Inject(Virtualization);
,

```

Getting started

UI virtualization can be enabled in the ListView by setting the [enableVirtualization](#) property to true.

It has two types of scrollers as follows:

Window scroll: This scroller is used in the ListView by default.

Container scroll: This scroller is used, when the height property of the ListView is set.

INDEX.TS

```

import { ListView, Virtualization } from '@syncfusion/ej2-lists';
ListView.Inject(Virtualization);
let listData: { [key: string]: string | object }[] = [];
listData = [
  { text: 'Nancy', id: '0' },
  { text: 'Andrew', id: '1' },
  { text: 'Janet', id: '2' },
  { text: 'Margaret', id: '3' },
  { text: 'Steven', id: '4' },
  { text: 'Laura', id: '5' },
  { text: 'Robert', id: '6' },
  { text: 'Michael', id: '7' },
  { text: 'Albert', id: '8' },
  { text: 'Nolan', id: '9' }
];
for (let i: number = 10; i <= 1010; i++) {
  let index: number = parseInt((Math.random() * 10).toString());
  listData.push({ text: listData[index].text, id: i.toString() });
}

```

```
let listObj: ListView = new ListView({
  //Set defined data to dataSource property.
  dataSource: listData,
  //Set height
  height: 500,
  //enable UI virtualization
  enableVirtualization: true,
});
listObj.appendTo('#ui-list');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 for ListView </title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Essential JS 2 for ListView UI
Control">
  <meta name="author" content="Syncfusion">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
lists/styles/material.css" rel="stylesheet">
  <link href="index.css" rel="stylesheet">

type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="ui-list"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

You can use the **template** property to customize list items in UI virtualization.

INDEX.TS

```
import { ListView, Virtualization } from '@syncfusion/ej2-lists';
ListView.Inject(Virtualization);
let listData: { [key: string]: string | object }[] = [];
listData = [
  { name: 'Nancy', icon: 'N', id: '0', },
  { name: 'Andrew', icon: 'A', id: '1' },
  { name: 'Janet', icon: 'J', id: '2' },
```

```

    { name: 'Margaret', imgUrl:
    '//ej2.syncfusion.com/demos/src/listview/images/margaret.png', id: '3' },
    { name: 'Steven', icon: 'S', id: '4' },
    { name: 'Laura', imgUrl:
    '//ej2.syncfusion.com/demos/src/listview/images/laura.png', id: '5' },
    { name: 'Robert', icon: 'R', id: '6' },
    { name: 'Michael', icon: 'M', id: '7' },
    { name: 'Albert', imgUrl:
    '//ej2.syncfusion.com/demos/src/listview/images/albert.png', id: '8' },
    { name: 'Nolan', icon: 'N', id: '9' }
  ]
  for (let i: number = 10; i <= 1010; i++) {
    let index: number = parseInt((Math.random() * 10).toString());
    listData.push({ name: listData[index].name, icon: listData[index].icon,
    imgUrl: listData[index].imgUrl, id: i.toString() });
  }
  var template: Function = (data: any) => {
    var result = `<div class="e-list-wrapper e-list-avatar" >`+
    `<span class="e-avatar e-avatar-circle ${data.icon} ${data.imgUrl ?
    'hideUI' : 'showUI' }">${data.icon}</span> ` +
    `<span class="e-list-content">${data.name}</span></div>`;
    return result;
  };
  let listObj: ListView = new ListView({
    //Set defined data to dataSource property.
    dataSource: listData,
    //enable UI virtualization
    enableVirtualization: true,
    //Set height
    height: 500,
    //Set header title
    headerTitle: 'Contacts',
    //Set true to show header title
    showHeader: true,
    cssClass: 'e-list-template',

    //Set defined customized template
    template: template
  });
  listObj.appendTo('#ui-list');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Conditional rendering

The following conditional rendering support is provided for the template and groupTemplate.

| Name | Syntax |

| --- | --- | --- |

| conditional class | `<div class="$ { $id % 2 === 0 ? 'even-list' : 'odd-list' }"></div>` |

| conditional attribute | `<div id="$ { $id % 2 === 0 ? 'even-list' : 'odd-list' }"></div>` |

| conditional text content | `<div>${ $id % 2 === 0 ? 'even-list' : 'odd-list' }</div>` |

In the following sample, the light blue is applied for the even list and light coral is applied for the odd list based on the conditional class.

INDEX.TS

```

import { ListView, Virtualization } from '@syncfusion/ej2-lists';
ListView.Inject(Virtualization);
let listData: { [key: string]: string | object }[] = [];
listData = [

```

Scrolling in EJ2 JavaScript Listview

Scrolling is a technique that allows you to load more items as the user scrolls through a list, providing a seamless and dynamic user experience.

Render the ListView with [dataSource](#), and bind the [scroll](#) event. Within the scroll event, you can access information such as the scroll direction, event name and the distance from the scrollbar to the top and bottom ends through the distanceY parameter.

In the given example, new data is seamlessly added while scrolling. When you scrolls to the bottom and the distance scrolled is less than 100 pixels, it dynamically loads a batch of items into the list as long as there are more items to render.

INDEX.TS

```
import { ListView, ScrolledEventArgs } from '@syncfusion/ej2-lists';
let data: { [key: string]: Object }[] = [
  {
    text: "Hi Guys, Good morning! \uD83D\uDE0A, I'm very delighted to share with you the news that our team is going to launch a new mobile application",
    positionClass: 'right',
  },
  {
    text: "Oh! That's great \uD83D\uDE42",
    positionClass: 'left',
  },
  {
    text: 'That is a good news \uD83D\uDE00',
    positionClass: 'right',
  },
  {
    text: 'What kind of application we are gonna launch? \uD83E\uDD14',
    positionClass: 'left',
  },
  {
    text: 'A kind of "Emergency Broadcast App" like being able to just invite someone to teams without it impacting how many people have official access',
    positionClass: 'right',
  },
  {
    text: 'Who will be the client users for our applications? ',
    positionClass: 'left',
  },
  {
    text: 'Is currently the only way to invite someone through 0365? Just wondering down the road how organization would want to handle that with freelancers, like being able to just invite someone to teams without it impacting how many people have official access \uD83D\uDE14',
    positionClass: 'right',
  },
  {
    text: 'Yes, however, that feature of inviting someone from outside your organization is planned - expected closer to GA next year \uD83D\uDC4D',
    positionClass: 'left',
  },
  {
    text: 'I guess we should switch things over to hear for a while. How long does the trial last? \uD83E\uDD14',
    positionClass: 'right',
  },
],
```

```

    { text: 'I think the trial is 30 days. \uD83D\uDE03', positionClass:
    'left' },
    {
        text: 'Only 0365 only members of your organization. They said that they
        are listening to customer feedback and hinted that guest users would be
        brought in down the road \uD83D\uDE09',
        positionClass: 'right',
    },
    { text: 'Cool thanks! \uD83D\uDC4C', positionClass: 'left' },
];

Accessibility in EJ2 JavaScript Listview component

The ListView component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the ListView component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | ` |`

| Screen Reader Support | ` |`

| Right-To-Left Support | ` |`

| Color Contrast | ` |`

| Mobile Device Support | ` |`

| Keyboard Navigation Support | ` |`

| [Accessibility Checker](#) Validation | ` |`

| [Axe-core](#) Accessibility Validation | ` |`

`<style>`

```
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
```

`</style>`

`<div> - All features of the component meet the requirement.</div>`

`<div> - Some features of the component do not meet the requirement.</div>`

`<div> - The component does not meet the requirement.</div>`

WAI-ARIA attributes

The ListView component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the ListView component:

| Attributes | Purpose |

| --- | --- |

| `role=list` | Specifies the non selectable list container. |

| `role=listitem` | Specifies the role of each item in a selectable ListView and its containment within the list. |

| `role=presentation` | Specifies the role of non selectable list element. |

- | `role=checkbox` | Indicates checkbox control along with listitem element. |
- | `aria-checked` | Indicates the current checked state of checkbox. |
- | `aria-label` | Provides an accessible name for the ListView Checkbox. |
- | `aria-disabled` | Indicates element is perceivable but disabled. |

Keyboard interaction

The ListView component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the ListView component.

| Keyboard shortcuts | Actions |

|-----|-----|

| Arrow Up | Move to the previous list item |

| Arrow Down | Move to the next list item |

| Space | Check and uncheck the targeted list from the whole list |

| BackSpace | Get back to the previous lists if it is nested list |

| Home | Moves focus to first list item |

| End | Moves focus to last list item |

Ensuring accessibility

The ListView component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the ListView component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the ListView component with accessibility tools.

Style in EJ2 JavaScript Listview control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on user preference.

Customizing ListView

Use the following CSS to customize the ListView.

```
`css
.e-listview {
border: 5px solid rgb(173, 255, 47);
}
```

Customizing the list items

Use the following CSS to customize the items of ListView.

```
`css
.e-listview .e-list-item {
text-align: center;
color: pink;
background-color: #2fa1ff;
}
`
```

Customizing ListView's header

Use the following CSS to customize the header of ListView control.

```
`css
.e-listview .e-list-header{
color: #2fa1ff;
justify-content: center;
}
`
```

Customizing group header of ListView

Use the following CSS to customize the category of the group items.

```
`css
.e-listview .e-list-group-item {
color: rgb(173, 255, 47);
background-color: maroon;
text-align: end;
}
`
```

Customizing the hover state of ListView control

Use the following CSS to customize the list item when hovering.

Customizing ListView hover state with the checkbox checked

```
`css
.e-listview .e-list-item.e-hover.e-active.e-checklist {
color: rgb(83, 5, 79);
background-color: rgb(173, 255, 47);
}
`
```

`

Customizing ListView hover state

`css

```
.e-listview .e-list-item.e-hover {
color:red;
background-color: rgb(173, 255, 47);
}
```

`

Customizing selected item of ListView control

Use the following CSS to customize the selected list item.

Customizing ListView's selected item with the checkbox checked

`css

```
.e-listview .e-list-item.e-checklist.e-focused.e-active {
color: rgb(83, 5, 79);
background-color: rgb(0, 15, 100);
}
```

`

Customizing ListView's selected item

`css

```
.e-listview .e-list-item.e-focused {
color: #2fa1ff;
background-color: rgb(0, 15, 100);
}
```

`

Ej1 api migration in EJ2 JavaScript Listview control

This article describes the API migration process of ListView component from Essential JS 1 to Essential JS 2.

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Virtualization | **Property:** *allowVirtualScrolling*
 \$("#list").ejListView ({
 dataSource: dataSrc,
 allowVirtualScrolling: true,
virtualScrollMode: "normal"
 }); | **Property:** *enableVirtualization*
 let list: ListView = new ej.lists.ListView({
 dataSource: data,
 enableVirtualization: true
 });
 list.appendTo('#test'); |

| Checkbox | **Property:** *enableCheckMark*
 \$("#list").ejListView ({
dataSource: dataSrc,
enableCheckMark: true
 }); | **Property:** *showCheckBox*
 let list: ListView = new ej.lists.ListView({
 dataSource: data,
 showCheckBox: true
 });
 list.appendTo('#test'); |

| Fields | **Property:** *fieldSettings*
 enableGroupList [
 <ul data-ej-grouplisttitle="Settings">
]
 \$(" #list").ejListView({
 dataSource: dataSrc,
 fieldSettings:{'text':'textfield'},
 enableGroupList: true
 }); | **Property:** *fields*
 Inner properties: *child, enabled, groupBy htmlAttributes, iconsCss, id, isChecked, isVisible, sortBy, tableName, text, tooltip*
 let list: ListView = new ej.lists.ListView({
 dataSource: data,
 fields: { enabled: enable_item, groupBy: groupByProp,...}
 });
 list.appendTo('#test'); |

| Template | **Property:** *renderTemplate*
 <div id="lb">

 <li data-ej-templateid="target1">
 <li data-ej-templateid="target2">
 <li data-ej-templateid="target3">

 </div>
 <div id="target1">
 <div> Template1 </div>
 </div>
 <div id="target2">
 <div> Template2 </div>
 </div>
 <div id="target3">
 <div> Template3 </div>
 </div>
 \$(" #list").ejListView({
 dataSource: dataSrc,
 renderTemplate: true
 }); | **Property:** *template*
 let list: ListView = new ej.lists.ListView({
 dataSource: data,
 template: "<div>string template</div>"
 });
 list.appendTo('#test'); |

| Animation | **Not Applicable** | **Property:** *animation*
 let list: ListView = new ej.lists.ListView({
 dataSource: data,
 animation: { effect: 'SlideLeft', duration: 400, easing: 'ease' }
 });
 list.appendTo('#test'); |

| Enable | **Not Applicable** | **Property:** *enable*
 let list: ListView = new ej.lists.ListView({
 dataSource: data,
 enable: true
 });
 list.appendTo('#test'); |

| Template for grouping | **Not Applicable** | **Property:** *groupTemplate*
 let list: ListView = new ej.lists.ListView({
 dataSource: data,
 groupTemplate: 'group template string'
 });
 list.appendTo('#test'); |

| Template for header | **Not Applicable** | **Property:** *headerTemplate*
 let list: ListView = new ej.lists.ListView({
 dataSource: data,
 headerTemplate: 'header template string'
 });
 list.appendTo('#test'); |

| HTML attributes | **Not Applicable** | **Property:** *htmlAttributes*
 var attribute = {id: 'listid', class: '.listtest'}
 let list: ListView = new ej.lists.ListView({
 dataSource: data,
 htmlAttributes: this.attribute
 });
 list.appendTo('#test'); |

| Clear | **Method:** *clear()*
 \$(" #list").ejListView({dataSource: dataSrc });
 \$(" #lb").ejListView("clear"); | **Property** *dataSource*
 let emptyDataSrc: { [key: string]: Object }[] = [];
 let list: ListView = new ej.lists.ListView({
 dataSource: emptyDataSrc,
 });
 list.appendTo('#test');
 list.destory();
 |

| IsChecked | **Method:** *isChecked()*
 \$(" #list").ejListView({enableCheckMark:true});
 \$(" #lb").ejListView("isChecked"); | **Method:** *checkItem()*
 let list: ListView = new ej.lists.ListView({
 dataSource: data,
 });
 list.appendTo('#test');
 list.checkItem({id:'2'});
 |

| Load Ajax Content | **Method:** *loadAjaxContent()*
 \$(" #list").ejListView ({ enableAjax: true });
 \$(" #list").ejListView("loadAjaxContent","load1.html"); | **Event:** *onSuccess*
 let template: string;
 let ajax: Ajax = new Ajax('./template.html', 'GET', false);
 ajax.onSuccess= (e: string)=>{
 template = e;
 }
 ajax.send();
 let list: ListView = new ej.lists.ListView({
 dataSource: data,
 template: template,
 headerTitle: 'Settings',
 showHeader: true
 });
 list.appendTo('#element');
 |

```
| Remove CheckMark | Method: removeCheckMark() <br />
$("#list").ejListView({enableCheckMark:true}); <br /> $("#list").ejListView("removeCheckMark",2); |
Method: uncheckItem() <br />let list: ListView = new ej.lists.ListView({<br />dataSource: data,<br
/>});<br />list.appendTo('#test');<br />list.uncheckItem ({id:'2'})<br />|

| Set Active | Method: setActive() <br /> $("#list").ejListView({persistSelection:true}); <br />
$("#list").ejListView("setActive",2); | Method: selectItem() <br /> let list: ListView = new
ej.lists.ListView({<br />dataSource: data,<br />});<br />list.appendTo('#test');<br />list.selectItem({id:'2'})
<br />|

| Select | Not Applicable | Event: select <br /> let list: ListView = new ej.lists.ListView({ <br /> select:
function(e: Event): void { } <br /> }); <br /> list.appendTo('#test');|

| Ajax Before Load | Event: ajaxbeforeLoad <br /> $("#list").ejListView({ <br /> enableAjax: true, <br />
ajaxBeforeLoad: function (args) { } <br /> }); | Event: onSuccess <br /> let template: string;<br /> let ajax:
Ajax = new Ajax('./template.html', 'GET', false);<br /> ajax.onSuccess= (e: string)=>{ <br /> template =
e;<br /> }<br /> ajax.beforeSend();<br /> let list: ListView = new ej.lists.ListView({<br /> dataSource:
data,<br />template: template,<br />headerTitle: 'Settings',<br />showHeader: true<br />});<br
/>list.appendTo('#element');<br />|

| Ajax Complete | Event: ajaxComplete <br /> $("#list").ejListView({ <br /> enableAjax: true, <br />
ajaxComplete: function (args) { } <br /> }); | Event: onSuccess <br /> let template: string;<br /> let ajax:
Ajax = new Ajax('./template.html', 'GET', false);<br /> ajax.onSuccess= (e: string)=>{ <br /> template =
e;<br /> }<br /> ajax.send();<br /> let list: ListView = new ej.lists.ListView({<br /> dataSource: data,<br
/>template: template,<br />headerTitle: 'Settings',<br />showHeader: true<br />});<br
/>list.appendTo('#element');<br />|

| Ajax Error | Event: ajaxError <br /> $("#list").ejListView({ <br />enableAjax: true, <br />ajaxError:
function (args) { } <br />}); | Event: onError <br /> let template: string; <br />let ajax: Ajax = new
Ajax('./template.html', 'GET', false);<br />ajax.onError = (e: string)=>{<br />template = e;<br />}<br
/>ajax.send();<br />let list: ListView = new ej.lists.ListView({<br />dataSource: data,<br />template:
template,<br />headerTitle: 'Settings',<br />showHeader: true<br />});<br
/>list.appendTo('#element');<br />|
```

How To

Get selected items from listview in EJ2 JavaScript Listview control

Single or many items can be selected by users in the ListView control. An API is used to get selected items from the list items. This is called as the [getSelectedItems](#) method.

getSelectedItems method

This is used to get the details of the currently selected item from the list items. It returns the [SelectedItem](#) | [SelectedCollection](#)

The `getSelectedItems` method returns the following items from the selected list items.

Return type	Purpose
text	Returns the text of selected item lists
data	Returns the whole data of selected list items, i.e., returns the fields data of selected li.
item	Returns the collections of list items

INDEX.TS

```

import { ListView, SelectedCollection } from '@syncfusion/ej2-lists';
import { Button } from '@syncfusion/ej2-buttons';
//define the array of string
let data: { [key: string]: Object }[] = [
    { text: 'Hennessey Venom', id: 'list-01' },
    { text: 'Bugatti Chiron', id: 'list-02', isChecked: true },
    { text: 'Bugatti Veyron Super Sport', id: 'list-03' },
    { text: 'SSC Ultimate Aero', id: 'list-04', isChecked: true },
    { text: 'Koenigsegg CCR', id: 'list-05' },
    { text: 'McLaren F1', id: 'list-06' },
    { text: 'Aston Martin One- 77', id: 'list-07', isChecked: true },
    { text: 'Jaguar XJ220', id: 'list-08' }
];
//Initialize the ListView control
let listViewInstance: ListView = new ListView({
    //set the data to the dataSource property
    dataSource: data,
    //Enable check box
    showCheckBox: true,
});
//Render the initialized ListView
listviewInstance.appendTo("#element");
let button: Button = new Button();
button.appendTo("#btn")
document.getElementById('btn').addEventListener('click', () => {
    let selecteditem: SelectedCollection =
listviewInstance.getSelectedItems() as SelectedCollection;
    let data: HTMLElement = document.getElementById('val');
    data.innerHTML = "";
    let row1: HTMLTableRowElement = document.createElement('tr');
    let header1: HTMLTableHeaderCellElement = document.createElement('th');
    header1.innerHTML = 'Text';
    row1.appendChild(header1);
    let header2 = document.createElement('th');
    header2.innerHTML = 'Id';
    row1.appendChild(header2);
    document.getElementById('val').appendChild(row1);
    for (let i: number = 0; i < (selecteditem["data"] as { [key: string]:
object }[]).length; i++) {
        let row2: HTMLTableRowElement = document.createElement('tr');
        row2.setAttribute("id", i.toString());
        let data1: HTMLElement = document.createElement('td');
        data1.innerHTML = selecteditem["text"][i];
        row2.appendChild(data1);
        let data2: HTMLElement = document.createElement('td');
        data2.innerHTML = (selecteditem["data"] as { [key: string]: object
}[])[i].id.toString();
        row2.appendChild(data2);
        document.getElementById('val').appendChild(row2);
    }
});

```

```

Add and remove list items from listview in EJ2 JavaScript Listview control

You can add or remove list items from the ListView control using the [addItem](#) and [removeItem](#) methods. Refer to the following steps to add or remove a list item.

- Render the ListView with data source, and use the [template](#) property to append the delete icon for each list item. Also, bind the click event for the delete icon using the [actionComplete](#) handler.
- Render the Add Item button, and bind the click event. On the click event handler, pass data with random id to the [addItem](#) method to add a new list item on clicking the Add Item button.
- Bind the click handler to the delete icon created in step 1. Within the click event, remove the list item by passing the delete icon list item to [removeItem](#) method.

INDEX.TS

```

import { ListView } from "@syncfusion/ej2-lists";
import { Button } from "@syncfusion/ej2-buttons";
import { MouseEventArgs } from "@syncfusion/ej2-base";
//Define an array of JSON data
let data: { [key: string]: Object }[] = [
    { text: "Hennessey Venom", id: "1", icon: "delete-icon" },
    { text: "Bugatti Chiron", id: "2", icon: "delete-icon" },
    { text: "Bugatti Veyron Super Sport", id: "3", icon: "delete-icon" },
    { text: "Aston Martin One- 77", id: "4", icon: "delete-icon" },

Dynamic templates in listview based on device in EJ2 JavaScript Listview control

The Syncfusion Essential JS2 controls are desktop and mobile-friendly. So, you can use Syncfusion controls in both modes. The control templates are not always fixed. Applications may need to load various templates depending upon the device.

Integration

In the ListView control, template support is being used. In some cases, the control wrapper is always responsive across all devices, but the template contents are dynamically changed with unspecified (sample side) dimensions. CSS customization is also needed in sample-side to align template content responsively in both mobile and desktop modes. Here, two templates have been loaded for mobile and desktop modes. To check the device mode, a browser module has been imported from the ej2-base package.

INDEX.TS

```

import { ListView } from '@syncfusion/ej2-lists';
import { Browser } from '@syncfusion/ej2-base';
let mob_template: string = '<div class="settings">'
    + '<div id="postContainer"><div id="postImg">'
    + '<img src=${image} /></div>'
    + '<div id="content">'
    + '<div id="info">'
    + '<div id="logo"> <div id="share">'
    + '<span class="share"></span> </div> <div id="comments"> <span
class="comments"></span> </div>'
    + '<div id="bookmark"> <span class="bookmark"></span> </div></div></div>'
    + '<div class="name">${Name}</div>'
    + '<div class="description">${content}</div>'
    + '<div class="timeStamp">${timeStamp} </div>'
    + '</div>'

Create mobile contact layout from listview in EJ2 JavaScript Listview control

You can customize the ListView using the [template](#) property. Refer to the following steps to customize ListView as mobile contact view with our [ej2-avatar](#).

- Render the ListView with [dataSource](#) that has avatar data. You can set avatar data as either text or class names. Refer to the following codes.

```
`ts
let dataSource: { [key: string]: Object }[] = [
{
text: "Jenifer", contact: "(206) 555-985774", id: "1", avatar: "", pic: "pic01"
},
{
text: "Amenda", contact: "(206) 555-3412", id: "2", avatar: "A", pic: ""
}
];
`
```

- Set [avatar](#) classes in ListView template to customize contact icon. In the following codes, medium size avatar has been set using the class name [e-avatar e-avatar-circle](#) from data source.

```
`ts
template: '<div class="e-list-wrapper e-list-multi-line e-list-avatar">' +
'${if(avatar!=="")}' +
'<span class="e-avatar e-avatar-circle">${avatar}</span>' +
'${else}' +
'<span class="${pic} e-avatar e-avatar-circle"> </span>' +
'${/if}' +
'<span class="e-list-item-header">${text}</span>' +
'<span class="e-list-content">${contact}</span>' +
'</div>';
`
```

Avatars can be set in different sizes in avatar classes. To know more about avatar classes, refer to [Avatar](#).

- Sort the contact names using the [sortOrder](#) property of ListView.
- Enable the [showHeader](#) property, and set the [headerTitle](#) as Contacts.

INDEX.TS

```
import { ListView } from "@syncfusion/ej2-lists";
let template: string = '<div class="e-list-wrapper e-list-multi-line e-list-avatar">' +
    '${if(avatar!=="")}' +
    '<span class="e-avatar e-avatar-circle">${avatar}</span>' +
    '${else}' +
    '<span class="${pic} e-avatar e-avatar-circle"> </span>' +
    '${/if}' +
    '<span class="e-list-item-header">${text}</span>' +
    '<span class="e-list-content">${contact}</span>' +
    '</div>';
//Define an array of JSON data
let dataSource: { [key: string]: Object }[] = [
    {
        text: "Jenifer",
        contact: "(206) 555-985774",
        id: "1",
        avatar: "",
        pic: "pic01"
    },
    { text: "Amenda", contact: "(206) 555-3412", id: "2", avatar: "A", pic: "" },
    {
        text: "Isabella",
        contact: "(206) 555-8122",
        id: "4",
        avatar: "",
        pic: "pic02"
    },
    {
        text: "William ",
        contact: "(206) 555-9482",
        id: "5",
        avatar: "W",
        pic: ""
    },
    {
        text: "Jacob",
        contact: "(71) 555-4848",
        id: "6",
        avatar: "",
        pic: "pic04"
    },
    { text: "Matthew", contact: "(71) 555-7773", id: "7", avatar: "M", pic: "" },
    {
        text: "Oliver",
```

```

        contact: "(71) 555-5598",
        id: "8",
        avatar: "",
        pic: "pic03"
    },
    {
        text: "Charlotte",
        contact: "(206) 555-1189",
        id: "9",
        avatar: "C",
        pic: ""
    }
];
// Initialize the ListView control
let listObj: ListView = new ListView({
    //Set the defined data to the dataSource property
    dataSource: dataSource,
    //Map the appropriate columns to the fields property
    fields: { text: "text" },
    //Set the width of the ListView
    width: "350px",
    //Enable the header of the ListView
    showHeader: true,
    //Set the header title
    headerTitle: "Contacts",
    //set cssClass for template customization
    cssClass: 'e-list-template',
    //Set the customized template
    template: template,
    sortOrder: "Ascending"
});
//Render the initialized ListView control
listObj.appendTo("#List");

```

Filter and search list items using listview in EJ2 JavaScript Listview control

The filtered data can be displayed in the ListView control depending upon on user inputs using the [DataManager](#). Refer to the following steps to render the ListView with filtered data.

- Render a textbox to get input for filtering data.
- Render ListView with [dataSource](#), and set the [sortOrder](#) property.
- Bind the [keyup](#) event for textbox to perform filtering operation. To filter list data, pass the list data source to the [DataManager](#), manipulate the data using the [executeLocal](#) method, and then update filtered data as ListView dataSource.

INDEX.TS

```

import { ListView } from "@syncfusion/ej2-lists";
import { enableRipple } from "@syncfusion/ej2-base";
import { DataManager, Query } from "@syncfusion/ej2-data";
enableRipple(true);
//Define an array of JSON data
let listData: { [key: string]: Object }[] = [
    { text: "Hennessey Venom", id: "list-01" },
    { text: "Bugatti Chiron", id: "list-02" },
    { text: "Bugatti Veyron Super Sport", id: "list-03" },
    { text: "SSC Ultimate Aero", id: "list-04" },
    { text: "Koenigsegg CCR", id: "list-05" },
    { text: "McLaren F1", id: "list-06" }
];
// Initialize the ListView control
let listObj: ListView = new ListView({
    //Set the defined data to the dataSource property
    dataSource: listData,
    //Map the appropriate columns to the fields property
    fields: { text: "text", id: "id" },
    //Set the sortOrder property
    sortOrder: "Ascending"
});
//Render the initialized ListView control
listObj.appendTo("#list");
document.getElementById("textbox").addEventListener("keyup", onKeyUp);
//Here, the list items are filtered using the DataManager instance for
//ListView

```

```
function onKeyUp() {
    let value = (document.getElementById("textbox") as
HTMLInputElement).value;
    let data: Object[] = new DataManager(listData).executeLocal(
        new Query().where("text", "startswith", value, true)
    );
    if (!value) {
        listObj.dataSource = listData.slice();
    } else {
        listObj.dataSource = data as { [key: string]: Object }[];
    }
    listObj.dataBind();
}
```

    ele.style.visibility = "visible";
}
    </script>
```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

In this demo, data has been filtered with starting character of the list items. You can also filter list items with ending character by passing the `endsWith` in [where](#) clause instead of `startswith`.

ListView with hyper link navigation in EJ2 JavaScript ListView control

We can use `anchor` tag along with `href` attribute in our ListView [template](#) property for navigation.

```
`ts
```

```
let anchorTemplate: string = "<a target='blank' href='${url}'>${name}</a>";
```

```
,
```

In the below sample, we have rendered `ListView` with search engines URL.

INDEX.TS

```
import { ListView } from '@syncfusion/ej2-lists';
//Define an array of JSON data
let dataSource: { [key: string]: Object }[] = [
  { name: 'Google', url: 'https://www.google.com' },
  { name: 'Bing', url: 'https://www.bing.com' },
  { name: 'Yahoo', url: 'https://www.yahoo.com' },
  { name: 'Ask.com', url: 'https://www.ask.com' },
  { name: 'AOL.com', url: 'https://www.aol.com' }
];
let anchor_template: string = "<a target='_blank'
href='${url}'>${name}</a>";
// Initialize ListView control
let listObj: ListView = new ListView({
  //Set defined data to dataSource property
  dataSource: dataSource,
  //Set header title
  headerTitle: 'Search engines',
  //Set true to show header title
  showHeader: true,
  template: anchor_template
});
//Render initialized ListView control
listObj.appendTo('#element');
```

INDEX.HTML

```

```

Chat window user interface using listview in EJ2 JavaScript Listview control

ListView can be customized as chat window. To achieve that, use the ListView [template](#) property and [Avatar](#) control.

- The ListView template property is used to showcase the ListView as chat window.
- Avatar control is used to design the image of contact person.

Refer the below template code snippet for Template of chat window.

```

`ts
let template =
'<div class="settings">' +
'${if(chat!="receiver")}' +
'<div id="content">' +
'<div class="name">${text}</div>' +
'<div id="info">${contact}</div></div>' +
'${if(avatar!="")}' +
'<div id="image"><span class="e-avatar img1 e-avatar-circle">${avatar}</span></div>' +
"${else}" +
'<div id="image"><span class="${pic} img1 e-avatar e-avatar-circle"> </span></div>' +
"${/if}" +
"${else}" +

```

```
'${if(avatar!="")}' +
'<div id="image2"><span class="e-avatar img2 e-avatar-circle">${avatar}</span></div>' +
"${else}" +
'<div id="image2"><span class="${pic} img2 e-avatar e-avatar-circle"> </span></div>' +
"${if}" +
'<div id="content1">' +
'<div class="name1">${text}</div>' +
'<div id="info1">${contact}</div>' +
"</div>" +
"${if}" +
"</div>";
`
```

Chat order in template

In ListView template, we have rendered the list items based on receiver and sender information from dataSource of listview.

Adding messages to chat window

- Use textbox to get message from user.
- Add the textbox message to ListView dataSource using [addItem](#) method.

```
`ts
document.getElementById("btn").addEventListener("click", e => {
var value = document.getElementById("name").value;
document
.getElementById("List")
.ej2_instances[0].addItem([
{
text: "Amenda",
contact: value,
id: "2",
avatar: "A",
pic: "",
chat: "receiver"
}
]);
`
```

```
});
```

```
,
```

INDEX.TS

```
import { ListView } from "@syncfusion/ej2-lists";
import { Button } from "@syncfusion/ej2-buttons";
let template: any =
    '<div class="settings">' +
    '${if(chat!=="receiver")}' +
    '<div id="content">' +
    '<div class="name">${text}</div>' +
    '<div id="info">${contact}</div></div>' +
    '${if(avatar!=="")}' +
    '<div id="image"><span class="e-avatar img1 e-avatar-circle">${avatar}</span></div>' +
    '${else}' +
    '<div id="image"><span class="${pic} img1 e-avatar e-avatar-circle">
</span></div>' +
    '${/if}' +
    '${else}' +
    '${if(avatar!=="")}' +
    '<div id="image2"><span class="e-avatar img2 e-avatar-circle">${avatar}</span></div>' +
    '${else}' +
    '<div id="image2"><span class="${pic} img2 e-avatar e-avatar-circle">
</span></div>' +
    '${/if}' +
    '<div id="content1">' +
    '<div class="name1">${text}</div>' +
    '<div id="info1">${contact}</div>' +
    '</div>' +
    '${/if}' +
    '</div>';
//Define an array of JSON data
let dataSource: any = [
    {
        text: "Jenifer",
        contact: "Hi",
        id: "1",
        avatar: "",
        pic: "pic01", chat: "sender"
    },
    { text: "Amenda", contact: "Hello", id: "2", avatar: "A", pic: "", chat:
"receiver" },
    {
        text: "Jenifer",
        contact: "What Knid of application going to launch",
        id: "4",
        avatar: "",
        pic: "pic02", chat: "sender"
    },
    {
        text: "Amenda ",
        contact: "A knid of Emergency broadcast App",
        id: "5",
```

```

        avatar: "A",
        pic: "", chat: "receiver"
    },
    {
        text: "Jacob",
        contact: "Can you please elaborate",
        id: "6",
        avatar: "",
        pic: "pic04", chat: "sender"
    },
];
// Initialize the ListView component
let listObj: ListView = new ListView({
    //Set the defined data to the dataSource property
    dataSource: dataSource,
    //Map the appropriate columns to the fields property
    fields: { text: "Name" },
    //Set the width of the ListView
    width: "350px",
    //Enable the header of the ListView
    showHeader: true,
    //Set the header title
    headerTitle: "Chat",
    //Set the customized template
    template: template,
});
//Render the initialized ListView component
listObj.appendTo("#List");
let button: Button = new Button();
// Render initialized button.
button.appendTo('#btn');
document.getElementById('btn').addEventListener('click', (e) => {
    let value = (document.getElementById('name') as HTMLElement).value;
    listObj.addItem([
        { text: "Amenda", contact: value, id: "2", avatar: "A",
        pic: "", chat: "receiver" }
    ]);
    (document.getElementById('name') as HTMLElement).value = "";
});

```

Drag and drop list items in listview in EJ2 JavaScript Listview control

In ListView control, we don't have drag and drop support. But we can achieve this requirement using [TreeView](#) control with ListView appearance.

Drag and Drop in TreeView control was enabled by setting [allowDragAndDrop](#) to `true`.

```
`ts
```

```
let treeViewInstance: TreeView = new TreeView({
fields: { dataSource: data, id: 'id', text: 'text' },
allowDragAndDrop: true
```

```
});
```

```
,
```

The TreeView control is used to represent hierarchical data in a tree like structure. So, list items in TreeView can be dropped to child of target element. we can prevent this behaviour by cancelling the [nodeDragStop](#) and [nodeDragging](#) events.

```
`ts
```

```
let treeViewInstance: TreeView = new TreeView({
fields: { dataSource: data, id: 'id', text: 'text' },
allowDragAndDrop: true,
nodeDragging: onDragStop,
```

```

nodeDragStop: onDragStop
});
function onDragStop(args: DragAndDropEventArgs) {
//Block the Child Drop operation in TreeView
let draggingItem: HTMLCollection = document.getElementsByClassName("e-drop-in");
if (draggingItem.length == 1) {
draggingItem[0].classList.add('e-no-drop');
args.cancel = true;
}
}

```

In the below sample, we have rendered draggable list items.

INDEX.TS

```

import { TreeView, DragAndDropEventArgs } from '@syncfusion/ej2-
navigations';
let data: { [key: string]: Object }[] = [
    { text: 'Hennessey Venom', id: 'list-01' },
    { text: 'Bugatti Chiron', id: 'list-02' },
    { text: 'Bugatti Veyron Super Sport', id: 'list-03' },
    { text: 'SSC Ultimate Aero', id: 'list-04' },

Create dual list from listview in EJ2 JavaScript Listview control

The dual list contains two ListView. This allows you to move list items from one list to another using the client-side events. This section explains how to integrate the ListView control to achieve dual list.

Use cases

- Stock exchanges of two different countries
- Job applications (skill sets)

Integration of Dual List

Here, two ListView controls have been used to display the list items. An ej2-button is used to transfer data between the ListView, and a textbox is used to achieve the UI of filtering support.

The dual list supports:

- Moving whole data from one list to another.
- Moving selected data from one list to another.
- Filtering the list by using a client-side typed character.

In the ListView control, sorting is enabled using the [sortOrder](#) property, and the [select](#) event is triggered while selecting an item. Here, the select event is triggered to enable and disable button states.

Manipulating data

Moving whole data from the first list to the second list(>>)

Here, the whole data can be moved from the first ListView to the second by clicking the first button. When clicking the button, the whole list items are sliced, and `concat` with the second ListView. This button is enabled only when the data source of the first ListView is not empty.

Moving whole data from the second list to the first list(<<)**

The functionality of the second button is the same as above, and data is transferred from the second list to the first list. This button is enabled only when the data source of the second ListView is not empty.

Moving selected item from one list to another list (>) and (<)**

The [Select](#) event is triggered when selecting a list item in the ListView. The selected items can be transferred between two lists. These buttons will be enabled when selecting an item in lists.

Filtering method

The filtering method is used to filter list items when typing a character in the text box. In this method, the [dataManager](#) has been used to fetch data from the data source and display in ListView.

Sorting

By using the dual list, list items can be sorted in the ListView control using the [sortOrder](#) property.

You can enable sorting in one ListView; in the same order, data can be transferred to another ListView.

INDEX.TS

```
import { ListView, SelectedItem } from '@syncfusion/ej2-lists';
import { Button } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
import { DataManager, Query } from '@syncfusion/ej2-data';
enableRipple(true);

Dynamic listview by loading ajax html content in EJ2 JavaScript Listview control

We can set external **HTML** page content as [template](#) for our **ListView** control by making use of **AJAX** call.

```

`ts
let template: string;
let ajax: Ajax = new Ajax('./template.html', 'GET', false);
ajax.onSuccess = (e: string)=>{
    template = e;
}
ajax.send();
`

```

In the below sample, we have rendered smartphone settings template from external **HTML** file.

INDEX.TS

```

import { ListView } from '@syncfusion/ej2-lists';
import { Ajax } from '@syncfusion/ej2-base';
let data: { [key: string]: Object }[] = [
    { name: 'Network & Internet', id: '0', description: 'Wi-Fi, mobile, data usage, hotspot' },
    { name: 'Connected devices', id: '1', description: 'Bluetooth, cast, NFC' },
    { name: 'Battery', id: '2', description: '18% -4h 12m left' },
    { name: 'Display', id: '3', description: 'Wallpaper, sleep, font size' },
    { name: 'Sound', id: '4', description: 'Volume, vibration, Do Not Disturb' },
    { name: 'Storage', id: '5', description: '52% used - 15.48 GB free' }
];
let template: string;
let ajax: Ajax = new Ajax('./template.html', 'GET', false);
ajax.onSuccess = (e: string)=>{
    template = e;
}
ajax.send();
let listViewInstance: ListView = new ListView({
    dataSource: data,
    template: template,

```

```

        headerTitle: 'Settings',
        showHeader: true,
        fields: {text:'name', id: 'id'}
    });
    listViewInstance.appendTo('#element');

```

```

Display spinner for list item loading from remote data in EJ2 JavaScript Listview control

The features of the ListView control such as remote data-binding take more time to fetch data from corresponding dataSource/remote URL. In this case, you can use EJ2 [Spinner](#) to enhance the appearance of the UI. This section explains how to load a spinner control to groom the appearance.

Refer to the following code sample to render the spinner control.

```

`ts
createSpinner({
target: document.getElementById('spinner')
});
showSpinner(document.getElementById('spinner'));

```

Refer to the following code sample to render the ListView control.

```
`ts
let listViewInstance: ListView = new ListView({
//Bind the DataManager instance to the dataSource property
dataSource: new DataManager({
url: '///js.syncfusion.com/ejServices/Wcf/Northwind.svc/',
crossDomain: true
}),
//Bind the Query instance to the query property
query: new Query().from('Products').select('ProductID,ProductName').take(10),
//Map the appropriate columns to the fields property
fields: { id: 'ProductID', text: 'ProductName' },
//Set the header tittle to the list
headerTitle: 'Product Name',
showHeader: true,
width:"300",
actionComplete : oncomplete
});
//Render the initialized ListView
listviewInstance.appendTo("#element");
```

Here, the data is fetched from **Northwind** Service URL; it takes a few seconds to load the data. To enhance the UI, the spinner control has been rendered initially. After the data is loaded from remote URL, the spinner control will be hidden in ListView [actionComplete](#) event.

INDEX.TS

```
import { ListView } from '@syncfusion/ej2-lists';
//Import DataManager related classes
import { DataManager, Query } from '@syncfusion/ej2-data';
import { createSpinner, showSpinner } from '@syncfusion/ej2-popups';
//Initialize the ListView control
let listViewInstance: ListView = new ListView({
    //Bind the DataManager instance to dataSource property
    dataSource: new DataManager({
        url: 'https://services.syncfusion.com/js/production/api/',
        crossDomain: true
    }),
    //Initialize query with the Query instance to get specified set of data
```

```

    query: new
    Query().from('ListView').select('EmployeeID,FirstName').take(10),
    //Map the appropriate columns to fields property
    fields: { id: 'EmployeeID', text: 'FirstName' },
    //Set header title
    headerTitle: 'Employees',
    //Set true to show header title
    showHeader: true,
    width:"300",
    actionComplete : oncomplete
});
//Render the initialized ListView
listviewInstance.appendTo("#element");
createSpinner({
    target: document.getElementById('spinner')
});
showSpinner(document.getElementById('spinner'));
function oncomplete() {
    document.getElementById('spinner').style.display = "none";
}

```

Dynamic hierarchical listview in EJ2 JavaScript Listview control

To dynamic hierarchical listview, push the new list item data into the existing [dataSource](#) using the [select](#) event.

Refer to the following steps to load list item into the child list:

1. Initially, render the ListView with the required data source.
2. Bind the [select](#) event that triggers selecting list item in the ListView control. By using the select event, you can push the new list item to the child list of the data source on specifying its item index. Item index can be obtained from the

[SelectEventArgs](#) of the select event.

INDEX.TS

```

import { ListView, SelectEventArgs } from '@syncfusion/ej2-lists';
let dataSource: { [key: string]: Object }[] = [
  {
    id: '01', text: 'Music', icon: 'folder',
    child: [
      { id: '01-01', text: 'Gouttes.mp3', icon: 'file' }
    ]
  },
  {
    id: '02', text: 'Videos', icon: 'folder',
    child: [
      { id: '02-01', text: 'Naturals.mp4', icon: 'file' },
      { id: '02-02', text: 'Wild.mpeg', icon: 'file' },
    ]
  },
  {

Hide checkbox in listview in EJ2 JavaScript Listview control

The checkbox of the any list item can be hidden by using [htmlAttributes](#) of [fields](#) object. With the help of [htmlAttributes](#) we can add unique class to each list item that will be rendered from the data source, from the CSS class we can hide the checkbox of the list item.

In this sample, we had hidden the multiple leaf node of nested list. The `e-checkbox-hidden` class has been added in the data source where the checkbox needs to be hidden. Refer the below snippet for simple data source.

```

`ts
{
  'text': 'New York',
  'id': '3002',
  'category': 'USA',
  'htmlAttributes': { 'class': 'e-file e-checkbox-hidden' }
}
,

```

Even though we have hidden the checkbox the functionality will be same for the list item which might affect the `getSelectedItems` method. So, to counteract that we will follow certain logic in the `select` event. The Logic here is to remove the `e-active` class from the other checkbox hidden list item which will be added when we select on that item and retain `e-active` on currently selected item.

In this process we will exclude the visible checkbox list items and only consider the hidden checkbox items.

INDEX.TS

```
import { ListView, SelectEventArgs } from '@syncfusion/ej2-lists';
//define the array of JSON
let dataSource: { [key: string]: Object }[] = [

Display items count in group header in EJ2 JavaScript Listview control

The ListView control supports wrapping list items into a group based on the category. The category of each list item can be mapped with groupBy field of the data source. You can display grouped list items count in the list-header using the group header template. Refer to the following code sample to display grouped list item count.

INDEX.TS

```
import { ListView } from '@syncfusion/ej2-lists';
let template: string = '<div class="e-list-wrapper e-list-multi-line e-list-avatar">' +
    '<img class="e-avatar e-avatar-circle" src=${image} ' +
    'style="background:#BCBCBC" />' +
    '<span class="e-list-item-header">${Name}</span>' +
    '<span class="e-list-content">${contact}</span>' +
    '</div>';
//Define an array of JSON data
let dataSource: { [key: string]: string }[] = [
    { Name: 'Nancy', contact: '(206) 555-985774', id: '1', image:
    'https://ej2.syncfusion.com/demos/src/grid/images/1.png', category:
    'Experience' },
    { Name: 'Janet', contact: '(206) 555-3412', id: '2', image:
    'https://ej2.syncfusion.com/demos/src/grid/images/3.png', category:
    'Fresher' },

Customize listview as grid layout in EJ2 JavaScript Listview control

In ListView, list items can be rendered in grid layout with following data manipulations.

- Add Item
- Remove Item
- Sort Items
- Filter Items

Grid Layout

In this section, we will discuss about rendering of list items in grid layout.

- Initialize and render ListView with dataSource which will render list items in list layout.
- Now, add the below CSS to list item. This will make list items to render in grid layout

```

default-list .e-list-item {
height: 100px;

width: 100px;

float: left;
}

```

In the below sample, we have rendered List items in grid layout.

INDEX.TS

```

import { ListView } from '@syncfusion/ej2-lists';
//define the array of string
let data: number[] = [1, 2, 3, 4, 5, 6, 7, 8, 9];
//Initialize ListView control
let listViewInstance: ListView = new ListView({
    //set the data to datasource property
    dataSource: data,
    //set the template for list items
    template: ''
});
//Render initialized ListView
listViewInstance.appendTo("#element");

Data manipulation

In this section, we will discuss about ListView data manipulations.

Add Item

We can add list item using [addItem](#) API. This will accept array of data as argument.

```
`ts
```

```
listViewInstance.addItem([{'text': 'Apricot', id: '32'}]);
```

```
,
```

In the below sample, you can add new fruit item by clicking add button which will open dialog box with fruit name and image URL text box. After entering the item details, click the add button. This will add your new fruit item.

Remove item

We can remove list item using [removeItem](#) API. This will accept fields with `id` or list item element as argument.

```
`ts
```

```
listViewInstance.removeItem({id: '32'});
```

```
,
```

In the below sample, you can remove fruit by hovering the fruit item which will show delete button and click that delete button to delete that fruit from your list.

Sort Items

ListView can be sorted either in Ascending or Descending order. To enable sorting in your ListView, set [sortOrder](#) as `Ascending` or `Descending`.

```
`ts
```

```
let listViewInstance: ListView = new ListView({
  sortOrder: 'Ascending';
})
```

```
,
```

We can also set sorting after control initialization.

```
`ts
```

```
listViewInstance.sortOrder = 'Ascending'
```

```
,
```

In the below sample, we have sorted fruits in **Ascending** order. To sort it in descending, click on sort order icon and vice versa.

Filter Items

Listview data can be filtered with the help of [dataManager](#). After filtering the data, update ListView [dataSource](#) with filtered data.

```
`ts
```

```
let value = document.getElementById("filter").value; //input text box value
```

```
let filteredData = new DataManager(listdata).executeLocal(
```

```
new Query().where("text", "startswith", value, true)
```

```
);
```

```
listViewInstance.dataSource = filteredData;
```

```
,
```

In the below sample, we can filter fruit items with the help of search text box. This will filter fruit items based on your input. Here we used [startswith](#) of input text to filter data in DataManager.

Customize listview with dynamic tags in EJ2 JavaScript Listview control

You can customize the ListView items using the [template](#) property. Here, the dynamic tags are added and removed in the list item from another ListView. Refer to the following steps to achieve this.

- Render the ListView with data source, and add button element with each list item of ListView on [actionComplete](#) event. Refer to the following code sample of actionComplete event.

```
`ts
```

```
// The actionComplete event for first ListView to add the button
```

```
function addButton() {
```

```
let buttonObj: { [key: string]: Object } = { obj: Button, prop: { iconCss: 'e-icons e-add-icon', cssClass: 'e-
small e-round' } };
```

```

let ele: HTMLCollection = document.getElementsByClassName("e-but");
for (let i: number = 0; i < ele.length; i++) {
  buttonObj.obj = new Button(buttonObj.prop);
  (buttonObj.obj as Button).appendTo(ele[i] as HTMLElement);
}
}
,

```

- Initialize dynamic ListView with required property that holds the tags of parent ListView, and bind the [select](#) event (triggers when the list item is selected), in which you can get and add the selected item value as tags into parent

ListView. Refer to the following code sample.

```

`ts
//Select the event that is is rendered inside dialog for ListView
function addTag(e: SelectEventArgs) {
  let listTag: HTMLSpanElement = document.createElement('span');
  listTag.className = 'advanced-option';
  let labelElem: HTMLSpanElement = document.createElement('span');
  labelElem.className = 'label';
  let deleteElem: HTMLSpanElement = document.createElement('span');
  deleteElem.className = 'delete';
  deleteElem.onclick = removeTag;
  labelElem.innerHTML = e.text;
  listTag.appendChild(labelElem);
  listTag.appendChild(deleteElem);
  let tag: HTMLSpanElement = document.createElement('span');
  tag.className = 'advanced-option-list';
  tag.appendChild(listTag);
  listViewInstance.element.querySelector('.e-active').appendChild(tag);
}
,

```

- Render the dialog control with empty content and append the created dynamic ListView object to the dialog on [created](#) event.

- Bind the click event for button icon (+) to update the ListView data source with tags, and open the dialog with this dynamic ListView. Refer to the following code sample.

```
`ts
//Method to hide/show the dialog and update the ListView data source
function renderDialog(id: string): void {
  if (document.getElementsByClassName('e-popup-open').length != 0) {
    dialog.hide();
  }
  else {
    listObj.dataSource = datasource[id];
    listObj.dataBind();
    dialog.show();
  }
}
```

- Bind the click event with added dynamic tags to remove it. Refer to the following code sample.

```
`ts
//Method to remove the list item
function removeTag() {
  this.parentNode.parentNode.remove();
}
```

INDEX.TS

```
import { ListView, SelectEventArgs } from '@syncfusion/ej2-lists';
import { Button } from '@syncfusion/ej2-buttons';
import { Dialog } from '@syncfusion/ej2-popups';

Fetch selected items from listview template sample in EJ2 JavaScript Listview control

Single or multiple items can be selected by users in the ListView control.

By default, dataSource id and text is mapped in default rendering of listview, since it returns the selected item data properly. But in the custom template, dataSource and the corresponding mapping (text, id, elements rendered inside li element) will vary as per the application requirement.

So, we need to map id attribute to listview items using [fields](#) of [dataSource](#) to get the selected item data properly while working with custom templates. Refer to the below code snippet for template sample.

```
`ts
// Initialize ListView control
let listObj: ListView = new ListView({
//Set defined data to dataSource property
dataSource: dataSource,
//Map the appropriate columns to fields property
fields: { text: 'Name', id:'Name'},
//Set customized template
template: template,
enableRtl: true,
//ListView Select event
select: onSelect
});
//Render initialized ListView control
listObj.appendTo('#listview');
`
```

INDEX.TS

```
import { ListView } from '@syncfusion/ej2-lists';
let template: any = '<div class="settings">'
+ '<div id="postContainer"><div id="postImg">'
+ '<img src=${image} style="height:35px;width:35px;border-
radius:50%; border: 1px solid #ccc;" /></div>'
+ '<div id="content">'
+ '<div class="name">${Name}</div>'
+ '<div id="info">${contact}</div>'
+ '</div>'
+ '</div>'
//Define an array of JSON data
let dataSource: any = [
{ Name: 'Nancy', contact: '(206) 555-985774', id: '1', image:
'https://ej2.syncfusion.com/demos/src/grid/images/1.png', category:
'Experience' },
```

```

    { Name: 'Janet', contact: '(206) 555-3412', id: '2', image:

Trace events of listview in EJ2 JavaScript Listview control

The ListView control triggers events based on its actions. The events can be used as extension points to perform

custom operations. Refer to the following steps to trace the ListView events:

1. Render the ListView with [dataSource](#), and bind the [actionBegin](#), [actionComplete](#), and [select](#) events.
2. Perform custom operations in actionBegin, actionComplete, and select events.
3. Provide event log details for actionBegin and actionComplete events, and they will be displayed in the event trace panel when the ListView action starts and the dataSource bound successfully.
4. Get the selected item details from the [SelectEventArgs](#) in the select event, and display the selected list item text in the event trace panel while selecting list items.
5. Use clear button to remove event trace information.

INDEX.TS

```

import { ListView, SelectEventArgs } from "@syncfusion/ej2-lists";
import { Button } from "@syncfusion/ej2-buttons";
//Define an array of JSON data
let data: { [key: string]: Object }[] = [
  { text: "Hennessey Venom", id: "list-01" },
  { text: "Bugatti Chiron", id: "list-02" },
  { text: "Bugatti Veyron Super Sport", id: "list-03" },
  { text: "SSC Ultimate Aero", id: "list-04" },
  { text: "Koenigsegg CCR", id: "list-05" },

Customize nested listview as bread crumbs in EJ2 JavaScript Listview control

ListView header can be customized using [headerTemplate](#) property. Here We customized the header of nested ListView as BreadCrumbs with headerTemplate property . i.e while navigating to child data of a list item, the header data is customized with the selected data path. For example, the header of nested ListView is Continent. While selecting a list item(Asia) then the header will be customized as Continent>Asia.

- This customization achieved while front and back navigations of list items with `actionComplete` event of ListView.
- On actionComplete we append the selected text in header element.
- And in back navigation, we removed the last appended span from header template

And also we can able to navigate the desired child level by clicking list items appended in the customized header. For example, let consider header of nested ListView is `Continent>Asia>India`. If we want to navigate to Continent level of ListView, then we can click the Continent in Header

Note: In each navigation we have calculated the appended span tag length in `calculateLevelForElements` method to update header.

INDEX.TS

```

import { ListView } from '@syncfusion/ej2-lists';
//define the array of JSON
let continent: { [key: string]: Object }[] = [
    {
        'text': 'Asia',
        'id': '01',
        'category': 'Continent',
        'child': [{
            'text': 'India',
            'id': '1',
            'category': 'Asia',
            'child': [{
                'text': 'Delhi',

```

Integrate pager component with listview in EJ2 JavaScript Listview control

The first and foremost step is to obtain the **Pager** component from **Grid**. Install the ej2-grid package using the following command.

,

```
npm install @syncfusion/ej2-grids --save
```

,

Import the Pager to the ListView sample which has been created.

,

```
import { Pager } from "@syncfusion/ej2-grids";
```

,

The [totalRecordsCount](#) property of Pager must be specified whenever using this particular component. By using [pageSize](#) property, the number of list items to be displayed is made available. The [pageCount](#) property allows the user to specify the visibility of the page numbers accordingly. Since the paging sample in the upcoming code snippet uses these three properties, the explanation provided here were minimal and to the point. For further API concerns in Pager component, [click here](#).

With the help of the **query** property of ListView, the user can specify the number of records to be displayed in the current page.

The [query](#) property helps in splitting the entire datasource based on our convenience. In the sample provided below, when clicking the next button in pager, it fetches the datasource based on page size and current page of Pager component.

```
`ts
```

```
click: function () {
```

```
listObj.query= new Query().range((pager.currentPage - 1) * pager.pageSize, (pager.currentPage * pager.pageSize));
```

```
}
```

,

Note: When **pageSize** isn't mentioned, it defaults to 12 records per page.

INDEX.TS

```
import { ListView } from '@syncfusion/ej2-lists';
import { Pager } from '@syncfusion/ej2-grids';
import { DataManager, Query, JsonAdaptor } from '@syncfusion/ej2-data';
import { data } from './datasource.ts';
let pager: Pager = new Pager({
  totalRecordsCount: data.length,
  pageSize: 10,
  pageCount: 2,
  click: function () {
    listObj.query= new Query().range((pager.currentPage - 1) *
pager.pageSize, (pager.currentPage * pager.pageSize));
  }
});
```

```

pager.appendTo('#Pager');
let header: string = '<table class="w-100"> <tr><td class="w-25">Order
ID</td><td class="w-45">Ship Name</td><td class="w-
25">ShipCity</td></tr></table>';
let template: string = '<table class="w-100"> <colgroup><col
span="2"><col></colgroup><tr><td class="w-25">${OrderID}</td><td class="w-
45">${ShipName}</td><td class="w-25">${ShipCity}</td></tr></table>';
//Initialize ListView component
// Initialize the ListView control
let listObj: ListView = new ListView({
    //Set the defined data to the data source property
    dataSource: new DataManager({
        json: data,
        adaptor: new JsonAdaptor
    }),
    query: new Query().range(0, pager.pageSize),
    template: template,
    headerTemplate: header,
    showHeader: true
});
//Render the initialized ListView control
listObj.appendTo('#element');

```

Maps

Populate data in EJ2 JavaScript Maps control

This section explains how to populate data inputs and provide it to the Maps component.

Geometry types

GeoJSON data contains geometry objects with properties such as geometry types and coordinates. The geometry types are the values present in the geometry objects of the GeoJSON data that specify the type of shape to be rendered, as well as the coordinates that help to draw the shape's boundary line. The supportive geometry types are:

| Shapes | Supported |

| --- | --- |

| Polygon | Yes |

| MultiPolygon | Yes |

| LineString | Yes |

| MultiLineString | Yes |

| Point | Yes |

| MultiPoint | Yes |

| GeometryCollection | Yes |

Shape data

The shape data collection describes geographical shape information that can be obtained from [GEOJSON format shapes](#). The Map shapes are rendered with this data. The custom shapes such as seat selection in bus, seat selection in a cricket stadium and more useful information can be also added to the geographical data.

Data source

The [dataSource](#) property is used to represent statistical data in the Maps component, and it accepts a collection of values as input. For example, a list of objects as input can be provided to the data source. This data source will be used to color the map, display data labels, and display tooltip, among other things.

The data source is populated with JSON data relative to shape data and stored in JSON object. The USA population as data source is used for better understanding. The **populationData.ts** file is used to store JSON data in JSON object **populationData**.

[populationData.ts]

```
`ts
export let populationData: object[] = [
{
'code': 'AF',
'value': 53,
'name': 'Afghanistan',
'population': 29863010,
'density': 119
},
{
'code': 'AL',
'value': 117,
'name': 'Albania',
'population': 3195000,
'density': 111
},
{
'code': 'DZ',
'value': 15,
'name': 'Algeria',
'population': 34895000,
'density': 15
},
{
'code': 'AO',
'value': 15,
'name': 'Angola',
'population': 18498000,
'density': 15
},
{
'code': 'AR',
'value': 15,
```

```
'name': 'Argentina',
'population': 40091359,
'density': 14
},
{
'code': 'AM',
'value': 109,
'name': 'Armenia',
'population': 3230100,
'density': 108
}
];
`
```

Data binding

The following properties in the [layers](#) are used for binding data in the Maps component. Both the properties are related to each other.

- `shapePropertyPath`
- `shapeDataPath`

Shape property path

The [shapePropertyPath](#) property is used to refer to the column name in the [shapeData](#) property of shape layers to identify the shape. When the values of [shapeDataPath](#) property from the [dataSource](#) property and [shapePropertyPath](#) property from the [shapeData](#) property match, then the associated object from the data source is bound to the corresponding shape.

`world-map.js` file contains following data and its field **name** value is used to map the corresponding shape with the provided data source.

```
`javascript
export var world_map = {
"type": "Feature",
"properties": {
"admin": "Afghanistan",
"name": "Afghanistan",
"continent": "Asia"
},
"geometry": { "type": "Polygon", "coordinates": [[[61.21081709172573, ... ],
...

```

Shape data path

The [shapeDataPath](#) property is similar to the [shapePropertyPath](#) property, but it refers to the field name in the [dataSource](#) property. For example, [populationData](#) contains the **code**, **value**, **name**, **population** and **density** fields. Here, the **name** field is set to the shapeDataPath to map the corresponding name field value of shape data.

In the below example, both **name** fields contain the same value as **Afghanistan**, this value is matched in both shape data and data source, so that the details associated with **Afghanistan** will be mapped to the corresponding shape and used to color the corresponding shape, display data labels, display tooltips, and more.

INDEX.JS

```
var map = new ej.maps.Maps({
  layers: [{
    shapeData: world_map,
    shapeDataPath: 'name',
    shapePropertyPath: 'name',
    dataSource: [
      {
        'code': 'AF',
        'value': 53,
        'name': 'Afghanistan',
        'population': 29863010,
        'density': 119,
        'color': '#DEEBAE'
      },
      {
        'code': 'AL',
        'value': 117,
        'name': 'Albania',
        'population': 3195000,
        'density': 111,
        'color': '#A4D6AD'
      },
      {
        'code': 'DZ',
        'value': 15,
        'name': 'Algeria',
        'population': 34895000,
        'density': 15,
        'color': '#37AFAB'
      },
      {
        'code': 'AO',
        'value': 15,
        'name': 'Angola',
        'population': 18498000,
        'density': 15,
        'color': '#547C84'
      },
      {
        'code': 'AR',
        'value': 15,
```

```

        'name': 'Argentina',
        'population': 40091359,
        'density': 14,
        'color': '#CEBF93'
    },
    {
        'code': 'AM',
        'value': 109,
        'name': 'Armenia',
        'population': 3230100,
        'density': 108,
        'color': '#a69d70'
    }
],
shapeSettings: {
    colorValuePath: 'color',
    fill: '#E5E5E5'
}
}]
});
map.appendTo('#element');
```

INDEX.HTML

```

<!DOCTYPE html>
<html lang="en">
<head>
    <title>EJ2 Maps</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">

        <div id="element"></div>
    </div>
    <script>
        var ele = document.getElementById('container');
        if (ele) {
            ele.style.visibility = "visible";
        }
    </script>
    <script src="index.js" type="text/javascript"></script>
</body>
</html>
```

Binding complex data source

To bind the data field from data source to the maps in two different ways.

1. Bind the field name directly to the properties as [shapeDataPath](#), [colorValuePath](#), [valuePath](#) and [shapeValuePath](#).
2. Bind the field name as `data.field` to the properties as [shapeDataPath](#), [colorValuePath](#), [valuePath](#) and [shapeValuePath](#).

INDEX.JS

```
var map = new ej.maps.Maps({
  layers: [
    {
      shapeData: world_map,
      shapeDataPath: 'data.continent',
      shapePropertyPath: 'continent',
      dataSource: [
        { "Continent": "North America", 'color': '#71B081',
          data: { "continent": "North America", 'color': '#71B081' } },
        { "Continent": "South America", 'color': '#5A9A77',
          data: { "continent": "South America", 'color': '#5A9A77' } },
        { "Continent": "Africa", 'color': '#498770',
          data: { "continent": "Africa", 'color': '#498770' } },
        { "Continent": "Europe", 'color': '#39776C',
          data: { "continent": "Europe", 'color': '#39776C' } },
        { "Continent": "Asia", 'color': '#266665',
          data: { "continent": "Asia", 'color': '#266665' } },
        { "Continent": "Australia", 'color': '#124F5E',
          data: { "continent": "Australia", 'color': '#124F5E' } }
      ],
      shapeSettings: {
        colorValuePath: 'data.color',
      },
      tooltipSettings: {
        visible: true,
        valuePath: 'data.continent'
      },
      bubbleSettings: [
        {
          visible: true,
          valuePath: 'data.value',
          colorValuePath: 'data.color',
          animationDuration: 0,
          minRadius: 20,
          maxRadius: 90,
          opacity: 0.8,
          dataSource: [
            { 'name': 'India', 'value': 18.89685398845257,
              'population': 391292635,
```

```

        data: { 'color': 'red', 'population': 391292635,

```

Layers in EJ2 JavaScript Maps control

The Maps component is rendered through [layers](#) and any number of layers can be added to the Maps.

Multilayer

The Multilayer support allows loading multiple shapefiles and map providers in a single container, enabling Maps to display more information. The shape layer or map providers are the main layers of the Maps. Multiple layers can be added as **SubLayer** over the main layers using the [type](#) property in the [layers](#).

SubLayer

Sublayer is a type of shape file layer. It allows loading multiple shape files in a single map view. For example, a sublayer can be added over the main layer to view geographic features such as rivers, valleys and cities in a map of a country. Similar to the main layer, elements in the Maps such as markers, bubbles, color mapping and legends can be added to the sub-layer.

In this example, the United States map shape is used as shape data by utilizing the **usa.ts** file, and the **texas.ts** and **california.ts** files are used as sub-layers in the United States map.

INDEX.JS

```

var map = new ej.maps.Maps({
  layers: [
    {
      shapeData: usa_map,
      shapeSettings: {
        fill: '#E5E5E5',
        border: {
          color: 'black',
          width: 0.1
        }
      }
    }
  ]
});

```

```

    },
    {
      shapeData: texas,
      type: 'SubLayer',
      shapeSettings: {
        fill: 'rgba(141, 206, 255, 0.6)',
        border: {
          color: '#1a9cff',
          width: 0.25
        }
      }
    },
    {
      shapeData: california,
      type: 'SubLayer',
      shapeSettings: {
        fill: 'rgba(141, 206, 255, 0.6)',
        border: {
          color: '#1a9cff',
          width: 0.25
        }
      }
    }
  ]
});
map.appendTo('#element');

```

INDEX.HTML

```

      ele.style.visibility = "visible";
    }
  </script>

```

```

</script>
<script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Displaying layer in the view

Multiple shape files and map providers can be loaded simultaneously in Maps. The [baseLayerIndex](#) property is used to determine which layer on the user interface should be displayed. This property is used for the Maps drill-down feature, so when the [baseLayerIndex](#) value is changed, the corresponding shape is loaded. In this example, two layers can be loaded with the World map and the United States map. Based on the given [baseLayerIndex](#) value the corresponding shape will be loaded in the user interface. If the [baseLayerIndex](#) value is set to **0**, then the world map will be loaded.

INDEX.JS

```

var map = new ej.maps.Maps({
  baseLayerIndex: 1,
  layers: [
    {
      shapeData: world_map,
    },
    {
      shapeData: usa_map
    }
  ]
});
map.appendTo('#element');

```

INDEX.HTML

```

Providers

Map provider in EJ2 JavaScript Maps control

The OpenStreetMap (OSM) is the online Maps provider built by a community of developers; it is free to use under an open license. It allows to view geographical data in a collaborative way from anywhere on the earth. The OSM Maps provides small tile images based on our requests and combines those images into a single image to display the Maps area in the Maps component.

Adding OpenStreetMap

The OSM Maps can be rendered using the [urlTemplate](#) property.

INDEX.JS

```
var maps = new ej.maps.Maps ({
  layers: [
    {
      urlTemplate: "https://tile.openstreetmap.org/level/tileX/tileY.png"
    }
  ],
});
maps.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html>
<html lang="en">
<head>
  <title>EJ2 Maps</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <script src="africa.js"></script>
  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>
  <div id="element">
  </div>
  <script>
    var ele = document.getElementById('container');
```

```

        if (ele) {
            ele.style.visibility = "visible";
        }
    </script>
    <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Changing the tile server of the OpenStreetMap

The OSM tile server can be changed by setting the tile URL in the [urlTemplate](#) property. For more details about the OSM tile server, refer [here](#).

Enabling zooming and panning

The OSM Maps layer can be zoomed and panned. Zooming helps to get a closer look at a particular area on a Maps for in-depth analysis. Panning helps to move a Maps around to focus the targeted area.

INDEX.JS

```

var maps = new ej.maps.Maps({
    zoomSettings: {
        enable: true,
        toolBars: ["Zoom", "ZoomIn", "ZoomOut", "Pan", "Reset"]
    },
    layers: [
        {
            urlTemplate: "https://tile.openstreetmap.org/level/tileX/tileY.png"
        }
    ]
});
maps.appendTo('#element');

```

INDEX.HTML

```

    <link href="index.css" rel="stylesheet">
    <script src="africa.js"></script>
    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>
    <div id="element">
    </div>
    <script>
        var ele = document.getElementById('container');
        if (ele) {

```

```

        ele.style.visibility = "visible";
    }
</script>
<script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Adding markers and navigation line

Markers can be added to the layers of OSM Maps by setting the corresponding location's coordinates of latitude and longitude using [markerSettings](#). Navigation lines can be added on top of an OSM Maps layer for highlighting a path among various places by setting the corresponding location's coordinates of latitude and longitude in the [navigationLineSettings](#).

INDEX.JS

```

var maps = new ej.maps.Maps({
    zoomSettings: {
        zoomFactor: 4
    },
    centerPosition: {
        latitude: 29.394708,
        longitude: -94.954653
    },
    layers: [
        {
            urlTemplate: "https://tile.openstreetmap.org/level/tileX/tileY.png",
            markerSettings: [{
                visible: true,
                height: 25,
                width: 15,
                dataSource: [
                    {
                        latitude: 34.060620,
                        longitude: -118.330491,
                        name: "California"
                    },
                    {
                        latitude: 40.724546,
                        longitude: -73.850344,
                        name: "New York"
                    }
                ]
            }],
            navigationLineSettings: [{
                visible: true,
                color: "blue",
                width: 5,
                angle: 0.1,
                latitude: [34.060620, 40.724546],
                longitude: [-118.330491, -73.850344]
            }
        ]
    ]
});
maps.appendTo('#element');

```

INDEX.HTML

```

Bing maps in EJ2 JavaScript Maps control

Bing Maps is a online Maps provider, owned by Microsoft. As like OSM, it provide Maps tile images based on our requests and combines those images into a single one to display Maps area.

Adding Bing Maps

The Bing Maps can be rendered using the [urlTemplate](#) property, which is based on the URL generated by the [getBingUrlTemplate](#) method in the Maps. The format of the required URL of Bing Maps varies from

other online map providers. As a result, a built-in [getBingUrlTemplate](#) method has been included that returns the URL in a generic format. In the meantime, a subscription key is required for Bing Maps. The Bing Maps key can be obtained from [here](#), then append it to the Bing Maps URL before passing it to the [getBingUrlTemplate](#) method. The URL returned by this method must be passed to the [urlTemplate](#) property.

```
`javascript
var map = new ej.maps.Maps({
load: function(args){
args.maps.getBingUrlTemplate("https://dev.virtualsearth.net/REST/V1/Imagery/Metadata/Aerial?output=json&uriScheme=https&key=?").then(function(url) {
args.maps.layers[0].urlTemplate= url;
});
},
layers:[{
}]
});
map.appendTo('container');
`
```

Types of Bing Maps

Bing Maps provides different types of Maps and it is supported in the Maps control.

- **Aerial** - Displays satellite images to highlight roads and major landmarks for easy identification.
- **AerialWithLabel** - Displays aerial Maps with labels for the continent, country, ocean, etc.
- **Road** - Displays the default Maps view of roads, buildings, and geography.
- **CanvasDark** - Displays dark version of the road Maps.
- **CanvasLight** - Displays light version of the road Maps.
- **CanvasGray** - Displays grayscale version of the road Maps.

To render the light version of the road Maps, set the **CanvasLight** value is passed via the URL into the [getBingUrlTemplate](#) method demonstrated in the following code sample.

```
`javascript
var map = new ej.maps.Maps({
load: function(args){
args.maps.getBingUrlTemplate("https://dev.virtualsearth.net/REST/V1/Imagery/Metadata/CanvasLight?output=json&uriScheme=https&key=?").then(function(url) {
args.maps.layers[0].urlTemplate= url;
});
},
`
```

```

zoomSettings: {
zoomFactor: 12,
},
centerPosition : {
latitude: 38.8951,
longitude: -77.0364
},
layers:[{
}]
});
map.appendTo('container');
`

```

Enabling zooming and panning

Bing Maps layer can be zoomed and panned. Zooming helps to get a closer look at a particular area on a Maps for in-depth analysis. Panning helps to move a Maps around to focus the targeted area.

```

`javascript
var map = new ej.maps.Maps({
load: function(args){
args.maps.getBingUrlTemplate("https://dev.virtualearth.net/REST/V1/Imagery/Metadata/Aerial?output=json&uriScheme=https&key=?").then(function(url) {
args.maps.layers[0].urlTemplate= url;
});
},
zoomSettings: {
enable: true,
toolBars: [{ "Zoom", "ZoomIn", "ZoomOut", "Pan", "Reset" }]
},
layers: [{
}]
});
map.appendTo('container');
`

```

Adding markers and navigation line

Markers can be added to the layers of Bing Maps by setting the corresponding location's coordinates of latitude and longitude using [markerSettings](#). Navigation lines can be added on top of an Bing Maps layer

for highlighting a path among various places by setting the corresponding location's coordinates of latitude and longitude in the [navigationLineSettings](#).

```
`javascript
var map = new ej.maps.Maps({
  load: function(args){
    args.maps.getBingUrlTemplate("https://dev.virtualearth.net/REST/V1/Imagery/Metadata/Aerial?output=json&uriScheme=https&key=?").then(function(url) {
      args.maps.layers[0].urlTemplate= url;
    });
  },
  zoomSettings: {
    zoomFactor: 4
  },
  centerPosition: {
    latitude: 29.394708
    logitude: -94.954653
  },
  layers: [{
    markerSettings: [{
      visible: true,
      height: 25,
      width: 15,
      dataSouce: [{
        latitude: 34.060620,
        longitude: -118.330491,
        name: "California"
      },
      {
        latitude: 40.724546,
        longitude: -73.850344,
        name: "New York"
      }
    ]
  }],
  navigationLineSettings: [{
```

```

visible: true,
color: "blue",
angle: 0.1,
latitude: {
  34.060620, 40.724546
},
longitude: {
  -118.330491, -73.850344
}
}]
}
});
map.appendTo('container');
`

```

Adding sublayer

Any GeoJSON shape can be rendered as a sublayer on top of the Bing Maps layer for highlighting a particular continent or country in Bing Maps by adding another layer and specifying the [type](#) property of Maps layer to **SubLayer**.

```

`javascript
var map = new ej.maps.Maps({
  load: function(args){
    args.maps.getBingUrlTemplate("https://dev.virtualearth.net/REST/V1/Imagery/Metadata/Aerial?output=json&uriScheme=https&key=?").then(function(url) {
      args.maps.layers[0].urlTemplate= url;
    });
  },
  layers: [
    {
      // Add Bing Map.
    },
    {
      shapeData: Africa_Continent,
      type: 'SubLayer',
      shapeSettings: {

```

```

fill: "blue"
}
}
]
});
map.appendTo('container');
`

```

Enabling legend

The legend can be added to the tile Maps by setting the [visible](#) property of [legendSettings](#) to **true**.

```

`javascript
var map = new ej.maps.Maps({
load: function(args){
args.maps.getBingUrlTemplate("https://dev.virtualsearth.net/REST/V1/Imagery/Metadata/Aerial?output=json&uriScheme=https&key=?").then(function(url) {
args.maps.layers[0].urlTemplate= url;
});
},
legendSettings: {
visible: true,
type: 'Markers',
useMarkerShape:true,
toggleLegendSettings: {
enable: true,
applyShapeSettings: false,
border: {
color: 'green',
width: 2
}
}
},
layers: [
{
shapeDataPath: 'name',
shapePropertyPath: 'name',

```

```

shapeSettings: {
  fill: '#E5E5E5'
},
markerSettings: [
  {
    dataSource: markerDataSource,
    colorValuePath: 'color',
    shapeValuePath: 'shape',
    legendText: 'country',
    visible: true
  }
]
});
map.appendTo('#element');

```

Azure maps in EJ2 JavaScript Maps control

Azure Maps is yet another online Maps provider, owned by Microsoft. As like OSM and Bing Maps, it provides Maps tile images based on our requests and combines those images into a single one to display Maps area.

Adding Azure Maps

The Azure Maps can be rendered using the [urlTemplate](#) property with the tile server URL provided by online map providers. In the meantime, a subscription key is required for Azure Maps. Follow the steps in this [link](#) to generate an API key, and then added the key to the URL.

Refer to [Azure Maps Licensing](#).

```

`javascript
var map = new ej.maps.Maps({
  layers: [{
    urlTemplate: "https://atlas.microsoft.com/map/imagery/png?subscription-key=Your-Key &api-version=1.0&style=satellite&zoom=level&x=tileX&y=tileY"
  }]
});
map.appendTo('container');

```

Enabling zooming and panning

The Azure Maps layer can be zoomed and panned. Zooming helps to get a closer look at a particular area on a map for in-depth analysis. Panning helps to move a map around to focus the targeted area.

```
`javascript
var map = new ej.maps.Maps({
  zoomSettings: {
    enable: true,
    toolbars: ["Zoom", "ZoomIn", "ZoomOut", "Pan", "Reset"]
  },
  layers: [{
    urlTemplate: "https://atlas.microsoft.com/map/imagery/png?subscription-key=Your-Key &api-version=1.0&style=satellite&zoom=level&x=tileX&y=tileY"
  }]
});
map.appendTo('container');
```

Adding markers and navigation line

Markers can be added to the layers of Azure Maps by setting the corresponding location's coordinates of latitude and longitude using [markerSettings](#). Navigation lines can be added on top of the Azure Maps layer for highlighting a path among various places by setting the corresponding location's coordinates of latitude and longitude in the [navigationLineSettings](#).

```
`javascript
var map = new ej.maps.Maps({
  zoomSettings: {
    zoomFactor: 4,
  },
  centerPosition: {
    latitude: 29.394708,
    longitude: -94.954653,
  },
  layers: [
    {
      urlTemplate: 'https://atlas.microsoft.com/map/imagery/png?subscription-key=Your-Key &api-version=1.0&style=satellite&zoom=level&x=tileX&y=tileY',
      markerSettings: [
        {
```

```
visible: true,
height: 25,
width: 15,
dataSource: [
{
latitude: 34.06062,
longitude: -118.330491,
name: 'California',
},
{
latitude: 40.724546,
longitude: -73.850344,
name: 'New York',
},
],
navigationLineSettings: [
{
visible: true,
color: 'blue',
width: 5,
angle: 0.1,
latitude: [34.06062, 40.724546],
longitude: [-118.330491, -73.850344],
},
],
});
map.appendTo('container');
```

Adding sublayer

Any GeoJSON shape can be rendered as a sublayer on top of the Azure Maps layer for highlighting a particular continent or country in Azure Maps by adding another layer and specifying the [type](#) property of Maps layer to **SubLayer**.

```
`javascript
var map = new ej.maps.Maps({
  layers: [
    {
      urlTemplate: "https://atlas.microsoft.com/map/imagery/png?subscription-key=Your-Key &api-version=1.0&style=satellite&zoom=level&x=tileX&y=tileY"
    },
    {
      shapeData: Africa_Continent,
      type: 'SubLayer',
      shapeSettings: {
        fill: "blue"
      }
    }
  ]
});
map.appendTo('container');
`
```

Enabling legend

The legend can be added to the Azure Maps by setting the [visible](#) property of [legendSettings](#) to **true**.

```
`javascript
var map = new ej.maps.Maps({
  legendSettings: {
    visible: true,
    type: 'Markers',
    useMarkerShape:true,
    toggleLegendSettings: {
      enable: true,
      applyShapeSettings: false,
      border: {
        color: 'green',
```

```

width: 2
}
}
},
layers: [
{
urlTemplate: "https://atlas.microsoft.com/map/imagery/png?subscription-key=Your-Key &api-
version=1.0&style=satellite&zoom=level&x=tileX&y=tileY",
shapeDataPath: 'name',
shapePropertyPath: 'name',
shapeSettings: {
fill: '#E5E5E5'
},
markerSettings: [
{
dataSource: markerDataSource,
colorValuePath: 'color',
shapeValuePath: 'shape',
legendText: 'country',
visible: true
}
]
}
]
});
map.appendTo('#element');
`

```

Other maps in EJ2 JavaScript Maps control

Apart from OpenStreetMap and Bing Maps, you can also render Maps from other online map service providers by specifying the URL provided by those providers in the [urlTemplate](#) property. The URL template concept has been implemented in such a way that any online map service providers using the following template can benefit from previewing their Map in the Syncfusion EJ2 Maps control.

<!-- markdownlint-disable MD034 -->

Sample Template: `https://< domain_name >/maps/basic/{z}/{x}/{y}.png`

- "\${z}" - It represents zoom factor (level).
- "\${x}" - It indicates tile image x-position (tileX).
- "\${y}" - It indicates tile image y-position (tileY).

In this case, the key generated for those online map service providers can also be appended to the URL. This allows to create personalized Maps with your own content and imagery.

Following is an example of how to add a TomTom map. You can generate an API key by following the steps in this [link](#) and then adding the key to the URL.

```
`javascript
var map = new ej.maps.Maps({
layers: [{
urlTemplate:
"http://api.tomtom.com/map/1/tile/basic/main/level/tileX/tileY.png?key=subscription_key"
}]
});
map.appendTo('container');
`
```

Enabling zooming and panning

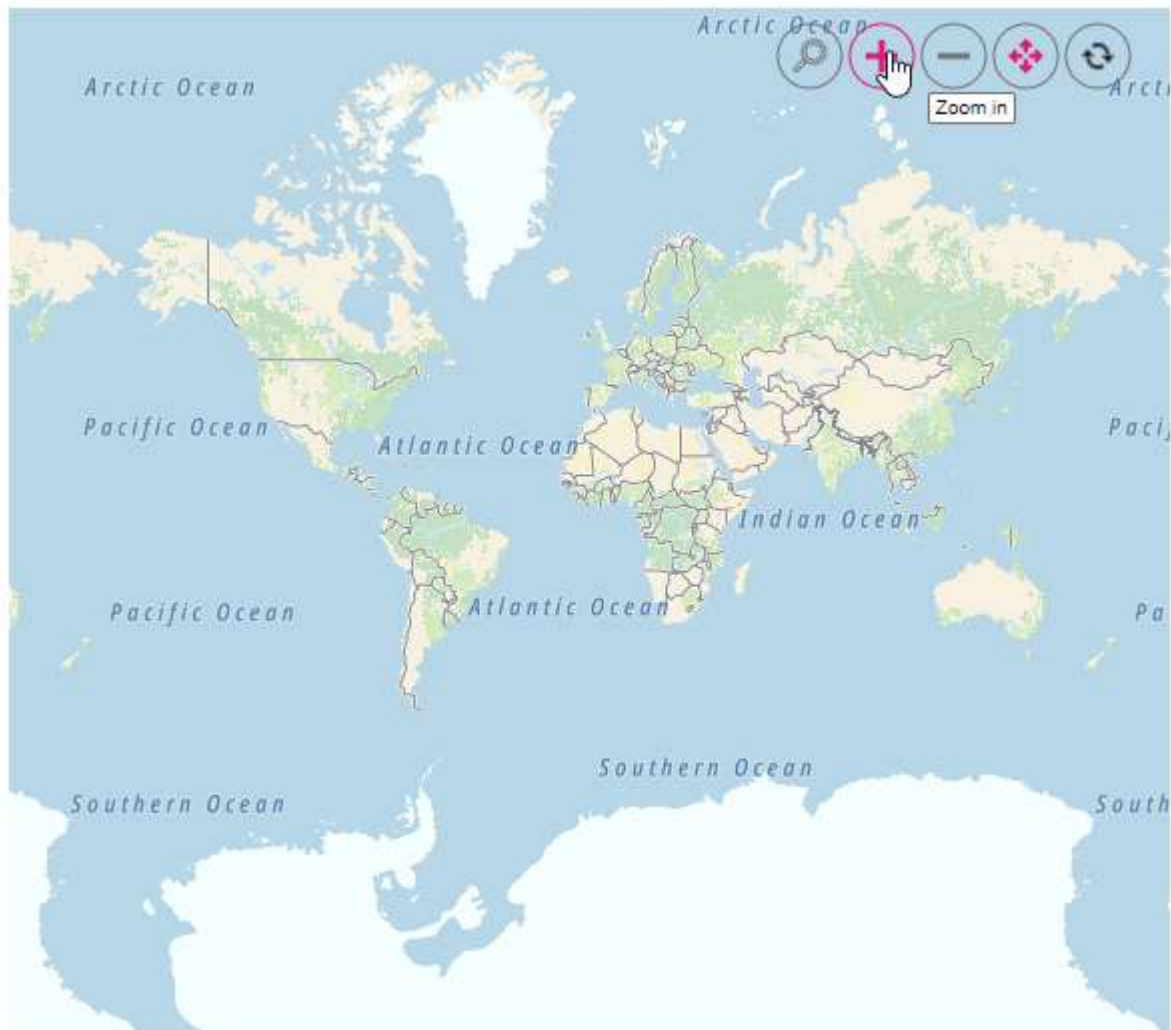

Tile Maps layer can be zoomed and panned. Zooming helps to get a closer look at a particular area on a map for in-depth analysis. Panning helps to move a map around to focus the targeted area.

```
`javascript
var maps = new ej.maps.Maps({
  zoomSettings: {
    enable: true,
    toolbars: ["Zoom", "ZoomIn", "ZoomOut", "Pan", "Reset"]
  },
  layers: [
    {
      urlTemplate:
        "http://api.tomtom.com/map/1/tile/basic/main/level/tileX/tileY.png?key=subscription_key"
```

```

}
]
});
maps.appendTo('#element');
`

```

Adding markers and navigation line

Markers can be added to the layers of tile Maps by setting the corresponding location's coordinates of latitude and longitude using [markerSettings](#). Navigation lines can be added on top of an tile Maps layer for highlighting a path among various places by setting the corresponding location's coordinates of latitude and longitude in the [navigationLineSettings](#).

```

`javascript
var maps = new ej.maps.Maps({
  zoomSettings: {

```

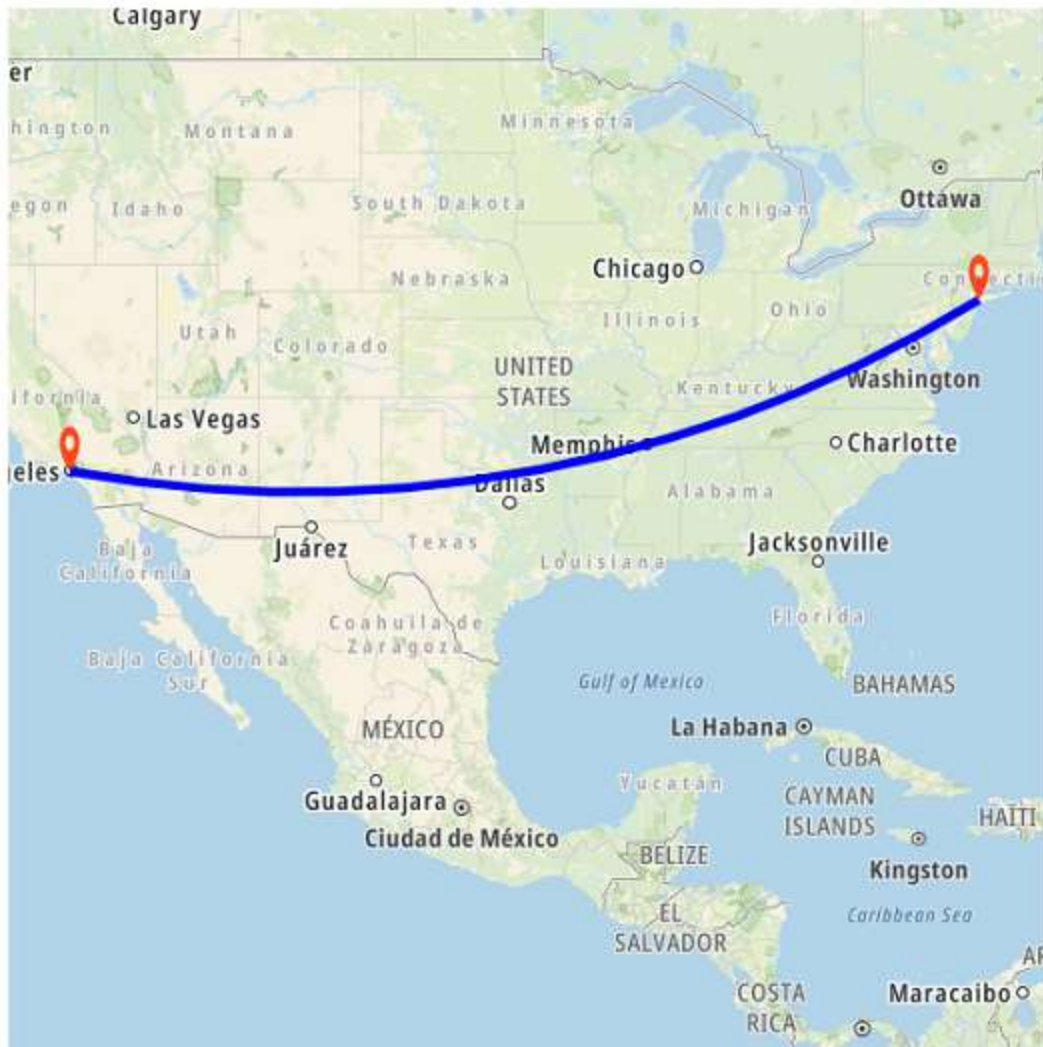

```
zoomFactor: 4
},
centerPosition: {
latitude: 29.394708,
longitude: -94.954653
},
layers: [
{
urlTemplate:
"http://api.tomtom.com/map/1/tile/basic/main/level/tileX/tileY.png?key=subscription_key",
markerSettings: [{
visible: true,
height: 25,
width: 15,
dataSource: [{
latitude: 34.060620,
longitude: -118.330491,
name: "California"
},
{
latitude: 40.724546,
longitude: -73.850344,
name: "New York"
}]
}],
navigationLineSettings: [{
visible: true,
color: "blue",
width: 5,
angle: 0.1,
latitude: [34.060620, 40.724546],
longitude: [-118.330491, -73.850344]
}]
}]
```

```

}
]
});
maps.appendTo('#element');
`

```

Adding sublayer

Any GeoJSON shape can be rendered as a sublayer on top of the tile Maps layer for highlighting a particular continent or country in tile Maps by adding another layer and specifying the [type](#) property of Maps layer to **SubLayer**.

```

`javascript
var maps = new ej.maps.Maps({
layers: [
{

```

```
urlTemplate:
"http://api.tomtom.com/map/1/tile/basic/main/level/tileX/tileY.png?key=subscription_key"
},
{
shapeData: africa_continent,
type: "SubLayer",
shapeSettings: {
fill: "blue"
}
}
]
});
maps.appendTo('#element');
、
```

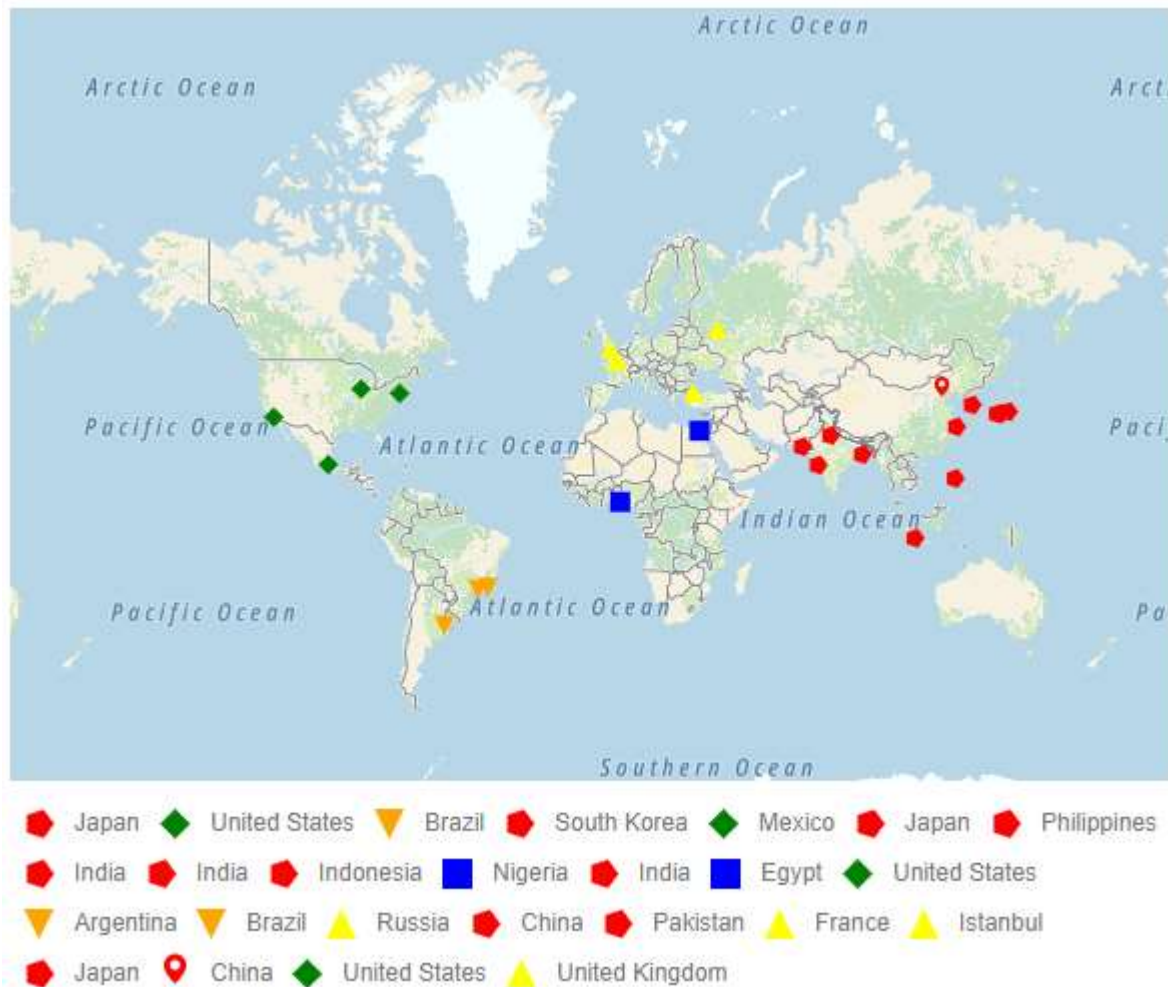

Enabling legend

The legend can be added to the tile Maps by setting the [visible](#) property of [legendSettings](#) to **true**.

```
`javascript
var map = new ej.maps.Maps({
  legendSettings: {
    visible: true,
    type: 'Markers',
    useMarkerShape:true,
    toggleLegendSettings: {
      enable: true,
      applyShapeSettings: false,
      border: {
        color: 'green',
```

```
width: 2
}
},
layers: [
{
urlTemplate:'http://api.tomtom.com/map/1/tile/basic/main/level/tileX/tileY.png?key=subscription_key'
,
shapeDataPath: 'name',
shapePropertyPath: 'name',
shapeSettings: {
fill: '#E5E5E5'
},
markerSettings: [
{
dataSource: markerDataSource,
colorValuePath: 'color',
shapeValuePath:'shape',
legendText: 'country',
visible: true
}
]
}
]
});
map.appendTo('#element');
、
```

Customization in EJ2 JavaScript Maps control

Setting the size for Maps

The width and height of the Maps can be set using the [width](#) and [height](#) properties in the Maps control. Percentage or pixel values can be used for the height and width values.

INDEX.TS

```
import { Maps } from '@syncfusion/ej2-maps';
import { world_map } from './world-map.ts';
let map: Maps = new Maps({
  height: '200px',
  width: '500px',
  layers: [{
    shapeData: world_map,
    shapeSettings: {
      autofill: true
    }
  }]
});
map.appendTo('#element');
```

INDEX.HTML

```

      ele.style.visibility = "visible";
    }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Maps title

The title for the Maps can be set using the [titleSettings](#). It can be customized using the following properties.

- [alignment](#) - To customize the alignment for the text in the title for the Maps. The possible values are **Center**, **Near** and **Far**.
- [description](#) - To set the description of the title in Maps.
- [text](#) - To set the text for the title in Maps.
- [textStyle](#) - To customize the text of the title in Maps.
- [subtitleSettings](#) - To customize the subtitle for the Maps.

INDEX.TS

```

import { Maps } from '@syncfusion/ej2-maps';
import { world_map } from './world-map.ts';
let map: Maps = new Maps({
  titleSettings: {
    text: 'Maps Control',
    textStyle: {
      color: 'red',
      fontStyle: 'italic',
      fontWeight: 'regular',
      fontFamily: 'arial',

        }
    </script>
    <script src="index.js" type="text/javascript"></script>
</body>
</html>
```

Setting theme

The Maps control supports following themes.

- Material
- Fabric
- Bootstrap
- Highcontrast
- MaterialDark
- FabricDark

- BootstrapDark
- Bootstrap4
- HighContrastLight
- Tailwind

By default, the Maps are rendered by the **Material** theme. The theme of the Maps component is changed using the [theme](#) property.

INDEX.TS

```
import { Maps, MapsTheme } from '@syncfusion/ej2-maps';
import { world_map } from './world-map.ts';
let map: Maps = new Maps({
  layers: [{
    shapeData: world_map,
    shapeSettings: {
      autofill: true
    }
  }]
});
map.appendTo('#container');
document.getElementById('theme').onchange = () => {
  var value = (<HTMLInputElement>document.getElementById('theme')).value;
  map.theme= <MapsTheme>value;
  map.refresh();
}

Customizing Maps container

The following properties are available to customize the container in the Maps.

- [background](#) - To apply the background color to the container in the Maps.
- [border](#) - To customize the color, width and opacity of the border of the Maps.
- [margin](#) - To customize the margins of the Maps.

INDEX.TS

```

import { Maps } from '@syncfusion/ej2-maps';
import { world_map } from './world-map.ts';
let map: Maps = new Maps({
    background: '#CCD1D1',
    border: {
        color: 'green',
        width: 2
    },
    margin: {
        bottom: 10,
        left: 20,
        right: 20,
        top: 10
    },
    layers: [{
        shapeData: world_map,
        shapeSettings: {
            autofill: true
        }
    }]
});
map.appendTo('#element');

```

      ele.style.visibility = "visible";
    }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body>
</html>
```

Customizing the shapes

The following properties are available in [shapeSettings](#) to customize the shapes of the Maps.

- [fill](#) - To apply the fill color to the all the shapes.
- [autofill](#) - To apply the palette colors to the shapes if it is set as true.
- [palette](#) - To set the custom palette for the shapes.
- [border](#) - To customize the color, width and opacity of the border of the shapes.
- [dashArray](#) - To define the pattern of dashes and gaps that is applied to the outline of the shapes.
- [opacity](#) - To customize the transparency for the shapes.

INDEX.TS

```
import { Maps } from '@syncfusion/ej2-maps';
import { world_map } from './world-map.ts';
let map: Maps = new Maps({
  layers: [{
    shapeData: world_map,
    shapeSettings: {
      autofill: true,
```

```

        palette: ['#C7DE6C', '#59A076', '#88D0BC', '#FEA78C',
        '#FFC557'],
        border: {
            color: '#FEE1DD',
            width: 3
        },
        dashArray: '1',
        opacity: 0.9
    }
}
});
map.appendTo('#element');

```

        }
    </script>
    <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Setting color to the shapes from the data source

The color for each shape in the Maps can be set using the [colorValuePath](#) property of [shapeSettings](#). The value for the [colorValuePath](#) property is the field name from the data source of the [shapeSettings](#) which contains the color values.

INDEX.TS

```

import { Maps } from '@syncfusion/ej2-maps';
import { world_map } from './world-map.ts';
let map: Maps = new Maps({
    layers: [{

```

```

    shapeData: world_map,
    shapePropertyPath: 'continent',
    shapeDataPath: 'continent',
    dataSource: [
        { continent: "North America", color: '#71B081' },
        { continent: "South America", color: '#5A9A77' },
        { continent: "Africa", color: '#498770' },
        { continent: "Europe", color: '#39776C' },
        { continent: "Asia", color: '#266665' },
        { continent: "Oceania", color: '#124F5E' }
    ],
    shapeSettings: {
        colorValuePath: 'color'
    }
  }
}
});
map.appendTo('#element');

```

INDEX.HTML

```

<!DOCTYPE html>
<html lang="en">
<head>
  <title>EJ2 Maps</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <div id="container" style="height: 500px; width: 700px">
    <div id="element"></div>
  </div>
  <script>
    var ele = document.getElementById('container');
    if (ele) {
      ele.style.visibility = "visible";
    }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Applying border to individual shapes

The border of each shape in the Maps can be customized using the [borderColorValuePath](#) and [borderWidthValuePath](#) properties to modify the color and the width of the border respectively. The field name in the data source of the layer which contains the color and the width values must be set in the [borderColorValuePath](#) and [borderWidthValuePath](#) properties respectively. If the values of

[borderWidthValuePath](#) and [borderColorValuePath](#) do not match with the field name from the data source, then the color and width of the border will be applied to the shapes using the [border](#) property in the [shapeSettings](#).

INDEX.TS

```
import { Maps } from '@syncfusion/ej2-maps';
import { world_map } from './world-map.ts';
let map: Maps = new Maps({
  layers: [{
    shapeData: world_map,

Projection type

The Maps control supports the following projection types:

- Mercator
- Equirectangular
- Miller
- Eckert3
- Eckert5
- Eckert6
- Winkel3
- AitOff

By default, the Maps are rendered by the **Mercator** projection type in which the Maps are rendered based on the coordinates. So, the Maps is not stretched. To change the type of projection in the Maps, the [projectionType](#) property is used.

INDEX.TS

```

import { Maps, ProjectionType } from '@syncfusion/ej2-maps';
import { world_map } from './world-map.ts';
import { projectionData } from './projection-data.ts';
let map: Maps = new Maps({

Color mapping in EJ2 JavaScript Maps control

Color mapping is used to customize the shape colors based on the given values. It has three types: range color mapping, equal color mapping and desaturation color mapping. To add color mapping to the shapes of the Maps, bind the data source to the [dataSource](#) property of [layerSettings](#) and set the field name which contains the color value in the data source to the [colorValuePath](#) property.

Range color mapping

Range color mapping applies the color to the shapes of the Maps which matches the numeric values in the data source within the given color mapping ranges. The [from](#) and [to](#) properties in the [colorMapping](#) are used to specify the color mapping ranges in the Maps.

```
`ts
```

```
export var Population_Density = [
```

```
...
```

```
{
```

```
'code': 'AE',
```

```
'value': 90,
```

```
'name': 'United Arab Emirates',
```

```
'population': 8264070,
```

```
'density': 99
```

```
},
```

```
{
```

```
'code': 'GB',
```

```
'value': 257,
```

```
'name': 'United Kingdom',
```

```
'population': 62041708,
```

```
'density': 255
```

```
},
```

```
{
```

```

'code': 'US',
'value': 34,
'name': 'United States',
'population': 325020000,
'density': 33
}
...
];
`

```

Bind the **Population_Density** data to the [dataSource](#) property of [layerSettings](#) and set the [colorValuePath](#) property of [shapeSettings](#) as **density**. The range values can be set using the [from](#) and [to](#) properties of [colorMapping](#).

INDEX.JS

```

var map = new ej.maps.Maps({
  legendSettings:{
    visible:true,
  },
  layers: [{
    shapeData: world_map,
    shapeDataPath: 'name',
    shapePropertyPath: 'name',
    dataSource: Population_Density,
    shapeSettings: {
      colorValuePath: 'density',
      fill: '#E5E5E5',
      colorMapping: [
        {
          from: 0.00001, to: 100, color: 'rgb(153,174,214)'
        },
        {
          from: 100, to: 200, color: 'rgb(115,143,199)'
        },
        {
          from: 200, to: 300, color: 'rgb(77,112,184)'
        },
        {
          from: 300, to: 500, color: 'rgb(38,82,168)'
        },
        {
          from: 500, to: 19000, color: 'rgb(0,51,153)'
        }
      ]
    }
  }
]
});
map.appendTo('#element');

```

INDEX.HTML

```

<!DOCTYPE html>
<html lang="en">
<head>
  <title>EJ2 Maps</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <script src="world-map.js"></script>
  <script src="data.js"></script>
  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>
  <div id="container" style="height: 500px; width: 700px">
    <div id="element"></div>
  </div>
  <script>
    var ele = document.getElementById('container');
    if (ele) {
      ele.style.visibility = "visible";
    }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Equal color mapping

Equal color mapping applies the color to the shapes of the Maps when the [value](#) property of [colorMapping](#) matches with the values provided in the data source. The following example shows how to apply equal color mapping to the shapes with the data source **unCountries** which illustrates the permanent and non-permanent countries in the UN security council.

```
`ts
```

```

export var unCountries: object[] = [
  { Country: 'China', Membership: 'Permanent' },
  { Country: 'France', Membership: 'Permanent' },
  { Country: 'Russia', Membership: 'Permanent' },
  { Country: 'United Kingdom', Membership: 'Permanent' },
  { Country: 'United States', Membership: 'Permanent' },
  { Country: 'Bolivia', Membership: 'Non-Permanent' },
  { Country: 'Eq. Guinea', Membership: 'Non-Permanent' },
  { Country: 'Ethiopia', Membership: 'Non-Permanent' },

```

```
{ Country: "Côte d'Ivoire", Membership: 'Permanent' },
{ Country: 'Kazakhstan', Membership: 'Non-Permanent' },
{ Country: 'Kuwait', Membership: 'Non-Permanent' },
{ Country: 'Netherlands', Membership: 'Non-Permanent' },
{ Country: 'Peru', Membership: 'Non-Permanent' },
{ Country: 'Poland', Membership: 'Non-Permanent' },
{ Country: 'Sweden', Membership: 'Non-Permanent' },
];
`
```

Bind the **unCountries** data to the [dataSource](#) property of [layerSettings](#) and set the [colorValuePath](#) property of [shapeSettings](#) as **Membership**. Set the [value](#) property in the [colorMapping](#) to **Permanent** and **Non-Permanent** in the different set of color mapping properties. If the corresponding value of the [colorValuePath](#) property matches with the corresponding field name in the data source, then the given color will be applied.

INDEX.JS

```
var map = new ej.maps.Maps({
  layers: [{
    shapeData: world_map,
    shapeDataPath: 'Country',
    shapePropertyPath: 'name',
    dataSource : unCountries,
    shapeSettings: {
      fill: '#E5E5E5',
      colorMapping: [
        {
          value: 'Permanent',
          color: '#C3E6ED'
        },
        {
          color: '#F1931B',
          value: 'Non-Permanent'
        }
      ]
    },
    colorValuePath: 'Membership'
  }
]
});
map.appendTo('#element');
```

INDEX.HTML

```

</body>
</html>

```

Desaturation color mapping

Desaturation color mapping applies the color to the shapes of the Maps, similar to the range color mapping. The opacity will be applied in this color mapping based on the [minOpacity](#) and [maxOpacity](#) properties in the [colorMapping](#).

The following example shows how to apply desaturation color mapping to the shapes with the data source **Population_Density** that is available in the [Range color mapping](#) section. Bind the **Population_Density** data to the [dataSource](#) property of [layerSettings](#) and set the [colorValuePath](#) property of [shapeSettings](#) as **density**. The range values can be set using the [from](#) and [to](#) properties of [colorMapping](#).

INDEX.JS

```

var map = new ej.maps.Maps({
  layers: [{
    shapeData: world_map,
    shapeDataPath: 'name',
    shapePropertyPath: 'name',
    dataSource: Population_Density,
    legendSettings: {
      visible: true
    },
    shapeSettings: {
      colorValuePath: 'density',
      colorMapping: [
        {
          from: 0, to: 100, color: 'red', minOpacity: 0.2,
maxOpacity: 1
        },
        {

```

```

        from: 101, to: 200, color: 'blue', minOpacity:0.3,
maxOpacity:1
    }
    ]
}
}]
});
map.appendTo('#element');

```

INDEX.HTML

```

<!DOCTYPE html>
<html lang="en">

            ele.style.visibility = "visible";
        }
    </script>
    <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Multiple colors for a single shape

Multiple colors can be added to the color mapping which can be used as gradient effect to a specific shape based on the ranges in the data source. By using the [color](#) property of [colorMapping](#), any number of colors can be set to the shapes as a gradient.

The following example demonstrates how to use multiple colors in color mapping with the data source **Population_Density** that is available in the [Range color mapping](#) section. Bind the **Population_Density** data to the [dataSource](#) property of [layerSettings](#) and set the [colorValuePath](#) property of [shapeSettings](#) as **density**. The range values can be set using the [from](#) and [to](#) properties of [colorMapping](#).

INDEX.JS

```

var map = new ej.maps.Maps({
    layers: [{

```

```

        shapeData: world_map,
        shapeDataPath: 'name',
        shapePropertyPath: 'name',
        dataSource: Population_Density,
        legendSettings: {
            visible: true
        },
        shapeSettings: {
            colorValuePath: 'density',
            colorMapping: [
                {
                    from: 0, to: 100, color: ['red', 'blue']
                },
                {
                    from: 101, to: 200, color: ['green', 'yellow']
                }
            ]
        }
    }
}
});
map.appendTo('#element');

```

INDEX.HTML

```

<!DOCTYPE html>
<html lang="en">

    <script>
        var ele = document.getElementById('container');
        if (ele) {
            ele.style.visibility = "visible";
        }
    </script>
    <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Color for items excluded from color mapping

Color mapping can be applied to the shapes in the Maps which does not match color mapping criteria such as range or equal values using the [color](#) property of [colorMapping](#).

The following example shows how to set the color for items excluded from the color mapping with the data source **Population_Density** that is available in the [Range color mapping](#) section. In the following example, color mapping is added for the ranges from 0 to 200. If there are any records in the data source that are outside of this range, the color mapping will not be applied. To apply the color for these excluded items, set the [color](#) property alone in the [colorMapping](#).

INDEX.JS

```
var map = new ej.maps.Maps({
  layers: [{
    shapeData: world_map,
    shapeDataPath: 'name',
    shapePropertyPath: 'name',
    dataSource: Population_Density,
    legendSettings: {
      visible: true
    },
    shapeSettings: {
      colorValuePath: 'density',
      colorMapping: [
        {
          from: 0, to: 100, color: 'skyblue',
        },
        {
          from: 101, to: 200, color: 'blue',
        },
        {
          color: 'green'
        }
      ]
    }
  }]
});
map.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html>
<html lang="en">
<head>
  <title>EJ2 Maps</title>

  <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Color mapping for bubbles

The color mapping types such as range color mapping, equal color mapping and desaturation color mapping are applicable for bubbles in the Maps. To add color mapping for bubbles of the Maps, bind the data source to the [dataSource](#) property of [bubbleSettings](#) and set the field name which contains the color value in the data source to the [colorValuePath](#) property. Multiple colors for a single set of bubbles and color for excluded items from [colorMapping](#) are also applicable for bubbles.

INDEX.JS

```

var map = new ej.maps.Maps({
  legendSettings:{
    visible:true,
  },
  layers: [{
    shapeData: world_map,
    shapeDataPath: 'name',
    shapePropertyPath: 'name',
    bubbleSettings: [{
      visible: true,
      minRadius: 5,
      dataSource: [
        { name: 'India', population: '38332521' },
        { name: 'New Zealand', population: '19651127' },
        { name: 'Pakistan', population: '3090416' }
      ],
      fill: 'green',
      valuePath: 'population',
      colorValuePath: 'population',
      colorMapping: [{
        value: '38332521',
        color: '#C3E6ED'
      },
      {
        value: '19651127',
        color: '#F1931B'
      },
      {
        value: '3090416',
        color: 'blue'
      }
    ]
  }
]

```

```

    }]
  }
});
map.appendTo('#element');

```

Data label in EJ2 JavaScript Maps control

Data labels provide information to users about the shapes of the Maps control. It can be enabled by setting the [visible](#) property of the [dataLabelSettings](#) to **true**.

Adding data labels

To display the data labels in the Maps, set the field name containing the text to be displayed from the data source or shape data in the [labelPath](#) property of the [dataLabelSettings](#) property.

In the following example, the value of [labelPath](#) property is set from the field name in the shape data of the Maps layer.

INDEX.JS

```

var map = new ej.maps.Maps({
  layers: [
    {
      shapeData: usa_map,
      shapeSettings: {
        autofill: true

```

```

        },
        dataLabelSettings: {
            visible: true,
            labelPath: 'name',
        }
    }
}
]);
map.appendTo('#element');

```

INDEX.HTML

```

<!DOCTYPE html>
<html lang="en">

</html>

```

Customization

The following properties are available in the `dataLabelSettings` to customize the data label of the Maps control.

- [border](#) - To customize the color, width and opacity for the border of the data labels in Maps.

- [fill](#) - To apply the color of the data labels in Maps.
- [opacity](#) - To customize the transparency of the data labels in Maps.
- [textStyle](#) - To customize the text style of the data labels in Maps.

INDEX.JS

```
var map = new ej.maps.Maps({
  layers: [
    {
      shapeData: usa_map,
      shapeSettings: {
        autofill: true
      },
      dataLabelSettings: {
        visible: true,

type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
```

```
<body>
  <div id="container" style="height: 500px; width: 700px">
    <div id="element"></div>
  </div>
  <script>
    var ele = document.getElementById('container');
    if (ele) {
      ele.style.visibility = "visible";
    }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body>
</html>
```

Label animation

The data labels can be animated during the initial rendering of the Maps. This can be enabled by setting the [animationDuration](#) property in the [dataLabelSettings](#) of the Maps. The duration of the animation is specified in milliseconds.

INDEX.JS

```
var map = new ej.maps.Maps({
  layers: [{
    shapeData: usa_map,
    dataLabelSettings: {
      visible: true,
      labelPath: 'name',
      smartLabelMode: 'Hide',
      intersectionAction: 'Trim',
      animationDuration: 2000,
    },
    shapeSettings: {
      autofill: true,
    },
    tooltipSettings: {
      visible: true,
      valuePath: 'name',
    },
  ]
});
map.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Maps</title>
  <meta charset="utf-8">

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Smart labels

The Maps control provides an option to handle the labels when they intersect with the corresponding shape borders using the [smartLabelMode](#) property. The following options are available in the `smartLabelMode` property.

- **None** - It specifies that no action is taken, when a label exceeds the shape's region.
- **Hide** - It specifies to hide the labels, when it exceeds the shape's region.
- **Trim** - It specifies to trim the labels, when it exceeds the shape's region.

INDEX.JS

```

var map = new ej.maps.Maps({
    layers: [
        {
            shapeData: usa_map,
            shapeSettings: {
                autofill: true
            },
            dataLabelSettings: {
                visible: true,
                labelPath: 'name',
                smartLabelMode: 'Hide'
            }
        }
    ]
});
map.appendTo('#element');

```

<script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Intersect action

The Maps component provides an option to handle the labels when a label intersects with another label using the [intersectionAction](#) property. The following options are available in the [intersectionAction](#) property.

- **None** - It specifies that no action is taken, when the labels intersect.
- **Hide** - It specifies to hide the labels when they intersect.
- **Trim** - It specifies to trim the labels when they intersect.

INDEX.JS

```

var map = new ej.maps.Maps({
  layers: [
    {
      shapeData: usa_map,
      shapeSettings: {
        autofill: true
      },
      dataLabelSettings: {
        visible: true,
        labelPath: 'name',
        intersectionAction: 'Trim'
      }
    }
  ]
});
map.appendTo('#element');

      ele.style.visibility = "visible";
    }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Adding data label as a template

Any HTML elements can be added as a template in the data labels by using the [template](#) property of `dataLabelSettings` in the Maps control.

The properties of data label such as, `smartLabelMode`, `intersectionAction`, `animationDuration`, `border`, `fill`, `opacity` and `textStyle` properties are not applicable to `template` property. The styles can be applied to the label template using the CSS styles of the HTML element.

INDEX.JS

```

var map = new ej.maps.Maps({
  layers: [
    {
      shapeData: usa_map,
      shapeDataPath: 'Name',
      shapePropertyPath: 'name',
      dataSource: [
        { Name: 'Iowa', Population: 29863010 },
        { Name: 'Utah', Population: 1263010 },
        { Name: 'Texas', Population: 963010 }
      ],
      shapeSettings: {
        autofill: true
      },
      dataLabelSettings: {
        visible: true,
        labelPath: 'Name',

```

```

        template: '<div><div> </div> ${Name}</img></div>'
    }
}
]
});
map.appendTo('#element');

```

Polygon shape in EJ2 JavaScript Maps control

The Maps control allows you to add polygon shape to a geometry map or an online map by using the properties in the [polygons](#). This section describes how to add polygon shape to the map and customize them.

The polygon shape can be rendered over the map layer by defining the [points](#) property in the **polygons** of the Maps control. The **points** property uses a collection of latitude and longitude values to define the polygon shape.

The **polygons** provides the following properties for customizing the polygon shape of the Maps control.

- [fill](#) - It is used to change the color of the polygon shape.
- [opacity](#) - It is used to change the opacity of the polygon shape.
- [borderColor](#) - It is used to change the color of the border in the polygon shape.

- [borderWidth](#) - It is used to change the width of the border in the polygon shape.
- [borderOpacity](#) - It is used to change the opacity of the border in the polygon shape.

You can also include “n” polygon shapes using the [polygons](#) property.

The following example shows how to customize the polygon shape over the geometry map.

INDEX.JS

```
var map = new ej.maps.Maps({
  layers: [
    {
      shapeData: world_map,
      polygonSettings: {
        polygons: [
          {
            points: [
              { longitude: 34.88539587371454, latitude:

Markers in EJ2 JavaScript Maps control

Markers are notes that are used to leave a message on the Maps. It indicates or marks a specific location with desired symbols on the Maps. It can be enabled by setting the [visible](#) property of the [markerSettings](#) to **true**.

Adding marker

The [dataSource](#) property of the [markerSettings](#) has a list of objects that contains the data for Markers. Using this property, any number of markers can be added to the shape layers. By default, it displays the markers based on the specified latitude and longitude in the given data source. Each data source object contains the following list of properties.

- label - Text that displays some information about the marker in text format.
- latitude - The latitude point which determines the X location of the marker.
- longitude - The longitude point which determines the Y location of the marker.

markerSettings is an Array property.

INDEX.JS

```
var map = new ej.maps.Maps({
  layers: [{
    shapeData: world_map,
    markerSettings: [
      {
        visible: true,
        height: 20,
        width: 20,
        dataSource: [
          { latitude: 49.95121990866204, longitude:
18.468749999999998 },
          { latitude: 59.88893689676585, longitude: -109.3359375
},
          { latitude: -6.64607562172573, longitude: -
55.546874999999999 }
        ],
        animationDuration: 0,
      },
    ]
  }]
});
map.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html>
<html lang="en">
<head>
  <title>EJ2 Maps</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

      ele.style.visibility = "visible";
    }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body>
</html>
```

Adding marker template

The Marker can be added as a template in the Maps component. The [template](#) property of the [markerSettings](#) is used to set the Marker as a template. HTML element or id of an element can be added as the template in Markers.

INDEX.JS

```
var map = new ej.maps.Maps({
  layers: [{
    shapeData: world_map,
    markerSettings: [
      {
        visible: true,
        template: '<div id="marker4" class="markerTemplate">Europe' +
          '</div>',
        dataSource: [
          { latitude: 49.95121990866204, longitude: 18.468749999999998 }
        ]
      },
      {
        visible: true,
        template: '<div id="marker5" class="markerTemplate" style="width:50px">North America' +
          '</div>',
        dataSource: [
          { latitude: 59.88893689676585, longitude: -109.3359375 }
        ],
        animationDuration: 0
      },
      {
        visible: true,
        template: '<div id="marker6" class="markerTemplate" style="width:50px">South America' +
          '</div>',
        dataSource: [
          { latitude: -6.64607562172573, longitude: -55.54687499999999 }
        ],
        animationDuration: 0
      }
    ]
  }
]);
map.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html>
<html lang="en">
<head>
  <title>EJ2 Maps</title>
  <meta charset="utf-8">
```

```

<meta name="viewport" content="width=device-width, initial-scale=1.0">

      ele.style.visibility = "visible";
    }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Customization

The following properties are available in [markerSettings](#) to customize the Markers of the Maps component.

- [border](#) - To customize the color, width and opacity of the border for the markers in Maps.
- [fill](#) - To apply the color for markers in Maps.
- [dashArray](#) - To define the pattern of dashes and gaps that is applied to the outline of the markers in Maps.
- [height](#) - To customize the height of the markers in Maps.
- [width](#) - To customize the width of the markers in Maps.
- [offset](#) - To customize the position of the markers in Maps.
- [opacity](#) - To customize the transparency of the markers in Maps.
- [animationDelay](#) - To change the time delay in the transition for markers.
- [animationDuration](#) - To change the time duration of animation for markers.
- [highlightSettings](#) - To customize the highlight settings for the marker in Maps.
- [selectionSettings](#) - To customize the selection settings for the marker in Maps.

INDEX.JS

```

var map = new ej.maps.Maps({
  layers: [{
    shapeData: world_map,
    markerSettings: [{
      visible: true,
      border: {
        color: 'green',
        width: 2
      },
      fill: 'red',

```

```

        dashArray: '1',
        height: 20,
        width: 20,
        opacity: 0.9,
        animationDelay: 100,
        animationDuration: 1000,
        shape: 'Balloon',
        dataSource: [
            { latitude: 37.0000, longitude: -120.0000, city:

```

Marker shapes

The Maps component supports the following marker shapes. To set the shape of the marker, the [shape](#) property in [markerSettings](#) is used.

- Balloon
- Circle
- Cross
- Diamond
- Image
- Rectangle
- Start
- Triangle
- VerticalLine
- HorizontalLine

Rendering Marker shape as image

To render a marker as an image in Maps, set the [shape](#) property of [markerSettings](#) as **Image** and specify the path of the image to [imageUrl](#) property. There is another way to render a marker as an image using the [imageUrlValuePath](#) property of the [markerSettings](#). Bind the field name that contains the path of the image in the data source to the [imageUrlValuePath](#) property.

INDEX.JS

```
var map = new ej.maps.Maps({
  layers: [{
    shapeData: world_map,
    markerSettings: [{
      visible: true,
      shape: 'Image',
      imageUrl:
'https://ej2.syncfusion.com/javascript/demos/src/maps/images/ballon.png',
      height: 20,
      width: 20,
      dataSource: [
        { latitude: 37.0000, longitude: -120.0000, city:
'California' },
        { latitude: 40.7127, longitude: -74.0059, city: 'New York' },
        { latitude: 42, longitude: -93, city: 'Iowa' }
      ]
    }]
  }]
});
map.appendTo('#element');
```

INDEX.HTML

```

      ele.style.visibility = "visible";
    }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body>
</html>
```

Multiple marker groups

Multiple group of markers can be added to the Maps using the [markerSettings](#) in which the properties of markers are added as an array. The customization for the markers can be done with the [markerSettings](#).

INDEX.JS

```
var map = new ej.maps.Maps({
  layers: [{
    shapeData: world_map,
    markerSettings: [{
      visible: true,
      shape: 'Diamond',
      height: 15,
      fill: "green",
      width: 15,
      dataSource: [
        {
          latitude: 37.0000, longitude: -120.0000,
          name: 'California',
        },
        {
          latitude: 40.7127, longitude: -74.0059, name: "New York"
        },
        {
          latitude: 42, longitude: -93, name: 'Iowa'
        }
      ]
    },
    {
      visible: true,
      dataSource: [{
        latitude: 19.228825, longitude: 72.854118, name: "Mumbai"
      }, {
        latitude: 28.610001, longitude: 77.230003, name: "Delhi"
      }, {
        latitude: 13.067439, longitude: 80.237617, name: "Chennai"
```

```

        },
        shape: 'Circle',
        fill: "blue",
        height: 10,
        width: 10
    }
  ]
});
map.appendTo('#element');

```

INDEX.HTML

```

Customize marker shapes from data source

Bind different colors and shapes to the marker from data source

Using the [shapeValuePath](#) and [colorValuePath](#) properties, apply the color and shape of the marker from the given data source. Bind the data source to the [dataSource](#) property of the [markerSettings](#) and set the field names that contains the shape and color values in the data source to the [shapeValuePath](#) and [colorValuePath](#) properties. A default marker object is represented by a **balloon** shape. To set various shapes to the marker object by using the [shape](#) property in [markerSettings](#).

The following shapes are used for the marker object.

- Circle
- Rectangle

- Balloon
- Cross
- Polyline
- Diamond
- Star
- Triangle
- HorizontalLine
- VerticalLine
- pentagon

INDEX.JS

```
var map = new ej.maps.Maps({
  layers: [{
    shapeData: world_map,
    markerSettings: [{
      visible: true,
      shapeValuePath: 'shape',
      colorValuePath: 'color',
      dataSource: [
        { latitude: 49.95121990866204, longitude:
18.468749999999998, name: 'Europe', color: 'red', shape: 'Triangle' },
        { latitude: 59.88893689676585, longitude: -109.3359375,
name: 'North America',
        color: 'blue', shape: 'Pentagon' },
        { latitude: -6.64607562172573, longitude: -
55.54687499999999, name: 'South America',
        color: 'green', shape: 'InvertedTriangle' }
      ]
    }]
  }]
});
map.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Maps</title>
  <meta charset="utf-8">

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Setting value path from the data source

The latitude and longitude values are used to determine the location of each marker in the Maps. The [latitudeValuePath](#) and [longitudeValuePath](#) properties are used to specify the value path that presents in the data source of the marker. In the following example, the field name from the data source is set to the [latitudeValuePath](#) and [longitudeValuePath](#) properties.

INDEX.JS

```

var map = new ej.maps.Maps({
  layers: [{
    shapeData: world_map,
    markerSettings: [{
      visible: true,
      latitudeValuePath: 'latitude',
      longitudeValuePath: 'longitude',
      dataSource: [
        { latitude: 49.95121990866204, longitude: 18.468749999999998 },
        { latitude: 59.88893689676585, longitude: -109.3359375 },
        { latitude: -6.64607562172573, longitude: -55.546874999999999 }
      ]
    }
  ]
});
map.appendTo('#element');

```

INDEX.HTML

```

<!DOCTYPE html>
<html lang="en">
<head>
  <title>EJ2 Maps</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

    var ele = document.getElementById('container');
    if (ele) {
      ele.style.visibility = "visible";
    }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Repositioning the marker using drag and drop

The markers on the map can be dragged and dropped to change their position. To enable marker drag and drop, set the [enableDrag](#) property to **true** in the [markerSettings](#) property.

INDEX.JS

```

var map = new ej.maps.Maps({
  layers: [{
    shapeData: world_map,
    shapeSettings: {
      fill: '#C3E6ED'
    },
    markerSettings: [
      {
        enableDrag: true,
        dataSource: [
          { latitude: 49.95121990866204, longitude:
18.468749999999998, name: 'MarkerOne' },
          { latitude: 59.88893689676585, longitude: -109.3359375,
name: 'MarkerTwo' },
          { latitude: -6.64607562172573, longitude: -
55.54687499999999, name: 'MarkerThree' },
          { latitude: 23.644385824912135, longitude:
77.83189239539234, name: 'MarkerFour' },
          { latitude: 63.66569332894224, longitude:
98.2225173953924, name: 'MarkerFive' }
        ],
        visible: true,
        animationDuration: 0,
        shape: 'Balloon',
        width: 20,
        height: 20,
        border: { width: 2, color: '#285255' },
        tooltipSettings: {
          visible: true,
          valuePath: 'name',
        }
      },
    ],
  }],
});

```

```

    }}
  });
  map.appendTo('#element');

```

INDEX.HTML

```

</html>

```

The data of the drag and dropped marker in the marker data source can be customized using the [markerDragStart](#) and [markerDragEnd](#) events. When you change the appropriate marker data, the tooltip and legend item text of that marker are automatically updated. The following properties are available in the event argument of the marker drag events.

Argument Name	Description
dataIndex	It represents the index of the data of the dragged marker in the marker data source.
latitude	It represents the latitude coordinate point of the dragged marker.
longitude	It represents the longitude coordinate point for the dragged marker.
markerIndex	It represents the index of the marker setting.

layerIndex	It represents the index of the layer in which the marker belongs.	
name	It represents the name of the event.	
x	It represents the horizontal location of the mouse pointer on the map when the drag action is performed.	
y	It represents the vertical location of the mouse pointer on the map when the drag action is performed.	

The following example shows how to use marker drag events to customize the data of the drag and dropped marker in the marker data source.

INDEX.JS

```
var map = new ej.maps.Maps({
  legendSettings:{
    visible:true,
    type:'Markers',
    shape:'Circle',
    shapeWidth:10,
    shapeHeight:10,
    fill:'#FF471A',
    shapeBorder: { width: 2, color: '#285255' },
  },
  markerDragStart: function(args){
    // When the marker begins to move on the map, the event is triggered.
  },
  markerDragEnd: function(args) {
    // When the marker on the map stops dragging, the event is triggered.
    var mapsInstance =
document.getElementById('element').ej2_instances[0];

mapsInstance.layers[args.layerIndex].markerSettings[args.markerIndex].dataSo
urce[args.dataIndex].name = 'Dragged Marker ' + (args.dataIndex + 1);
mapsInstance.refresh();
  },
  layers: [{
    shapeData: world_map,
    shapeSettings: {
      fill: '#C3E6ED'
    },
  },
  markerSettings: [
    {
      enableDrag: true,
      legendText: 'name',
      dataSource: [
        { latitude: 49.95121990866204, longitude:
18.468749999999998, name: 'MarkerOne' },
        { latitude: 59.88893689676585, longitude: -109.3359375,
name: 'MarkerTwo'},
        { latitude: -6.64607562172573, longitude: -
55.546874999999999 , name: 'MarkerThree'},
        { latitude: 23.644385824912135, longitude:
77.83189239539234 , name: 'MarkerFour'},
        { latitude: 63.66569332894224, longitude:
98.2225173953924 , name: 'MarkerFive'}
```

```

        ],
        visible: true,
        animationDuration: 0,
        shape: 'Balloon',
        width: 20,
        height: 20,
        border: { width: 2, color: '#285255' },
        tooltipSettings: {
            visible: true,
            valuePath: 'name',
        }
    },
]
}]
});
map.appendTo('#element');

```

INDEX.HTML

```

<!DOCTYPE html>
<html lang="en">

    <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Marker zooming

The Maps is initially scaled to the center value based on the marker distance. This can be achieved by setting the [shouldZoomInitially](#) property in [zoomSettings](#) as **true**.

INDEX.JS

```

var map = new ej.maps.Maps({

```

```

        zoomSettings: {
            enable: true,
            horizontalAlignment: 'Near',
            shouldZoomInitially: true
        },
        layers: [{
            shapeData: world_map,
            markerSettings: [{
                visible: true,
                dataSource: [
                    { latitude: 49.95121990866204, longitude:

</body>
</html>

```

Marker clustering

Maps provide support to hide and cluster markers when they overlap each other. The number on a cluster indicates how many overlapped markers it contains. If zooming any of the cluster locations in Maps, the number on the cluster will decrease and begin to see the individual markers on the map. When zooming out, the overlapping marker will increase so that it can cluster again and increase the count over the cluster.

To enable clustering in markers, set the [allowClustering](#) property of [markerClusterSettings](#) as **true** and customization of clustering can be done with the [markerClusterSettings](#).

INDEX.JS

```
var maps = new ej.maps.Maps({
  useGroupingSeparator: true,
  format: 'n',
  zoomSettings: {
    enable: true
  },
  titleSettings: {
    text: 'Top 13 largest cities in the World',
    textStyle: {
      size: '16px'
    }
  },
  layers: [
    {
      shapeData: world_map,
      shapeSettings: {
        fill: '#C1DFF5'
      },
      markerClusterSettings: {
        allowClustering: true,
        shape: 'Circle',
        height: 40,
        width: 40,
        labelStyle : { color: 'white' },
      },
      markerSettings: [
        {
          visible: true,
          dataSource: cluster,
          shape: 'Balloon',
          tooltipSettings: {
            visible: true,
            valuePath: 'area',
            format: 'City: ${city} <br> Area: ${area}'
          },
          height: 20,
          width: 20,
          animationDuration: 0
        },
      ],
    }
  ],
});
maps.appendTo('#container');
```

INDEX.HTML

```

Customization of marker cluster

The following properties are available to customize the marker clustering in the Maps component.

- [border](#) - To customize the color, width and opacity of the border of cluster in Maps.
- [connectorLineSettings](#) - To customize the connector line in cluster separating the markers.
- [dashArray](#) - To customize the dash array for the marker cluster in Maps.
- [fill](#) - Applies the color of the cluster in Maps.
- [height](#) - To customize the height of the marker cluster in Maps.
- [imageUrl](#) - To customize the URL path for the marker cluster when the cluster shape is set as image in Maps.
- [labelStyle](#) - To customize the text in marker cluster.
- [offset](#) - To customize the offset position for the marker cluster in Maps.
- [opacity](#) - To customize the opacity of the marker cluster.
- [shape](#) - To customize the shape for the cluster of markers.
- [width](#) - To customize the width of the marker cluster in Maps.

INDEX.JS

```

var maps = new ej.maps.Maps({

```

```

zoomSettings: {
  enable: true
},
layers: [{
  shapeData: world_map,
  shapeSettings: {
    fill: '#C1DFF5'
  },
  markerClusterSettings: {
    allowClustering: true,
    allowClusterExpand: true,
    shape: 'Circle',
    height: 40,
    width: 40,
    labelStyle : { color: 'white'},
    opacity: 0.9,
    fill: 'green',
    connectorLineSettings: {
      color: 'orange',
      opacity: 0.8,
      width: 2
    }
  },
  markerSettings: [{
    visible: true,
    dataSource: cluster,
    shape: 'Balloon',
    tooltipSettings: {
      format: 'City: ${city} <br> Area: ${area}',
      visible: true,
      valuePath: 'area',
    },
    height: 20,
    width: 20,
    animationDuration: 0
  }]
}]
});
maps.appendTo('#container');

```

INDEX.HTML

```

Marker cluster expand

The cluster is formed by grouping an identical and non-identical marker from the surrounding area. By clicking on the cluster and setting the [allowClusterExpand](#) property in [markerClusterSettings](#) as **true** to expand the identical markers. If zoom in any of the locations of the cluster, the number on the cluster will decrease and the overlapping marker will be split into an individual marker on the map. When performing zoom out, it will increase the marker count and then cluster it again.

INDEX.JS

```

var map = new ej.maps.Maps({
  zoomSettings: {
    enable: true,
    mouseWheelZoom : true,
  },
  layers: [{
    shapeData: world_map,
    markerClusterSettings: {

Tooltip for marker

Tooltip is used to display more information about a marker on mouse over or touch end event. This can be enabled separately for marker by setting the [visible](#) property or [tooltipSettings](#) to **true**. The [valuePath](#) property in the [tooltipSettings](#) takes the field name that presents in dataSource and displays that value as tooltip text.

INDEX.JS

```

var map = new ej.maps.Maps({
  layers: [
```

```

        {
            shapeData: usa_map,
            markerSettings: [

Bubble in EJ2 JavaScript Maps control

Bubbles in the Maps control represent the underlying data values of the Maps. It can be scattered throughout the Maps shapes that contain values in the data source. Bubbles are enabled by setting the [visible](#) property of [bubbleSettings](#) to **true**.

To add bubbles to the Maps, bind the data source to the [dataSource](#) property of [bubbleSettings](#) and set the field name, that contains the numerical data, in the data source to the [valuePath](#) property.

INDEX.JS

```
var map = new ej.maps.Maps({
  layers: [{
    shapeData: world_map,
    shapeDataPath: 'name',
    shapePropertyPath: 'name',
    bubbleSettings: [{
      visible: true,
      minRadius: 20,
      dataSource: [
        { name: 'India', population: '38332521' },
        { name: 'Burundi', population: '10524117' },
        { name: 'Pakistan', population: '3090416' }
      ],
      maxRadius: 40,
      valuePath: 'population'
    }]
  }]
});
map.appendTo('#element');
```

INDEX.HTML

```

    }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body>
</html>
```

Bubble shapes

The following types of shapes are available to render the bubbles in Maps.

- Circle
- Square

By default, bubbles are rendered in the **Circle** type. To change the type of the bubble, set the [bubbleType](#) property of [bubbleSettings](#) as **Square** to render the square shape bubbles.

INDEX.JS

```
var map = new ej.maps.Maps({
  layers: [{
    shapeData: world_map,
    shapeDataPath: 'name',
    shapePropertyPath: 'name',
    bubbleSettings: [{
      bubbleType: 'Square',
      visible: true,
      dataSource: [
        { name: 'India', population: '38332521' },
        { name: 'Pakistan', population: '3090416' }
      ],
      valuePath: 'population'
    }]
  }]
});
map.appendTo('#element');

</body>
</html>

```

Customization

The following properties are available in [bubbleSettings](#) to customize the bubbles of the Maps component.

- [border](#) – To customize the color, width and opacity of the border of the bubbles in Maps.
- [fill](#) – To apply the color for bubbles in Maps.
- [opacity](#) – To apply opacity to the bubbles in Maps.
- [animationDelay](#) - To change the time delay in the transition for bubbles.
- [animationDuration](#) - To change the time duration of animation for bubbles.
- [highlightSettings](#) - To customize the highlight settings for the bubbles in Maps.
- [selectionSettings](#) - To customize the selection settings for the bubbles in Maps.

INDEX.JS

```

var map = new ej.maps.Maps({
  layers: [{
    shapeData: world_map,
    shapeDataPath: 'name',
    shapePropertyPath: 'name',
    bubbleSettings: [{
      visible: true,
      minRadius: 5,
      dataSource: [
        { name: 'India', population: '38332521' },
        { name: 'New Zealand', population: '19651127' },
        { name: 'Pakistan', population: '3090416' }
      ],
      fill: 'green',
      animationDelay: 100,
      animationDuration: 1000,
      maxRadius: 80,
      border: {
        color: 'blue',
        width: 2
      }
    }
  ]
});

```

```

        },
        opacity: 1,
        valuePath: 'population'
    }
  ]
}
});
map.appendTo('#element');
```

INDEX.HTML

```

    }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body>
</html>
```

Setting color to the bubbles from the data source

The color for each bubble in the Maps can be set using the [colorValuePath](#) property of [bubbleSettings](#). The value for the [colorValuePath](#) property is the field name from the data source of the [bubbleSettings](#) which contains the color values.

INDEX.JS

```

var map = new ej.maps.Maps({
  layers: [{
    shapeData: world_map,
    shapeDataPath: 'name',
    shapePropertyPath: 'name',
    bubbleSettings: [{
      visible: true,
      minRadius: 20,
      colorValuePath: 'color',
```

```

        dataSource: [
            { name: 'India', population: '38332521', color: 'blue' },
            { name: 'New Zealand', population: '19651127', color:
'#c2d2d6' },
            { name: 'Pakistan', population: '3090416', color: '#09156d'
}
        ],
        maxRadius: 40,
        valuePath: 'population'
    }
}
});
map.appendTo('#element');

```

INDEX.HTML

```

<!DOCTYPE html>
<html lang="en">
<head>
    <title>EJ2 Maps</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">

        <div id="element"></div>
    </div>
    <script>
        var ele = document.getElementById('container');
        if (ele) {
            ele.style.visibility = "visible";
        }
    </script>
    <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Bubble sizing

The size of the bubbles is calculated from the values got from the [valuePath](#) property. The range for the radius of the bubbles can be modified using [minRadius](#) and [maxRadius](#) properties.

INDEX.JS

```

var map = new ej.maps.Maps({
    layers: [{
        shapeData: world_map,
        shapeDataPath: 'name',
    }

```

```

        shapePropertyPath: 'name',
        bubbleSettings: [{
            visible: true,
            minRadius: 5,
            dataSource: [
                { name: 'India', population: '38332521' },
                { name: 'New Zealand', population: '19651127' },
                { name: 'Pakistan', population: '3090416' }
            ],
            maxRadius: 80,
            valuePath: 'population'
        }]
    });
    map.appendTo('#element');

```

INDEX.HTML

```

<!DOCTYPE html>
<html lang="en">
<head>
    <title>EJ2 Maps</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

    <div id="container" style="height: 500px; width: 700px">
        <div id="element"></div>
    </div>
    <script>
        var ele = document.getElementById('container');
        if (ele) {
            ele.style.visibility = "visible";
        }
    </script>
    <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Multiple bubble groups

Multiple groups of bubbles can be added to the Maps using the [bubbleSettings](#) in which the properties of bubbles are added as an array. The customization for the bubbles can be done with the [bubbleSettings](#). In the following example, the gender-wise population ratio is demonstrated with two different bubble groups.

INDEX.JS

```

var map = new ej.maps.Maps({
  layers: [{
    shapeData: world_map,
    shapeDataPath: 'name',
    shapePropertyPath: 'name',
    bubbleSettings: [{
      visible: true,
      minRadius: 5,
      valuePath: "femaleRatio",
      colorValuePath: "femaleRatioColor",
      dataSource: [
        {
          country: "United States", femaleRatio: 50.50442726,
maleRatio: 49.49557274, femaleRatioColor: "green", maleRatioColor: "blue"
        },
        {
          country: "India", femaleRatio: 48.18032713, maleRatio:
51.81967287, femaleRatioColor: "blue", maleRatioColor: "#c2d2d6"
        },
        {
          country: "Oman", femaleRatio: 34.15597234, maleRatio:
65.84402766, femaleRatioColor: "#09156d", maleRatioColor: "orange"
        },
        {
          country: "United Arab Emirates", femaleRatio:
27.59638942, maleRatio: 72.40361058, femaleRatioColor: "#09156d",
maleRatioColor: "orange"
        }
      ],
      maxRadius: 20,
    },
    {
      visible: true,
      bubbleType: 'Circle',
      opacity: 0.4,
      minRadius: 15,
      valuePath: "maleRatio",
      colorValuePath: "maleRatioColor",

Enable tooltip for bubble

The tooltip for the bubbles can be enabled by setting the [visible](#) property of the [tooltipSettings](#) as **true**. The content for the tooltip can be set using the [valuePath](#) property in the [tooltipSettings](#) of the [bubbleSettings](#) where the value for the [valuePath](#) property is the field name from the data source of the [bubbleSettings](#). Also added any HTML element as the template in tooltip using the [template](#) property.

INDEX.JS

```

Legend in EJ2 JavaScript Maps control

A Legend is a key on a Maps that contains descriptions for swatches of symbols. It can be represented in various colors, shapes or other identifiers based on the data and provides valuable information for interpreting what the Maps are displaying. It explains what each symbol in the Maps represents. Legends are enabled by setting the [visible](#) property of [legendSettings](#) to **true**.

Positioning of the legend

The legend can be positioned in the following two ways:

- Absolute position.
- Dock position.

Absolute position

The legend of the Maps can be positioned using the [location](#) property in the [legendSettings](#), which is based on the margin values of the X and Y axes. For positioning the legend based on margins corresponding to a Maps, the [position](#) property is set as **Float**.

Dock position

Legends are positioned in the following locations within the container. The [position](#) property in [legendSettings](#) is used to set these options in Maps.

- Top
- Left
- Bottom
- Right

The above four positions can be aligned combination of **Near**, **Center** and **Far** using [alignment](#) property in [legendSettings](#) property. So, the legend can be aligned to 12 positions.

INDEX.JS

```
var map = new ej.maps.Maps({
  titleSettings: {
    text: 'USA Election Results - 2016'
  },
  layers: [
    {
      shapeData: world_map,
      dataSource: [
        { "Country": "China", "Membership": "Permanent" },
        { "Country": "France", "Membership": "Permanent" },
        { "Country": "Russia", "Membership": "Permanent" },
        { "Country": "Kazakhstan", "Membership": "Non-Permanent" },
        { "Country": "Poland", "Membership": "Non-Permanent" },
        { "Country": "Sweden", "Membership": "Non-Permanent" } ],
      shapePropertyPath: 'name',
      shapeDataPath: 'Country',
      shapeSettings: {
        colorValuePath: 'Membership',
        colorMapping: [
          { value: 'Permanent', color: '#D84444' },
          { value: 'Non-Permanent', color: '#316DB5' }
        ]
      }
    }
  ],
  legendSettings: {
    visible: true,
    position: 'Top',
    alignment: 'Near'
  }
});
```

```
map.appendTo('#element');
```

</html>
```

Legend mode

Legend had two types of mode. **Default** mode and **Interactive** mode.

Default mode

Default mode legends having symbols with legend labels, used to identify the shape or bubble or marker color. To enable this option by setting the [mode](#) property of [legendSettings](#) as **Default**.

Interactive mode

The legends can be made interactive with an arrow mark indicating the exact range color in the legend when the mouse hovers over the corresponding shapes. To enable this type of mode by setting the [mode](#) property of [legendSettings](#) as **Interactive**. The [invertedPointer](#) property is used to enable or disable the visibility of the inverted pointer in interactive legend in Maps.

INDEX.JS

```
var map = new ej.maps.Maps({
  titleSettings: {
    text: 'USA Election Results - 2016'
  },
  layers: [
    {
```

```

        shapeData: world_map,
        dataSource: [
            { "Country": "China", "Membership": "Permanent" },
            { "Country": "France", "Membership": "Permanent" },

        <div id="element"></div>
    </div>
    <script>
        var ele = document.getElementById('container');
        if (ele) {
            ele.style.visibility = "visible";
        }
    </script>
    <script src="index.js" type="text/javascript"></script>
</body>

```

```
</html>
```

Legend for shapes

Legend for shapes can be generated from color mapping types such as equal color mapping, range color mapping and desaturation color mapping. Refer to the below data source which demonstrates the permanent and non-permanent countries in the UN security council.

```
`ts
```

```
export var unCountries: object[] = [
  { Country: 'China', Membership: 'Permanent' },
  { Country: 'France', Membership: 'Permanent' },
  { Country: 'Russia', Membership: 'Permanent' },
  { Country: 'United Kingdom', Membership: 'Permanent' },
  { Country: 'United States', Membership: 'Permanent' },
  { Country: 'Bolivia', Membership: 'Non-Permanent' },
  { Country: 'Eq. Guinea', Membership: 'Non-Permanent' },
  { Country: 'Ethiopia', Membership: 'Non-Permanent' },
  { Country: "Côte d'Ivoire", Membership: 'Permanent' },
  { Country: 'Kazakhstan', Membership: 'Non-Permanent' },
  { Country: 'Kuwait', Membership: 'Non-Permanent' },
  { Country: 'Netherlands', Membership: 'Non-Permanent' },
  { Country: 'Peru', Membership: 'Non-Permanent' },
  { Country: 'Poland', Membership: 'Non-Permanent' },
  { Country: 'Sweden', Membership: 'Non-Permanent' },
];
```

The below code snippet demonstrate the equal color mapping legends for the shapes. To bind the given data source to the [dataSource](#) property of [layerSettings](#). Set the value of [shapePropertyPath](#) to **name** and [shapeDataPath](#) to **Country**. To enable equal color mapping set the [colorMapping](#) as an array in [shapeSettings](#). Finally, set the [visible](#) property of [legendSettings](#) as **true**. The [label](#) property in [colorMapping](#) property is used to set the text name for legend in Maps.

INDEX.JS

```
var map = new ej.maps.Maps({
  titleSettings: {
    text: 'USA Election Results - 2016'
  },
  layers: [
    {
      shapeData: world_map,
      dataSource: [
```

```

        { "Country": "China", "Membership": "Permanent" },
        { "Country": "France", "Membership": "Permanent" },
        { "Country": "Russia", "Membership": "Permanent" },
        { "Country": "Kazakhstan", "Membership": "Non-Permanent" },
        { "Country": "Poland", "Membership": "Non-Permanent" },
        { "Country": "Sweden", "Membership": "Non-Permanent" }
    ],
    shapePropertyPath: 'name',
    shapeDataPath: 'Country',
    shapeSettings: {
        colorValuePath: 'Membership',
        colorMapping: [
            { value: 'Permanent', color: '#D84444' },
            { value: 'Non-Permanent', color: '#316DB5' }
        ]
    }
},
legendSettings: {
    visible: true
}
});
map.appendTo('#element');

```

INDEX.HTML

```

Legend Shape

Maps supports the following types of legend shapes. The [shape](#) property in the [legendSettings](#) can be used to change the type of legend shapes.

- Circle
- Rectangle
- Triangle
- Diamond
- Cross
- Star
- HorizontalLine
- VerticalLine
- Pentagon
- InvertedTriangle

The shape of legends can be customized by using the [shapeWidth](#), [shapeHeight](#), [shapeBorder](#) and [shapePadding](#) properties.

Customization

The following properties are available in legend to customize the legend shape and legend text in Maps.

- [background](#) - To customize the background color of the Legend.
- [border](#) - To customize the color, width and opacity of the border for the Legend.
- [fill](#) - To apply the color for the Legend.
- [labelDisplayMode](#) - To customize the display mode for the Legend text.
- [labelPosition](#) - To customize the position of the Legend text.
- [orientation](#) - To customize the orientation of the Legend.
- [textStyle](#) - To customize the text style for Legend.
- [title](#) - To apply the title for the Legend .
- [titleStyle](#) - To customize the style of the title for the Legend.
- [height](#) - To customize the height of the Legend.
- [width](#) - To customize the width of the Legend.
- [opacity](#) - To apply the opacity to the Legend.

INDEX.JS

```
var map = new ej.maps.Maps({
  titleSettings: {
    text: 'USA Election Results - 2016'
  },
  layers: [
    {

="text/javascript"></script>

```

```
</head>
<body>
  <div id="container" style="height: 500px; width: 700px">
    <div id="element"></div>
  </div>
  <script>
    var ele = document.getElementById('container');
    if (ele) {
      ele.style.visibility = "visible";
    }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body>
</html>
```

Legend for items excluded from color mapping

The legend can be enabled for items excluded from the color mapping using the [color](#) property in [colorMapping](#) property. Refer to the **population_density** data which demonstrates the population density of some countries.

```
`ts
export var population_density = [
...
{
'code': 'AE',
'value': 90,
'name': 'United Arab Emirates',
'population': 8264070,
'density': 99
},
{
'code': 'GB',
'value': 257,
'name': 'United Kingdom',
'population': 62041708,
'density': 255
},
{
'code': 'US',
'value': 34,
'name': 'United States',
```

```

'population': 325020000,
'density': 33
}
...
];
`

```

The following example shows how to enable legend for items excluded from the color mapping. In the following example, color mapping is added for the ranges from 0 to 200. If there are any records in the data source that are outside of this range, the color mapping will not be applied. To apply the color for these excluded items, set the [color](#) property alone in the [colorMapping](#). To enable legend for these items, set the [visible](#) property of [legendSettings](#) to **true**.

INDEX.JS

```

var map = new ej.maps.Maps({
  legendSettings: {
    visible: true
  },
  layers: [{
    shapeData: world_map,
    shapeDataPath: 'name',
    shapePropertyPath: 'name',
    dataSource: Population_Density,
    shapeSettings: {
      colorValuePath: 'density',
      colorMapping: [
        {
          from: 0, to: 100, color: 'rgb(153,174,214)',
        },
        {
          from: 101, to: 200, color: 'rgb(115,143,199)',
        },
        {
          color: 'rgb(77,112,184)'
        },
      ],
    },
  ]
});
map.appendTo('#element');

```

INDEX.HTML

```

<!DOCTYPE html>
<html lang="en">
<head>
  <title>EJ2 Maps</title>
  <meta charset="utf-8">

  if (ele) {
    ele.style.visibility = "visible";
  }
</script>
<script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Hide desired legend items

Use the [showLegend](#) property in the [colorMapping](#) to show or hide the desired legend items in Maps. If the [showLegend](#) property is set to **false**, the legend item will be hidden. otherwise, it will be visible.

INDEX.JS

```

var map = new ej.maps.Maps({
  legendSettings:{
    visible: true,
  },
  layers: [{
    shapeData: world_map,
    shapeDataPath: 'name',
    shapePropertyPath: 'name',
    dataSource: Population_Density,
    shapeSettings: {
      colorValuePath: 'density',
      colorMapping: [
        {
          from: 0, to: 100, color: 'rgb(153,174,214)', showLegend:
true
        },
        {
          from: 101, to: 200, color: 'rgb(115,143,199)',
showLegend: false
        },
        {
          color: 'rgb(77,112,184)', showLegend: false
        }
      ]
    }
  }]
});
map.appendTo('#element');

```

Hide legend items based on data source value

Depending on the values provided in the data source, the legend items will be hidden or visible. Bind the field name that contains the visibility state in the data source to the [showLegendPath](#) property of the [legendSettings](#) to achieve this.

INDEX.JS

```
var map = new ej.maps.Maps({
  legendSettings:{
    visible:true,
    showLegendPath:'visibility'
  },
  layers: [
    {
      shapeData: world_map,
      dataSource: default_data,
      shapePropertyPath: 'continent',
      shapeDataPath: 'continent',
      shapeSettings: {
        colorValuePath: 'color'
      }
    }
  ]
});
```

```
map.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html>
<html lang="en">
<head>

    <div id="element"></div>
  </div>
  <script>
    var ele = document.getElementById('container');
    if (ele) {
      ele.style.visibility = "visible";
    }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body>
</html>
```

Bind legend item text from data source

To show the legend text based on values provided in the data source, use the [valuePath](#) property in the [legendSettings](#).

INDEX.JS

```
var map = new ej.maps.Maps({
  legendSettings: {
    visible: true,
    valuePath: 'continent'
  },
  layers: [{
    shapeData: world_map,
    shapeDataPath: 'continent',
    shapePropertyPath: 'continent',
    dataSource: default_data,
    shapeSettings: {
      colorValuePath: 'color'
    }
  }]
});
```

```
map.appendTo('#element');
```

INDEX.HTML

```

      ele.style.visibility = "visible";
    }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body>
</html>
```

Hide duplicate legend items

To hide the duplicate legend items in Maps, set the [removeDuplicateLegend](#) property to **true** in the [legendSettings](#).

INDEX.JS

```
var map = new ej.maps.Maps({
  legendSettings: {
    visible: true,
    valuePath: 'continent',
    removeDuplicateLegend: true
  },
  layers: [{
    shapeData: world_map,
    shapeDataPath: 'continent',
    shapePropertyPath: 'continent',
    dataSource: default_data,
    shapeSettings: {
      colorValuePath: 'color'
    }
  }]
});
```

```
});
map.appendTo('#element');
```

INDEX.HTML

```

</body>
</html>
```

Toggle option in legend

The toggle option has been provided for legend. If the legend can be toggled, the given color will be changed to the corresponding map shape item. To enable the toggle options in Legend, set the [enable](#) property of the [toggleLegendSettings](#) to **true**.

The following properties are available to customize the toggle option in legend.

- [applyShapeSettings](#) – To apply the [fill](#) property value to the shape of the Maps when it is set to **true**.
- [fill](#) – To apply the color to the shape of the Maps for which legend item is toggled.
- [opacity](#) – To customize the transparency for the shapes for which legend item is toggled.
- [border](#) – To customize the color, width and opacity of the border of the shapes in Maps.

INDEX.JS

```
var map = new ej.maps.Maps({
  legendSettings: {
    visible: true,
    toggleLegendSettings: {
```

```

        enable: true,
        applyShapeSettings: false,
        border: {
            color: 'green',
            width: 2
        }
    },
    layers: [{
        shapeData: world_map,
        shapeDataPath: 'name',
        shapePropertyPath: 'name',
        dataSource: Population_Density,
        shapeSettings: {
            colorValuePath: 'density',
            colorMapping: [
                {
                    from: 0, to: 100, color: 'rgb(153,174,214)',
                },
                {
                    from: 101, to: 200, color: 'rgb(115,143,199)',
                },
                {
                    color: 'rgb(77,112,184)'
                },
            ]
        }
    }]
});
map.appendTo('#element');

```

INDEX.HTML

```

Annotations in EJ2 JavaScript Maps control

<!-- markdownlint-disable MD013 -->

Annotations are used to mark the specific area of interest in the Maps with texts, shapes, or images. Any number of annotations can be added to the Maps component.

Annotation

By using the [content](#) property of [annotation](#), text content or id of an element or an HTML string can be specified to render a new HTML element in Maps.

<!-- markdownlint-disable MD036 -->

```

<script id='annotation' type='text/x-template'>
<div id='template'>
<img src='src/maps/images/flight.png'>
</div>
</script>

```

```

`ts
var maps = new ej.maps.Maps({
  annotations: [
    {
      content: '#annotation',
      x: '0%', y: '50%'
    }
  ],
  layers: [
    {
      shapeData: world_map,
    }
  ]
});
maps.appendTo('#element');

```

Annotation customization

Changing the z-index

The stack order of an annotation element can be changed using the [zIndex](#) property in the [annotation](#).

INDEX.JS

```

var map = new ej.maps.Maps({
  annotations: [{
    content: '<div id="first"><h1>Maps</h1></div>',
    x: '0%', y: '50%',
    zIndex: '-1'
  }],
  layers: [{
    shapeData: world_map
  }]
});
map.appendTo('#element');

```

INDEX.HTML

```

<!DOCTYPE html>
<html lang="en">
<head>
  <title>EJ2 Maps</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">

<body>
  <div id="container" style="height: 500px; width: 700px">
    <div id="element"></div>
  </div>
  <script>
    var ele = document.getElementById('container');
    if (ele) {
      ele.style.visibility = "visible";
    }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

<!-- markdownlint-disable MD036 -->

Positioning an Annotation

Annotations can be placed anywhere in the Maps by specifying pixel or percentage values to the [x](#) and [y](#) properties in the [annotation](#).

INDEX.JS

```

var map = new ej.maps.Maps({
  annotations: [{
    content: '<div id="first"><h1>Maps</h1></div>',
    x: '20%', y: '50%',
    zIndex: '-1'
  }],
  layers: [{
    shapeData: world_map
  }]
});
map.appendTo('#element');

```

INDEX.HTML

```

<!DOCTYPE html>

```

```

<html lang="en">
<head>
  <title>EJ2 Maps</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <script src="world-map.js"></script>
  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>
  <div id="container" style="height: 500px; width: 700px">
    <div id="element"></div>
  </div>
  <script>
    var ele = document.getElementById('container');
    if (ele) {
      ele.style.visibility = "visible";
    }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

<!-- markdownlint-disable MD036 -->

Alignment of an Annotation

Annotations can be aligned using the [horizontalAlignment](#) and [verticalAlignment](#) properties in the [annotation](#). The possible values can be **Center**, **Far**, **Near** and **None**.

INDEX.JS

```

var map = new ej.maps.Maps({
  annotations: [{
    content: '<div id="first"><h1>Maps</h1></div>',
    verticalAlignment: 'Center',
    horizontalAlignment: 'Center',
    x: '20%', y: '50%',
    zIndex: '-1'
  }],
  layers: [{
    shapeData: world_map
  }]
});
map.appendTo('#element');

```

INDEX.HTML

```

<!DOCTYPE html>
<html lang="en">
<head>
  <title>EJ2 Maps</title>

```

```

<meta charset="utf-8">
<meta name="viewport" content="width=device-width, initial-scale=1.0">

="text/javascript"></script>
</head>
<body>
  <div id="container" style="height: 500px; width: 700px">
    <div id="element"></div>
  </div>
  <script>
    var ele = document.getElementById('container');
    if (ele) {
      ele.style.visibility = "visible";
    }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Multiple Annotation

Multiple annotations can be added to the Maps using the [annotations](#) and customization for the annotations can be done with this property.

INDEX.JS

```

var map = new ej.maps.Maps({
  annotations: [{
    content: '<div id="first"><h1>Maps-Annotation</h1></div>',
    x: '50%', y: '0%',
    zIndex: '-1'
  },
  {
    content: '<div id="first"><h1>Maps</h1></div>',
    x: '20%', y: '50%',
    zIndex: '-1'
  }],
  layers: [{
    shapeData: world_map
  }]
});
map.appendTo('#element');

```

INDEX.HTML

```

Navigation line in EJ2 JavaScript Maps control

The navigation lines are used to denote the path between two locations. This feature can be used to draw flight or sea routes. Navigation lines are enabled by setting the [visible](#) property of the [navigationLineSettings](#) to **true**.

Customization

The following properties are available in [navigationLineSettings](#) to customize the navigation line of the Maps component.

- [color](#) - To apply the color for navigation lines in Maps.
- [dashArray](#) - To define the pattern of dashes and gaps that is applied to the outline of the navigation lines.
- [width](#) - To customize the width of the navigation lines.
- [angle](#) - To customize the angle of the navigation lines.
- [highlightSettings](#) - To customize the highlight settings of the navigation line.
- [selectionSettings](#) - To customize the selection settings of the navigation line.

INDEX.JS

```

var map = new ej.maps.Maps({
  layers: [{
    navigationLineSettings: [{
      visible: true,
      latitude: [40.7128, 36.7783],
      longitude: [-74.0060, -119.4179],
      color: 'black',
      angle: 90,
      width: 2,
      dashArray: '4'
    }
  ]
});

```

```

    }],
    shapeData: world_map,
  }]
});
map.appendTo('#element');
```

INDEX.HTML

```

</html>
```

Enabling the arrows

To enable the arrow in the navigation line, set the [showArrow](#) property of [arrowSettings](#) to **true**. The following properties are available in [arrowSettings](#) to customize the arrow of the navigation lines.

- [color](#) - To apply the color for arrow of the navigation line.
- [offset](#) - To customize the offset position of the arrow of the navigation line.
- [position](#) - To customize the position of the arrow in navigation line. The possible values can be **Start** and **End**.
- [size](#) - To customize the size of the arrow in pixels.

INDEX.JS

```

var map = new ej.maps.Maps({

User interactions in EJ2 JavaScript Maps control

Zooming, panning, single and double click, highlight and selection are all options that allow for effective interaction with Map elements.

Zooming

The zooming feature is used to zoom in and out of Maps to show in-depth information. It is controlled by the [zoomFactor](#) property of the [zoomSettings](#) of the Maps. The [zoomFactor](#) is increased or decrease dynamically based on zoom in and out interaction.

Enable Zooming

Zooming of Maps is enabled by setting the [enable](#) property of [zoomSettings](#) to **true**. To enable Zooming in Maps, the **Zoom** module must be injected into Maps using **Maps.Inject(Zoom)** method.

<!-- markdownlint-disable MD010 -->

Enable panning

To enable the panning feature, set the [enablePanning](#) property of [zoomSettings](#) to **true**.

```
`ts
var map = new ej.maps.Maps({
  zoomSettings: {
    enable: true,
    enablePanning:true
  },
  layers: [{
    shapeData: world_map,
  }]
});
map.appendTo('#element');
```

Various type of zooming

Zooming can be performed in following types:

Zooming toolbar

By default, the toolbar is rendered with **zoom-in**, **zoom-out**, and **reset** options when it is set to **true** in the [enable](#) property of [zoomSettings](#).

The following options are available in toolbar.

1. Zoom - Provides rectangular zoom support.
2. ZoomIn - Zooms in the Maps.
3. ZoomOut - Zooms out the Maps.
4. Pan - Switches to panning if rectangular zoom is activated.
5. Reset - Restores the Maps to the default view.

Refer the [API](#) links for Zooming.

```
`ts
var map = new ej.maps.Maps({
```

```
zoomSettings: {  
  enable: true,  
  buttonSettings: {  
    toolbarItems: ['Zoom', 'ZoomIn', 'ZoomOut', 'Pan', 'Reset']  
  }  
},  
layers: [{  
  shapeData: usa_map,  
}]  
});  
map.appendTo('#element');
```

Pinch zooming

To enable or disable the pinch zooming, use the [pinchZooming](#) property in [zoomSettings](#).

```
`ts
```

```
var map = new ej.maps.Maps({  
  zoomSettings: {  
    enable: true,  
    pinchZooming: true  
  },  
  layers: [{  
    shapeData: usa_map,  
  }]  
});  
map.appendTo('#element');
```

Single-click zooming

To enable or disable the single-click zooming, use the [zoomOnClick](#) property in [zoomSettings](#).

```
`ts
```

```
var map = new ej.maps.Maps({  
  zoomSettings: {  
    enable: true,  
    zoomOnClick: true  
  }  
});  
map.appendTo('#element');
```

```
},  
layers: [{  
  shapeData: usa_map,  
}]  
});  
map.appendTo('#element');  
`
```

Double-click zooming

To enable or disable the double-click zooming, use the [doubleClickZoom](#) property in [zoomSettings](#).

```
`ts  
var map = new ej.maps.Maps({  
  zoomSettings: {  
    enable: true,  
    doubleClickZoom: true  
  },  
  layers: [{  
    shapeData: usa_map,  
  }]  
});  
map.appendTo('#element');  
`
```

Mouse wheel zooming

To enable or disable mouse wheel zooming, use the [mouseWheelZoom](#) property in [zoomSettings](#).

```
`ts  
var map = new ej.maps.Maps({  
  zoomSettings: {  
    enable: true,  
    mouseWheelZoom: true  
  },  
  layers: [{  
    shapeData: usa_map,  
  }]  
});
```

```
map.appendTo('#element');  
`ts
```

Minimum and maximum zooming

The zooming range can be adjusted using the [minZoom](#) and [maxZoom](#) properties in [zoomSettings](#). The minZoom value is set to **1** by default, and the maxZoom value is set to **10**.

```
`ts  
var map = new ej.maps.Maps({  
  zoomSettings: {  
    enable: true,  
    minZoom: 2,  
    maxZoom: 12  
  },  
  layers: [{  
    shapeData: usa_map,  
  }]  
});  
map.appendTo('#element');  
`ts
```

Zooming with animation

To zoom in or zoom out the Maps with animation, use the [animationDuration](#) property in [layers](#).

```
`ts  
var map = new ej.maps.Maps({  
  zoomSettings: {  
    enable: true,  
  },  
  layers: [{  
    shapeData: usa_map,  
    animationDuration: 500  
  }]  
});  
map.appendTo('#element');  
`ts
```

Customizing the zoom toolbar

The zoom toolbar can be customized by using the [toolbarSettings](#) option in the [zoomSettings](#). The following properties can be used to customize the zoom toolbar.

- [backgroundColor](#) - It is used to customize the background color of the zoom toolbar.
- [borderOpacity](#) - It is used to customize the opacity of the border of the zoom toolbar.
- [borderWidth](#) - It is used to customize the thickness of the border of the zoom toolbar.
- [borderColor](#) - It is used to customize the color of the border of the zoom toolbar.
- [horizontalAlignment](#) - It is used to position the zoom toolbar in near, far, and center positions to customize its horizontal placement.
- [verticalAlignment](#) - It is used to position the zoom toolbar in near, far, and center positions to customize its vertical placement.
- [orientation](#) - It is used to change the orientation (horizontal/vertical) of the zoom toolbar.

INDEX.JS

```
var map = new ej.maps.Maps({
  zoomSettings: {
    enable: true,
    toolbarSettings: {
      orientation: 'Vertical',
      backgroundColor: 'pink',
      borderWidth: 3,
      borderColor: 'green',
      verticalAlignment: 'Near',
      buttonSettings: {
        toolbarItems: ['Zoom', 'ZoomIn', 'ZoomOut', 'Pan', 'Reset']
      }
    }
  },
  layers: [
    {
      shapeData: world_map,
      shapeSettings: {
        fill: '#C1DFF5'
      }
    }
  ]
});
map.appendTo('#element');
```

```

<!-- markdownlint-disable MD036 -->

Customizing the buttons in the zoom toolbar

The appearance of the buttons in the zoom toolbar can be customized by using the [buttonSettings](#) option in the [toolbarSettings](#) of the [zoomSettings](#) property. The following properties can be used to customize the zoom toolbar buttons.

- [fill](#) - It is used to set the background color of the buttons.
- [color](#) - It is used to customize the color of the icons inside the button.
- [borderOpacity](#) - It is used to set the opacity of the border of the zoom toolbar buttons.
- [borderWidth](#) - It is used to set the thickness of the border of the zoom toolbar buttons.
- [borderColor](#) - It is used to set the color of the border of the zoom toolbar buttons.
- [radius](#) - It is used to set the size of the button.
- [selectionColor](#) - It is used to set the color of the icons inside the button when selection is performed.
- [highlightColor](#) - It is used to change the color of the button when the mouse is hovered over it.
- [padding](#) - It is used to change the padding space between each button.
- [opacity](#) - It is used to change the opacity of the button.
- [toolbarItems](#) - It is used to change the items that should be displayed in the zoom toolbar. By default, zoom-in, zoom-out, and reset buttons will be available. Other options include selection zoom and panning.

INDEX.JS

```
var map = new ej.maps.Maps({
  zoomSettings: {
    enable: true,
    toolbarSettings: {
      buttonSettings: {
        fill: 'pink',
        padding: 10,
        toolbarItems: ['Zoom', 'ZoomIn', 'ZoomOut', 'Pan', 'Reset'],
        color: 'red',
        borderColor: 'green',
        radius: 35,
        selectionColor: '#d55e5e',
        highlightColor: '#5ed59a',
        opacity: 0.6,
      }
    }
  }
});
```

```

        borderWidth: 2
    }
}
},
layers: [
    {
        shapeData: world_map,
        shapeSettings: {
            fill: '#C1DFF5'
        }
    }
]
});
map.appendTo('#element');

```

Customizing the tooltip of the zoom toolbar

The appearance of the tooltip of the zoom toolbar can be customized by using the [tooltipSettings](#) option in the [toolbarSettings](#) of the [zoomSettings](#) property. The following properties are available to customize the zoom toolbar tooltip.

- [visible](#) - Enables or disables the tooltip of the zoom toolbar.

- [fill](#) - It is used to change the background color of the tooltip of the zoom toolbar.
- [borderOpacity](#) - It is used to change the opacity of the border of the zoom toolbar's tooltip.
- [borderWidth](#) - It is used to change the thickness of the border of the zoom toolbar's tooltip.
- [borderColor](#) - It is used to change the color of the border of the zoom toolbar's tooltip.
- [fontColor](#) - It is used to change the color of the text in the tooltip of the zoom toolbar.
- [fontFamily](#) - It is used to change the font family of the text in the tooltip of the zoom toolbar.
- [fontStyle](#) - It is used to change the font style of the text in the tooltip of the zoom toolbar.
- [fontWeight](#) - It is used to change the font weight of the text in the tooltip of the zoom toolbar.
- [fontSize](#) - It is used to change the size of the text in the tooltip of the zoom toolbar.
- [fontOpacity](#) - It is used to change the opacity of the text in the tooltip of the zoom toolbar.

INDEX.JS

```
var map = new ej.maps.Maps({
  zoomSettings: {
    enable: true,
    toolbarSettings: {
      tooltipSettings: {
        visible: true,
        borderWidth: 2,
        borderColor: 'green',
        fontColor: 'black',
        fill: 'violet',
        fontFamily: 'Times New Roman',
        fontWeight: 200,
        fontSize: '22px',

Selection

Each shape in the Maps can be selected and deselected during interaction with the shapes. Selection is enabled by setting the [enable](#) property of [selectionSettings](#) to **true**.

The following properties are available to customize the selection of Maps elements such as shapes, bubbles, markers and legends.

- [border](#) - To customize the color, width and opacity of the border of which element is selected in Maps.
- [fill](#) - Applies the color for the element that is selected.
- [opacity](#) - To customize the transparency for the element that is selected.
- [enableMultiSelect](#) - To enable or disable the selection for multiple shapes or markers or bubbles in the Maps.

INDEX.JS

```

var map = new ej.maps.Maps({
  layers: [
    {
      shapeData: world_map,
      dataSource: [{ "Country": "China", "Membership": "Permanent" },
        { "Country": "France", "Membership": "Permanent" },

Enable selection for polygons

When the [enable](#) property of [selectionSettings](#) is set to **true**, the polygon shapes can be selected via user interaction. The following properties are available in [selectionSettings](#) to customize the polygon shape when it is selected.

- [enableMultiSelect](#) - It is used to enable multiple selection of polygon shapes.
- [fill](#) - It is used to change the color of the selected polygon shape.
- [opacity](#) - It is used to change the opacity of the selected polygon shape.
- [border](#) - This property is used to change the color, width, and opacity of the border of the selected polygon shape.

The following example shows how to select the polygon shape in the geometry map.

INDEX.JS

```

var map = new ej.maps.Maps({
    layers: [
        {
            shapeData: world_map,
            polygonSettings: {

Public method for the shape selection

The [shapeSelection](#) method can be used to select each shape in the Maps.

LayerIndex, propertyName, country name, and selected value as a boolean state(true / false) are the input parameters for this method.

INDEX.JS

```
var map = new ej.maps.Maps({
  layers: [{
    shapeData: world_map,
    selectionSettings: {
      enable: true,
      fill: 'green',
      border: { color: 'white', width: 2}
    }
  }]
});
map.appendTo('#element');
document.getElementById('selection').onclick = () => {
  map.shapeSelection(0, "continent", "Asia", true);
};
document.getElementById('unselection').onclick = () => {
  map.shapeSelection(0, "continent", "Asia", false);
};
```

INDEX.HTML

</body></html>
```

Initial shape selection

The shape is initially selected using the [initialShapeSelection](#) property, and the values are mapped to the [shapePath](#) and [shapeValue](#).

`initialShapeSelection` is an Array property.

INDEX.JS

```
var map = new ej.maps.Maps({
  layers: [{
    shapeData: world_map,
    initialShapeSelection: [
      { shapePath: 'continent', shapeValue: 'Africa' },
      { shapePath: 'name', shapeValue: 'India' }
    ],
    selectionSettings: {
      enable: true,
      fill: 'green',
      border: { color: 'white', width: 2 }
    }
  ]
});
map.appendTo('#element');
```

INDEX.HTML

Highlight

Each shape in the Map can be highlighted during mouse hover on the Map elements such as shapes, bubbles, markers and legends. Highlight is enabled by setting the [enable](#) property of [highlightSettings](#) to **true**.

The following properties are available to customize the highlight of Map elements such as shapes, bubbles, markers and legends.

- [border](#) - To customize the color, width and opacity of the border of which element is highlighted in Maps.
- [fill](#) - Applies the color for the element that is highlighted.
- [opacity](#) - To customize the transparency for the element that is highlighted.

Hovering on the specific legend, the shapes which are bounded to the selected legend is also highlighted and vice versa.

INDEX.JS

```

var map = new ej.maps.Maps({
  layers: [

Enable highlight for polygons

The polygon shapes can be highlighted via user interaction if the [enable](#) property of [highlightSettings](#) is set to **true**. The following properties are available in [highlightSettings](#) to customize the polygon shape when it is highlighted.

- [fill](#) - It is used to change the color of the highlighted polygon shape.
- [opacity](#) - It is used to change the opacity of the highlighted polygon shape.
- [border](#) - This property is used to change the color, width, and opacity of the border of the highlighted polygon shape.

The following example shows how to highlight a polygon shape on a geometry map.

INDEX.JS

```
var map = new ej.maps.Maps({
  layers: [
    {
      shapeData: world_map,
      polygonSettings: {
        polygons: [
          {
            points: [

```

Tooltip

On mouse over or touch end event, the tooltip is used to get more information about the layer, bubble, or marker. It can be enabled separately for layer or bubble or marker by using the [visible](#) property of [tooltipSettings](#) as **true**. The [valuePath](#) property in the tooltip takes the field name that presents in data source and displays that value as tooltip text. The [tooltipDisplayMode](#) property is used to change the

display mode of the tooltip in Maps. Following display modes of tooltip are available in the Maps component. By default, [tooltipDisplayMode](#) is set to **MouseMove**.

INDEX.JS

```
var map = new ej.maps.Maps({
  layers: [{
    shapeData: world_map,
    tooltipSettings: {
      visible: true,
      valuePath: 'name'
    }
  }]
});
map.appendTo('#element');
```

</body>
</html>
```

Customization

The following properties are available in the [tooltipSettings](#) to customize the tooltip of the Maps component.

- [border](#) - To customize the color, width and opacity of the border of the tooltip in layers, markers, and bubbles of Maps.
- [fill](#) - Applies the color of the tooltip in layers, markers, and bubbles of Maps.

- [format](#) - To customize the format of the tooltip in layers, markers, and bubbles of Maps
- [textStyle](#) - To customize the style of the text in the tooltip for layers, markers, and bubbles of Maps.

INDEX.JS

```
var map = new ej.maps.Maps({
  tooltipRender: function (args) {
    if (!args.options.data) {
      args.cancel = true;
    }
  },
  layers: [{
    shapeData: world_map,

Tooltip template

The HTML element can be rendered in the tooltip of the Maps using the [template](#) property of the [tooltipSettings](#). In the following example, \${value1} and \${value2} are the place holders in the HTML element to display the value1 and value2 values of the corresponding shape.

INDEX.JS

```

var map = new ej.maps.Maps({
    tooltipRender(args) {
        if (!args.options['data']) {
            args.cancel = true;

```

```

    },
    legendSettings: {
        visible: true,
        mode: 'Interactive',
        position: 'Left',
        orientation: 'Vertical',
        height: '70%',
        width: '10'
    },
    layers: [{
        shapeData: world_map,
        shapePropertyPath: 'name',
        shapeDataPath: 'name',
        dataSource: tooltipData,
        tooltipSettings: {
            visible: true,
            valuePath: 'name',
            template: '#template'
        },
        shapeSettings: {
            fill: '#E5E5E5',
            colorMapping: [
                { color: '#b3daff', value: '1' },
                { color: '#80c1ff', value: '2' },
                { color: '#1a90ff', value: '3' },
                { color: '#005cb3', value: '7' }
            ],
            colorValuePath: 'value1'
        }
    ]
});
map.appendTo('#element');

```

Print in EJ2 JavaScript Maps control

Print

The rendered Maps can be printed directly from the browser by calling the [print](#) method. To use the print functionality in Maps, set the [allowPrint](#) property to **true**.

INDEX.JS

```
var maps = new ej.maps.Maps({
  allowPrint: true,
  layers: [
    {
      dataLabelSettings: {
        visible: true,
        labelPath: 'name',
        smartLabelMode: 'Trim'
      },
      shapeData: usa_map,
      shapeSettings: {
        autofill: true
      },
      tooltipSettings: {
        visible: true,
        valuePath: 'name'
      },
    },
  ],
});
maps.appendTo('#element');
document.getElementById('print').onclick = () => {
  maps.print();
};
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Maps</title>
  <meta charset="utf-8">

```

Export

Image Export

To use the image export functionality, set the [allowImageExport](#) property to **true**. The rendered Maps can be exported as an image using the [export](#) method. The method requires two parameters: image type and file name. The Maps can be exported as an image in the following formats.

- JPEG
- PNG
- SVG

INDEX.JS

```

var maps = new ej.maps.Maps({
    allowImageExport: true,
    layers: [
        {
            dataLabelSettings: {
                visible: true,
                labelPath: 'name',
                smartLabelMode: 'Trim'
            },
            shapeData: usa_map,
            shapeSettings: {
                autofill: true
            },
            tooltipSettings: {
                visible: true,
                valuePath: 'name'
            },
        }
    ]
});
maps.appendTo('#element');
document.getElementById('export').onclick = () => {
    maps.export('PNG', 'Maps');
};

```

Exporting Maps as base 64 string of the file

The image can be exported as base64 string for the JPEG and PNG formats. The rendered Maps can be exported to image as a base64 string using the [export](#) method. There are four parameters required: image type, file name, orientation of the exported PDF document which must be set as **null** for image export and finally **allowDownload** which should be set as **false** to return base64 string.

INDEX.JS

```

var maps = new ej.maps.Maps({
    allowImageExport: true,
    layers: [
        {
            dataLabelSettings: {
                visible: true,
                labelPath: 'name',
                smartLabelMode: 'Trim'
            },
            shapeData: usa_map,
            shapeSettings: {
                autofill: true
            },
            tooltipSettings: {
                visible: true,
                valuePath: 'name'
            }
        }
    ]
})

```

```

    });
    maps.appendTo('#element');
    document.getElementById('export').onclick = () => {
        maps.export('JPEG', 'Maps', null, false).then((data) => {
            document.getElementById('data').innerHTML = data;
        });
    };
};

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Maps</title>

```

PDF Export

To use the PDF export functionality, set the [allowPdfExport](#) property to **true**. The rendered Maps can be exported as PDF using the [export](#) method. The [export](#) method requires three parameters: file type, file name and orientation of the PDF document. The orientation setting is optional and **0** indicates portrait and **1** indicates landscape.

INDEX.JS

```

var maps = new ej.maps.Maps({
    allowPdfExport: true,
    layers: [
        {
            dataLabelSettings: {

```

```

        visible: true,
        labelPath: 'name',
        smartLabelMode: 'Trim'
    },
    shapeData: usa_map,
    shapeSettings: {
        autofill: true
    },
    tooltipSettings: {
        visible: true,
        valuePath: 'name'
    }
}
});
maps.appendTo('#element');
document.getElementById('export').onclick = () => {
    maps.export('PDF', 'Maps', 0);
};

```

INDEX.HTML

  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

The exporting of the Maps as base64 string is not supported for the PDF export.

<!-- markdownlint-disable MD010 -->

Export the tile Maps

The rendered Maps with providers such as OSM, Bing and Google static Maps can be exported using the [export](#) method. It supports the following export formats.

- JPEG
- PNG
- PDF

INDEX.JS

```
var maps = new ej.maps.Maps({
  allowImageExport: true,
  allowPdfExport: true,
  allowPrint: true,
  titleSettings:{
    text:'OSM'
  },
  layers: [
    {
      urlTemplate:"https://tile.openstreetmap.org/level/tileX/tileY.png"
    }
  ]
});
maps.appendTo('#container');
document.getElementById('export').onclick = () => {
  maps.export('PNG', 'Maps');
};
document.getElementById('print').onclick = () => {
  maps.print();
};
```

INDEX.HTML

```

Accessibility in EJ2 JavaScript Maps control

Maps has built-in accessibility features like screen reading, keyboard navigation, and WAI-ARIA attributes.

WAI-ARIA attributes

To meet accessibility standards, the Maps control follows to the [WAI-ARIA](#) patterns. In the Maps control, the following ARIA attributes are used:

Attributes	Purpose
---	---
role=region	It specifies the Maps areas that do not support interactive functions like selection and highlight.
role=button	It specifies the Maps areas where interactive functions such as selection and highlight are available.
aria-label	Provides an accessible name for Maps elements such as geometric map shapes, legend title, data labels, and so on. To learn more, see the next topic.

Screen reading in Maps

Accessibility in the Maps control ensures that all users, regardless of ability or disability, can use screen reading. The following Map elements will be read aloud using screen reading software, such as Narrator for Windows.

Elements	Description
---	---
Shapes in the layer	Reads the names of the geographical shapes (such as countries, states, and regions) that appear on the Maps.
Legend title	Reads the contents of the legend's title as specified in Maps.
Legend item label	Reads the label of a legend item in Maps.
Data label	Reads the label specified for the shapes in the Maps layer.
Annotation	Reads the content specified in the annotation.
Marker template	Reads the content provided in the marker template.
Tooltip template	Reads the content provided in the tooltip template.
Data label template	Reads the content provided in the data label template.

Keyboard Navigation

All the Maps actions can be controlled via keyboard keys. The applicable key combinations and their relative functionalities are listed below for the appropriate UI features available in the control.

Interaction Keys | Description

Tab | Moves to the next focusable element on the map, such as the legend or shape.

Shift + Tab | Moves to the previous focusable element on the map, such as the legend or shape.

+ | When zooming is enabled, zoom in operation can be performed.

- | When zooming is enabled, zoom out operation can be performed.

Left arrow | When zoomed in, the map can be scrolled to the left.

Right arrow | When zoomed in, the map can be scrolled to the right.

Up arrow | When zoomed in, the map can be scrolled upward.

Down arrow | When zoomed in, the map can be scrolled downward.

R | When zooming is enabled, reset operation can be performed.

Enter | The page can be navigated to the next and previous states in legend. Similarly, the selection can be made while navigating over the shape.

Ensuring accessibility

The Maps control's accessibility levels are ensured using an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Maps control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Maps control with accessibility tools.

Internationalization in EJ2 JavaScript Maps control

Maps provide support for internationalization for the below elements.

- Data label
- Tooltip

For more information about number and date formatter, refer to the [internationalization](#) section.

<!-- markdownlint-disable MD036 -->

Globalization

Globalization is the process of designing and developing a component that works in different cultures/locales. Internationalization library is used to globalize number, date, time values in Maps component using [format](#) property in the [Maps](#).

Numeric Format

The numeric formats such as currency, percentage and so on can be displayed in the tooltip and data labels of the Maps using the [format](#) property in the [Maps](#). In the below example, the tooltip is globalized to **German** culture. When setting the [useGroupingSeparator](#) property as **true**, the numeric text in the Maps separates with the comma separator.

```
`ts
import { Maps, MapsTooltip } from '@syncfusion/ej2-maps';
import { world_map } from './world-map.ts';
import { setCulture } from '@syncfusion/ej2-base';
setCulture('de');
Maps.Inject(MapsTooltip);
let maps: Maps = new Maps({
  format: 'c',
  useGroupingSeparator: true,
  layers: [
    {
      shapeData: world_map,
      dataSource: [
        { "Country": "China", "Membership": "Permanent", population: '38332521' },
        { "Country": "France", "Membership": "Permanent", population: '19651127' },
        { "Country": "Russia", "Membership": "Permanent", population: '3090416' },
        { "Country": "Kazakhstan", "Membership": "Non-Permanent", population: '1232521' },
        { "Country": "Poland", "Membership": "Non-Permanent", population: '90332521' },
        { "Country": "Sweden", "Membership": "Non-Permanent", population: '383521' }
      ],
      shapePropertyPath: 'name',
      shapeDataPath: 'Country',
      shapeSettings: {
        colorValuePath: 'Membership',
        colorMapping: [
          {
            value: 'Permanent', color: '#D84444'
          },
          {
```

```

value: 'Non-Permanent', color: '#316DB5'
}}
},
tooltipSettings: {
visible: true,
valuePath: 'population'
}
}
]
});
maps.appendTo('#element');
`

```

Localization in EJ2 JavaScript Maps control

The localization library allows localizing the default text content of the Maps control. The Maps control has the static text of some features such as tooltip of zoom toolbar, and that can be changed to any other culture(Arabic, Deutsch, French, etc) by defining the locale value and translation object.

<!-- markdownlint-disable MD033 -->

Locale key words	Text to display
Zoom	Zoom
ZoomIn	Zoom In
ZoomOut	Zoom Out
Reset	Reset
Pan	Pan

To load translation object in the application, use `load` function of **L10n** class. For more information about localization, refer [here](#).

INDEX.TS

```

import { Maps, Zoom } from '@syncfusion/ej2-maps';
import { world_map } from './world-map.ts';
import { L10n } from '@syncfusion/ej2-base';
Maps.Inject(Zoom);
L10n.load({
  'ar-AR': {
    'maps': {
      ZoomIn: 'تكبير',
      ZoomOut: 'تصغير',
      Zoom: 'زوم',
      Pan: 'مقللة',

```

```

        Reset: 'إعادة تعيين'
      },
    },
  });
let map: Maps = new Maps({
  zoomSettings: {
    enable: true,
    toolbars: ['ZoomIn', 'ZoomOut', 'Zoom', 'Pan', 'Reset' ]
  },
  locale: 'ar-AR',
  layers: [
    {
      shapeData: world_map
    }
  ]
});
map.appendTo('#element');

```

INDEX.HTML

```

Methods in EJ2 JavaScript Maps control

Methods

This section explains the methods used in the Maps control.

getMinMaxLatitudeLongitude

The `getMinMaxLatitudeLongitude` method returns the minimum and maximum latitude and longitude values of the Maps visible area. This method returns a [IMinMaxLatitudeLongitude](#) object that contains the Maps minimum and maximum latitude and longitude coordinates.

INDEX.JS

```
var maps = new ej.maps.Maps({
  zoomSettings: {
    enable: true,
    zoomFactor: 7
  },
  centerPosition: {
    latitude: 21.815447,
    longitude: 80.1932
  },
  layers: [
    {
      shapeData: world_map,
      markerSettings: [
        {
          visible: true,
          height: 25,
          width: 25,
          shape: 'Circle',
          animationDuration: 1500,
          dataSource: [
            {
              latitude: 22.572646,
              longitude: 88.363895
            },
            {
              latitude: 25.0700428,
              longitude: 67.2847875
            }
          ]
        }
      ]
    }
  ]
});
maps.appendTo('#element');
function formatKey(key) {
  if (key === 'minLatitude') {
    return 'Minimum Latitude';
  } else if (key === 'maxLatitude') {
    return 'Maximum Latitude';
  } else if (key === 'minLongitude') {
    return 'Minimum Longitude';
  } else if (key === 'maxLongitude') {
    return 'Maximum Longitude';
  }
}
document.getElementById('button').onclick = () => {
  var mapBoundCoordinates;
  mapBoundCoordinates = maps.getMinMaxLatitudeLongitude();
}
```

```

const displayDiv = document.getElementById('coordinatesDisplay');
displayDiv.innerHTML = '';
if (mapBoundCoordinates) {
    for (const key in mapBoundCoordinates) {
        if (Object.hasOwnProperty.call(mapBoundCoordinates, key)) {
            const p = document.createElement('p');
            const formattedKey = formatKey(key);
            p.textContent = `${formattedKey}:`;
            displayDiv.appendChild(p);
        }
    }
} else {
    displayDiv.textContent = 'No coordinates available';
}
};

```

Ej1 api migration in EJ2 JavaScript Maps control

This article describes the API migration process of Maps component from Essential JS 1 to Essential JS 2.

Size Customization

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Height | Not Applicable | **Property:** *height*
var maps = new ej.maps.Maps({
height : '300px' }); maps.appendTo('#container');

| Width | Not Applicable | **Property:** *width*
var maps = new ej.maps.Maps({
width : '600px' }); maps.appendTo('#container');

Title and Subtitle Customization

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Title Text | Not Applicable | **Property:** *title.text*
var maps = new ej.maps.Maps({
titleSettings:{ text : 'Members of the UN Security Council' } }); maps.appendTo('#container');

| Subtitle Text | Not Applicable | **Property:** *title.subtitle.text*
var maps = new ej.maps.Maps({
titleSettings:{ subtitleSettings:{ text : 'In 2017' } } }); maps.appendTo('#container');

| Title Alignment | Not Applicable | **Property:** *title.alignment*
var maps = new ej.maps.Maps({
titleSettings:{ alignment : 'Center' } }); maps.appendTo('#container');

| Subtitle Alignment | Not Applicable | **Property:** *title.subtitle.alignment*
var maps = new ej.maps.Maps({
titleSettings:{ subtitleSettings:{ alignment : 'Center' } } }); maps.appendTo('#container');

<!-- markdownlint-disable MD034 -->

Layer Customization

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Type | Not Applicable | **Property:** *layers.type*
var maps = new ej.maps.Maps({
layers:[{ type:'Layer' }] }); maps.appendTo('#container');

| Layer Type | **Property:** *layers.layerType*
\$("#container").ejMap({
layers:[{ layerType:'geometry' }] }); | **Property:** *layers.layerType*
var maps = new ej.maps.Maps({
layers:[{ layerType:'Geometry' }] }); maps.appendTo('#container');

| Visible | Not Applicable | **Property:** *layers.visible*
var maps = new ej.maps.Maps({
layers:[{ visible:true }] }); maps.appendTo('#container');

| Bing Map Type | **Property:** *layers.bingMapType*
\$("#container").ejMap({
layers:[{ bingMapType:'aerial' }] }); | **Property:** *layers.bingMapType*
var maps = new ej.maps.Maps({
layers:[{ bingMapType:'Aerial' }] }); maps.appendTo('#container');

| Bing Map Key | **Property:** *layers.key*
\$("#container").ejMap({
layers:[{ key:'' }] }); | **Property:** *layers.key*
var maps = new ej.maps.Maps({
layers:[{ key:'' }] }); maps.appendTo('#container');

| URL Template | **Property:** *layers.urlTemplate*
\$("#container").ejMap({
layers:[{ urlTemplate:'http://a.tile.openstreetmap.org/level/tileX/tileY.png' }] }); | **Property:** *layers.urlTemplate*
var maps = new ej.maps.Maps({
layers:[{

```
urlTemplate:'http://a.tile.openstreetmap.org/level/tileX/tileY.png' }} <br/> }}; <br/>

 });
 maps.appendTo('#container') |

| Angle | Not Applicable | **Property:** *layers.navigationLineSettings.angle*

 var maps = new ej.maps.Maps({
 layers:[{ navigationLineSettings:{ angle:180 }}]
 });
 maps.appendTo('#container') |

| Arrow Position | Not Applicable | **Property:** *layers.navigationLineSettings.arrow.position*

 var maps = new ej.maps.Maps({
 layers:[{ navigationLineSettings:{ arrow:{ position:"start" }}]
 });
 maps.appendTo('#container') |

| Show Arrow | Not Applicable | **Property:** *layers.navigationLineSettings.arrow.showArrow*

 var maps = new ej.maps.Maps({
 layers:[{ navigationLineSettings:{ arrow:{ showArrow:true }}]
 });
 maps.appendTo('#container') |

| Arrow size | Not Applicable | **Property:** *layers.navigationLineSettings.arrow.size*

 var maps = new ej.maps.Maps({
 layers:[{ navigationLineSettings:{ arrow:{ size:2 }}]
 });
 maps.appendTo('#container') |

| Arrow Color | Not Applicable | **Property:** *layers.navigationLineSettings.arrow.color*

 var maps = new ej.maps.Maps({
 layers:[{ navigationLineSettings:{ arrow:{ color:'red' }}]
 });
 maps.appendTo('#container') |

| Arrow Offset | Not Applicable | **Property:** *layers.navigationLineSettings.arrow.offSet*
 var maps = new ej.maps.Maps({ layers: [{ navigationLineSettings: { arrow: { offSet: 10 } } }] });
 maps.appendTo('#container') |

Tooltip Customization

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Tooltip Enable | **Property:** *layers.showTooltip*
 \$("#container").ejMap({ layers: { layers: { showTooltip: true } } }); | **Property:** *layers.tooltipSettings.visible*
 var maps = new ej.maps.Maps({ layers: { tooltipSettings: { visible: true } } });
 maps.appendTo('#container') |

| Tooltip Template | **Property:** *layers.tooltipTemplate*
 \$("#container").ejMap({ layers: { layers: { tooltipTemplate: "Template" } } }); | **Property:** *layers.tooltipSettings.visible*
 var maps = new ej.maps.Maps({ layers: { tooltipSettings: { visible: true } } });
 maps.appendTo('#container') |

| Value Path | Not Applicable | **Property:** *layers.tooltipSettings.valuePath*
 var maps = new ej.maps.Maps({ layers: { tooltipSettings: { valuePath: 'Population' } } });
 maps.appendTo('#container') |

| Format | Not Applicable | **Property:** *layers.tooltipSettings.format*
 var maps = new ej.maps.Maps({ layers: { tooltipSettings: { format: '\${State}
\${Population}' } } });
 maps.appendTo('#container') |

| Border Color | Not Applicable | **Property:** *layers.tooltipSettings.border.color*
 var maps = new ej.maps.Maps({ layers: { tooltipSettings: { border: { color: 'red' } } } });
 maps.appendTo('#container') |

| Border Width | Not Applicable | **Property:** *layers.tooltipSettings.border.width*
 var maps = new ej.maps.Maps({ layers: { tooltipSettings: { border: { width: " " } } } });
 maps.appendTo('#container') |

| Text Style | Not Applicable | **Property:** *layers.tooltipSettings.textStyle*
 var maps = new ej.maps.Maps({ layers: { tooltipSettings: { textStyle: { size: '15px', color: 'red', fontFamily: 'arial', fontWeight: 'bold', fontStyle: 'normal', opacity: 0.8 } } } });
 maps.appendTo('#container') |

Annotation Cutomization

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Content | Not Applicable | **Property:** *legendSettings.annotations.content*
 var maps = new ej.maps.Maps({ annotations: { content: '<div>USA Population 2018</div>' } });
 maps.appendTo('#container') |

| Location X | Not Applicable | **Property:** *legendSettings.annotations.x*
 var maps = new ej.maps.Maps({ annotations: { x: '250px' } });
 maps.appendTo('#container') |

| Location Y | Not Applicable | **Property:** *legendSettings.annotations.y*
 var maps = new ej.maps.Maps({ annotations: { y: '150px' } });
 maps.appendTo('#container') |

| Vertical Alignment | Not Applicable | **Property:** *legendSettings.annotations.verticalAlignment*
legendSettings.annotations.verticalAlignment
 var maps = new ej.maps.Maps({
 annotations: { verticalAlignment:'Center' }
 }); maps.appendTo('#container') |

| Horizontal Alignment | Not Applicable | **Property:** *legendSettings.annotations.horizontalAlignment*
legendSettings.annotations.horizontalAlignment
 var maps = new ej.maps.Maps({
 annotations: { horizontalAlignment:'Center' }
 }); maps.appendTo('#container') |

| Zindex | Not Applicable | **Property:** *legendSettings.annotations.zIndex*
legendSettings.annotations.zIndex
 var maps = new ej.maps.Maps({
 annotations: { zIndex:'-1' }
 }); maps.appendTo('#container') |

Maps Other Properties Customization

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Projection Type | Not Applicable | **Property:** *projectionType*
projectionType
 var maps = new ej.maps.Maps({
 projectionType: 'Mercator'
 }); maps.appendTo('#container') |

| Background | **Property:** *background*
background
 \$("#container").ejMap({
 background:'red'
 }); | **Property:** *background*
background
 var maps = new ej.maps.Maps({
 background: 'red'
 }); maps.appendTo('#container') |

| Enable Group Separator | **Property:** *enableGroupSeparator*
enableGroupSeparator
 \$("#container").ejMap({
 enableGroupSeparator:true
 }); | **Property:** *useGroupingSeparator*
useGroupingSeparator
 var maps = new ej.maps.Maps({
 useGroupingSeparator: true
 }); maps.appendTo('#container') |

| Base Layer Index | **Property:** *baseMapIndex*
baseMapIndex
 \$("#container").ejMap({
 baseMapIndex:0
 }); | **Property:** *baseLayerIndex*
baseLayerIndex
 var maps = new ej.maps.Maps({
 baseLayerIndex: 0
 }); maps.appendTo('#container') |

| locale | **Property:** *locale*
locale
 \$("#container").ejMap({
 locale:'en-us'
 }); | Not Applicable |

| Responsive | **Property:** *isResponsive*
isResponsive
 \$("#container").ejMap({
 isResponsive:true
 }); | Not Applicable |

| Enable Pan | **Property:** *enablePan*
enablePan
 \$("#container").ejMap({
 enablePan:true
 }); | Not Applicable |

| Enable Navigation | **Property:** *navigationControl.enableNavigation*
navigationControl.enableNavigation
 \$("#container").ejMap({
 navigationControl:{ enableNavigation:true }
 }); | Not Applicable |

| Navigation Orientation | **Property:** *navigationControl.orientation*
navigationControl.orientation
 \$("#container").ejMap({
 navigationControl:{ orientation:'vertical' }
 }); | Not Applicable |

| Navigation Dock Position | **Property:** *navigationControl.dockPosition*
navigationControl.dockPosition
 \$("#container").ejMap({
 navigationControl:{ dockPosition:'centerleft' }
 }); | Not Applicable |

| Navigation Absolute Position | **Property:** *navigationControl.absolutePosition*
navigationControl.absolutePosition
 \$("#container").ejMap({
 navigationControl:{ absolutePosition:{ x: 100, y : 100 } }
 }); | Not Applicable |

| Dragging Selection | **Property:** *draggingOnSelection*
draggingOnSelection
 \$("#container").ejMap({
 draggingOnSelection : true
 }); | Not Applicable |

| Resize | **Property:** *enableResize*
 \$("#container").ejMap({ enableResize : true
 }); | Not Applicable |

| Enable Animation | **Property:** *enableAnimation*
 \$("#container").ejMap({ enableAnimation : true
 }); | Not Applicable |

| Enable Layer Animation | **Property:** *enableLayerChangeAnimation*
 \$("#container").ejMap({ enableLayerChangeAnimation : true
 }); | Not Applicable |

| Center Position | **Property:** *centerPosition*
 \$("#container").ejMap({ centerPosition:[90.52734374999999,30.41078179084589]
 }); | **Property:** *centerPosition*
 var maps = new ej.maps.Maps({ centerPosition:{ latitude:
 30.41078179084589,longitude: 90.52734374999999 }
 }); maps.appendTo('#container') |

Events

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Shape Selected | **Property:** *shapeSelected*
 \$("#container").ejMap({ shapeSelected:'MapShapeSelected'
 }); | **Property:** *shapeSelected*
 var maps = new ej.maps.Maps({ shapeSelected:'MapShapeSelected'
 }); maps.appendTo('#container') |

| Marker Selected | **Property:** *markerSelected*
 \$("#container").ejMap({ markerSelected:'MapMarkerSelected'
 }); | **Property:** *markerClick*
 var maps = new ej.maps.Maps({ markerClick:'MapMarkerSelected'
 }); maps.appendTo('#container') |

| Marker Move | **Property:** *markerEnter*
 \$("#container").ejMap({ markerEnter:'MapMarkerMove'
 }); | **Property:** *markerMouseMove*
 var maps = new ej.maps.Maps({ markerMouseMove:'MapMarkerMove'
 }); maps.appendTo('#container') |

| Marker Leave | **Property:** *markerLeave*
 \$("#container").ejMap({ markerLeave:'MapMarkerLeave'
 }); | Not Applicable |

| Legend Item Rendering | **Property:** *legendItemRendering*
 \$("#container").ejMap({ legendItemRendering:'MapLegendItemRendering'
 }); | Not Applicable |

| Display Text Rendering | **Property:** *displayTextRendering*
 \$("#container").ejMap({ displayTextRendering:'MapDisplayTextRendering'
 }); | **Property:** *dataLabelRendering*
 var maps = new ej.maps.Maps({ dataLabelRendering:'MapDataLabelRendering'
 }); maps.appendTo('#container') |

| Legend Item Click | **Property:** *legendItemClick*
 \$("#container").ejMap({ legendItemClick:'MapLegendItemClick'
 }); | Not Applicable |

| Bubble Rendering | **Property:** *bubbleRendering*
 \$("#container").ejMap({ bubbleRendering:'MapBubbleRendering'
 }); | **Property:** *bubbleRendering*
 var maps = new ej.maps.Maps({ bubbleRendering:'MapBubbleRendering'
 }); maps.appendTo('#container') |

| Shape Rendering | **Property:** *shapeRendering*
 \$("#container").ejMap({ shapeRendering:'MapShapeRendering'
 }); | **Property:** *shapeRendering*
 var maps = new

```

 });
 maps.appendTo('#container') |

| Animation Complete | Not Applicable | **Property:** *animationComplete*

 var maps = new ej.maps.Maps({
 animationComplete:'MapAnimationComplete'
 });
 maps.appendTo('#container') |

How To

Annotation in EJ2 JavaScript Maps control

Annotations are used to mark the specific area of interest in the Maps with texts, shapes, or images. Any number of annotations can be added to the Maps component.

Initialize the Maps control with annotation option, text content or ID of an HTML element or an HTML string can be specified to render a new element that needs to be displayed in the Maps by using the [content](#) property. To specify the content position with [x](#) and [y](#) properties as mentioned in the following example.

INDEX.TS

```
import { Africa_Continent } from './Africa_Continent.ts';
import { Maps, Annotations } from '@syncfusion/ej2-maps';
Maps.Inject(Annotations);
// initialize Maps component
let map: Maps = new Maps({
  layers: [
    {
      shapeData: Africa_Continent,
      shapeSettings: {
        fill: 'url(#grad1)'
      }
    }
  ],
  annotations: [
    {
      content: '#maps-annotation', // To insert the text content
      x: '0%', y: '70%'
    },
    {
```

```

        content: '#compass-maps', // To insert the image
        x: '80%', y: '5%'
    }
}
}, '#element');

```

Custom path in EJ2 JavaScript Maps control

Maps control can be customized as the desired layout using the custom path map feature. Here, the Maps control has been showcased with normal geometry type shapes to represent the bus seat selection layout. Please refer to the following example to render the bus seat selection.

<!-- markdownlint-disable MD031 -->

INDEX.TS

```
import { seat } from './seat.ts';
import { Maps, Selection } from '@syncfusion/ej2-maps';
Maps.Inject(Selection);
// initialize Maps component
let map: Maps = new Maps({
    layers: [
        {
            geometryType: 'Normal',
            shapeData: seat,
            selectionSettings: {
                enable: true,
                opacity: 1,
                enableMultiSelect: true
            }
        }
    ],
    height: '400'
}, '#container');
```

INDEX.HTML

```

</div>
</div>

```

Drilldown in EJ2 JavaScript Maps control

By clicking a continent, all the countries available in that continent can be viewed using the drill-down feature. For example, the countries in the **Africa** continent have been showcased here. To showcase all the countries in **Africa** continent by clicking the [shapeSelected](#) event as mentioned in the following example.

<!-- markdownlint-disable MD031 -->

INDEX.TS

```

import { world_map } from './world-map.ts';
import { Africa_Continent } from './Africa_Continent.ts';
import { default_data } from './data.ts';

Marker type in EJ2 JavaScript Maps control

Add different types of markers

Different marker objects can be added to the Maps component using the marker settings. To update different marker settings in Maps, please follow the given steps:

```
<!-- markdownlint-disable MD034 -->
```

Step 1:

Initialize the Maps control with marker settings. Here, a marker has been added with specified latitude and longitude of California by using the [dataSource](#) property. To customize the shape of the marker using the [shape](#) property and change the border color and width of the marker using the [border](#) property as mentioned in the following example.

INDEX.TS

```
import { world_map } from './world-map.ts';
import { Maps, Marker, MarkerSettings } from '@syncfusion/ej2-maps';
// Initialize Map component.
let map: Maps = new Maps({
  // Initializing Map with Marker settings.
  layers: [
    {
      shapeData: world_map,
      markerSettings: [
        {
          dataSource: [
            { latitude: 40.7424509, longitude: -74.0081468, city:
'New York' }
          ],
          visible: true,
          shape: 'Circle',
          fill: 'white',
          width: 3,
          animationDuration: 0,
          border: {width: 2, color: '#333'}
        }
      ]
    }
  ]
});
map.appendTo('#element'); // render initialized Map.
```

INDEX.HTML

```
<!DOCTYPE html>
<html lang="en">
<head>
  <title>EJ2 Maps</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <script src="world-map.js"></script>
  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>
  <div id="container" style="height: 500px; width: 700px">
    <div id="element"></div>
```

```

</div>
<script>
  var ele = document.getElementById('container');
  if (ele) {
    ele.style.visibility = "visible";
  }
</script>
<script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Step 2:

Customize the above option for n number of markers as mentioned in the following example.

INDEX.TS

```

import { world_map } from './world-map.ts';
import { Maps, Marker, MarkerSettings } from '@syncfusion/ej2-maps';
Maps.Inject(Marker);
// initialize Maps component
let map: Maps = new Maps({
  layers: [
    {
      shapeData: world_map,
      markerSettings: [
        {
          dataSource: [
            { latitude: 37.6276571, longitude: -122.4276688,
city: 'San Bruno' },
          ],
          visible: true,
          shape: 'Circle',
          fill: 'white',
          width: 3,
          animationDuration: 0,
          border: { width: 2, color: '#333' }
        },
        {
          dataSource: [
            { latitude: 33.5302186, longitude: -117.7418381,
city: 'Laguna Niguel' },
          ],
          visible: true,
          shape: 'Rectangle',
          fill: 'yellow',
          width: 15,
          height: 4,
          animationDuration: 0,
          border: { width: 2, color: '#333' }
        },
        {
          dataSource: [
            { latitude: 40.7424509, longitude: -74.0081468,
city: 'New York' }
          ],
          visible: true,

```

```

        shape: 'Diamond',
        fill: 'white',
        width: 10,
        height: 10,
        animationDuration: 0,
        border: {width: 2, color: 'blue'}
      }
    ]
  }
}
});
map.appendTo('#element'); // render initialized Map.

```

INDEX.HTML

```

Multiple layer in EJ2 JavaScript Maps control

The multilayer support allows loading multiple shape files in a single container and enables Maps to display more information. The shape layer is the main layer of the Maps. Multiple layers can be added in a shape layer as **SubLayer** using the [type](#) property.

INDEX.TS

```

import { usa_map } from './usa.ts';
import { california } from './california.ts';
import { texas } from './texas.ts';
import { Maps } from '@syncfusion/ej2-maps';

```

```
// initialize Maps component
let map: Maps = new Maps({

Navigation line in EJ2 JavaScript Maps control

To navigate a particular country by setting the center position zooming using the [centerPosition](#) and [zoomFactor](#) property as demonstrated in the following sample. The center position is used to configure the zoom level of maps, and zoom factor is used to specify the center position where the map should be displayed.

To navigate to a particular country, follow the given steps:

Step 1:

Initialize the maps and add country list for drop-down elements in the load event.

INDEX.TS

```

import { Maps, ILoadEventArgs, Zoom } from '@syncfusion/ej2-maps';
import { world_map } from './world-map.ts';
import { latLongPoints } from './latLongPoints.ts';
Maps.Inject(Zoom);
// initialize Maps component
let map: Maps = new Maps(
  {
    zoomSettings: {
      enable: true,
      zoomOnClick: true
    },
    layers: [
      {
        animationDuration: 1000,
        shapeData: world_map,
        dataSource: latLongPoints,
        shapePropertyPath: 'name',
        shapeDataPath: 'name',
        selectionSettings: {
          enable: true,
          fill: 'red'
        },
        shapeSettings: {
          autofill: true,
          palette: [
            '#4A3825', '#736F3D', '#F2DABD', '#BF9D7E',

MaskedTextBox

Mask configuration in EJ2 JavaScript Maskedtextbox control

The mask is a combination of standard and custom mask elements that validates the user input based on its behavior.

When the mask value is empty, the MaskedTextBox behaves as an input element with text type.

Standard mask elements

The following table shows the list of mask elements and its behavior based on [MSDN](#) standard.

The mask can be formed by combining any one or more of these mask elements.

Mask Element	Description
-----	-----
0	Digit required. This element will accept any single digit from 0 to 9.
9	Digit or space, optional.
#	Digit or space, optional, Plus(+) and minus(-) signs are allowed.
L	Letter required. It will accept letters a-z and A-Z.
?	Letter or space, optional.
&	Requires a character.
C	Character or space, optional.
A	Alphanumeric (A-Za-z0-9) required.
a	Alphanumeric (A-Za-z0-9) or space, optional.
<	Shift down. Converts all characters to lower case.

- | > | Shift up. Converts all characters to upper case. |
- | | | Disable a previous shift up or shift down. |
- | \\\ | Escapes a mask character, turning it into a literal. |
- | All other characters | Literals. All non-mask elements (literals) will appear as themselves within MaskedTextBox. |

The following example demonstrates the usage of standard mask elements.

INDEX.TS

```
import { MaskedTextBox } from '@syncfusion/ej2-inputs';
// initializes the MaskedTextBox component
let mask1: MaskedTextBox = new MaskedTextBox({
    // sets mask with the mask element '#' which accepts any single
    digit from '0' to '9',
    // space, + and - signs
    mask: '#####',
    placeholder: 'Mask ##### (ex: 012+-)',
    floatLabelType: 'Always'
});
mask1.appendTo('#mask1');
let mask2: MaskedTextBox = new MaskedTextBox({
    // sets mask format with the mask element 'L' which allows only
    alphabets('A-Z and a-z')
    mask: 'LLLLLL',
    placeholder: 'Mask LLLLLL (ex: Sample)',
    floatLabelType: 'Always'
});
mask2.appendTo('#mask2');
let mask3: MaskedTextBox = new MaskedTextBox({
    // sets mask format with the mask element '&' which allows
    `alphabets`, `numbers`
    // and `special characters`
    mask: '#####',
    placeholder: 'Mask ##### (ex: A12@#)',
    floatLabelType: 'Always'
});
mask3.appendTo('#mask3');
let mask4: MaskedTextBox = new MaskedTextBox({
    // sets mask format with the mask element `>` which converts all
    characters that follow
    // to upper case and `<` which converts all characters that follow
    to lower case
    mask: '>LLL<LLL',
    placeholder: 'Mask >LLL<LL (ex: SAMple)',
    floatLabelType: 'Always'
});
mask4.appendTo('#mask4');
let mask5: MaskedTextBox = new MaskedTextBox({
    // sets mask format with the mask element '\\' which turns mask
    element `A` into
    // a literal and it displays the alphabet `A`
    mask: '\\A999',
    placeholder: 'Mask \\A999 (ex: A321)',
    floatLabelType: 'Always'
});
```

```
});
mask5.appendTo('#mask5');
```

        width: 240px;
    }
}

```

Custom mask elements

Other than the above standard mask elements, the mask can be configured with the custom characters or regular expression to define a custom behavior.

Custom characters

You can define any of the non-mask element as the mask element and its behavior through the [customCharacters](#) property.

In the following example, non-mask element **P** accepts the values **P, A, p, a**, and **M** accepts the values **M, m** as mentioned in the custom characters collection.

INDEX.TS

```

import { MaskedTextBox } from '@syncfusion/ej2-inputs';
// initializes the MaskedTextBox component
let mask: MaskedTextBox = new MaskedTextBox({
    // sets custom characters collection for non-mask elements 'P' and 'M'
    customCharacters: {
        P: 'P,A,a,p',
        M: 'M,m'
    },
    // sets mask format to the MaskedTextBox
    mask: '00:00 >PM',
    placeholder: 'Time (ex: 10:00 PM, 10:00 AM)',
    floatLabelType: 'Always'
});
mask.appendTo('#mask');

```

    color: #008cff;
    font-family: 'Helvetica Neue', 'calibiri';
    font-size: 14px;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.wrap {
    margin: 0 auto;
    width: 240px;
}
.label {
    font-family: 'Helvetica Neue', 'Helvetica', 'Arial', 'sans-serif';
    font-size: 14px;
}

```

Regular expression

Instead of the mask element, you can define your own regular expression to validate the input of a particular input place. The regular expressions should be wrapped by the square brackets (e.g., [Regex]).

In the following example, regular expression has been set for each input places.

INDEX.TS

```
import { MaskedTextBox } from '@syncfusion/ej2-inputs';  
// Render the Masked Textbox  
let mask: MaskedTextBox = new MaskedTextBox({  
  placeholder: 'IP Address (ex: 212.212.111.222) ',  
  floatLabelType: 'Always',  
  mask: '[0-2][0-9][0-9].[0-2][0-9][0-9].[0-2][0-9][0-9].[0-2][0-9][0-9]',  
});  
mask.appendTo('#mask');
```

  top: 45%;
  width: 30%;
}
.wrap {
  margin: 0 auto;
  width: 240px;
}
```

Prompt character

The Prompt character is a prompting symbol in the MaskedTextBox for the mask elements. The symbol is used to show the input positions in the MaskedTextBox. You can customize the prompt character of MaskedTextBox by using the [promptChar](#) property.

The following example demonstrates the MaskedTextBox with customized prompt character as `*`.

INDEX.TS

```
import { MaskedTextBox } from '@syncfusion/ej2-inputs';
// initializes the MaskedTextBox component
let mask: MaskedTextBox = new MaskedTextBox({
  // sets the prompting symbol to the MaskedTextBox
  promptChar: "#",
  // sets mask format to the MaskedTextBox
  mask: '999-999-9999'
});
mask.appendTo('#mask');
```

Accessibility in EJ2 JavaScript Maskedtextbox control

The Maskedtextbox component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Maskedtextbox component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) | |

| [Section 508 Support](#) | |

| [Screen Reader Support](#) | |

| [Right-To-Left Support](#) | |

| [Color Contrast](#) | |

| [Mobile Device Support](#) | |

| [Keyboard Navigation Support](#) | |

| [Accessibility Checker Validation](#) | |

| [Axe-core Accessibility Validation](#) | |

```
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>
<div> - All
features of the component meet the requirement.</div>
<div> - Some features of the component do not meet the requirement.</div>
<div> - The
component does not meet the requirement.</div>
```

WAI-ARIA attributes

The MaskedTextBox is characterized with complete ARIA Accessibility support that helps to access through the on-screen readers and other assistive technology devices. This component is designed with the reference of the guidelines document given in [WAI ARAI Accessibility practices](#).

The MaskedTextBox uses the `textbox` role and following ARIA properties for its element based on its state.

| Property | Functionality |

| --- | --- |

| aria-live | The `aria-live` attribute indicates the priority of updates to a live region. |

| aria-disabled | The `aria-disabled` property indicates the disabled state of the MaskedTextBox. |

| aria-valuenow | The `aria-valuenow` property specifies the current value of the MaskedTextBox. |

| aria-invalid | The `aria-invalid` property indicates that the user input is incorrect or not within the acceptable ranges. |

| aria-placeholder | The `aria-placeholder` is a short hint to help the users with data entry when the MaskedTextBox has no value. |

| aria-labelledby | The `aria-labelledby` property indicates the floating label element of the MaskedTextBox. |

Ensuring accessibility

The MaskedTextBox component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the MaskedTextBox component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the MaskedTextBox component with accessibility tools.

Style appearance in EJ2 JavaScript Maskedtextbox control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the appearance of MaskedTextBox wrapper element

Use the following CSS to customize the appearance of wrapper element.

`

/ To specify height, font size, and border /

```
.e-input-group input.e-input, .e-input-group.e-control-wrapper input.e-input, .e-input-group textarea.e-input, .e-input-group.e-control-wrapper textarea.e-input {
```

```
font-size: 20px;
```

```
border-color: red;
```

```
height: 40px;
```

```
border: 2px solid;
```

```
}
```

`

Customizing the MaskedTextBox element on hovering

Use the following CSS to customize the Input Mask element on hovering

`

/ To specify border /

```
.e-input-group input.e-input, .e-input-group input.e-input:hover:not(.e-success):not(.e-warning):not(.e-error):not([disabled]):not(:focus), .e-input-group.e-control-wrapper input.e-input,.e-input-group.e-
```

```
control-wrapper input.e-input:hover:not(.e-success):not(.e-warning):not(.e-error):not([disabled]):no(:focus){
```

```
border: 3px solid red;
```

```
}
```

```
,
```

How To

Perform custom validation using form validator in EJ2 JavaScript Maskedtextbox control

To perform custom validation on the MaskedTextBox use the FormValidator along with custom validation rules.

In the following example, the MaskedTextBox is validated for invalid mobile number by adding custom validation in the rules collection of the FormValidator.

INDEX.TS

```
import { MaskedTextBox } from '@syncfusion/ej2-inputs';
import { Button } from '@syncfusion/ej2-buttons';
import { FormValidator, FormValidatorModel } from '@syncfusion/ej2-inputs';
// initializes the MaskedTextBox component
let mask: MaskedTextBox = new MaskedTextBox({
    // sets mask format to the MaskedTextBox
    mask: '000-000-0000',
    placeholder: 'Mobile Number',
    floatLabelType: 'Always'
});
mask.appendTo('#mask1');
//initialize button
let button: Button = new Button();
button.appendTo('#submit_btn');
// checks the length of mask value and returns corresponding boolean value
let customFn: (args: { [key: string]: string }) => boolean = (args: { [key: string]: string }) => {
    let argsLength:number = args.element.ej2_instances[0].value.length;
    if(argsLength != 0) {
        return argsLength >= 10;
    } else {
        return true;
    }
};
//value is returned based on the length of mask
let custom: (args: { [key: string]: string }) => boolean = (args: { [key: string]: string }) => {
    let argsLength:number = args.element.ej2_instances[0].value.length;
    if(argsLength == 0) {
        return 0;
    } else {
        return argsLength;
    }
};
// sets required property in the FormValidator rules collection
let options: FormValidatorModel = {
    rules: {
```

```

        'mask_value': { numberValue: [customFn, 'Enter valid mobile number']
    },
    },
}
// defines FormValidator to validate the MaskedTextBox
let formObject: FormValidator = new FormValidator('#form-element', options);
//FormValidator rule is added for empty MaskedTextBox
formObject.addRules('mask_value', { maxLength: [custom, 'Enter mobile
number'] });
// places error label outside the MaskedTextBox using the customPlacement
event of FormValidator
let customPlace: (element: HTMLElement, error: HTMLElement) => void =
(element: HTMLElement, error: HTMLElement) => {
    document.querySelector(".form-group").appendChild(error);
};
formObject.customPlacement = customPlace;
document.getElementById('submit_btn').onclick = () => {
    // validates the MaskedTextBox
    formObject.validate("mask_value");
    let ele: HTMLInputElement =
<HTMLInputElement>document.getElementById('mask1');
    // checks for incomplete value and alerts the format submit
    if (ele.value !== "" && ele.value.indexOf(mask.promptChar) === -1) {
        alert("Submitted");
    }
};

```

    margin: 0 auto;
    width: 240px;
}

```

Set cursor position while focus on the input textbox in EJ2 JavaScript Maskedtextbox control

By default, on focusing the MaskedTextBox the entire mask gets selected. You can customize by using any one of the following methods:

- Setting cursor position at the start of the MaskedTextBox.
- Setting cursor position at the end of the MaskedTextBox.
- Setting cursor at the specified position in the MaskedTextBox.

The **selectionStart** and **selectionEnd** set to **0** instead of the input element value's length, when we focus on a MaskedTextBox control filled with all mask characters. This is the default behavior of the HTML 5 input element.

Following is an example that demonstrates the above cases to set cursor position in the MaskedTextBox using [focus](#) event.

INDEX.TS

```
import { MaskedTextBox } from '@syncfusion/ej2-inputs';
// initializes the First MaskedTextBox component
let mask: MaskedTextBox = new MaskedTextBox({
    // Default MaskedTextBox
    mask: '00000-00000',
    value: '93828-3213',
    placeholder: 'Default cursor position',
    floatLabelType: 'Always'
});
mask.appendTo('#mask1');
// initializes the Second MaskedTextBox component
let mask1: MaskedTextBox = new MaskedTextBox({
    // sets mask format to the MaskedTextBox
    mask: '00000-00000',
    value: '83929-4343',
    placeholder: 'Cursor positioned at start',
    floatLabelType: 'Always',
    focus: function(args) {
        //sets cursor position at start of MaskedTextBox
        args.selectionEnd = args.selectionStart = 0;
    }
});
mask1.appendTo('#mask2');
// initializes the Third MaskedTextBox component
let mask2: MaskedTextBox = new MaskedTextBox({
    // sets mask format to the MaskedTextBox
    mask: '00000-00000',
    value: '83929-3213',
    placeholder: 'Cursor positioned at end',
    floatLabelType: 'Always',
    focus: function(args) {
        //sets cursor position at end of MaskedTextBox
        args.selectionStart = args.selectionEnd = args.maskedValue.length;
    }
});
mask2.appendTo('#mask3');
// initializes the Fourth MaskedTextBox component
let mask3: MaskedTextBox = new MaskedTextBox({
    // sets mask format to the MaskedTextBox
    mask: '+1 000-000-0000',
    value: '234-432-432',
    placeholder: 'Cursor at specified position',
    floatLabelType: 'Always',
    focus: function(args) {
        //sets cursor at specified position
        args.selectionStart = 3;
        args.selectionEnd = 3;
    }
})
```

```
});
mask3.appendTo('#mask4');
```

Display numeric keypad when focus on mobile devices in EJ2 JavaScript Maskedtextbox control

By default, on focusing the MaskedTextBox, alphanumeric keypad will be displayed on mobile devices. Sometimes only numeric keypad for number values is needed, and this can be achieved by setting "type" property to tel.

Refer to the following example to enable numeric keypad in MaskedTextBox.

INDEX.TS

```

import { MaskedTextBox } from '@syncfusion/ej2-inputs';
// initializes the MaskedTextBox component
let mask: MaskedTextBox = new MaskedTextBox({
    // sets mask format to the MaskedTextBox
    mask: '999-99999',
    value: "342-45432",
});
mask.appendTo('#mask1');

```

INDEX.HTML

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>

```

STYLES.CSS

```

#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    font-family: 'Helvetica Neue', 'calibri';
    font-size: 14px;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.wrap {
    margin: 0 auto;
    width: 240px;
}

```

Customize the ui appearance of the control in EJ2 JavaScript Maskedtextbox control

The appearance of the MaskedTextBox can be changed by adding custom `cssClass` to the component and enabling styles.

Refer to the following example to change the appearance of the MaskedTextBox.

INDEX.TS

```

import { MaskedTextBox } from '@syncfusion/ej2-inputs';
// initializes the MaskedTextBox component
let mask: MaskedTextBox = new MaskedTextBox({
    // sets mask format to the MaskedTextBox
    mask: '00000',
    value: "42648",

```

```

placeholder: 'Enter User ID',
floatLabelType: 'Always',
cssClass: 'e-style',
focus: function(args) {
    //sets cursor position at start of MaskedTextBox
    args.selectionEnd= args.selectionStart;
}
});
mask.appendTo('#mask1');

```

INDEX.HTML

```

Ej1 api migration in EJ2 JavaScript Maskedtextbox control

This article describes the API migration process of MaskEdit component from Essential JS 1 to Essential JS 2.

Common

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Adding custom class | **Property:** *cssClass*

\$("#mask").ejMaskEdit({
maskFormat: "9999",
cssClass: "custom"
}); | **Property:** *cssClass*

var mask = new ej.inputs.MaskedTextBox({
mask: "9999",
cssClass: "custom"
});
mask.appendTo("#mask"); |

| Destroy editor | Not Applicable | **Property:** *destroy*

var mask = new ej.inputs.MaskedTextBox({
mask: "00-000"
});
mask.appendTo("#mask");
mask.destroy(); |

| Disable the maskedit control | **Method:** *disable*

\$("#mask").ejMaskEdit({
maskFormat: "0000",
value: "1234"
});
var maskObj = \$("#mask").data("ejMaskEdit");
maskObj.disable(); | **Can be achieved using
API:** *enabled*
var mask = new ej.inputs.MaskedTextBox({
mask: "99,999"
});
mask.appendTo("#mask");
var maskObj = document.getElementById("mask").ej2_instances[0];
maskObj.enabled= false; |

| Enable the maskedit control | **Method:** *enable*

\$("#mask").ejMaskEdit({
maskFormat: "0000",
value: "1234"
});
var maskObj = \$("#mask").data("ejMaskEdit");
maskObj.enable(); | **Can be achieved using
API:** *enabled*
var mask = new ej.inputs.MaskedTextBox({
mask: "99,999"
});
mask.appendTo("#mask");
var maskObj = document.getElementById("mask").ej2_instances[0];
maskObj.enabled= true; |

| Control state | **Property:** *enabled*

\$("#mask").ejMaskEdit({
maskFormat: "00-000",
enabled: false
}); | **Property:** *enabled*

var mask = new ej.inputs.MaskedTextBox({
mask: "00-000",
enabled: false
});
mask.appendTo("#mask"); |

| Persistence | **Property:** *enablePersistence*

\$("#mask").ejMaskEdit({
maskFormat: "0000",
enablePersistence: true
}); | **Property:** *enablePersistence*

var mask = new ej.inputs.MaskedTextBox({
mask: "0000",
enablePersistence: true
});
mask.appendTo("#mask"); |

| Triggers when editor is focused in | **Event:** *focusIn*

\$("#mask").ejMaskEdit({
maskFormat: "00-00",
focusIn: function() {}
}); | **Event:** *focus*

var mask = new ej.inputs.MaskedTextBox({
mask: "0000",
focus: function() {}
});
mask.appendTo("#mask"); |

| Triggers when editor is focused out | **Event:** *focusOut*

\$("#mask").ejMaskEdit({
maskFormat: "0000",
focusOut: function() {}
}); | **Event** *blur*

var mask = new ej.inputs.MaskedTextBox({
mask: "00000",
blur: function() {}
});
mask.appendTo("#mask"); |

| Sets height | **Property:** *height*

\$("#mask").ejMaskEdit({
maskFormat: "0000",
height : "30px"
}); | **Can be achieved using,**

var mask = new ej.inputs.MaskedTextBox({
mask: "0000",
cssClass: "custom"
});
mask.appendTo("#mask");
Css
.e-maskedtextbox.custom{
height: 30px;
} |

| HTML Attributes | **Property:** *htmlAttributes*
 "0000",
htmlAttributes: {name: "maskedtextbox"}
}); | **Can be achieved using**
HTML
 <input id="mask" type="text" name="maskedtextbox" />
var mask = new
 ej.inputs.MaskedTextBox({
mask: "0000"
});
mask.appendTo("#mask"); |

| Specifies Input mode | **Property:** *inputMode*
 "0000",
inputMode: ej.InputMode.Password
}); | **Can be achieved using**
HTML
 <input id="mask" type="password" />
var mask = new
 ej.inputs.MaskedTextBox({
mask: "0000",
});
mask.appendTo("#mask"); |

| Triggers on key press | **Event:** *keyPress*
 "000",
keyPress: function() {}
}); | **Can be achieved using native event** **HTML**
 <input id="mask" type="text" onkeypress="keyPress()" />
 <script>
function
 keyPress(){}
</script>
 |

| Triggers on key up | **Event:** *keyUp*
 "9999",
keyUp: function() {}
}); | **Can be achieved using native event** **HTML**
 <input id="mask" type="text" onkeyup="keyUp()" />
 <script>
function keyUp(){}
</script>
 |

| Triggers on mouse out in maskedit control | **Event:** *mouseOut*
 "0000-000",
mouseOut: function() {}
}); | **Can be achieved using native event** **HTML**
 <input id="mask" type="text" onmouseout="mouseOut()" />
 <script>
function mouseOut(){}
</script>
 |

| Triggers when mouse over in maskedit control | **Event:** *mouseOver*
 "00-00",
mouseOver: function() {}
}); | **Can be achieved using native event** **HTML**
 <input id="mask" type="text" onmouseover="mouseOver()" />
 <script>
function mouseOver(){}
</script>
 |

| Name of maskedit control | **Property:** *name*
 "0000",
name: "pin"
}); | **Can be achieved using** **HTML**
 <input id="mask" type="text" name="maskedtextbox" />
var mask = new ej.inputs.MaskedTextBox({
mask:
 "0000",
});
mask.appendTo("#mask"); |

| Triggers on keydown | **Event:** *onKeyDown*
 "9999-9999",
onKeyDown: function() {}
}); | **Can be achieved using native event**
HTML
 <input id="mask" type="text" onkeydown="keyDown()" />
 <script>
function
 keyDown(){}
</script>
 |

| Read only | **Property:** *readOnly*
 "99-999",
readOnly: true
}); | **Can be achieved using**,
var mask = new
 ej.inputs.MaskedTextBox({
mask: "0000",
enabled: false,

});
mask.appendTo("#mask");
CSS
 .e-mask{
 background-image: none
 !important;
border-bottom-color: rgba(0, 0, 0, 0.42) !important;
 |

| Right to left | **Property:** *textAlign*
 "9999",
textAlign: "right"
}); | **Property:** *enableRtl*

var mask = new
 ej.inputs.MaskedTextBox({
mask: "9999",
enableRtl:
 true
});
mask.appendTo("#mask"); |

```
| Sets width | Property: width<br/><br/>$("#mask").ejMaskEdit({<br/>maskFormat: "0000",<br/>width:
"100px"<br/>}); | Property: width<br/><br/>var mask = new ej.inputs.MaskedTextBox({<br/>mask:
"0000",<br/>width: "100px"<br/>});<br/>mask.appendTo("#mask"); |
```

Mask Configuration

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

```
| Triggers on value change | Event change<br/><br/>$("#mask").ejMaskEdit({<br/>maskFormat: "00-00",<br/>change: function() {}<br/>}); | Event: change<br/><br/>var mask = new ej.inputs.MaskedTextBox({<br/>mask: "00-00",<br/>change: function() {}<br/>});<br/>mask.appendTo("#mask"); |
```

```
| Clears masked text/value | Method: clear<br><br>$("#mask").ejMaskEdit({<br>maskFormat: "0000",<br>value: "1234"<br>});<br>var maskObj = $("#mask").data("ejMaskEdit");<br>maskObj.clear(); | Can be achieved using<br>var mask = new ej.inputs.MaskedTextBox({<br>mask: "99,999"<br>});<br>mask.appendTo("#mask");<br>var maskObj = document.getElementById("mask").ej2_instances[0];<br>maskObj.value = ""; |
```

```
| Triggers on creation | Event: create<br/><br/>$("#mask").ejMaskEdit({<br/>maskFormat: "00-00",<br/>create: function() {}<br/>}); | Event: created<br/><br/>var mask = new ej.inputs.MaskedTextBox({<br/>mask: "00-00",<br/>created: function() {}<br/>});<br/>mask.appendTo("#mask"); |
```

```
| Custom Character | Property: customCharacter<br/><br/>$("#mask").ejMaskEdit({<br/>maskFormat:
"C-0000",<br/>customCharacter : "#"<br/>}); | Property: customCharacters<br/><br/>var mask = new
ej.inputs.MaskedTextBox({<br/>mask: "C-0000",<br/>customCharacters: {C:
'#'}<br/>});<br/>mask.appendTo("#mask"); |
```

```
| Triggers when maskedit control is destroyed | Event:  
destroy<br/><br/>$("#mask").ejMaskEdit({<br/>maskFormat: "00-00",<br/>destroy: function() {}<br/>});  
| Event: destroyed<br/><br/>var mask = new ej.inputs.MaskedTextBox({<br/>mask: "00-  
00",<br/>destroyed: function() {}<br/>});<br/>mask.appendTo("#mask"); |
```

```
| Placeholder float type | Not Applicable | Property: floatLabelType<br/><br/>var mask = new
ej.inputs.MaskedTextBox({<br/>mask: "9,999",<br/>placeholder: "Enter value",<br/>floatLabelType:
"Auto"<br/>});<br/>mask.appendTo("#mask"); |
```

| Gets pure value of masked edit control | **Method:**

```
getStrippedValue<br/><br/>$("#mask").ejMaskEdit({<br/>maskFormat: "0000",<br/>value:
"123"<br/>});<br/>var maskObj = $("#mask").data("ejMaskEdit");<br/>maskObj.getStrippedValue(); |
```

Can be achieved using,
 var mask = new ej.inputs.MaskedTextBox({
mask: "00-00",
value: "1234"
});
mask.appendTo("#mask");
var maskObj = document.getElementById("mask").ej2_instances[0];
alert(maskObj.value);
 |

```
| Get whole maskedit value | Method:  
getUnstrippedValue<br/><br/>$(("#mask").ejMaskEdit({<br/>maskFormat: "00-00",<br/>value:  
"1234"<br/>}));<br/>var maskObj = $(("#mask").data("ejMaskEdit"));<br/>maskObj.getUnstrippedValue();  
| Method: getMaskedValue<br/><br/>var mask = new ej.inputs.MaskedTextBox({<br/>mask: "00-  
00",<br/>value: "1234"<br/>});<br/>mask.appendTo("#mask");<br/>mask.getMaskedValue(); |
```

| Hides prompt character on focus out | **Property:**
hidePromptOnLeave

\$("#mask").eiMaskEdit({
maskFormat:

"aaaa",
hidePromptOnLeave: true
}); | **Can be achieved using**
var mask = new ej.inputs.MaskedTextBox({
mask: '000-000-0000',
focus: function(){
 this.promptChar = "";
 }
});
var maskObj = document.getElementById("mask1")
maskObj.addEventListener("focusout",function(){
maskObj.ej2instances[0].promptChar = " ";
 } |

| Mask format | **Property:** maskFormat

\$("#mask").ejMaskEdit({
maskFormat: "99,999"
}); | **Property:** mask

var mask = new ej.inputs.MaskedTextBox({
mask: "99,999"
});
mask.appendTo("#mask"); |

| Prompt character | Not Applicable | **Property:** promptChar

var mask = new ej.inputs.MaskedTextBox({
mask: "0000",
promptChar: "#"
});
mask.appendTo("#mask"); |

| Clear Button | Not Applicable | **Property:** promptChar

var mask = new ej.inputs.MaskedTextBox({
mask: "aaaa",
showClearButton: true
});
mask.appendTo("#mask"); |

| Prompt character display | **Property:** showPromptChar

\$("#mask").ejMaskEdit({
maskFormat: "\$ 99-999",
showPromptChar: false
}); | **Can be achieved using**
var mask = new ej.inputs.MaskedTextBox({
mask: "0000",
promptChar: "
");
mask.appendTo("#mask"); |

| Show rounded corner | **Property:** showRoundedCorner

\$("#mask").ejMaskEdit({
maskFormat: "0000",
showRoundedCorner: true
}); | **Can be achieved using following Css**
var mask = new ej.inputs.MaskedTextBox({
mask: "9999",
cssClass: "e-style",
 floatLabelType: "Always"
});
mask.appendTo("#mask");
CSS
#mask{
border: 2px solid grey;
padding: 10px;
border-radius: 10px;
}
.e-control-wrapper.e-mask.e-float-input.e-style .e-float-line::before, .e-control-wrapper.e-mask.e-float-input.e-style .e-float-line::after {
 background: none ;
}
</style> |

| Value of maskedit control | **Property:** value

\$("#mask").ejMaskEdit({
maskFormat: "0000",
value: "1234"
}); | **Property:** value

var mask = new ej.inputs.MaskedTextBox({
mask: "0000",
value: "1234"
});
mask.appendTo("#mask"); |

| Displays hint on maskedit control | **Property:** watermarkText

\$("#mask").ejMaskEdit({
maskFormat: "9999",
watermarkText: "Enter value"
}); | **Property:** placeholder

var mask = new ej.inputs.MaskedTextBox({
mask: "9999",
placeholder: "Enter value"
});
mask.appendTo("#mask"); |

Validation

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Displays error until correct value is entered | **Property:** showError

\$("#mask").ejMaskEdit({
maskFormat: "99-999",
showError: true
}); | **MaskedTextBox by default shows error until correct value is entered.**
var mask = new

```
ej.inputs.MaskedTextBox({<br/>mask: "9999",<br/>placeholder: "Enter
value"<br/>});<br/>mask.appendTo("#mask"); |
```

| Validation message | **Property:**

```
validationMessage<br/><br/>$("#mask").ejMaskEdit({<br/>maskFormat: "0000",<br/>validationRules:
{required: true},<br/>validationMessage: {required: "Required value"}<br/>}); | Validation in
```

MaskedTextBox can be achieved through form validation
var options = {
 rules:

```
{<br/>'maskValue': { required: [ true, 'Enter valid mobile number' ] },<br/> },<br/>}<br/>var formObject =
new ej.inputs.FormValidator('#form-element', options);<br/> formObject.customPlacement =
function(element, error) {<br/> document.querySelector(".form-
```

```
group").appendChild(error);<br/>}<br/>var mask = new ej.inputs.MaskedTextBox({<br/> mask: '000-
000-0000',<br/>});<br/>mask.appendTo("#mask");<br/>HTML <br/> <form id="form-element"
class="form-horizontal"><br/><div class = "form-group"><br/><input id="mask" type="text"
name="maskValue" class="form-control" /> <br/> <div id="error"></div><br/></div><br/></form> |
```

| Validation Rules | **Property:** validationRules

\$("#mask").ejMaskEdit({
maskFormat: "00-

```
00",<br/>validationRules: {required: true}<br/>}); | Validation in MaskedTextBox can be achieved
through form validation<br/>var options = {<br/> rules: {<br/>'maskValue': { required: [ true] },<br/>
},<br/>}<br/>var formObject = new ej.inputs.FormValidator('#form-element', options);<br/>
```

```
formObject.customPlacement = function(element, error) {<br/> document.querySelector(".form-
group").appendChild(error);<br/>}<br/>var mask = new ej.inputs.MaskedTextBox({<br/> mask: '000-
000-0000',<br/>});<br/>mask.appendTo("#mask");<br/>HTML <br/> <form id="form-element"
class="form-horizontal"><br/><div class = "form-group"><br/><input id="mask" type="text"
name="maskValue" class="form-control" /> <br/> <div id="error"></div><br/></div><br/></form> |
```

Mention

Working with data in EJ2 JavaScript Mention control

The Mention loads the data either from local data sources or remote data services using the [dataSource](#) property. It supports the data type of either [array](#) or [DataManager](#).

The Mention also supports different kinds of data services such as OData V4 and Web API, and data formats such as XML, JSON, and JSONP with the help of [DataManager](#) adaptors.

| Fields | Type | Description |

| ----- | ----- | ----- |

| text | [string](#) | Specifies the display text of each list item. |

| value | [number or string](#) | Specifies the hidden data value mapped to each list item that should contain a unique value. |

| groupBy | [string](#) | Specifies the category under which the list item has to be grouped. |

| iconCss | [string](#) | Specifies the icon class of each list item. |

When binding complex data to the Mention, fields should be mapped correctly. Otherwise, the selected item remains undefined.

Binding local data

Local data can be represented in three ways as described in the following.

Array of simple data

The Mention has provided support to load an array of primitive data such as strings and numbers. Here, both the value and text fields act the same.

INDEX.TS

```
import { Mention } from '@syncfusion/ej2-dropdowns';
// defined the array of data
let userData: string[] = ['Selma Rose', 'Garth', 'Robert', 'William', 'Joseph'];
// initialize Mention control
let mentionObject: Mention = new Mention({
    //set the data to dataSource property
    dataSource: userData
});
// render initialized Mention
mentionObject.appendTo('#mentionElement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 Mention</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="styles.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-base/styles/bootstrap5.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-inputs/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-dropdowns/styles/bootstrap5.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container" style="width:200px;">
    <!--element which is the Mention target to list the suggestions-->
    <label style="font-size: 15px; font-weight: 600;">Comments</label>
    <div id="mentionElement" style="min-height: 100px; border: 1px solid
    #D7D7D7; border-radius: 4px; padding: 8px; font-size: 14px; width:
    600px;"></div>
  </div>
  <script>
  var ele = document.getElementById('container');
  if(ele) {
    ele.style.visibility = "visible";
  }
  </script>
  <script src="index.js" type="text/javascript"></script>
```

```
</body></html>
```

Array of JSON data

The Mention can generate its list of items through an array of JSON data. Therefore the appropriate columns should be mapped to the [fields](#) property.

In the following example, ID column and Game column from complex data have been mapped to the value field and text field, respectively.

INDEX.TS

```
import { Mention } from '@syncfusion/ej2-dropdowns';
//define the array of complex data
let sportsData: { [key: string]: Object }[] = [
  { ID: 'game1', Game: 'Badminton' },
  { ID: 'game2', Game: 'Football' },
  { ID: 'game3', Game: 'Tennis' },
  { ID: 'game4', Game: 'Hockey' },
  { ID: 'game5', Game: 'Basketball' }
];
//initiate the Mention
let mentionObject: Mention = new Mention({
  // bind the sports Data to datasource property
  dataSource: sportsData,
  // maps the appropriate column to fields property
  fields: { text: 'Game', value: 'ID' }
});
//render the control
mentionObject.appendTo('#mentionElement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 Mention</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="styles.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
inputs/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
dropdowns/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container" style="width:200px;">
```

```

        <label style="font-size: 15px; font-weight: 600;">Comments</label>
        <!--element which is the Mention target to list the suggestions-->
        <div id="mentionElement" style="min-height: 100px; border: 1px solid
#D7D7D7; border-radius: 4px; padding: 8px; font-size: 14px; width:
600px;"></div>
    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Array of complex data

The Mention can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [fields](#) property.

In the following example, **Code.ID** column and **Country.Name** column from complex data have been mapped to the **value** field and **text** field, respectively.

INDEX.TS

```

import { Mention } from '@syncfusion/ej2-dropdowns';
//define the array of complex data
let CountryGroup: { [key: string]: Object }[] = [

Binding remote data

The Mention supports retrieval of data from remote data services with the help of **DataManager** control. The [Query](#) property is used to fetch the data from the database and bind it to the Mention control.

OData v4 adaptor - Binding OData v4 service

The ODataV4 is an improved version of OData protocols, and the **DataManager** can also retrieve and consume OData v4 services. For more details on OData v4 services, refer to the [odata documentation](#). To bind OData v4 service, use the **ODataV4Adaptor**.

The following sample displays the first 6 contacts from **Customers** table of the **Northwind** Data Service.

INDEX.TS

```

import { Mention } from '@syncfusion/ej2-dropdowns';
//import DataManager related classes
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
//initiates the control
let mentionObject: Mention = new Mention({
    //bind the DataManager instance to dataSource property
    dataSource: new DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
    }),
    //bind the Query instance to query property

```

```

    query: new Query().from('Customers').select(['ContactName',
'CustomerID']).take(6),
    //map the appropriate columns to fields property
    fields: { text: 'ContactName', value: 'CustomerID' },
    popupWidth: '250px'
});
//render the control
mentionObject.appendTo('#mentionElement');

```

Mention integration in EJ2 JavaScript Rich text editor control

By integrating the [Mention](#) control with a Rich Text Editor, users can easily mention or tag other users or objects from the suggested list without having to manually type out their names or other identifying information.

The [target](#) property of the Mention control allows you to specify the **ID** of the content editable div element within the Rich Text Editor that you want to bind the Mention control to. This allows you to enable the Mention functionality within the Rich Text Editor, so that users can mention or tag other users or objects from the suggested list while editing the text.

When the user types the **@** symbol followed by a character, the Rich Text Editor will display a list of suggestions for items that the user can select from. The user can then select an item from the list by clicking on it, or by typing the name of the item they want to tag.

In the following sample, configured the following properties with popup dimensions.

- [allowSpaces](#) - Allow to continue search action if user enter space after mention character while searching.
- [suggestionCount](#) - The maximum number of items that will be displayed in the suggestion list.
- [itemTemplate](#) - Used to display the customized appearance in suggestion list.

[View Sample](#)[See Also](#)

- [Mention](#)

Filtering data in EJ2 JavaScript Mention control

The Mention control has built-in support to filter data items. The filter operation starts as soon as you start typing characters in the mention element.

Limit the minimum filter character

You can control the minimum length of user input to initiate the search action using the [minLength](#) property. This can be useful if you have a very large list of data. The default value is 0, where the suggestion list opens as soon as the user inputs the mention character.

The remote request does not fetch the search data until the search key contains three characters as shown in the following example.

INDEX.TS

```
import { Mention } from '@syncfusion/ej2-dropdowns';
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
let searchData: DataManager = new DataManager({
    url: 'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
    adaptor: new ODataV4Adaptor,
    crossDomain: true
});
let filter: Mention = new Mention({
    dataSource: searchData,
    query: new Query().select(['ContactName', 'CustomerID']).take(7),
    // map the appropriate column
    fields: { text: 'ContactName', value: 'CustomerID' },
    minLength: 3
});
filter.appendTo('#mentionElement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 Mention</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">

  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
inputs/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
dropdowns/styles/bootstrap5.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
```

```

<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="width:200px;">
        <!--element which is the Mention target to list the suggestions-->
        <label style="font-size: 15px; font-weight: 600;">Comments</label>
        <div id="mentionElement" style="min-height: 100px; border: 1px solid
#D7D7D7; border-radius: 4px; padding: 8px; font-size: 14px; width:
600px;"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Change the filter type

While filtering, you can change the filter type to **Contains**, **StartsWith**, or **EndsWith** in the [filterType](#) property. The default filter operator is **Contains**.

- **StartsWith** - Filter the items that begin with the specified text value.
- **Contains** - Filter the items that contain the specified text value.
- **EndsWith** - Filter the items that end with the specified text value.

INDEX.TS

```

import { Mention } from '@syncfusion/ej2-dropdowns';
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
let searchData: DataManager = new DataManager({
    url: 'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
    adaptor: new ODataV4Adaptor,
    crossDomain: true
});
let filter: Mention = new Mention({
    dataSource: searchData,
    query: new Query().select(['ContactName', 'CustomerID']).take(7),
    // map the appropriate column
    fields: { text: 'ContactName', value: 'CustomerID' },
    filterType: 'StartsWith'
});
filter.appendTo('#mentionElement');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 Mention</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">

```

```

<meta name="author" content="Syncfusion">
<link href="styles.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/bootstrap5.css" rel="stylesheet">

inputs/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
dropdowns/styles/bootstrap5.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="width:200px;">
        <!--element which is the Mention target to list the suggestions-->
        <label style="font-size: 15px; font-weight: 600;">Comments</label>
        <div id="mentionElement" style="min-height: 100px; border: 1px solid
#D7D7D7; border-radius: 4px; padding: 8px; font-size: 14px; width:
600px;"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Allow spacing between search

While filtering the data in the data source, you can allow the space in the middle of the mention using the [allowSpaces](#) property. If the data source does not match with the mentioned element data, the popup will be hidden on the space key press. The default value of the [allowSpaces](#) is `false`.

By default, the [allowSpaces](#) property is disabled, and the space ends the mention control search.

INDEX.TS

```

import { Mention } from '@syncfusion/ej2-dropdowns';
// defined the array of complex data
let employeeData: { [key: string]: Object }[] = [
    { Name: 'Andrew Fuller', ID: '1' },

Sorting in EJ2 JavaScript Mention control

You can display the suggestion list items in a specific order. It has possible types as **Ascending**, **Descending** and **None** in the [sortOrder](#) property.

- **None** - The data source is not sorted.
- **Ascending** - The data source is sorted in ascending order.
- **Descending** - The data source is sorted in descending order.

INDEX.TS

```
import { Mention } from '@syncfusion/ej2-dropdowns';
// defined the array of complex data
let sportsData: { [key: string]: Object }[] = [
  { ID: 'game1', Game: 'Badminton' },
  { ID: 'game2', Game: 'Football' },

Templates in EJ2 JavaScript Mention control

The Mention has been provided with several options to customize each suggestion list item, display item, and data loading indication.

Item template

The content of each list item in the Mention can be customized using the [itemTemplate](#) property.

In the following sample, each list item is split into two columns to display relevant data using [itemTemplate](#).

INDEX.TS

```

import { Mention } from '@syncfusion/ej2-dropdowns';
//import data manager related classes
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
//initiates the control
let mentionObject: Mention = new Mention({
    //bind the data manager instance to dataSource property
    dataSource: new DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
    }),
    //bind the Query instance to query property
    query: new Query().from('Employees').select(['FirstName',
'City', 'EmployeeID']).take(6),
    //map the appropriate columns to fields property
    fields: { text: 'FirstName', value: 'EmployeeID' },
    //set width to popup list
    popupWidth: '200px',
    //set the value to itemTemplate property

```

```

    itemTemplate:"<span><span class='name'>${FirstName}</span><span class
    ='city'>${City}</span></span>"
  });
  //render the control
  mentionObject.appendTo('#mentionElement');

```

INDEX.HTML

```

</body></html>

```

Display template

You can customize the mentioned value's display appearance using the [displayTemplate](#) property.

In the following sample, the selected value is displayed as a combined text of both **FirstName** and **City** in the mention element, which is separated by a hyphen.

INDEX.TS

```

import { Mention } from '@syncfusion/ej2-dropdowns';
//import data manager related classes

```

```

import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
//initiates the control
let mentionObject: Mention = new Mention({
    //bind the data manager instance to dataSource property
    dataSource: new DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
    }),
    //bind the Query instance to query property
    query: new Query().from('Employees').select(['FirstName',
    'City', 'EmployeeID']).take(6),
    //map the appropriate columns to fields property
    fields: { text: 'FirstName', value: 'EmployeeID' },
    //set width to popup list
    popupWidth: '200px',
    //set the template value to itemTemplate property
    itemTemplate: "<span><span>${FirstName}</span><span class
    ='city'>${City}</span></span>",
    //set the value to displayTemplate property
    displayTemplate: "<span>${FirstName} - ${City}</span>"
});
//render the control
mentionObject.appendTo('#mentionElement');

```

- [How to achieve filtering](#)

Localization in EJ2 JavaScript Mention control

The Localization library allows you to localize static text content of the [noRecordsTemplate](#) properties according to the culture currently assigned to the Mention.

| Locale key | en-US (default) |

|-----|-----|

| noRecordsTemplate | No records found |

Loading translations

To load the translation object to your application, use the load function of the **L10n** class.

In the following sample, French culture is set to the mention control and no data is loaded. Hence, the [noRecordsTemplate](#) property displays its text in French culture initially.

INDEX.TS

```

import { Mention } from '@syncfusion/ej2-dropdowns';
// import L10n class for load function
import { L10n, setCulture } from '@syncfusion/ej2-base';
import { DataManager, ODataV4Adaptor, Query } from '@syncfusion/ej2-data';
// bind remotedata to showcase actionFailureTemplate in offline.

```

```

let customerData: DataManager = new DataManager({
    url: 'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
    adaptor: new ODataV4Adaptor,
    crossDomain: true
});
let mentionObject: Mention = new Mention({
    dataSource: customerData,
    // set locale culture to Mention
    locale: 'fr-BE',
    // map appropriate column
    fields: { text: 'ContactName', value: 'CustomerID' },
    // take 0 item to showcase noRecordsTemplate property.
    query: new Query().select(['ContactName', 'CustomerID']).take(0)
});
mentionObject.appendTo('#mentionElement');
L10n.load({
    'fr-BE': {
        'mention': {
            'noRecordsTemplate': "Aucun enregistrement trouvé"
        }
    }
});

```

Customization in EJ2 JavaScript Mention control

Show or hide mention character

You can show the mention character as the prefix of the selected item in mention component using [showMentionChar](#) property. The default value of `showMentionChar` is `false`.

INDEX.TS

```

import { Mention } from '@syncfusion/ej2-dropdowns';
// defined the array of complex data
let emailData: { [key: string]: Object }[] = [
    { Name: 'Selma Rose', EmailId : 'selma@gmail.com' },
    { Name: 'Maria', EmailId : 'maria@gmail.com' },
    { Name: 'Russo kay', EmailId : 'russo@gmail.com' },
    { Name: 'Robert', EmailId : 'robert@gmail.com' },
    { Name: 'Garth', EmailId : 'garth@gmail.com' }
];
// initialize Mention control
let mentionObject: Mention = new Mention({
    //set the data to dataSource property
    dataSource: emailData,
    // maps the appropriate column to fields property
    fields: { text: 'Name', value: 'EmailId' },
    mentionChar: '#',
    showMentionChar: true
});
// render initialized Mention
mentionObject.appendTo('#mentionElement');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 Mention</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="styles.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/bootstrap5.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
inputs/styles/material.css" rel="stylesheet">

```

```

<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
dropdowns/styles/bootstrap5.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="width:200px;">
        <!--element which is the Mention target to list the suggestions-->
        <label style="font-size: 15px; font-weight: 600;">Comments</label>
        <div id="mentionElement" style="min-height: 100px; border: 1px solid
#D7D7D7; border-radius: 4px; padding: 8px; font-size: 14px; width:
600px;"></div>
    </div>

var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Adding the suffix character after selection

You can add the suffix character while selecting an item in the Mention component using [suffixText](#) property. You can add space or new line as suffix to the selected item. The default values are empty string.

INDEX.TS

```

import { Mention } from '@syncfusion/ej2-dropdowns';
// define the array of complex data
let sportsData: { [key: string]: Object }[] = [
    { ID: 'game1', Game: 'Badminton' },
    { ID: 'game2', Game: 'Football' },
    { ID: 'game3', Game: 'Tennis' },
    { ID: 'game4', Game: 'Hockey' },
    { ID: 'game5', Game: 'Basketball' }
];
// initialize Mention control
let mentionObject: Mention = new Mention({
    dataSource: sportsData,
    // maps the appropriate column to fields property
    fields: { text: 'Game', value: 'ID' },
    suffixText: '&#160;'
});
// render initialized Mention
mentionObject.appendTo('#mentionElement');

```

  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Configure the popup list

You can customize the suggestion list as width and height using the [popupHeight](#) and [popupWidth](#) properties.

By default, the popup list width value is set as `auto`. Depending on the mentioned suggestion data list, the width value is automatically adjusted. The popup list height value is set as `300px`.

INDEX.TS

```

import { Mention } from '@syncfusion/ej2-dropdowns';
// define the array of complex data
let countriesData: { [key: string]: Object }[] = [
  { Country : 'Australia', Code : 'AU' },
  { Country : 'Bermuda', Code : 'BM' },
  { Country : 'Canada', Code : 'CA' },
  { Country : 'Cameroon', Code : 'CM' },
  { Country : 'Denmark', Code : 'DK' }
];

```

```
// initialize Mention control
let mentionObject: Mention = new Mention({
  //set the data to dataSource property
  dataSource: countriesData,
  // maps the appropriate column to fields property
  fields: { text: 'Country', value: 'Code' },
  //set height to popup list
  popupHeight: '200px',
  //set width to popup list
  popupWidth: '250px'
});
// render initialized Mention
mentionObject.appendTo('#mentionElement');
```

</body></html>
```

Trigger character

You can customize the trigger character by using the [mentionChar](#) property in the Mention control. The trigger character triggers the suggestion list to display in the target area.

By default, the [mentionChar](#) is @.

Accessibility in EJ2 JavaScript Mention control

Web accessibility makes web content and web applications more accessible for people with disabilities. Mention control provides built-in compliance with WAI-ARIA specifications. The WAI-ARIA support is achieved using the attributes such as [aria-selected](#) and [aria-activedescendent](#).

The Mention component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Mention component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) | |

| [Section 508 Support](#) | |

| [Screen Reader Support](#) | |

| [Right-To-Left Support](#) | |

| [Color Contrast](#) | |

| [Mobile Device Support](#) | |

| [Keyboard Navigation Support](#) | |

| [Accessibility Checker Validation](#) | |

| [Axe-core Accessibility Validation](#) | |

<style>

```
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
```

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

WAI-ARIA attributes

The Mention control uses the **Listbox** role where each list item has an **option** role. The following **ARIA attributes** denote the Mention state.

| Properties | Functionalities |

| --- | --- |

| aria-selected | Indicates the selected option. |

| aria-activedescendent | This attribute holds the ID of the active list item to focus its descendant child element. |

| aria-owns | This attribute contains the ID of the popup list to indicate popup as a child element. |

Keyboard interaction

You can use the following key shortcuts to access the Mention without interruptions.

| Keyboard shortcuts | Actions |

| --- | --- |

| Arrow Down | Selects the first item in the Mention list. Otherwise, selects the item next to the currently selected item. |

| Arrow Up | Selects the item previous to the currently selected one. |

| Esc(Escape) | Closes the popup list when it is in an open state. |

| Enter | Selects the focused item, and when it is in an open state the popup list closes. |

| Tab | Focuses on the next TabIndex element on the page when the popup is closed. Otherwise, inserts the selected popup list item and closes the popup list. |

INDEX.TS

```
import { Mention } from '@syncfusion/ej2-dropdowns';
// defined the array of complex data
let employeeData: { [key: string]: Object }[] = [
  { Name: 'Andrew Fuller', ID: '1' },
  { Name: 'Janet Leverling', ID: '2' },
  { Name: 'Laura Callahan', ID: '3' },
  { Name: 'Margaret Peacock', ID: '4' },
  { Name: 'Anne Dodsworth', ID: '5' }
];
// initialize Mention control
let mentionObject: Mention = new Mention({
  //set the data to dataSource property
  dataSource: employeeData,
  // maps the appropriate column to fields property
```

```

    fields: { text: 'Name', value: 'ID' }
  });
  // render initialized Mention
  mentionObject.appendTo('#mentionElement');

```

Ensuring accessibility

The Mention component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Mention component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Mention component with accessibility tools.

Menu Bar

Icons and sub menu items in EJ2 JavaScript Menu control

Icons

The menu item contains an icon/image in it to provide a visual representation of an action. To place the icon on a menu item, set the [iconCss](#) property with the required icon CSS. By default, the icon is positioned at the left of the menu item. In the following sample, the icons of File and Edit menu items and Open, Save, Cut, Copy, and Paste sub menu items are added using the [iconCss](#) property.

INDEX.TS

```
import { Menu, MenuItemModel } from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Menu items definition
let menuItems: MenuItemModel[] = [
    {
        text: 'File',
        iconCss: 'em-icons e-file',
        items: [
            { text: 'Open', iconCss: 'em-icons e-open' },
            { text: 'Save', iconCss: 'e-icons e-save' },
            { separator: true },
            { text: 'Exit' }
        ]
    },
    {
        text: 'Edit',
        iconCss: 'em-icons e-edit',
        items: [
            { text: 'Cut', iconCss: 'em-icons e-cut' },
            { text: 'Copy', iconCss: 'em-icons e-copy' },
            { text: 'Paste', iconCss: 'em-icons e-paste' }
        ]
    },
    {
        text: 'View',
        items: [
            { text: 'Toolbar' },
            { text: 'Sidebar' },
            { text: 'Full Screen' }
        ]
    },
    {
        text: 'Tools',
        items: [
            { text: 'Spelling & Grammar' },
            { text: 'Customize' },
            { text: 'Options' }
        ]
    },
    { text: 'Go' },
    { text: 'Help' }
];
// Initialize Menu component.
let menuObj: Menu = new Menu({ items: menuItems }, '#menu');
```

</body></html>

```

Navigation

Navigation in Menu is used to navigate to the other web page when a menu item is clicked. It can be achieved by providing a link to the menu item using the [url](#) property. In the following sample, the Navigation URL is added to sub menu items using the [url](#) property.

INDEX.TS

```

import { Menu, MenuItemModel, MenuEventArgs } from '@syncfusion/ej2-
navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Menu items definition
let menuItems: MenuItemModel[] = [
